Filter on entries that begin with the text entered in the *Filter* field.

**Ends With**

Filter on entries that end with the text entered in the *Filter* field.

**Contains**

Filter on entries that contain, anywhere in the entry, the text entered in the *Filter* field.

3. Press **Enter (OK)**. If no entries are found for the filter item, a message displays.

**Xtra Global Table**

The Xtra Global Table option (available in the Define dialog box) was originally created to assist scopists that worked with dictionaries that were not continually updated with new definitions. For example, let's say the scopist gets a transcript from a reporter and while scoping, comes across "enter containment" with the steno SPWER/TAEUPLT. The scopist defines the steno correctly as "entertainment" and when finished with the job, sends the job and defines back to the reporter. For whatever reason, the scopist continues to get jobs from the reporter with words or phrases that have been correctly defined by the scopist but the reporter's dictionary never was updated. As a result, the scopist is continually defining the same words/phrases over and over again in multiple jobs. When you check the add to Xtra Global Table option in a define dialog box, CATalyst will add the definition to the current job and selected dictionary if applicable, but also will add the definition to the Xtra Global Table. The scopist can apply the Xtra Global Table to all future jobs the scopist receives from the reporter and the result is a better translation because defines are applied even though the reporter never updated her/his dictionary.

Although the Xtra Global Table was originally designed for scopists, reporters may find it useful also. For example, let's say the reporter has made some e-defines while editing and has also added them to the Xtra Global Table. The reporter can select the Xtra Global Table to help translate future jobs so the e-defines apply to the text during translation on future jobs.

## Replace

Replace (Ctrl + r) is a command that replaces text or steno with new text for this single occurrence only. You can also replace text by marking it and typing the new text.

If [Intuitive Replace](#) is active, Case CATalyst suggests a word in the New Text field based on previous replacements. When you replace a word not previously replaced and you place your cursor in the New Text field, the most recently replaced word displays. You can toggle through the last 10 replacements by pressing **Ctrl + r**.

## Replace Steno or Text

1. Place the cursor immediately before the word, on the word, or mark the steno or text you want to replace.
2. Press **Ctrl + r (Replace)**. The Global – Replace dialog box displays.
3. Make necessary entries:

### Old Text

The text selected for replacement.

### Steno

The steno, if any, for the text selected.

### Mark/Unmark Left

Press **Alt + [** (left bracket) to expand or **Alt + ]** (right bracket) to deselect the marking to the left.

### Mark/Unmark Right

Press **Alt + Right Arrow** or **Ctrl + g** to expand or **Alt + Left Arrow** to deselect the marking to the right.

### New Text

Type the new text, including any format symbols. Press **F9** to add [extended characters](#).

To copy the old text to the New Text field, press **F6**. You can toggle through the last ten typed replacement words by pressing **Ctrl + r** with the cursor in the New Text field; or **Ctrl + Shift + r** to toggle backwards through the selection.

When the option, [Spell Check While Defining](#) is not active, press **Shift + F7** to spell check the word in the New Text Field. To look up a definition, press **Ctrl + F7**.

### FS (Alt + f)

Display the list of available format symbols. To always display the format symbol list, check the box, Always Show Format Symbols. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry.

You can also use shortcut keys to insert a format symbol. Place the cursor in the New Text field, press **F4** and then press the appropriate letter or symbol.

### Insert Field

Display the [Insert Field](#) dialog box from which you can select a field to insert into the text portion of the definition.

### Cap

Copy the text in the Old Text field to the New Text field and cycle through three Cap/Uncap options:

- Capitalize the first letter in a word or phrase, except for words in the NoCapWords list
- Capitalize all the letters in a word or phrase
- Uncap the letters in a word or phrase

### Conflict

This option is available when a conflict is part of the Old Text. When you select Conflict, Case CATalyst copies the text from the Old Text field to the New Text field, automatically choosing the first conflict. If you select Conflict a second time, Case CATalyst chooses the second conflict. If additional conflict choices exist, select Conflict until the desired choice displays in the New Text field. If more than one conflict exists in the Old Text field, your selection applies to all the conflicts.

### Suggest

Display a list of up to ten possible text definitions for the steno in the Steno field. Click on a selection or press the associated number. Case CATalyst inserts the entry into the New Text field. If you do not want to select a suggestion, type the correct text, press ESC or press ALT. Case CATalyst closes the suggestion list and places the cursor focus in the New Text field.

Case CATalyst determines which definitions display based on current globals, dictionaries used to translate the job, dictionary entry usage count, recently used data, drag/drop and stacking possibilities and spell checked phonetic suggestions based on the current Phonetic Table.

When editing a job on a computer other than the one on which the job was originally taken, you must have all dictionaries and the phonetic table used during translation.

### Endings

The Endings feature is not available when replacing a word or phrase. If you change your action from a replace to a global, the Endings feature may be available. When you type a word in the Text field, Case CATalyst analyzes word to see if a " G", " S" or " D" steno outline could be added to the word. If so, then Case CATalyst activates the Endings button. The Global Endings dialog box displays. You can select any of the suggested definitions to add to your dictionary.

For example, you have REPT in the Steno field and type "represent" in the Text field. The following suggested entries display when you select Endings:

REPTD = represented

REPTS = represents

The word "representing" is not suggested because the final "g" comes before the final "t" in the original steno outline.

### Spaces

When two or more words display in the Old Text field, copies the text to the New Text field and places a [<Sticky Space>](#) format symbol between the words. Spaces is also available when you type two or more words in the New Text field.

### **Stitch**

Copy the text in the Old Text field to the New Text field and places hyphens between each letter. Stitch is also available when you type words in the New Text field. If there is one word, the letters are hyphenated. If there are two or more words, the words are hyphenated. For example step-by-step. To undo a stitch, select this feature again.

### **Open with Suggestions**

Not available for Replace.

### **Global Type**

The type of define originally selected displays.

### **Entire File**

Not available for Replace.

### **Case Sensitive**

Not available for Replace.

### **Selective**

Not available for Replace.

### **Generate All Possible Misstrokes**

Not available for Replace.

4. When finished replacing press **Enter (OK)** to replace the text.

## **Quick Suggest**

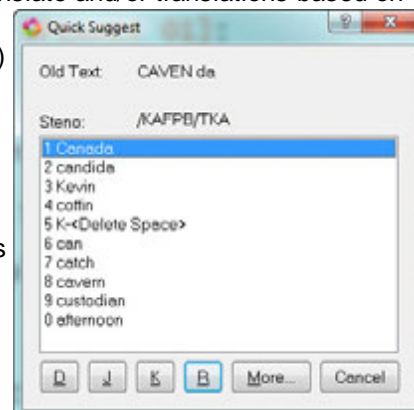

Quick Suggest is an editing command that will display a list of suggestions when your cursor is positioned on an untranslate, Drag/Drop or Suffix Drag translation or on any words. If multiple words are highlighted before invoking Quick Suggest, the Quick Suggest command will only offer suggestions for what is highlighted. This is the editing version of the realtime [Live Suggestions](#) feature. The Quick

Suggest feature may offer suggestions based on the individual untranslate and/or translations based on steno outlines before and/or after the untranslate. Once the Quick Suggest dialog box displays, you will see the Old Text (if applicable) and

the steno for the entry in the list. Based on the suggestion that is highlighted, the steno/text will also be selected in the transcript.

When you move your cursor up and down by the arrow keys or select a list

entry by the assigned number, the Old Text and Steno field contents may adjust and the transcript selection may also adjust based on the suggestion. You can select More to open the Global dialog box defaulting to a J-define where you can take more actions (such as Endings, Cap, etc.) on the definition or type a new text definition.

Quick Suggest is available when your cursor is positioned on an untranslate, Drag/Drop or Suffix Drag translation. In the [Scan For options](#), the *Automatically open Quick Suggestion* for option has been added and once you select any or all of the items (Untranslate, Drag/Drop or Suffix Drag), when [Scan](#) stops on an item, the Quick Suggest dialog box automatically opens displaying possible suggestions. In the Scan For options, if you have selected to have Quick Suggest automatically open for an untranslate, Drag/Drop and/or Suffix Drag, those items must also be selected in the options above the Quick Suggest items. In other words, if you want Quick Suggest to automatically open for an untranslate, Untranslate must also be selected in the Scan For options.

Quick Suggest can manually be invoked on an untranslate, Drag/Drop or Suffix Drag translate regardless of your Scan For option selection by pressing **Alt + g, q** or assigning a key combination to the Quick Suggest function in a keyboard map.

A *No suggestions available* message displays if Quick Suggest cannot offer any suggestions. If Quick Suggest has no suggestions to offer, you can have CATalyst automatically open the Global dialog box by selecting Yes for the Open Global dialog when no Quick Suggest Available option in the [Global Options](#) dialog box.

A *There is too much steno selected* message displays if too many steno outlines are highlighted. Press Enter to close the message box, then highlight fewer words/steno outlines and try again.

A *There is no steno at the cursor location* message displays when highlighted text does not have underlying steno outlines. Press Enter to close the message box.

### Quick Suggest:

1. Scan or position your cursor on an untranslate, Drag/Drop or Suffix Drag translation and do any of the following
  - a. If the Quick Suggest dialog box automatically opened, go to Step 2.
  - b. Press **Alt + g, q**.
  - c. Press the key combination you assigned to the Quick Suggest feature in your [keyboard map](#).
2. To select a suggestion, do one of the following:
 

When a suggestion is highlighted, if the steno for the suggestion changes (based on number of steno outlines), the Steno field updates appropriately and the highlighted text in the transcript adjusts accordingly.

  - a. Press the number associated with the suggestion.
  - b. Use your up/down arrow keys to highlight the selection.

3. To take action, do one of the following
  - a. To Replace the current steno and/or text with the selected suggestion, press **Enter**.
  - b. To [D-define](#) (Personal dictionary) the current steno and/or text, press **d** and then **Enter**.
  - c. To [J-define](#) (job dictionary) the current steno and/or text, press **j** and then **Enter**.
  - d. To [K-define](#) (case dictionary) the current steno and/or text, press **k** and then **Enter**.
  - e. To do one of the above actions along with additional actions or to type a different text, press **m** (or **Alt + m**) to open the Global J-define dialog box.
  - f. To take no action and scan to the next item, press **F8**.
  - g. To take no action and close the Quick Suggest dialog box, press **Esc** or click Cancel.

[Keyboard Map Function](#): Quick Suggest

### Selective Globals

When defining in Edit, use the Selective option in the Global dialog box to have Case CATalyst stops on the first occurrence affected by the global change. You can choose to apply the change to this occurrence, all occurrences, to the [current Section](#) only, skip the occurrence and go to the next occurrence or take no action and return to Edit. If you apply the change to all occurrences, the global is no longer selective. The Entire File option is ignored when using the Selective option but selecting Entire Section does apply the global to **all** occurrences in the current section. Selective globals (not Entire Section) do not apply to previous text. The selective global starts at the current cursor location, moves forward in the file until CATalyst is finished applying the selective global. Click OK in finished dialog box and the cursor returns to the location where the global was started.

Globals marked as Selective are added to the Global table and identified as "Selective." A Selective global does not apply automatically when other globals apply. For example, if you select to apply globals backward, a selective global does not automatically apply. A selective global does not apply during realtime to new realtime text.

If you choose to apply a Selective global change to all occurrences or use the Add Other Globals command to apply a Selective global, Case CATalyst no longer considers the global Selective. If you cut or copy and paste Selective globals from one Global table to another, the globals are no longer considered selective. Globals no longer considered selective, apply automatically when other globals apply. To prevent selective globals from being added or pasted when using the Add Other Globals command or when marking and copying globals from one table to another, check the Global Table [option](#), *Exclude Selective Global*.

### Apply Globals by Occurrence

1. In the Global define dialog box, enter the text in the New Text field.
2. Check the box, **Selective**.
3. Press **Enter (OK)**, the Confirm dialog box displays. Use the following options as necessary:

#### Original

The existing text or steno you are replacing.

**Steno**

The marked steno if making a D-Define, J-Define, or K-Define.

**Replacement**

The new text replacing the original text or steno.

**Type of Define**

The type of define selected for this global displays below the Steno field.

**Yes**

Change this occurrence and move to the next occurrence.

**Yes To All**

Change all the occurrences from the cursor position forward in the file. Once you select Yes To All, the global is no longer considered selective.

**Entire Section**

Applies the selective global to all occurrences in the current section. The global remains selective in the Global Table.

**Goto Next**

Do not change this occurrence and move to the next occurrence.

**Done**

Do not make any more changes and cancel the command. The cursor remains in the current position.

4. The dialog box closes once all the occurrences are encountered. The cursor remains at the position of the last occurrence. Continue editing.

## Apply Global to Current Section

Globals can be applied only to a particular section of a transcript, rather than to the entire transcript. Many official reporters have several calendar calls, appearances, pre-trial motions, etc., in one transcript but each item is separated into its own section. For example, let's say you are an official and you had back to back preliminary hearings and some calendar calls. You have all of the "proceedings" in their own sections in the one transcript. You start editing the first hearing (first section) and you J-Define STPHAO to be <Colloquy>MR. PETERSEN: but it is only for the first hearing because you used the STPHAO outline in the second hearing to indicate another attorney. You can apply the J-define only to the current section instead of the entire transcript. When you get to the next section in the transcript, STPHAO will be an untranslate and you can define the steno outline to be whatever you want.

Although CATalyst had a method of only applying globals to particular text using the Selective option, it required the reporter/scopist to confirm each occurrence for the global to apply and then stop applying when appropriate. This new feature allows the reporter/scopist to specify the current section for the global to apply which eliminates the chore of saying yes multiple times and keeping track of when to stop applying the global.

Sections are created by using the [Set Page/Paragraph Number](#) feature available on the Format menu in Translate & Edit/Edit.

**To apply a global to a section only:**

1. In the Global define dialog box, type the text in the New Text field.

2. Check the box, **Selective**.

3. Press **Enter (OK)**, the Confirm dialog box displays. Select **Entire Section** to apply the selective global to all occurrences in the current section. The global remains selective in the Global Table.

4. The dialog box closes once all the occurrences are encountered. The cursor remains at the current position.

## Suggest a Brief

Suggest a Brief is a [Brief it](#) feature that allows you to force Brief It to suggest a brief while writing realtime or while editing. This may be helpful when preparing for a particular type of job with unfamiliar terminology or subject matter.

You can [assign](#) Suggest a Brief command to a [keyboard map](#) function. This works well in a macro to force briefs on previously written text. For example, you create a macro that selects the two previous words and invokes the Suggest a Brief command and then create an AccelerWriter definition. In a realtime file, you write "fibromyalgia syndrome." You then write the stroke to invoke the Suggest a Brief AccelerWriter. Brief It displays the suggested brief in the Brief It dialog pane.

This feature is available even though you may not have the Brief It option selected on Translate's Realtime tab.

To force a Suggested brief, press **Alt + g, s (Global/Suggest a Brief)**.

[Keyboard Map](#) Function: Suggest a Brief

## Text List Brief It

Text List Brief It is an Edit feature that analyzes text (.txt) files and creates [briefs](#) based on your [Brief It options](#). You may want to use Text List Brief It to suggest briefs from a list of words or phrases you anticipate writing in a future job or case. For example, you are doing a series of depositions on landscaping. You search the internet and download a landscaping wordlist and then use Text List Brief It to analyze the word list and create a list of Suggested briefs in the Brief It dialog pane. You could also use a core list from another reporter's job dictionary or transcript. To maximize results, it is best if each word or phrase is on a separate line. There is a 48 character limit per line.

When you select the Text List Brief It feature, the process begins immediately. Once Brief It begins the analysis, the process cannot be canceled. The Brief It dialog pane is visible during the analysis as Brief It populates the list. The number of characters on a line in the text file should not exceed 48. If the number of characters exceed 48, the line is not analyzed and the process continues. Alpha, numeric, punctuation and a white space are considered valid characters. If an invalid character is encountered during the analysis, such as a Unicode character, the processing stops and a message displays. When the analysis completes, a message displays indicating the number of lines for which Brief It attempted to suggest briefs along with the total number of lines processed. Blank lines are counted in the total number of lines processed but do not count towards the attempted number of briefs suggested.

When the Brief It option, Personal Briefs/Reminders Only is active, only Personal and Reminder briefs display in the Brief It dialog pane. No Suggested briefs are created when using Text List Brief It.

### Create Suggested Briefs from a Text List

1. In Edit, press **Alt + g, f** (**Global/Text List Brief It**). The Open dialog box displays.
2. Navigate to the location of the text file to analyze, select it and click **Open**.
3. Brief It analyzes the selected text file and displays any briefs in the Brief It dialog pane.
4. At the confirmation message, press **Enter** (**OK**).
5. Review the briefs.

[Keyboard Map](#) Function: Text List Brief It

## Request a Live Suggestion feature

*Request a Live Suggestion* feature is available from the Global menu while writing realtime. You can highlight X number of words and use the Request a Live Suggestion feature for the highlighted words. If a Live Suggestion or multiple Live Suggestions are found, they are displayed in the [Brief It](#) pane just like [Live Suggestions](#) currently display. If you like a suggestion, you can then use your [Define](#) or [Replace](#) Live Suggestion commands to take the Live Suggestion.

For example, let's say you write the following four steno outlines: /TPHAB /PWAU /PHET /TOEPB which translates as "nab because met tone" (without the quotes). The Live Suggestion feature would not automatically generate suggestions since there isn't an untranslate (all the words translated). So you highlight "nab because met tone" and select Request a Live Suggestion. The four stroke suggestions display in the Brief It pane. Nabumetone is one of the suggestions and is exactly what you want, so you write the Define or Replace Live Suggestion command to take it.

Another example for this feature is that you write five steno outlines, the first one being an untranslate and the rest of the steno outlines translate. Live Suggestions offers you great suggestions in the Brief It pane for the five strokes, you want a suggestion only for the last four strokes. So you highlight the last four strokes and use Request a Live Suggestion and, the new suggestions replace the original suggestions in the Brief It pane. You then write your Define or Replace Live Suggestion command to select the one you want.

If no suggestion can be found, the No Suggestions Found dialog box displays and automatically closes after several seconds. If you continue to write realtime, the realtime text displays behind the message box until it closes.

You can easily record macros to accommodate highlighting as few or as many words you want and then select the Request a Live Suggestion feature. Stop recording the macro, name and save it. From the Save Macro dialog box, create a dictionary entry to invoke the macro from your writer. It is recommended that you are in realtime when recording macros that are invoked from your writing machine to make sure the recorded macros work correctly based on the cursor position.

The Request a Live Suggestion feature is not available (grayed out) when you are in Edit. The Quick Suggest (**Alt + g, q**) feature is available while editing and is a better solution.

The Request a Live Suggestion feature is available in realtime even if you do not have the Live Suggestions option selected on Translate's Realtime tab.

[Keyboard Map](#) function: Request Live Suggestion

## Text To Dict Define

Text to Dict Define allows you to create a dictionary definition from transcript text that has no underlying steno and save it to the Global Table and the desired dictionary. For example, let's say that you are reviewing an ASCII file for an upcoming deposition about computer technology. As you are reviewing the ASCII, you come across the phrase, "baby duck syndrome" (interaction between human and computer) and you think of a great brief. You highlight the phrase and select the Text to Dict Define command from the Global menu. The Add Dictionary Definition - Job Dictionary dialog box displays. The Steno field is empty and the Text field contains the text you highlighted. You type the steno for the phrase and press Enter.

### Create a Text To Dict Definition

1. Position the cursor before a word or highlight multiple words in the transcript.
2. Press **Alt + g, n** (**Global, Text to Dict Define**). The Add Dictionary Definition – Job Dictionary dialog box displays.
3. Make necessary entries:

#### Steno (**Alt + s**)

Type the steno to associate with the text in the *Text* field. Separate multiple strokes with a forward slash (/).

#### Text (**Alt + t**)

The text selected for definition. Do any of the following:

- Select **FS** to add format symbols.

- Press **F9** to add [extended characters](#).
- Use the [Cap/Uncap](#) command, **Ctrl + F5**, to quickly cycle through the capping options for all the words in the Text field.

### **FS (Alt + f)**

Display the list of available [format symbols](#). Double click the format symbol to insert into the text portion of the definition. You can insert a format symbol at any point in the text entry.

### **Insert Field (Alt + i)**

Display the [Insert Field](#) dialog box from which you can select a field to insert into the text portion of the definition.

### **Endings (Alt + n)**

CATalyst BCS analyzes word in the *Text* field to see if a " G", " S" or " D" steno outline can be added to the word and additional dictionary entries created. If so, then CATalyst BCS activates the Endings button. The Global Endings dialog box displays. Select any of the suggested definitions to add to your dictionary.

For example, you have REPT in the *Steno* field and "represent" in the *Text* field. The following suggested entries display when you select Endings:

REPTD = represented

REPTS = represents

The word "representing" is not suggested because the final "g" comes before the final "t" in the original steno outline.

### **Global Type (Alt + g)**

The type of definition you are creating. The default is a J-Define. Make a selection from the drop down box to select a different global type.

### **Pick Other Dictionary (Alt + p)**

This field is available if you select Other Dictionary in the Global Type field. You can send the Brief It Suggestion to an alternative dictionary when making an O-Define. Select a current dictionary from the drop down list or use **Browse** to choose another dictionary. Depending on your [Global options](#) settings, Case CATalyst remembers your selection for the current session or for every job. This field displays when you select Other Dictionary in the Global Type field.

### **Generate All Possible Misstrokes (Alt + m)**

Check this box to have CATalyst BCS generate definitions based on all the possible misstrokes of the original steno outline. CATalyst BCS generates a definition provided one does not already exist in the Personal Dictionary for any of the identified misstrokes. For example, you define /SROEUS as "voice" with Generate All Possible Misstrokes selected. CATalyst BCS also creates a dictionary definition for the following steno outlines as "voice": /SROUS, SROES, and /SROS. The steno outline, /SRAOEUS already exists in your Personal Dictionary as "vice", so CATalyst BCS does not generate /SRAOEUS as a misstroke.

### **Add 2 Cat Scratch (Alt + 2)**

Send the definition to the [Cat Scratch](#) dialog pane in addition to the Global Table and selected dictionary. Depending on the Cat Scratch scope, the entries are sent to the job, case or user Cat Scratch pane.

4. Press **Enter (OK)** to save the definition.

[Keyboard Map](#) Function: Text to Dict Define

### Transcript Brief It

Transcript Brief It is an Edit feature that analyzes the current transcript and creates Reminder, Personal and Suggested [briefs](#) based on your [Brief It options](#). The file must contain text with underlying steno. When you select the Transcript Brief It feature, a confirmation message prompts you to continue. Once Brief It begins the analysis, the process cannot be canceled. The Brief It dialog pane is visible during the analysis as Brief It populates the list. For example, you have an upcoming job concerning a case you took several months ago. You run Transcript Brief It on the previous jobs related to the case to create briefs for the current job. You can then make defines for the upcoming job.

When the Brief It option, Personal Briefs/Reminders Only is active, only Personal and Reminder briefs display in the Brief It dialog pane. No Suggested briefs are created when using Transcript Brief It.

To create Suggested briefs from the current transcript:

1. Open the transcript from which you want to create briefs.
2. Press, **Alt + g, b (Global/Transcript Brief It)**.
3. At the confirmation message, press **Enter (OK)**. Brief It analyzes the transcript and Suggests possible briefs.
4. Review the new briefs.

[Keyboard Map](#) Function: Transcript Brief It

### Undo Globals

Case CATalyst contains three undo global commands that allow you to reverse the action of a global in the transcript and remove the definition from the designated dictionary. In most cases, if you are trying to *fix* globalized text, one of the Undo Global commands is the correct action.

When writing realtime using Case CATalyst V13 or higher and the Luminex or Diamante V2.0 or higher, Luminex and Diamante J-Defines and all Case CATalyst dictionary definitions are automatically exchanged. In other words, globals made in Case CATalyst are sent to the Luminex or Diamante and j-defines made on the Luminex or Diamante are sent to Case CATalyst. The Delete, Undo Global, Undo Last Global or Undo Global Once commands do not remove the definition from the Luminex or Diamante. Refer to the Luminex or Diamante User Guide for information on removing J-Defines from the Luminex or Diamante.

### Undo Last Global

Undo Last Global reverses the last global action throughout the current realtime or editing session of the file. CastCATalyst returns the last globalled items to their original state, removes the global from the global table and removes the global from the dictionary, if appropriate. Undo Last Global does not apply to a globalled word or phrase modified after the global took affect. To undo the last global, press **Ctrl + Shift, u (Global/Undo Last Global)**.

## Undo Global

The Undo Global command reverses the action of the global in the job, removes the global from the Global Table and removes the global from the dictionary, if appropriate. Undo Global does not apply to a globalled word or phrase modified after the global took affect. It is only possible to Undo a global from within Edit. You cannot undo a global when opening the Global Table from Manage Jobs.

To use Undo Global, position the cursor immediately before the globalled word or phrase in the transcript. Right click the mouse to select **Undo Global** or press the [assigned](#) keyboard command for Undo Global or select Undo Global (at Cursor) from the Global menu. Undo Global and Undo Global Once commands check the Global Table to verify if the replacement text has a paragraph style that automatically generated punctuation before the globalled text. If so, CATalyst checks to confirm the punctuation is ending punctuation and the ending punctuation will be replaced by a space when the global undo command is used. You can also open the [Global Table](#) while editing to undo a global.

## Undo Global Once

The Undo Global Once command reverses the global action for a single word. Position the cursor immediately before the globalled word or phrase in the transcript. Right click the mouse to select **Undo Global**, select Undo Global Once (at Cursor) from the Global menu or press the [assigned](#) keyboard command for Undo Global Once. Undo Global and Undo Global Once commands check the Global Table to verify if the replacement text has a paragraph style that automatically generated punctuation before the globalled text. If so, CATalyst checks to confirm the punctuation is ending punctuation and the ending punctuation will be replaced by a space when the global undo command is used.

### Global menu:

- Undo Last Global
- Undo Global (at Cursor)
- Undo Global Once (at Cursor)

[Keyboard Map](#) Functions: Undo Last Global

Undo Global

Undo Global Once

## Formatting Commands

CastCATalyst format commands in Edit allow you to add and modify transcript text using [format symbols](#); manage transcript sections, when applicable; make changes to page and paragraph numbering; and make [Layout](#) changes for the current transcript.

## Font

The Font feature allows you to modify the font, font style, font size, or font effect for characters within a word, a single word, or a block of text. In Manage Dictionary, you can change the font settings for the steno and text display portion of the dictionary entry and for column headings. In Layout, you can set default font values for any paragraph style, symbol, line numbers, timestamps, and headers and footers.

When selecting a font, keep in mind there are two types of fonts. Fixed or Monospaced fonts and proportional fonts. When using a fixed/monospaced font, each character takes up the same amount of space. In other words, an "i" and "w" take up the same amount of space. If you are wanting to control the number of characters on a line or using a characters per inch setting, you should use a fixed/monospaced font. When using a proportional font, the characters only take the amount of space needed for the size of the character. It is very difficult to control the number of characters on a line using a proportional font and should not be used with the characters per inch option.

## Modify Fonts

1. Do one of the following:

### Edit

Highlight the text you want to modify and then press **Alt + o, f (Format/Font)**.

### Layout

Select the Font option for paragraph styles, header/footer text, timestamps, line numbers, etc.

### Manage Dictionary

Press **Alt + o, f (Format/Font)** and then select one of the following to modify: **Steno**, **Text**, **Column Header**, or **Other**.

2. In the Font dialog box, use **any** of the options:

### Font

Select a font type. When you select a font for a paragraph style, we strongly recommend using a fixed width font instead of a proportional font.

### Font Style

Select any font styles. To remove Bold and Italic formatting, select **Regular**.

### Size

Select a font size from the list. You can also type a font size into the field; however, the size may not be available for the selected font style.

### Effects

#### Strikeout

Check the box to have the selected text display with strikeout line.

#### Underline

Check the box to have the selected text display underlined.

### Color

Available font colors. Click the down arrow to display the colors, and then click a color to select it.

**Sample**

A sample of how text displays in the job with the selected font settings.

**Script**

Not used by Case CATalyst.

3. Press **Enter (OK)**.

**Modify Current Paragraph**

The Modify Current Paragraph feature allows you to make changes to the current paragraph. The current paragraph is the one in which your cursor is located. This feature only affects the current paragraph.

When you make changes to any of the Paragraph Body values, Case CATalyst inserts a Paragraph Delta format symbol into the document to indicate the difference between the modified paragraph and the applied layout. Paragraphs containing paragraph deltas do not change when you apply a layout. For example, you change the paragraph from double to single spacing. Case CATalyst inserts the <Paragraph Delta Line Spacing> format symbol to indicate that line spacing for the paragraph is modified. For each Paragraph Body feature changed, Case CATalyst displays the associated Paragraph Delta format symbol. This includes: First-line Indent, Left Margin, Right Margin, Continuation, Line Spacing, Alignment, and Body Text Font.

You can view paragraph delta format symbols in Reveal Codes. You can remove them individually in Reveal Codes or by using the [Remove All Paragraph Deltas](#) command.

To make changes to a paragraph style that affects the entire job, use the [Modify Job Layout](#) feature.

**Modify a Paragraph in Edit**

1. Position your cursor anywhere in the paragraph that you want to modify.
2. Press **Alt + o, p (Format/Modify Current Paragraph)**. The Paragraph Style setup window displays.
3. Select a different paragraph style or make changes to any of the [Paragraph Setup](#) values.
4. Press **Enter (Apply)** to apply the changes. A Paragraph Delta format symbol which change information is inserted in Reveal Codes.
5. Press **Ctrl + s (File/Save)** to save the changes to the file.
6. Click the "X" in the upper right corner of the setup window to close it.

**Change Header Text**

Change Header Text is an Edit feature that allows you to make header or footer text changes to the transcript. Header/footer changes can be made using a variety of editing commands and can be made by applying a layout that has header/footer text assignment. For additional information on how applying a layout containing headers and footers while editing and changing headers/footers via a format symbol work in a transcript, see [Understanding Header Changes and Layout Changes](#).

**To change a header/footer via a format symbol:**

1. Do **one** of the following to display the Change Header/Footer Text dialog box:
  - Position your cursor anywhere on the page on which you want to change the header/footer and press **Ctrl + h**. The Change Header/Footer Text dialog box displays defaulting to Header #1.

- Press F4, h, and the number of the header you want to insert/change. The Change Header/Footer Text dialog box displays defaulting to the header number you indicated.
  - In Page View double click any header, footer or page number.
  - Select Change Header Text (Ctrl + h default assignment) from the Format menu. The Change Header/Footer Text dialog box displays defaulting to Header #1.
2. Select the Header/Footer you want to change and type the changes. The header or footer text displays in the field below. Use the following features as necessary:

### Apply through to next layout change

Check this box to apply the header or footer change for the selected header number to all pages forward in the file until the next page layout change. The current header/footer will apply the text and will delete all the other change header/footer format symbols that follow it until the next layout change is encountered.

### FS (Alt + f)

Display the list of available format symbols. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol you want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry. If your cursor is positioned in the Text field, you can also use F4 plus shortcut key to insert a format symbol.

To have the format symbol list always display, check the Always Show Format Symbols box. To move from the Text field to the Format Symbol list when this option is selected, press Alt + y.

### Extended Characters

Press **F9** to display the dialog box of [extended characters](#). Double click the extended character you want to use in the definition.

### Insert Field

Display the Insert Field dialog box from which you can select a field to insert into the text portion of the definition.

3. Do **one** of the following:
- If you are only inserting one header/footer, press **Enter (OK)** to apply the changes and close the dialog box.
  - Change the text for another header or footer. Press **Alt + a (Apply)** to apply the changes and keep the dialog box open. Select the next Header/Footer you want to change, type the changes and press **Alt + a (Apply)**. When finished making changes, press **Enter (OK)** to close the dialog box.

NOTE: if you are only inserting one header/footer, if you click Apply and then OK, the header/footer is inserted twice into the transcript. Once when you clicked Apply and then again when click OK. If you are only inserting one header/footer, just click OK.

## Understanding Header Changes and Layout Changes

Header/footer changes can be made through the layout or can be made while editing using the Change Header menu (default keyboard assignment Ctrl + h) item located on the Format menu, by using the Change Header command (F4 + h and then header number) in a keyboard map or if in Page View, double clicking the header.

When you [apply a layout](#) to a page or pages or [modify a layout](#) while editing, the headers and footers in the layout apply to the transcript pages. The headers and footers only apply to the locations you say when you select how to apply the layout – choices are Entire Document, Only this page, From this Page to the Next Layout change, From this Page to the End of this Section and From this Page to the End of the Document. For example, you apply a specific layout to your Appearance page or pages. The layout you select to apply has the text Appearances assigned to Header 1. The layout and Header 1 are applied to the transcript based on how you selected to apply the layout, i.e. Entire Document, Only this page, etc. Or another example might be that you selected the wrong layout at the time of translation. Let's say you selected the layout for a court transcript instead of the layout for a deposition. You now select to apply the deposition format that has the firm name as a footer. That layout including header/footer text is applied based on the scope you selected in the The Apply This change to: dialog box.

When you [change a header/footer](#) via a format symbol (Change Header via the menu or keyboard command), the text you type will override any other header/footer text that was/is in the layout for the same header/footer number. It applies until the next layout change and then stops. For example, you change Header 1 to read Deposition of Witness Name. Header 1 applies throughout the job until it reaches the next layout change. If you had included a Certificate page (with the Bring Layout option selected) that has Header 1 assigned to Certificate, the Witness Name header stops applying at the Certificate page.

In addition, when you put in a change header/footer format symbol, it applies until the next change header/footer format symbol within those pages with the same layout. For example, you put a header/footer change via the format symbol for direct examination text and then you put another header/footer change for cross examination text, the direct examination header/footer applies until the cross examination header/footer starts. The header/footers apply on the page they are found or in other words, where the header/footer change started.

However, in some instances you may have entered several header/footer format symbols in the job with different text, but realize you want the current header/footer text to apply from your current cursor location and override the other header/footer changes you previously made. In this event, in the Change Header/footer dialog box, you would select the Apply through to the next layout change option and the current header/footer will apply that text and will delete all the other change header/footer format symbols that follow it until the next layout change is encounter.

## Modify Layout

The Modify Job Layout feature allows you to make paragraph, page, and header/footer changes to the applied layout in Edit and select the scope for the changes. Scope identifies how to apply the changes to the job. For example, you may want to apply the change only to the current page, from the current page to the end of the file or to the entire file. If your current Edit view is set to Page View and you make changes using the ruler elements, those changes always apply to the entire file and you will not be prompted for a scope. Once you make changes to a layout and apply them, all those changes are now part of the layout. In other words, if you modify the layout again, all elements of the layout along with the current changes are applied based on the scope selected. If you simply want to modify a particular paragraph, you can use the [Modify Current Paragraph](#) feature.

When changing multiple paragraph styles, apply each paragraph style change before modifying the next one. This allows you to select the scope for the changes in each paragraph style. When you do not apply changes after each paragraph style change, Case CATalyst prompts you to save when switching paragraph styles. Selecting Yes automatically applies the changes to the entire document.

You can make margin, indent, and font changes to one paragraph style and apply them to multiple styles. For example, you may want to change the margin value for question, answer, and colloquy paragraph styles. Check the box *Apply changed measurements and fonts to multiple Paragraph Styles*. When you select Apply, Case CATalyst prompts you to select the scope and then to select the paragraph styles.

If you modify a transcript's layout using the Modify Layout feature, all aspects of the layout are applied, including any header/footer text. For additional information on how applying a layout containing headers and footers while editing and changing headers/footers via a format symbol work in a transcript, see [Understanding Header Changes and Layout Changes](#).

To view the text as it would appear on the printed page, use Print Preview or switch the text view to Page. Page view also allows you to view the both the horizontal and vertical rulers.

To make changes to a specific paragraph, use the [Modify Current Paragraph](#) feature.

### Modify the Applied Layout in Edit

1. Press **Alt + o, L (Format/Modify Job Layout)**. The Layout setup window displays.
2. Make changes to any of the layout settings for [Paragraph Setup](#), [Page Setup](#), or [Header & Footers](#).

Check the *Apply changed measurements and fonts to multiple Paragraph Styles* box to apply margin, indent, and font values to multiple paragraph styles. You will be able to select which paragraphs to apply the change to **after** Step 3.

3. Press **Enter (Apply)**.  
If you selected to apply changes to multiple paragraph styles,
4. The Apply This change to: dialog box displays. Click the button next to **one** of the following options to choose the scope.

#### **Entire Document.**

All elements of the layout (including headers and footers) and changes apply to the entire file. If you made Header or Footer changes, they apply to the entire file including the Concordance Index, if one exists.

#### **Only this page**

All elements of the layout and changes only apply to the page of your cursor location.

#### **From this Page to the Next Layout Change**

All elements of the layout and changes apply from the page of your cursor location to the next layout change.

#### **From this Page to the End of this Section**

All elements of the layout and changes apply from the page of your cursor location to the end of the current section.

#### **From this Page to the End of the Document**

All elements of the layout and changes apply from the page of your cursor location to the end of the file.

5. Press **Enter (OK)**. Case CATalyst applies the changes.

If you selected to apply a change to multiple paragraph styles and checked the box, *Apply changed measurements and fonts to multiple Paragraph Styles*, the Select Paragraph Styles dialog box displays. Click each paragraph style to which you want to apply the values or press **Alt + a** (Select All) to select all paragraph styles and press **Enter (OK)**. Case CATalyst applies the changes.

6. Press **Ctrl + s (File/Save)** to save the changes.
7. Click the "X" in the upper right corner of the dialog pane to close it.

New Layouts created in Case CATalyst version 11 and higher display the Layout name in Edit on the Status Bar. When you modify the Layout from Edit, an asterisk (\*) displays in front of the name.

## Apply New Layout

Apply New Layout is an Edit feature that allows you to apply a different layout to the job open in Edit. When you apply a new layout to a transcript while editing, all aspects of the layout are applied, including any header/footer text. If you modify a transcript's layout using the [Modify Layout](#) feature, all aspects of the layout are applied, including any header/footer text. For additional information on how applying a layout containing headers and footers while editing and changing headers/footers via a format symbol work in a transcript, see [Understanding Header Changes and Layout Changes](#).

1. In Edit, press (**Alt + o, a**) **Format/Apply New Layout**. The Select Layout to Apply dialog box displays with all the available layouts for the current user.
2. Highlight the Layout you want to apply.
3. Press **Enter (Open)**. The Apply this change to: dialog box displays.
4. Click the button next to **one** of the following options to choose how you want to apply the layout changes.

### Entire Document

Changes apply to the entire file. If you made Header or Footer changes, they apply to the entire file including the Concordance Index, if one exists.

### Only this page

Changes only apply to the page of your cursor location.

### From this Page to the Next Layout Change

Changes apply from the page of your cursor location to the next layout change.

### From this Page to the End of this Section

Changes apply from the page of your cursor location to the end of the current section.

### From this Page to the End of the Document

Changes apply from the page of your cursor location to the end of the file.

5. Press **Enter (OK)**.

## Save Layout As

The Save Layout As is an Edit feature that allows you to save the current layout under a new name. You may want to use this feature if you modify the layout for the text in Edit and want to create a new layout based on the current changes. For example, you are working for a new firm or client that has a slight difference in your current layout. Instead of starting from scratch, you could open the transcript in Edit, make the layout modification and use the Save Layout As feature to save the current layout as a new name. Modifying a layout in Edit, does apply the layout to the current transcript.

### Save the Current Layout to a New Name

1. In Edit, select **Format/Save Layout As**. The Save Layout File dialog box displays.
2. Type a new name in the File name field or select an existing layout name.

When you select an existing layout name, Case CATalyst prompts you with a message to replace the existing layout with the current values.

3. Press **Enter (Open)**.

## Section - Set Page/Paragraph Number

Set Page/Paragraph Number is an Edit command that allows you to reset the page and paragraph numbering in Edit which creates a new section in the transcript. For example, if this job is a continuation of an earlier job, you might need the first page to be page 143 instead of page 1. If you work in court, you might use this feature to separate calendar call cases.

Case CATalyst creates a Section in the job when you use the Set Page/Paragraph Number command. The Set Page/Paragraph Number command takes effect on the page where you invoke the command. This applies to page and paragraph renumbering. For example, you are on page 100 of a 1000 page job and invoke the Set Page/Paragraph Number command to change page 100 to page number 500. The result is a job that contains Section 1 consisting of pages 1 - 99 and Section 2 consisting of pages 500 - 1400.

To change the **format** of the page numbering, use the [Change Header Text](#) command. For example, the current page number format is Page 1, Page 2, Page 3, etc. and you want to change it to Vol. 1 Page 1, Vol. 1 Page 2, etc.

### Change Page and Paragraph Numbers in Edit

1. On the page where you want to reset the page or paragraph number, press **Alt + o, n (Format/Set Page/Paragraph Number)**. The Page Number Change dialog box displays.
2. Make entries as necessary:

#### New Page Number

Type the new page number.

#### New Paragraph Number

Type the new paragraph number. The number begins with the first paragraph style on that page. You must have the option, [Paragraph is Numbered](#), selected in the applied layout to display paragraph numbers for the chosen paragraph type.

3. Press **Enter (OK)**. Case CATalyst creates a new section and automatically renumbers the remaining pages and paragraphs based on the new page or paragraph number. The section number displays in the Status Bar.

---

To delete a section, place your cursor in the section and press **Alt + o, c** (**Format/Delete Current Section**).

## Delete Current Section

Case CATalyst inserts a section into a job when you use the [Set Page/Paragraph Number](#) feature. Use Delete Current Section to remove inserted sections. Case CATalyst automatically adjusts the page numbers when you delete a section but does not change paragraph numbering, if you use that feature. Use the Set Page/Paragraph Number feature to renumber the paragraph after deleting a section. If you want to delete multiple sections, you must delete each one individually. You may want to modify your [keyboard map](#) and assign a keyboard command to the Delete Section function.

### Delete a Section in the Job

1. Place your cursor in the section you want to delete.
2. From the Format menu, select **Delete Current Section**. Case CATalyst combines the current section with the previous section and renumbers the pages. Once the transcript pagination is refreshed the current page number changes. To refresh the page number, press Page Up or Page Down twice. Any other sections in the job remain.

## Remove All Paragraph Deltas

Use Remove All Paragraph Deltas in Edit to remove all paragraph delta symbols in the file. Case CATalyst uses paragraph deltas to indicate changes in paragraph formatting that are different from the applied layout. When you use the [Modify Current Paragraph](#) command to make changes to any of the Paragraph Body features, Case CATalyst inserts a paragraph delta. Case CATalyst also uses paragraph deltas when you import a Case CATalyst 3.x file, inserting paragraph deltas in place of the Secondary Margin format symbols.

Paragraphs containing paragraph delta information do not change when you apply a layout so it may be necessary to use the Remove All Paragraph Deltas command to be able to apply a layout and have it change all paragraphs. For example, let's say you imported a Case CATalyst 3.x file where the Secondary Margin format symbols were used for Colloquy. You want to apply a layout that reflects the correct position for Colloquy. You would open the imported file in Edit, select the Remove All Paragraph Deltas command and then you could apply a different layout.

Paragraph Delta symbols are visible in Reveal Codes and give information as to what changed in the paragraph settings. For example, <Paragraph Delta Left Margin 3.11> indicates that that particular paragraph's left margin is set to 3.11 inches from the left margin.

To remove all paragraph deltas:

1. Press **Alt + o, r** (**Format/Remove All Paragraph Deltas**).
2. At the confirmation message, press **Enter** to confirm the delete. All Paragraph Delta information is removed from the file.

## Cycle Paragraph Style

Cycle Paragraph Style is an Edit command that allows you to change the current paragraph style to another paragraph style by cycling through a series of preset choices. For example, if you wrote two Answer paragraphs in a row and the second Answer should really be a Question paragraph, you can quickly make the change with the Cycle Paragraph Style command. Available paragraph styles include: Question, Answer, Colloquy, Parenthetical, By Line, New Line and Centered. The Default or Single Spaced paragraph styles are not included. The existing ending punctuation does not change when you change paragraph style. In other words, if you change an Answer paragraph which currently ends in a period to a Question paragraph, the ending period does not change to a question mark.

If you find yourself using this feature quite often, you may want to assign a [keyboard](#) command to this feature.

## Change Paragraph Styles

1. Place your cursor in the paragraph you want to change.
2. Press **Alt + o, t** (**Format/Cycle Paragraph Style**). Continue to press **Alt + o, t** until you apply the desired paragraph style. Existing ending punctuation does not change based on the new paragraph style.

## Join current paragraph to previous

The Join current paragraph to previous command is available on Translate & Edit / Edit's Format menu. The command joins the current paragraph (where your cursor is positioned) to the previous paragraph and removes the current paragraph's format symbol. For example, you may have written an Answer paragraph style and anticipated the witness was done and wrote a Question paragraph style. Now you want to remove the Question symbol and join the two paragraphs together. Simply position your cursor on the Question paragraph and use the Join current paragraph to previous command.

If the prior paragraph ends with a period, question mark or colon, there will be two spaces following the punctuation. If Advanced Edit's *Match Ending Punctuation with inserted style* option is selected, the ending punctuation of the combined paragraphs will be corrected unless the paragraph being joined is a <Continuation Paragraph>. If your cursor is currently located in a Colloquy paragraph style that starts with upper case text followed by a colon, the join command will recognize it as Colloquy text and delete the Colloquy format symbol, text and colon and join the paragraph to the previous paragraph.

To join paragraphs:

1. Position your cursor on the paragraph that you want to join with the previous paragraph.
2. Press **Alt + o, j**. The paragraph format symbol is deleted and the paragraphs are joined.

## Image Properties

Image Properties is an Edit command that allows you to reposition and resize an existing image in the transcript. An example of an image might be the witness' picture on the title page or your electronic signature on your certificate page.

## Reposition and Resize an Image

1. Place the mouse pointer over the image until a cross bar with arrows displays.
2. Click the left mouse button once. Small sizing boxes display around the edges of the picture.

3. Press **Alt + o, i** (**Format/Image Properties**). The Image Placement and Size dialog box displays.
4. Make necessary entries:

#### Left

Type a value to determine how far from the left side of the page you want to place the image. The position is a measurement taken from the left edge of the paper in inches. It is typed in decimals. For example, ½ half inch is typed, **.5**.

#### Top

Type a value to determine how far down from the top of the page you want to place the image. The position is a measurement taken from the top edge of the paper in inches. It is typed in decimals. For example one inch is typed, **1.0**.

#### Width

Type a value to determine the width of the image. The measurement is in inches. It is typed in decimals. For example 1¼ inch is typed, **1.25**.

#### Height

Type a value to determine the height of the image. The measurement is in inches. It is typed in decimals. For example 3½ inches is typed, **3.5**.

#### Keep Aspect Ratio

Check this box to maintain the image ratio of width to height. When you make a change in one of the Width or Height fields, Case CATalyst automatically determines the value for the opposite field. Type a value in one field and click in the opposite field or press **Enter (OK)**.

If you check this box and make a change in both the Width and Height fields, Case CATalyst uses the value in the Height field to determine image ratio.

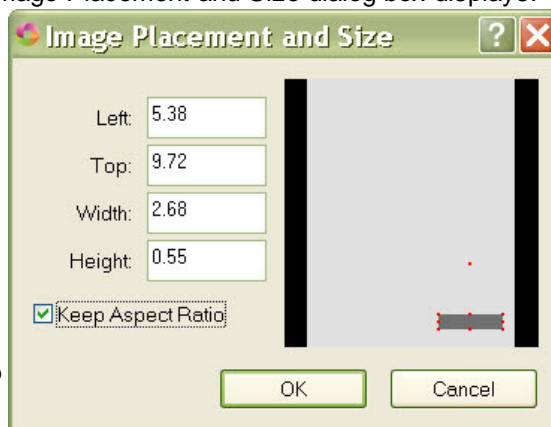

#### Placement Preview Window

On the right side of the Image Placement dialog box is a window that displays a preview of the image size and position on the transcript page. You can use your mouse in this window to resize or move the image.

To resize the image, move your cursor over the image until a line with arrows on each end displays. You can position the cursor so that the line is vertical to modify the height; horizontal to modify the width; or diagonal to modify both the width and height. Hold the mouse button down and move the cursor to modify the image size as desired. As you move the cursor, the values in the Width and Height field reflect the changes.

To reposition the image on the page, move your cursor over the image until a cross with arrows at the end of each line displays. Hold the mouse button down and move the image to the desired position. As you move the cursor, the values in the Left and Top field reflect the changes.

5. Press **Enter (OK)** to accept the changes.

## Print Layout Settings

The Print Layout Settings feature in Edit allows you to print all the values for the applied layout. Case CATalyst prints the Transcript Layout Detail Report which lists the current values for Paragraph Styles, Page Setup and Headers & Footers. Case CATalyst prints the full report. To [generate](#) a report for another layout, use the Layout function.

### Print a Report for the Applied Layout

1. From Edit, press **Alt + o, y (Format/Print Layout Settings)**. The Print dialog box displays.
2. Press **Enter (OK)**.
3. If you select to print the settings to the Stenograph PDF Printer, the Print to File dialog box displays. Select the location to which you want to save the PDF. Case CATalyst will suggest the name of layout\_layout.pdf as the default name of the PDF, although you can change the name.

## Format Symbols

Format symbols are codes or commands that help you format text when you translate or edit a transcript. For example, you can insert format symbols to format text as an Answer or to bold text. Other format symbols are used to perform editing activities such as <Index On> and <Index Off>, which indicates the text you want to itemize on the Index page. Depending on the format symbol, you can insert it:

- into the job in Edit.
- include it as part of a definition while defining in Edit.
- include it as part of a definition when inserting or modifying entries in Manage Dictionary.

The Insert Format Symbol dialog box contains a default list of format symbols along with their associated shortcut key, if assigned. Format symbols display surrounded by < > brackets. Some format symbols have an associated default shortcut key command. Shortcut keys allow you to insert a format symbol by invoking a key combination. To use a shortcut key, press F4 and then press the key associated with the command, such as the default key "t" to insert a Tab. Default paired format symbols that turn a feature On and Off, use capital letters to turn the feature On and lower case letters to turn the feature Off. For example, the default "F4 B" turns bold On and "F4 b" turns bold Off. You can customize the display of format symbols in the Format Symbols list and modify the shortcut key assignments by making changes in the [Format Symbols Options](#) table.

When the Insert Format Symbol dialog box is open, you can change the sort order of the Format Symbol list. Click on the Format Symbol column heading to select ascending or descending order by format symbol name or click on the Shortcut column heading to select ascending or descending order by shortcut key.

### Insert a Format Symbol During Edit or While Defining

- Use a shortcut key. Press **F4** and then press the key associated with the command, such as the default, capital "U" to turn underline On, or the default "F6" to cap the next word.
- Select a format symbol from the Format Symbol dialog box. Open the Format Symbol dialog box by

pressing **Shift + F4** or **F4, F4**, clicking the  icon on the toolbar or selecting [Insert Format Symbol](#) from the Edit menu. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol want is highlighted) and press **Enter**, double click the desired format symbol

or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry.

## Format Symbol Shortcut Keys

The Format Symbols Options table contains Case CATalyst [format symbols](#). The following list provides a brief summary of each format symbol. For a detailed description of the format symbol and how to apply it, click the name from the list.

If a format symbol shortcut has a default key assignment exists, it is shown with the command. You can assign and modify the shortcut key assignments in the [Format Symbol Options](#) table.

To use a shortcut key, press F4 and then press the key associated with the command, such as "B," the default to turn bold On.

<a href="#">All Caps Off (F4 v)</a>	Turns Off all word capitalization for text following this symbol.
<a href="#">All Caps On (F4 V)</a>	Capitalizes the letters of all words following this symbol. Turn it Off with the All Caps Off symbol.
<a href="#">Answer (F4 A)</a>	Formats the text following the symbol as an answer according to the paragraph information set in the applied layout.
<a href="#">Attachment Point</a>	Attach an electronic exhibit, such as a photo or scanned document to the transcript.
<a href="#">Bench Mode Off</a>	End the temporary suspension of text to the connected receiving systems. To temporarily suspend sending text, use the Bench Mode On symbol.
<a href="#">Bench Mode On</a>	Temporarily suspend sending realtime text to the connected receiving systems. To resume sending text, use the Bench Mode Off symbol.
<a href="#">Bold Off (F4 b)</a>	Turns bold formatting Off for text following this symbol.
<a href="#">Bold On (F4 B)</a>	Turns bold formatting On for text following this symbol. Turn it Off with the Bold Off symbol.
<a href="#">By Line (F4 M)</a>	Formats the text following this symbol as a By Line paragraph according to the By Line paragraph information set in the applied layout.
<a href="#">Cap Next (F4 F6)</a>	Initial capitalize the next word following this symbol.
<a href="#">Centered Paragraph (F4 f)</a>	Center the paragraph between the left and right margins based on the Centered paragraph style set in the applied layout.
<a href="#">Colloquy (F4 c)</a>	Formats the text following this symbol as colloquy according to the colloquy paragraph information set in the applied layout.
<a href="#">Conflict End (F4 \)</a>	Indicates the end of a conflict to allow specified text or format symbols to follow the conflict.
<a href="#">Continuation Paragraph (F4 P)</a>	Formats the text following this symbol as a paragraph according to the continuation paragraph information of the previous paragraph style set in the applied layout.

<a href="#">Default Paragraph</a>	Formats the text following this symbol as a paragraph according to the default paragraph information set in the applied layout. This paragraph style applies when no other paragraph style is selected.
<a href="#">Delete Space (F4 ~)</a>	Deletes a computer-generated space. Use it in conjunction with outlines or text to delete spaces before or after the specified outline or text. You can also use Prefix and Suffix symbols.
<a href="#">Font Color</a>	Use in a dictionary definition where you want to change the font color for the text that follows it.
<a href="#">Font Size</a>	Formats the text following this symbol in the specified font size.
<a href="#">Forces Next Lower</a>	Force the first character of the next word to be lower case.
<a href="#">Header</a>	Change the header or footer while writing
<a href="#">Index Allcap Cell</a>	Cap all the letters within a cell on an Index Template.
<a href="#">Index Cell</a>	Used on the index template to specify the placement of multiple page numbers on a single table row.
<a href="#">Index End Sort</a>	Use in conjunction with Index Sort format symbols and the Build Index feature to customize the sort for a specific indexed item.
<a href="#">Index Heading Off (F4 j)</a>	Indicates the end of transcript text to be copied to the transcript index page. Use it in conjunction with Index Heading On. When prompted for a letter or number to identify the surrounded text, enter the same character used for Index Heading On.
<a href="#">Index Heading On (F4 J)</a>	Indicates the beginning of transcript text to be copied to the transcript index page; and to indicate placement of text on the template index page. Use it in conjunction with Index Heading Off. Case CATalyst prompts you to enter a letter or number to identify the surrounded text.
<a href="#">Index Initial Cap Cell</a>	Initial cap text in a cell on an Index Template.
<a href="#">Index Item</a>	Used on the index template to specify the placement of the sequentially number indexed items.
<a href="#">Index Line</a>	Used on the index template to indicate the placement of the line numbers of indexed text located in the transcript.
<a href="#">Index Off (F4 i)</a>	Indicates the end of transcript text to be copied to the transcript index page. Use it in conjunction with Index On indicating the beginning of text for indexing. When prompted for a letter or number to identify the surrounded text, enter the same character used for Index On.
<a href="#">Index On (F4 I)</a>	Indicates the beginning of transcript text to be copied to the transcript index page; and to indicate placement of the text on the template index page. Use it in conjunction with Index Off indicating the end of text for copying. Case CATalyst prompts

---

	you to enter a letter or number to identify the surrounded text. Each indexed text item cannot exceed 900 bytes.
<a href="#">Index Page</a>	Used on the index template to indicate the placement of the page number of indexed text located in the transcript.
<a href="#">Index Placeholder Text #</a>	Use as a single placeholder for party names in all your exhibit and other Include files where needed.
<a href="#">Index Position</a>	Used in the transcript to indicate the placement of the transcript index page.
<a href="#">Index Section</a>	Used on the index template to indicate the placement of the section number of indexed text located in the transcript.
<a href="#">Index Sort - Alpha Case Insensitive</a>	Sort indexed items on the transcript index page alphabetically, disregarding upper and lower case letters.
<a href="#">Index Sort - Alpha Case Sensitive</a>	Sort indexed items on the transcript index page alphabetically according to case; upper case followed by lower case.
<a href="#">Index Sort - Alpha Word Override</a>	Override the index template sort options for a particular indexed entry.
<a href="#">Index Sort - Match Headings</a>	Sort the matching index header text so it is grouped together while leaving the headings in chronological order
<a href="#">Index Sub Sort - Alpha case insensitive</a>	Sorts on the first consecutive alphabetic characters as the text to be sorted on (following the main sort index criteria)
<a href="#">Index Sub Sort Alpha -Exhibit</a>	List exhibits on the transcript index page with single alpha character alphabetically followed by the double alpha character and digit and alpha character.
<a href="#">Index Sub Sort - Numeric</a>	Sort indexed items on the transcript index page numerically.
<a href="#">Index Volume Information</a>	Used on the index template to indicate the placement of the volume description.
<a href="#">Italics Off (F4 d)</a>	Turns italic formatting Off for text following this symbol.
<a href="#">Italics On (F4 D)</a>	Turns italic formatting On for text following this symbol. Turn it Off with the Italics Off format symbol.
<a href="#">Line Number Off (F4 z)</a>	Turns line numbers Off for text following this symbol.
<a href="#">Line Number On (F4 Z)</a>	Turns line numbers On for text following this symbol. Turn it Off with the Line Number Off format symbol. Formats the text following this symbol according to the New Line Paragraph information set in the applied layout.
<a href="#">New Line</a>	Moves the text to left margin of the following line based on the previous paragraph style's left margin.
<a href="#">New Line Paragraph (F4 L)</a>	Formats a new paragraph immediately after this symbol as a paragraph according to the New Line paragraph information in

---

	the applied layout.
<a href="#">New Page (F4 N)</a>	Start a new page of text immediately after this symbol.
<a href="#">No Auto Convert</a>	Use in a dictionary definition to prevent the Automatic Number Conversion translate option and Display 10 and Under as Words from affecting numbers within the definition.
<a href="#">Oops</a>	Place an invisible mark in the job on which you can search or scan. You can have up to 10 Oops categories.
<a href="#">Orphan Control</a>	Keep together a specific number of lines to prevent the lines from being separated between page breaks.
<a href="#">Parenthetical</a>	Formats the text following this symbol as a parenthetical according to the parenthetical paragraph information set in the applied layout.
<a href="#">Pause Time</a>	Realtime format symbol used to suspend timestamps, most likely used when a proceeding is being videotaped and the videographer has stopped the tape. This format symbol is used in conjunction with the Resume Time FS
<a href="#">Question (F4 Q)</a>	Formats the text following the symbol as a question according to the question paragraph information set in the applied layout.
<a href="#">Redaction Off</a>	Turn redaction off to resume the text display.
<a href="#">Redaction On</a>	Turn <a href="#">redaction</a> on to "block out" the text for sensitive information. Redaction options are available in the <a href="#">Advanced Edit Options</a> .
<a href="#">Reset Time</a>	Restart the Elapsed timestamps to 00 hours, 00 minutes, 00 seconds.
<a href="#">Resume Time</a>	Realtime format symbol used to resume timestamps, most likely when a a proceeding is being videotaped and the videographer is resuming the videotaping after stopping it. This format symbol is used in conjunction with the Pause Time FS.
<a href="#">Right Margin Release (F4 r)</a>	Move a word that has wrapped to the following line up to end of the current line.
<a href="#">Scanstop Begin (F4 O)</a>	Creates the beginning of a scan stop for the text following this symbol. Turn it Off with the Scanstop End symbol.
<a href="#">Scanstop End (F4 o)</a>	Ends Scanstop formatting for the text following this symbol.
<a href="#">Set Time</a>	Change the Elapsed time.
<a href="#">Single Space Off (F4 s)</a>	Turns single spacing Off for text following this symbol. Turn it On with the Single Space On format symbol.
<a href="#">Single Space On (F4 S)</a>	Turns single spacing On for text following this symbol. Turn it Off with the Single Space Off format symbol.

<a href="#">Sticky Space (F4 k)</a>	Creates a space between two words and keeps those words together on the same line.
<a href="#">Strikeout Off</a>	Turns Off strikeout formatting for text following this symbol.
<a href="#">Strikeout On</a>	Turns On strikeout formatting for text following this symbol. Strikeout text has a line that appears through the middle of the words. Turn it Off with the Strikeout Off symbol.
<a href="#">Subscript Off (F4 y)</a>	Turns Off subscript formatting for text following this symbol.
<a href="#">Subscript On (F4 Y)</a>	Turns On subscript positioning for text following this symbol. Subscripts appear slightly below the normal line of text. Turn it Off with the Subscript Off symbol.
<a href="#">Superscript Off (F4 w)</a>	Turns Off superscript formatting for text following this symbol.
<a href="#">Superscript On (F4 W)</a>	Turns On superscript positioning for text following this symbol. Superscripts appear slightly above the normal line of text. Turn Off Superscript formatting with the Superscript Off symbol.
<a href="#">Tab (F4 T)</a>	Inserts a tab according to the tab values set in the applied layout.
<a href="#">Uncap Next (F4 F5)</a>	Removes initial capitalization from the word following this symbol.
<a href="#">Underline Off (F4 u)</a>	Turns Off underlining for text following this symbol.
<a href="#">Underline On (F4 U)</a>	Turns On underlining for text following this symbol. Turn it Off with the Underline Off symbol.
<a href="#">User Defined Paragraph (F4 e)</a>	Formats the text following this symbol as a paragraph according to the User Defined Paragraph Style 1 information set in the applied layout.

## All Caps On/Off

Use the All Caps On format symbol to capitalize all letters of all the words following this format symbol until the All Caps Off format symbol is encountered. For example, if you are writing realtime for a sight-impaired person, you may want to have the text display in all capital letters for easier viewing. These format symbols control how the text displays in Edit and how the text prints.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

## Insert During Edit

1. Position the cursor immediately to the left of where you want capitalization to start and press **F4 V**.
2. Move the cursor immediately to the right of where you want the capitalization to stop and press **F4 v**.

### Create a Dictionary Definition

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)**. The Insert Dictionary Entry dialog box displays.
4. In the Steno field, type the steno outline for All Caps On.
5. In the New Text field, press **F4 V**.
6. Press **Enter (OK)**.
7. In the Steno field, type the steno outline for All Caps Off.
8. In the New Text field, press **F4 v**.
9. Press **Enter (OK)**.
10. Press **Ctrl + s (File/Save)** to save the dictionary.

### Answer

Use the Answer format symbol to indicate where Answer text begins. You can insert the Answer format symbol in Edit or make it part of a dictionary definition.

Answer symbols display in Edit in the [user selected](#) color. The formatting values, which determine how the Answer symbol and Answer text displays and prints, are set in the [Layout](#) function. You can customize these values as necessary. For example, some of the formatting values you can customize determine:

- The position of the Answer symbol.
- The first line indent which is the position of text immediately following the Answer symbol.
- Whether or not a period prints after the "A".
- The font style for the "A" and for the text following the "A".
- The left and right margins for the body text of the Answer paragraph.
- The default punctuation, such as period, for the Answer.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

#### Insert During Edit

Position the cursor to the left of where you want the Answer bank and press **F4 A**.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select the type of definition you want to make. The Global Definition dialog box displays.

3. In the New Text field, press **F4 a**.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Attachment Point

Use the Attachment Point format symbol to attach an electronic exhibit, such as a photo or scanned document to the transcript. A new document icon displays in the transcript at the point you insert the Attachment Point format symbol. The attachment point remains empty until you attach a file. You can attach any file type by double clicking the attachment icon to display the Open dialog box where you can select an electronic file. Depending on the file type, the size of the transcript may drastically increase in size. The ability to e-mail could be affected by the attachment size.

Hovering the cursor over the attachment point icon displays the attachment status in the Status Bar at the bottom of the screen, an empty attachment point or the name and location of the attached file. Attachment information also appears in Reveal Codes. To open and view the attached electronic file requires the appropriate software for the file type. In other words, if the attached file is a \*.pdf, you must have a PDF reader (such as Adobe PDF Reader) to open and view the file.

You can modify include files and dictionary entries to include the Attachment Point format symbol, however, it may be easier to use the [Autolink](#) feature. Autolink eliminates the need to manually insert an Attachment Point format symbol by automatically inserting one when one does not already exist next to the exhibit number.

If you do elect to use the Attachment Point format symbol as a part of your Include files and dictionary entries or when manually inserting it into the transcript, ensure the position of the Attachment Point format symbols immediately follows the exhibit number or exhibit number placeholder text.

You can print a [transcript containing attachments](#) (electronic files) to PDF. In the [Print](#) or [Finish 'em](#) dialog box, select to include attachments. You can also export a transcript to [TextMap](#) and any attachments are included with the exported file.

## Bench Mode On/Off

Use the Bench Mode format symbols to indicate where to start and stop the suspension of text sent to connected receive systems. Text written after Bench Mode On does not display on the receive systems, until you stroke the steno outline for Bench Mode Off. Use this command in situations when you want to prevent others from viewing the realtime translation, such as confidential bench conferences, in-chambers discussions, or when writing a note to a scopist or yourself. Bench text displays in a [user selected](#) color on the Case CATalyst Edit screen.

Realtime text you send to CaseView after turning Bench Mode On, does not display on the CaseView screen. Realtime text written after turning Bench Mode Off displays on the CaseView screen.

You can also use the [Toggle Bench Mode](#) command. Both command types invoke and turn off Bench Mode. With Toggle Bench Mode, you need to define only one steno outline to turn Bench Mode On and Off. The Bench Mode On/Off commands require two separate steno outlines; one to turn Bench Mode On and one to turn it Off. All Bench Mode commands must be in a dictionary used during realtime. The Toggle Bench Mode command is part of the Realtime Command Sample job dictionary. Modify the entry, as necessary, to accommodate your writing style.

## Bold On/Off

Use the Bold format symbols, to indicate where to begin and end bold text.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

Do one of the following:

- Position the cursor before the word where you want bold text to begin and press **F4 B**, then move the cursor where you want bold text to end and press **F4 b**.
- Mark the text you want to bold and press **F4 B**. The Bold Off format symbol is automatically inserted at the end of the marked text.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition.
4. At the location you want to begin bold text, press **F4 B**.
5. Type the text you want to bold. At the location you want to stop bold text, press **F4 b**. If appropriate, type any remaining text to complete the definition.
6. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## By Line

Use the By Line format symbol to indicate where a By Line paragraph begins. You can insert the By Line format symbol in Edit or make it part of a dictionary definition. You can have Case CATalyst automatically format By Line text using the Translate option, [Colloquy + Question = Auto By Line](#):

The applied Layout By Line paragraph formatting values determine how the By Line text displays and prints.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

Position the cursor before the word where you want to create a By Line and press **F4 m**.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.

2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type **F4 m** and the text of the definition. Include a colon ( : ), closed parenthesis ( ) ) or **Q** at the end of the definition to use the Colloquy + Question = Auto By Line feature.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Cap Next

Use the Cap Next format symbol to capitalize the first letter of the following word. This command is most beneficial when used in a dictionary definition where you always want the following word to be initial capitalized. For example, some people use the abbreviation "Ms" without punctuation and want the following surname capitalized. In this example, the text portion of the definition would be, Ms <Cap Next>.

You do not need to use the Cap Next format symbol in definitions that contain punctuation with embedded capitalization. For example, the dictionary entry "Mr." would not need the Cap Next format symbol because the period would automatically capitalize the following word.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

Position the cursor before the word you want to cap next and press **F4 F6**.

## Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. At the end of the definition, press **F4 F6**.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Centered Paragraph

Use the Centered Paragraph format symbol to center a paragraph between the left and right margins.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

1. Position the cursor immediately before the text you want centered and press **F4 f**.
2. Move the cursor to the end of the text you want centered.
3. Press the appropriate format symbol to change the paragraph style for the text that follows.

### Create a Dictionary Definition While Editing

When you use the Centered Paragraph format symbol in a definition, the translated text following the Centered Paragraph information takes the format of the current paragraph style, such as Question or Answer.

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, press **F4 f** and the text of the centered information.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

### Colloquy

Use the Colloquy format symbol to indicate a Colloquy paragraph. You can insert the Colloquy format symbol in Edit or make it part of a dictionary definition.

The Colloquy paragraph formatting values, set in the applied [Layout](#), determine how the Colloquy text displays and prints. You can customize these values in the Layout function.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

#### Insert During Edit

Position the cursor to the right of where you want to insert Colloquy and press **F4 c**. If necessary, continue to type the speaker's name.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, press **F4 c**. Type the speaker name followed by a colon (:) and then press **Spacebar**. For example, F4 c MS. MEYER:Spacebar
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

### Conflict End

Use the Conflict End format symbol when you want to place text or a format symbol after a conflict but do not want it to be associated with the conflict. For example:

<By-line>^ Atty1 ^ Atty2<Conflict End>:<Question>

Atty1 and Atty2 are part of the conflict. The colon and <Question> format symbol are not part of the conflict.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

1. Position the cursor where you want to insert the conflict and text and press **Ctrl + i** (**Edit/Insert/Conflict**). The Insert Conflict/Text dialog box displays.
2. In the Text field, type the conflict. For example:  
^ Spacebar text Spacebar ^ Spacebar text2
3. At the end of the conflict, press **F4 \** to insert the Conflict End format symbol. No space should exist between the end of the conflict and the Conflict End format symbol. For example:  
^ Spacebar text Spacebar ^ Spacebar text2<Conflict End>
4. Type the additional text or insert a format symbol and press **Enter (OK)**.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the conflict and then press **F4 \**. No space should exist between the end of the conflict and the Conflict End format symbol. Following the Conflict End format symbol, type the text or insert a format symbol.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Continuation Paragraph

Use the Continuation Paragraph format symbol to indicate where a secondary or continuation paragraph within a specific paragraph type begins. The Continuation Paragraph formatting values set in the applied [Layout](#) determine how the Continuation Paragraph displays in Edit and prints. Continuation paragraph values are customized separately for all paragraph styles.

### Creating a Continuation Paragraph Within an Existing Paragraph

When you create a continuation paragraph from within an existing paragraph, Case CATalyst:

- places a period at the end of the preceding sentence. If no punctuation is present, Case CATalyst always inserts a period at the end of the preceding sentence regardless of paragraph style. This includes the paragraph style for Question.
- places the continuation paragraph on a new line, correctly indented according to the paragraph style.
- places the correct punctuation, according to paragraph style, at the end of the paragraph.

For example, you have the question:

Q. Where did you go on that Tuesday evening and you also say that Jimmy was racing down the hill on his skateboard?

Place your cursor immediately before "and" and press Enter. The result is:

Q. Where did you go on that Tuesday evening.

And you also say that Jimmy was racing down the hill on his skateboard?

### Creating a Continuation Paragraph Following an Existing Paragraph

When you create a continuation paragraph following an existing paragraph, Case CATalyst:

- places a period at the end of the preceding sentence.
- places the continuation paragraph on a new line correctly indented according to the paragraph style.

For example, you have the following question and answer:

Q. What is your high school education?

A. I graduated from high school in 1985. I then attended UW at Stevens Point in the fall of 1985.

Place your cursor immediately after the "?" at the end of the question. Press Enter and type: "What college did you attend, if any, and when". The result is:

Q. What is your high school education?

What college did you attend, if any, and when

A. I graduated from high school in 1985. I then attended UW at Stevens Point in the fall of 1985.

You type the ending punctuation after "when".

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

Position the cursor before the word where you want to create a continuation paragraph and press **Enter**.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, press **F4 p**.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

### Default Paragraph

Use the Default Paragraph style to create a new paragraph style that may have different indentations and margins. You can also use the Default Paragraph when a new paragraph is needed but you do not want it to follow the current paragraph style. For example, to create a new paragraph in the middle of a Question paragraph that is not a [continuation paragraph](#) with Question formatting values, use the Default Paragraph style. You can insert the Default Paragraph style in Edit or make it part of a dictionary definition.

Case CATalyst uses the Default Paragraph information in the applied [Layout](#) to determine how text displays in Edit. you can customize these values in the Layout function. To align page numbering, headers, and footers on the page, set the alignment in Align field on the Headers & Footers tab in Layout.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

Position the cursor before the word where you want to create a default paragraph and press **Shift + F4** to display the Format Symbol list. Select **Default Paragraph** and press **Enter**.

You must insert the Default Paragraph by selecting it from the Format Symbol list. There is no shortcut key.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. Insert the Default Paragraph format symbol at the desired location in the definition; press **Alt + f** to display the Format Symbol list. Highlight Default Paragraph and press **Enter**.

You must insert the Default Paragraph by selecting it from the Format Symbol list. There is no shortcut key.

4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Delete Space

Use the Delete Space format symbol to delete computer-inserted spaces which Case CATalyst automatically inserts between words during translation. For example, use a <Delete Space> after the period in an internet address, www.<Delete Space>, so that there is no space following the period and remaining characters.

You can also use Backspace or Del to remove a space while editing.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

Position the cursor between the two words where you want the Delete Space and press **F4 ~**.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, do one of the following:

- Delete the space at the beginning of the definition, press **F4~** and then type the text of the definition.
  - Delete the space at the end of the definition, type the text of the definition and then press **F4~**.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

If you are defining a prefix or suffix you may want to use the [Prefix](#) and [Suffix](#) translate commands and take advantage of the Case CATalyst [EZ Link](#) feature.

## Font Color

Use the Font Color format symbol in a dictionary definition where you want to change the font color for the text that follows it. The font color change remains for all the text that follows until you insert another Font color format symbol. For example, you have a single word you want to display in bright green. In the dictionary definition you insert <Font Color Bright Green>word or words to highlight<Font Color Black>. You insert black because black is the color of the body text in the job.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

## Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, press **Alt + f** to display the Format Symbol list.
4. Select **Font Color**. The Choose Color dialog box displays.
5. Click a color and press **Enter (OK)**.
6. Type the text of the definition.
7. If you are applying the selected Font Color only to the text of the definition, insert the font color of the transcript text following the definition. From the Format Symbol list, select **Font Color**. The Choose Color dialog box displays.

If you do not insert the transcript text Font Color format symbol after the definition, all the text following the definition displays with the same color as the definition.

8. Select the color of the transcript text and press **Enter (OK)**.
9. Press **Enter (OK)** in the Global Definition dialog box. The definition displays in the current [color](#) selected for Globals. The new font color applies the next time you translate.

When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Font Size

Use the Font Size format symbol to set the font size for the text that follows it. The modified font size continues until Case CATalyst encounters a font change such as a paragraph style definition or a Font Size format symbol.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert during Edit

Do the following:

1. Mark the text for which you want to change the font size and press **Shift + F4** to display the Format Symbol list.
2. Select **Font Size** and press **Enter**. The Set Font Size dialog box displays.
3. In the *Enter Value* field, type a point size for the font and press **Enter (OK)**.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition.
4. At the location you want to change the font size, press **Alt + f** to display the Format Symbol list. Select **Font Size** and press **Enter**. The Set Font Size dialog box displays.
5. Type a point size for the font.
6. Press **Enter (OK)**. The new font size applies to the text until Case CATalyst encounters a font change, such as a paragraph style definition.

When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Force Next Lower

Use the Force Next Lower format symbol in a dictionary definition where you want the first character of the following word to be lower case. You would likely use this format symbol in dictionary definitions for web address or e-mail addresses. For example, you have "Stenograph" defined in your dictionary along with "www." and ".com". You write the web site address resulting in "[www.Stenograph.com](#)". Using the Force Next Lower format symbol in the "www." define, such as www.<Force Next Lower><Delete Space>, the result is: "[www.stenograph.com](#)".

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition.

4. At the location you want to force the following word to be lower case, press **Alt + f** to display the Format Symbol list. Select **Force Next Lower**. Add any other text or format symbols that follow.
5. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Header

Use the Header format symbol in a dictionary definition to change the header or footer while writing or [insert a specific header while editing](#). The header or footer changes on the page where you invoke the Header format symbol.

Use fields with the Header format symbol in dictionary definitions to add header text information. If you use the EZ Speakers Dictionary, you may want to insert this format symbol as part of the appropriate entries in that dictionary.

For additional information on how applying a layout containing headers and footers while editing and changing headers/footers via a format symbol work in a transcript, see [Understanding Header Changes and Layout Changes](#).

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Create a Dictionary Definition

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**.
2. From the dictionary menu, select the dictionary type. When you choose Case or Job, the Open Existing Document dialog box displays. Select the dictionary and press **Enter**.
3. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
4. In the Steno field, type the steno you want to use for the definition.
5. In the New Text field, press **F4 h**.
6. Type the appropriate header or footer line number and press **Enter (OK)**. The Change Header/Footer Text [dialog box](#) displays.
7. Type the header text, inserting any necessary format symbols, extended characters or fields and press **Enter (OK)**. For example, you need to change the text for header one. You press F4h 1 and in the header text field type DIRECT and insert the field for the witness:  
  
DIRECT - [!WITNESS]
8. The header text displays in the Text field of the Insert Dictionary Entry dialog box. For example, you entered DIRECT – [!WITNESS] in the header text field. It displays as:  
  
<Header 1 "DIRECT – [!WITNESS]">
9. Press **Enter (OK)**.
10. Press **Ctrl + s (File/Save)** to save the dictionary.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, press **F4 h**.
4. Type the header or footer line number you want to change and press **Enter (OK)**. The Change Header/Footer Text [dialog box](#) displays.
5. Type the header text, inserting any necessary format symbols, extended characters or fields and press **Enter (OK)**.
6. In the Insert Dictionary Entry dialog box, press **Enter (OK)**.
7. Press **Ctrl + s (File/Save)** to save the dictionary.

## Index Allcap Cell

Use Index Allcap Cell to cap all the letters within a cell on an Index Template. Place the Index Allcap Cell format symbol after the Index Heading or Index On format symbol. For example, your exhibits appear in the transcript in upper and lower case. To display them on the index page in all capital letters, place the Allcap Cell format symbol in the Index Template.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert into an Index Template or Index Page

1. Position the cursor where you want to insert the format symbol.
2. Press **Shift + F4** to display the Insert Format Symbol dialog box.
3. Use the Up or Down Arrow keys to locate the **Index Allcap Cell** format symbol.
4. Press **Enter** to insert the format symbol into the index template or index page at the location of the cursor.

## Index Cell

Use the Index Cell format symbol to reference the page number of indexed information when using the [Build Index](#) feature in Edit. You can index the item along with the page reference number only or index the item along with the page number references and text, such as a attorney names or exhibit descriptions.

The Index Cell format symbol is also a placeholder on an Index Template to indicate the table cell in which Case CATalyst places the reference number for the indexed information from the transcript. The Index Cell format symbol is also used in the transcript to indicate the occurrence of an event that you want to display in your index. When using the Index Cell format symbol in a transcript, you need to use an index template that contains Index Cell format symbols. See [<Index Cell> Guidelines](#) for details about the Index Cell format symbol.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

## Insert into the Transcript

The Index Cell format symbol can be used with either the Index Heading On/Off format symbols or the Index On/Off format symbols. You must include an Index Heading On format symbol when using the Index On format symbol.

1. Position the cursor where you want to insert the Index Cell format symbol.
2. At the location you want to identify the Index Cell, insert an Index Heading On format symbol by pressing **F4 J** followed by the appropriate index category (a-z or 1-0); or insert an Index On format symbol by pressing **F4 I** followed by the appropriate index category (a-z or 1-0).
3. To include text, move the cursor to the location where you want indexing to end.
4. Insert an Index Cell format symbol. Press **F4 =** to display the Enter Index Cell dialog box. Type a number **1 - 20** and press **Enter (OK)**.
5. Immediately after the Index Cell number, insert the Index Heading Off format symbol by pressing **F4 j** followed by the same index category as the Index Heading On format symbol; or insert the Index Off format symbol by pressing **F4 i** followed by the same index category as the Index On format symbol. For example, if you were indexing the examination of a witness where direct, cross, etc. examinations occurred, you might use the following format symbols:  
<Index Heading On A>[WITNESS NAME]<Index Heading Off A>  
DIRECT <Index On A><Index Cell 1><Index Off A>EXAMINATION  
CROSS <Index On A><Index Cell 2><Index Off A>EXAMINATION

## Insert into an Index Template

Refer to [Index Cell Guidelines](#) for details on using the Index Cell format symbol on an Index Template.

## Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition.
4. At the location you want to identify the Index Cell, insert an Index Heading On format symbol by pressing **F4 J** followed by the appropriate index category (a-z or 1-0); or insert an Index On format symbol by pressing **F4 I** followed by the appropriate index category.
5. Type any additional text following the format symbol.
6. Insert an Index Cell format symbol. Press **F4 =** to display the Enter Index Cell dialog box. Type a number **1 - 20** and press **Enter (OK)**.
7. Immediately after the Index Cell number, insert the Index Heading Off format symbol by pressing **F4 j** followed by the same index category as the Index Heading On format symbol; or insert the Index Off format symbol by pressing **F4 i** followed by the same index category as the Index On format symbol.
8. If appropriate, type any remaining text to complete the definition.
9. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Index End Sort

The Index End Sort format symbol is used in conjunction with Index Sort format symbols and the Build Index feature to customize the sort for a specific indexed item. Insert the Index End Sort format symbol in the transcript after the word where you want to stop sorting alphabetically. For example, you are indexing the examination of witnesses and the [index template](#) is set up to sort alphabetically on the first word. The witness name is Karen Blaha and your examinations display as follows.

Blaha Karen, Witness for the Defendant, Liability Phrase

Direct Examination 5

Cross Examination 10

In the transcript, you insert the Index End Sort format symbol after the word Karen. Case CATalyst stops sorting alphabetically after the witnesses name.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert into the Transcript

1. Position the cursor after the word where you want to stop the sort.
2. Press **Shift + F4** to display the Insert Format Symbol dialog box.
3. Use the Up or Down Arrow keys to locate the **Index End Sort** format symbol.
4. Press **Enter** to insert the format symbol into the transcript at the location of the cursor.

[Keyboard Map](#) Function: Insert Index End Sort

## Index Heading On/Off

Use the Index Heading On/Off format symbols to surround transcript text for copying to the transcript index page when using the [Build Index](#) feature in Edit. The Index Heading On format symbol is also a placeholder on an [Index Template](#) to indicate the location for the Index Heading text. Usually the letter or number assigned to the Index Heading On/Off format symbols correspond with the letter or number of an Index On/Off format symbol.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

1. Position the cursor immediately to the left of where you want indexing to begin.
2. Press **F4 J** and then type a letter or number.
3. Move the cursor to where you want indexing to end.

4. Press **F4 j** and then type the same letter or number associated with the Index On format symbol or press **Spacebar**, which turns off all Index Heading On format symbols.

You can also mark the text and then insert the format symbol:

1. Mark the text you want to index.
2. Press **F4 J <letter or number>**. Case CATalyst surrounds the text with Index Heading On/Off format symbols.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition.
4. At the location you want to begin indexing, press **F4 J** and then type a letter or number.
5. Type the text you want to index. At the location you want to stop indexing, press **F4 j** and type the same letter or number associated with the Index Heading On format symbol or press **Spacebar**. If appropriate, type any remaining text to complete the definition.
6. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

### Insert into an Index Template

1. Position the cursor where you want to locate the Index Heading text.
2. Press **F4 J** and then type a letter or number.

### Index Initial Cap Cell

Use the Index Initial Cap Cell to initial cap each word in a cell on an [Index Template](#). You must place the Index Initial Cap Cell format symbol after the Index Heading or Index On format symbol.

The Index Initial Cap Cell does not change an all capped word or phrase to lower case. The entries in Case CATalyst Wordlists determine when an all capped word, such as an acronym remains all capped or only initial capped.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert into an Index Template

1. Position the cursor where you want to insert the format symbol.
2. Press **Shift + F4** to display the Insert Format Symbol dialog box.
3. Use the Up or Down Arrow keys to locate the **Index Initial Cap Cell** format symbol.
4. Press **Enter** to insert the format symbol into the index template or index page at the location of the cursor.

## Index Item

Use the Index Item format symbol on an [Index Template](#) to specify where, on the transcript index page, you want to sequentially list the indexed items from the job. The indexed items, transcript text surrounded by the Index On/Off format symbols, list in the order they occur in the transcript. See [<Index Item> Guidelines](#) for more information.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

#### Insert into an Index Template

1. Position the cursor where you want to insert the format symbol.
2. Press **Shift + F4** to display the Insert Format Symbol dialog box.
3. Use the Up or Down Arrow keys to locate the **Index Item** format symbol.
4. Press **Enter** to insert the format symbol into the index template at the location of the cursor.

## Index Line

Use the Index Line format symbol on an [Index Template](#) to specify where on the transcript index page you want to list the line numbers for the indexed information from the transcript. See [<Index Line> Guidelines](#) for more information.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

#### Insert into an Index Template

1. Position the cursor where you want to insert the format symbol.
2. Press **Shift + F4** to display the Insert Format Symbol dialog box.
3. Use the Up and Down Arrow keys to locate the **Index Line** format symbol.
4. Press **Enter** to insert the format symbol into the index template at the location of the cursor.

## Index On/Off

Use the Index On/Off format symbols to surround transcript text that should be copied to the transcript index page when using the [Build Index](#) feature in Edit. Assuming you want specific items grouped together, such as all the examinations grouped together, exhibits (some index pages have a group of marked exhibits and a different group for previously marked exhibits). The Index On format symbol is also a placeholder on an [Index Template](#) to indicate the location for the indexed text.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

1. Position the cursor immediately to the left of where you want indexing to begin.
2. Press **F4 I** and then type a letter or number.
3. Move the cursor to where you want indexing to end.
4. Press **F4 i** and then type the same letter or number associated with the Index On format symbol or press **Spacebar**, which turns off all Index On format symbols.

You can also mark the text and then insert the format symbol:

1. Mark the text you want to index.
2. Press **F4 I <letter or number>**. Case CATalyst surrounds the text with Index On/Off format symbols.

### Insert into an Index Template

1. Position the cursor where you want to locate the indexed text.
2. Press **F4 I** and then type a letter or number.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition.
4. At the location you want to begin indexing, press **F4 I** and then type a letter or number.
5. Type the text you want to index. At the location you want to stop indexing, press **F4 i** and type the same letter or number associated with the Index On format symbol or press **Spacebar**. If appropriate, type any remaining text to complete the definition.
6. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Index Page

Use the Index Page format symbol on an [Index Template](#) to specify where on the transcript index page you want to list the page numbers for the indexed information from the transcript. See [<Index Page> Guidelines](#) for more information.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert into an Index Template

1. Position the cursor where you want to insert the format symbol.
2. Press **Shift + F4** to display the Insert Format Symbol dialog box.
3. Use the Up and Down Arrow keys to locate the **Index Page** format symbol.

4. Press **Enter** to insert the format symbol into the index template at the location of the cursor.

## Index Placeholder Text #

The Index Placeholder Text format symbol can be used in lieu of a conflict when you include a party name as part of an exhibit blurb or sworn statement. For example, you need your exhibit blurbs to read Plaintiff's, Defendant's, State's, etc. Exhibit #, marked for identification. Instead of creating a lengthy conflict between those choices, you can use the Index Placeholder Text format symbol instead. The Index Placeholder Text # format symbol allows you to use a single exhibit Include file when you need to have identifier names for exhibits. The Index Placeholder Text # format symbol is inserted into the exhibit blurb or dictionary definition and while editing, you select the appropriate identifier from the list. In [Advanced Edit Options](#), the Index Placeholder Assignment option allows you to customize a list of identifier names, such as Plaintiff's, Plaintiffs', Defendant's, Defendants', State's, etc. that can be used to identify exhibits, sworn statement information, etc. The Index Placeholder Assignments also facilitates using different indexing categories associated with specific identifiers. Once the include file or dictionary definition that contains the Index Placeholder Text # format symbol is in the transcript, you scan to the Index Placeholder Text # format symbol and Case CATalyst displays your customized list of identifier names. You select the correct one to insert into the current exhibit.

The selected Index Placeholder text will apply to multiple adjacent paragraph styles of the same type including Continuation paragraph styles and New Line (not New Line Paragraph) that contain the Index Placeholder Text # format symbol. All other paragraph styles prevent the selection from automatically changing Index Placeholders in subsequent paragraphs. Adjacent paragraphs applies to the direction you are scanning. In other words, if you are scanning forward, the adjacent paragraphs are the paragraphs following the current paragraph. If you are scanning backwards, the adjacent paragraphs are before the current paragraph.

### Example

The following are a couple exhibit blurb examples using the Index Placeholder Text format symbol:

( Exhibit #, was marked for identification.) or ( Exhibit #, description, was marked for identification.)

There is no physical indication of the Index Placeholder Text in the body of the transcript but can be seen in Reveal Codes.

Reveal Codes displays:

```
<Parenthetical>(<Index Placeholder Text #>space<Index On #>Exhibit<Scanstop Begin>#<Scanstop End><Index Off #>, was marked for identification.)
```

```
<Parenthetical>(<Index Placeholder Text #>space<Index Heading On #>Exhibit<Scanstop Begin>#<Scanstop End><Index Heading Off #>, <Index On #><Scanstop Begin>description<Scanstop End><Index Off #> was marked for identification.)
```

When you scan, the Index Placeholder Assignment List displays:

SC	Index	Text
1	B	Plaintiff's
2	B	Plaintiffs'
3	C	Defendant's
4	C	Defendants'
5	B	State's
6	C	State's

15 this as Exhibit 4.  
( Exhibit 4, vehicle estimate, was  
marked for identification.)

You can assign an indexing category to each replacement name. An index [category](#) organizes similar items, such as Plaintiff's exhibits in a group, Defendant's exhibits in a group and State's exhibits in a group on the index pages. In Case CATalyst, a category is identified by a letter "a" through "z", or a number "0" through "9." The [Build Index](#) feature sorts these categories and automatically places them in designated positions on the transcript index page. If you assign an indexing category to an identifier name, Case CATalyst inserts the associated index category along with the name.

It is necessary to create or modify existing include files with the Index Placeholder Text # format symbol to use the Placeholder Text list feature. If you use Index Heading or Index format symbols with indexing categories, you may want to use the " # " symbol in place of a letter for the category assignment in your include files. For example, <Index On #>. If you substitute the # for the Index Heading or Index On category, when you select the identifier name for insertion on the index page, Case CATalyst automatically replaces the " # " symbol with an index category letter or number assigned to the identifier name.

### Using the Placeholder Text List

1. Create your customized list of identifier names and index category assignments, if applicable, in [Advanced Edit Options](#).
2. Be sure your exhibit statements contain the Index Placeholder Text # format symbol. Add/modify any indexing format symbols to be Index Heading # and Index # format symbols in your exhibit statements if using the automatic index category assignment with the Placeholder Text format symbol.
3. Verify that your [Scan For options](#) are active for Index Placeholders.
4. In Edit, include the Exhibit statement into the job.
5. Press **F8 (Scan Forward)** or **Shift + F8 (Scan Backward)**.
6. When Case CATalyst stops on an Index Placeholders Text # format symbol, the Placeholder Text list displays.
7. Press the number associated with your selection or double click your selection. Case CATalyst inserts the selected replacement name into the transcript and applies the index category, if applicable.

The selected Index Placeholder text will apply to multiple adjacent paragraph styles of the same type including Continuation paragraph styles and New Line (not New Line Paragraph) that contain the Index Placeholder Text # format symbol. All other paragraph styles prevent the selection from automatically changing Index Placeholders in subsequent paragraphs. Adjacent paragraphs applies to the direction you are scanning. In other words, if you are scanning forward, the adjacent paragraphs are the paragraphs following the current paragraph. If you are scanning backwards, the adjacent paragraphs are before the current paragraph.

### Index Position

Use the Index Position format symbol in the transcript to indicate where [Build Index](#) places the index pages. You can place the Index Position format symbol anywhere in the job. If there is no Index Position format symbol in the transcript, Build Index places the index page at the end of the transcript. When you build the index, Case CATalyst removes the Index Position format symbol from the job.

When there are multiple sections in the job, an index Position format symbol can exist in each section. Build Index then builds an index page for each section. Each section can only have one Index Position format symbol. Use the Search command to confirm there is only one the Index Position format symbol in the job or section.

You can also add the Index Position format symbol to an include file and have it automatically incorporate into the job. When adding the Index Position format symbol to an include file, use a New Page format symbol to have the indexed information start on a new page.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert into the Transcript or Include File

1. Position the cursor where you want to insert the format symbol.
2. Press **Shift + F4** to display the Insert Format Symbol dialog box.
3. Use the Up and Down Arrow keys to locate the **Index Position** format symbol.
4. Press **Enter** to insert the highlighted format symbol into the file at the location of the cursor.

## Index Section

Use the Index Section format symbol on an [Index Template](#) to specify where on the transcript index page you want to list the section numbers for the indexed information from the transcript. See [<Index Section> Guidelines](#) for more information.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert into an Index Template

1. Position the cursor where you want to insert the format symbol.
2. Press **Shift + F4** to display the Insert Format Symbol dialog box.
3. Use the Up and Down Arrow keys to locate the **Index Section** format symbol.
4. Press **Enter** to insert the highlighted format symbol into the index template at the location of the cursor.

## Index Sort - Alpha Case Insensitive

Use the Index Sort – Alpha Case Insensitive format symbol in an [Index Template](#) to arrange the indexed items in a column alphabetically, regardless of case. When you insert the Index Sort – Alpha Case Insensitive format symbol, Case CATalyst prompts you to select a sort option: first, second, third or last word in the indexed entry. Case CATalyst automatically sorts all indexed entries in the specified column according to the option selected. You can use the [Index Sort - Alpha Word Override](#) format symbol in the index template to sort an index entry by a different word.

Insert the format symbol into the column heading table cell for the column you want to sort. You must place the Index Sort – Alpha Case Insensitive format symbol after Index Heading On or Index On format symbols. Only one type of index sort format symbol can exist in a table. See the [Sort Index Guidelines](#) for more information.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table

### Insert into an Index Template

1. Open the Index Template in which you want to add the Index Sort format symbol. For best results, display the Index Template in Page View and open the Reveal Codes window.
2. Position the cursor in the table cell where you want to insert the format symbol. The index sorting format symbol must be inserted immediately after the Index Heading On or Index On format symbol.
3. Press **Shift + F4** to display the Insert Format Symbol dialog box.
4. Use the Up or Down Arrow keys to locate the **Index Sort – Alpha Case Insensitive** format symbol. You must select the format symbol from the list. The Choose which word to alphabetize on dialog box displays.
5. Select one of the following options by which you want to sort the index entries.

**First Word**

**Second Word**

**Third Word**

**Last Word**

6. Press **Enter** to insert the format symbol into the index template at the location of the cursor.
7. Using the [Reveal Codes](#) window, confirm the Index Sort format symbol follows the Index Heading On or Index On format symbol.

### Index Sort - Alpha Case Sensitive

Use the Index Sort – Alpha Case Sensitive format symbol on an [Index Template](#) to arrange the indexed items alphabetically, in a column according to case; upper case followed by lower case. When you insert the Index Sort – Alpha Case Sensitive format symbol, Case CATalyst prompts you to select a sort option: first, second, third or last word in the indexed entry. Case CATalyst automatically sorts all indexed entries in the specified column according to the option selected. You can use the [Index Sort - Alpha Word Override](#) format symbol in the transcript to sort an index entry by a different word.

Insert the format symbol into the column heading table cell for the column you want to sort. You must place the Index Sort – Alpha Case Sensitive format symbol after Index Heading On or Index On format symbols. If you are using an Index Sub Sort format symbol, it must follow the Index Sort format symbol. Only one type of index sort format symbol can exist in a table ([index template](#)) although you can use an index sub sort format symbol following the index sort format symbol. See the [Index Sort Guidelines](#) for more information.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table

### Insert into an Index Template

1. Open the Index Template in which you want to add the Index Sort format symbol. For best results, display the Index Template in Page View and open the Reveal Codes window.

2. Position the cursor in the table cell where you want to insert the format symbol. The indexing sort format symbol must be inserted immediately following the Index Heading On or Index On format symbol.
3. Press **Shift + F4** to display the Insert Format Symbol dialog box.
4. Use the Up or Down Arrow keys to locate the **Index Sort – Alpha Case Sensitive** format symbol. You must select the format symbol from the list. The Choose which word to alphabetize on dialog box displays.
5. Select one of the following by which you want to sort the index entries.

**First Word**

**Second Word**

**Third Word**

**Last Word**

6. Press **Enter** to insert the format symbol into the index template at the location of the cursor.
7. Using the [Reveal Codes](#) window, confirm the Index Sort format symbol follows the Index Heading On or Index On format symbol.

## Index Sort Alpha - Exhibit

Use the Index Sort Alpha – Exhibit format symbol on an [Index Template](#) to list single alpha character exhibits alphabetically followed by the double alpha character and digit and alpha character exhibits.

For example, let's say you have the following exhibits in the transcript: Exhibit C, Exhibit G, Exhibit AA and then Exhibit DD. When exhibit entries appear in the transcript with the same letter in both initial cap and lower case (Exhibit A and Exhibit a), the capital letter lists first. For example, Exhibit A list before Exhibit a.

If you use the <Index Sort – Alpha Exhibit><Index Sub Sort Numeric> format symbols with alpha and numeric exhibits such as, ExhibitAA9, Exhibit AA, Exhibit A and Exhibit B, the results are Exhibit A, Exhibit B, Exhibit AA, Exhibit AA9. (If a digit or punctuation precede any of the alphabetic characters, the digit or number is ignored and sorting starts with the alpha character).

Insert the Index Sort Alpha – Exhibit format symbol after Index Heading On or Index On format symbols in the column you want to sort. If you are using an Index Sub Sort format symbol, it must follow the Index Sort format symbol. Only one type of index sort format symbol can exist in a table ([index template](#)) although you can use a index sub sort format symbol to fine tune your index. See the [Index Sort Guidelines](#) for more information.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table

### Insert into an Index Template

1. Open the Index Template in which you want to add the Index Sort format symbol. For best results, display the Index Template in Page View and open the Reveal Codes window.
2. Position the cursor immediately after the indexing format symbol in the column you want to sort to occur.

3. Press **Shift + F4** to display the Insert Format Symbol dialog box and use the Up or Down Arrow keys to locate the **Index Sort Alpha – Exhibit** format symbol.
4. Press **Enter** to insert the format symbol into the index template at the location of the cursor.
5. Using the Reveal Codes window, confirm the Index Sort format symbol follows the Index Heading On or Index On format symbol.

## Index Sort - Alpha Word Override

When you insert an Index Sort – Alpha Case Sensitive or Index Sort – Alpha Case Insensitive format symbol, Case CATalyst prompts you to specify which word in the index entry you want to sort on: first, second, third, or last. Use Index Sort – Alpha Word Override to identify the word on which you want to sort, when you want do not want to follow the selected sort option. For example, on the Index Template, you have an Index Sort – Alpha Case Insensitive format symbol with the sort option set to Last Word. Your witness names, MARTI COOPER, JAMES NEUMAN, and SEAN RYAN sort alphabetically according to the last word. However, you also have a witness, JACKIE VAN DER BEER. Insert the Index Sort – Alpha Word Override format symbol into the transcript immediately before VAN to have Case CATalyst sort on VAN instead of BEER.

Case CATalyst ignores initials, titles, and salutations such as Mr., Dr., Jr., III, etc. They are not counted as words when Case CATalyst sorts the index. See the [Index Sort Guidelines](#) for more information.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table

### Insert into the Transcript

1. Position the cursor in the transcript immediately before the word on which you want Case CATalyst to sort. The index sort format symbol must be inserted immediate after the Index Heading On or Index On format symbol.
2. Press **Shift + F4** to display the Insert Format Symbol dialog box.
3. Use the Up or Down Arrow keys to locate the **Index Sort – Alpha Word Override** format symbol. You must select the format symbol from the list.
4. Press **Enter** to insert the format symbol into the transcript at the location of the cursor.
5. Using the [Reveal Codes](#) window, confirm the placement of the format symbol.

## Index Sort - Match Headings

The <Index Sort – Match Headings> format symbol is used in the [index template](#) for indexed examination information. When the <Index Sort – Match Headings> format symbol is used in an index template and no other sort format symbol is used in the same table, the result will be the matching index header text is grouped while leaving the headings in chronological order.

For example, let's say there are two witnesses in the proceedings: Mary Poppins and George Bailey. MR. SMITH, questioning attorney, examines the witnesses; MR. JONES cross-examines the witnesses. After the recross-examination of Mary Poppins, she has an emergency and is unavailable to answer further re-direct by Mr. Smith, but returns to testify later. Using the new <Index Sort – Match Headings> format symbol following the index headings as described above, the index page would build as follows::

<b>MARY POPPINS</b>	
DIRECT EXAMINATION BY MR. SMITH	5
CROSS-EXAMINATION BY MR. JONES	25
REDIRECT EXAMINATION BY MR. SMITH	54
RE CROSS-EXAMINATION BY MR. JONES	72
REDIRECT EXAMINATION BY MR. SMITH	175
<b>GEORGE BAILEY</b>	
DIRECT EXAMINATION BY MR. SMITH	84
CROSS-EXAMINATION BY MR. JONES	115
REDIRECT EXAMINATION BY MR. SMITH	131
RE CROSS-EXAMINATION BY MR. JONES	151

(Notice the Re-direct examination of Mary Poppins is on page 175 which occurred after the Re-cross examination of George Bailey.)

This new format symbol can be used when there are times during a proceeding where a witness is called to testify, starts his/her testimony, cannot complete their testimony at the current time, and is called back to testify at a later time (but still by the initial questioning attorney). If you want that examination under the correct witnesses name and listed chronologically, the <Index Sort - Match Headings> format symbol should be used.

#### To use the <Index Sort – Match Headings> format symbol in an index template:

In your index template, insert the <Index Sort – Match Headings> format symbol after the <Index Heading On> format symbol or the Index On format symbol, depending on how you format your index page. (Remember: no other index sort format symbol can be used in the same table.)

<Index Heading On A><Index Sort – Match Headings>	
<Index On A>	<Index Page>

### Index Sort - Numeric

Use the Index Sort – Numeric format symbol on an [Index Template](#) to arrange the indexed items in a column numerically. <Index Sort – Numeric> skips over anything that is not numeric, then takes consecutive digits as the number to be sorted on. When exhibit entries contain numbers and numbers with alpha characters, the number only entry will be listed first followed by the same number with the alpha character. For example, let's say you have Exhibit 1, Exhibit 1A, Exhibit 1c, Exhibit 2, Exhibit 2A and Exhibit 4. Exhibit 1 would be listed first in the index followed by Exhibit 1A, Exhibit 1c, Exhibit 2, Exhibit 2A and then Exhibit 4.

Let's say you use the <Index Sort - Numeric><Index Sub Sort-Numeric> format symbols when your exhibits numbers contain integers, such as Exhibit 4.11, Exhibit 1.2, Exhibit 1.25 and Exhibit 4.2, then the exhibits would be sorted as Exhibit 1.2, Exhibit 1.25, Exhibit 4.2 and Exhibit 4.11. Each side of the decimal point is considered a integer.

Let's say you use the <Index Sort - Numeric><Index Sub Sort-Alpha Case Sensitive> format symbols when your exhibit contain alphabetic characters such as, A12B, B12A and B13C, the exhibits would be sorted as B12A, A12B and then B13C. Since the first sort is numeric, the first character in the above examples of the exhibit numbering is ignored, then the exhibits are sorted on the number and character following the number.

Insert the format symbol into the column heading table cell for the column you want to sort. You must place the Index Sort – Numeric format symbol after Index Heading On or Index On format symbols. If you are using an Index Sub Sort format symbol, it must follow the Index Sort format symbol. Only one type of index sort format symbol can exist in a table ([index template](#)) although a sub sort format symbol can follow in order to fine tune your index. See the [Index Sort Guidelines](#) for more information. Example:

Exhibit No.

Page

&lt;Index On E&gt;&lt;Index Sort – Numeric&gt;&lt;Index Sub Sort – Numeric&gt;

&lt;Index Page&gt;

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table

### Insert into an Index Template

1. Open the Index Template in which you want to add the Index Sort format symbol. For best results, display the Index Template in Page View and open the Reveal Codes window.
2. Position the cursor where you want to insert the format symbol. The index sort format symbol must be inserted following the Index Heading On or Index On format symbol.
3. Press **Shift + F4** to display the Insert Format Symbol dialog box.
4. Use the Up or Down Arrow keys to locate the **Index Sort – Numeric** format symbol. You must select the format symbol from the list.
5. Press **Enter** to insert the format symbol into the index template at the location of the cursor.
6. Using the Reveal Codes window, confirm the Index Sort format symbol follows the Index Heading On or Index On format symbol.

## Index Sub Sort - Alpha Case Insensitive

The Index Sub Sort - Alpha Case Insensitive format symbol allow you to fine tune the sorting of indexed items, specifically designed for indexed exhibits. The existing CATalyst indexing sort format symbols ([Index Sort - Alpha Case Insensitive](#), [Index Sort - Alpha Case Sensitive](#) and [Index Sort - Numeric](#)) along with the two other 'sub sort' indexing format symbol ([Index Sub Sort - Alpha Exhibit](#) and [Index Sub Sort - Numeric](#)) provide more flexibility when creating index pages. See [Index Template Guidelines](#) for more information about indexing.

The <Index Sub Sort – Alpha Case Insensitive> format symbol must be used in conjunction with the existing “index sort” format symbols listed above. <Index Sub Sort – Alpha Case Insensitive> looks for the first consecutive alphabetic characters as the text to be sorted on (following the main index sort criteria). For example, let's say you use the <Sort Index - Numeric><Index Sub Sort - Alpha Case Sensitive> format symbols when your exhibit contain alphabetic characters such as, A12B, B12A and B13C, the exhibits would be sorted as B12A, A12B and then B13C. Since the first sort is numeric, the first character in the above examples of the exhibit numbering is ignored, then the exhibits are sorted on the number and character following the number.

Insert the format symbol into the column heading table cell for the column you want to sort. You must place the Index Sort – Numeric format symbol after Index Heading On or Index On format symbols. If you are using an Index Sub Sort format symbol, it must follow the Index Sort format symbol. Only one type of index sort format symbol can exist in a table ([index template](#)) although an index sub sort format symbol can follow in order to fine tune your index. See the [Index Sort Guidelines](#) for more information. Example:

**Exhibit No.**  
**Page**

<Index On E><Index Sort - Numeric><Index Sub Sort - Alpha Case Insensitive>	<Index Page>
---	--------------

## Index Sub Sort - Alpha Exhibit

The Index Sub Sort - Alpha Exhibit format symbol allow you to fine tune the sorting of indexed items, specifically designed for indexed exhibits. The existing CATalyst indexing sort format symbols ([Index Sort - Alpha Case Insensitive](#), [Index Sort - Alpha Case Sensitive](#) and [Index Sort - Numeric](#)) along with the two other 'sub sort' indexing format symbol ([Index Sub Sort - Alpha Case Insensitive](#) and [Index Sub Sort - Numeric](#)) provide more flexibility when creating index pages. See [Index Template Guidelines](#) for more information about indexing.

<Index Sub Sort – Alpha Exhibit> will treat the entire string of characters as text to be sorted. Longer strings of text will be sorted after shorter strings of text and text with the same length of characters will be sorted by case sensitive characters (following the main index sort criteria). Use this one when you want text such as A-Z to be followed by AA-ZZ.

The Index Sub Sort format symbols must be used in conjunction with one of the three Sort Index format symbols listed above. Let's say you have the following exhibits: Exhibit A9, Exhibit AA, Exhibit A, Exhibit B3, Exhibit B1 and Exhibit A4. Using the <Index Sort Alpha -Exhibit> format symbol followed by <Index Sub Sort - Numeric> format symbol the sorting results are: Exhibit A, Exhibit A4, Exhibit A9, Exhibit AA, Exhibit B1 and Exhibit B3.

Insert the format symbol into the column heading table cell for the column you want to sort. You must place the Index Sort – Numeric format symbol after Index Heading On or Index On format symbols. If you are using an Index Sub Sort format symbol, it must follow the Index Sort format symbol. Only one type of index sort format symbol can exist in a table ([index template](#)) although an index sub sort format symbol can follow in order to fine tune your index. See the [Index Sort Guidelines](#) for more information. Example:

**Exhibit No.**  
**Page**

<Index On E><Index Sort - Alpha Exhibit><Index Sub Sort - Numeric>	<Index Page>
--	--------------

## Index Sub Sort - Numeric

The Index Sub Sort - Numeric format symbol allow you to fine tune the sorting of indexed items, specifically designed for indexed exhibits. The existing CATalyst indexing sort format symbols ([Index Sort - Alpha Case Insensitive](#), [Index Sort - Alpha Case Sensitive](#) and [Index Sort - Numeric](#)) along with the two other 'sub sort' indexing format symbol ([Index Sub Sort - Alpha Exhibit](#) and [Index Sub Sort - Alpha Case Insensitive](#)) provide more flexibility when creating index pages. See [Index Template Guidelines](#) for more information about indexing.

<Index Sub Sort – Numeric> looks for the first consecutive digits as the number to be sorted on (following the main sort index criteria). The <Index Sub Sort – Numeric> format symbol must be used in conjunction with the existing “index sort” format symbols listed above. For example, let's say you use the <Index Sort - Numeric><Index Sub Sort - Numeric> format symbols when your exhibit contain integers, such as Exhibit 4.11, Exhibit 1.2, Exhibit 1.25 and Exhibit 4.2, then the exhibits would be sorted as Exhibit 1.2, Exhibit 1.25, Exhibit 4.2 and Exhibit 4.11. Each side of the decimal point is considered a integer.

Insert the format symbol into the column heading table cell for the column you want to sort. You must place the Index Sort – Numeric format symbol after Index Heading On or Index On format symbols. If you are using an Index Sub Sort format symbol, it must follow the Index Sort format symbol. Only one type of Index Sort format symbol can exist in a table ([index template](#)) although an Index Sub Sort format symbol can follow in order to fine tune your index. See the [Sort Index Guidelines](#) for more information. Example:

Exhibit No.

Page

<Index On E><Index Sort – Numeric><Index Sub Sort – Numeric>	<Index Page>
--	--------------

## Index Volume Information

Use the Index Volume Information format symbol on an [Index Template](#) or index page to specify where to place the volume information on the transcript index page when creating one index from multiple files. A [volume description](#) identifies the contents of the indexed information when building a [master index](#). For example, you may want to create a volume description with information similar to one of the following:

Volume | 1

Volume | Testimony of James Doe

Volume | 11/15/03

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert into an Index Template

1. Position the cursor where you want to insert the format symbol.

2. Press **Shift + F4** to display the Insert Format Symbol dialog box.
3. Use the Up or Down Arrow keys to locate the **Index Volume Information** format symbol.
4. Press **Enter** to insert the format symbol into the index template or index page at the location of the cursor.

## Italics On/Off

Use the Italics On/Off format symbols to print text in *Italic* font. The Edit screen displays the text in Italics.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

## Insert During Edit

Do one of the following:

- Position the cursor before the word where you want begin italics and press **F4 D**; then move the cursor where you want to end Italics and press **F4 d**.
- Mark the text you want to Italicize and press **F4 D**. The Italics Off format symbol is automatically inserted at the end of the marked text.

## Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition.
4. At the location you want to begin Italics, press **F4 D**.
5. Type the text you want to italics. At the location you want to stop Italics, press **F4 d**. If appropriate, type any remaining text to complete the definition.
6. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Line Numbers Off/On

Use the Line Number Off/On to stop and start printing transcript line numbers on a particular page or pages. For example, if the page layout for a job has line numbers and you want to suspend the printing of line numbers on a particular page or pages, use the Line Number Off format symbol. To resume the printing of line numbers, use the Line Number On format symbol.

The Line Number Off/On format symbols take affect at the point of the cursor. For example, if you turn line number Off on line 1 and back On at line 10, the result is no line numbers from line 1 – 10 with line numbers resuming on line 11. If you want to remove line numbers for the entire page, you may want to adjust your layout and apply it to the current page.

The Line Number Off format symbol must appear in the file before the Line Number On format symbol is recognized.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

Do one of the following:

- Position the cursor at the point you want line numbers Off and press **F4 z**.
- Position the cursor at the point you want line numbers On and press **F4 Z**.

## New Line

Use the New Line format symbol to move text to the left margin of the following line using the left margin information set in the previous paragraph style. The New Line format symbol does not generate ending punctuation.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

1. Position the cursor on the word or format symbol where you want the New Line.
2. Press **Shift + F4** to display the Insert Format Symbol dialog box.
3. Highlight **New Line** and press **Enter**.

## Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. At the location you want to start a new line, press **Alt + f** to display the Format Symbol list. Highlight **New Line** and press **Enter** to insert the format symbol into the definition.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## New Line Paragraph

Case CATalyst automatically uses the New Line Paragraph format symbol when you open a new file or job and do not specify a particular paragraph style, such as Question, Answer, or Colloquy.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

Position the cursor on the word or format symbol where you want the New Line Paragraph and press **F4 I**.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. At the position you want the New Line Paragraph, press **F4 I**. If appropriate, type any remaining text to complete the definition.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

### New Page

Use the New Page format symbol to create a page break in the job. One of the most common uses of the New Page format symbol is in Include files, such as at the end of the Title Page or beginning of the Certificate Page. Text following a New Page format symbol takes on the New Line paragraph style unless other paragraph format information exists. To remove a "new page ", delete the New Page format symbol in [Reveal Codes](#).

When using Page View in Edit, pages display as they print. When using Normal View, a page break is indicated by a dashed line. You can [change](#) the color of the line.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

#### Insert During Edit

Position the cursor where you want the new page to begin and press **F4 n**.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. At the position you want the new page, press **F4 n**. If appropriate, type any remaining text to complete the definition.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

### No Auto Convert

Use the No Auto Convert format symbol in a dictionary definition to prevent the Automatic Number Conversion translate option and Display 10 and Under as Words from affecting numbers within the definition. For example, you write the steno for Global 1 Credit Union with Display 10 and Under as Words active. The result is Global one Credit. To prevent the conversion to Global one Credit Union, create the definition, Global<No Auto Convert>1 Credit.

You can also use the No Auto Convert format symbol in a definition by itself. For example, you create a dictionary definition for <No Auto Convert>. When writing a number, you recognize that you do not want it to convert in the current context. You write the stroke for No Auto Convert followed the "keyword" that creates a conversion. No conversion occurs because you wrote the stroke for <No Auto Convert> in between.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, press **Alt + f** to display the Format Symbol list. Highlight **No Auto Convert** and press **Enter** to insert the format symbol into the definition. Type the text of the definition.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Oops

Use the Oops format symbols to place an invisible mark in the job on which you can search or scan. The [Hotspots](#) pane allows you to quickly reference all the locations of the Oops format symbol and sort the results in the Hotspots pane. The Oops format symbols can be inserted while writing realtime (dictionary definitions) and while editing either manually or creating a macro to insert the specific Oops format symbol.

There can be several reasons to use the Oops format symbol. For example, most reporters seem to write something (i.e. SPEL/SPEL) in the transcript when they need to check the spelling of a name, street, prescription, etc. Using the Oops format symbol allows them to open the Hotspots pane, see all the occurrence of the "check spelling" Oops format symbol and it allows the reporter to quickly with the attendees before they leave the proceedings. Some reporters also write something when they want to remind themselves to check the audio (i.e. CK/CK). With Oops categories, you can write steno outlines defined with different Oops categories so nothing visible displays in the realtime file and yet everything you need is in the Hotspots pane categorized and sorted! Even if you write realtime just for yourself, you can instantly find the locations you want/need to check. No need to search or scan.

There are up to 10 possible Oops categories in the [Hotspots Options](#) which you can personalized with a name and color. You can assign specific items such as "check spelling" to one category, "check audio" to another category, etc." Using the example above, let's say you have the following categories: Oops 0 is assigned to check a spelling before everyone leaves the proceedings, Oops 1 is assigned to checking the audio and Oops 2 is assigned for things that you want your Scopist to research. Once you assign a name and a color (optional), when you view the Hotspots pane, you can quickly identify the categories and what to check when needed. The Oops format symbol categories apply to all jobs. Reveal Codes displays the different Oops categories with Oops followed by the number assignment. For example, <Oops 0> - check spelling, <Oops 1 - check audio>, <Oops 2> - Scopist research, etc. If you insert an Oops format symbol that has not been personalized, the Oops format symbol displays in Reveal Codes followed by the number.

There are certain actions such as aborting a Power Define, Scan Define, Create EZ Speakers or Text E-define dialog box, re-translating a steno file where Power Defines or AccelerWriters were used or having the Live Suggestion option *Insert Oops when replacing a live suggestion option* selected where Case CATalyst will automatically insert an Oops format symbol into the transcript. In the above cases, the Oops format symbol will always be inserted as <Oops 10> which is the CATalyst Inserted category.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table or you have remapped the F4 key in your keyboard map.

### Insert During Edit

Position the cursor before the word where you want to insert the Oops format symbol and press **Shift + F4** or press F4 twice to display the Format Symbol list. Highlight **Oops** and press **Enter**. The [Oops Category](#) dialog box displays, **type** the appropriate category number (0-9) and press **Enter**.

The Oops format symbol can be part of a dictionary definitions and include files. You can also make [macros](#) for commonly inserted Oops format symbols.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, press **Alt + f** to display the Format Symbol list. Highlight **Oops** and press **Enter**. The Oops Category dialog box displays. **Type** a valid Oops category number (0-9) and press **Enter** to insert the format symbol into the definition. If the Oops format symbol is the only entry in this definition, go to Step 4. If there is text with the Oops format symbol, type the text and go to Step 4.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Orphan Control

Use the Orphan Control format symbol to prevent lines of text from being separated between page breaks. You can insert the Orphan Control format symbol in dictionary definitions, include files and while editing. For example, use this format symbol with Examinations where you do not want the Witness name and examination separated between pages.

When you insert the Orphan Control format symbol, Case CATalyst prompts you to select the number of lines that you want to keep together. The Orphan Control format symbol must follow the first paragraph style in the text file or definition. Use Reveal Codes to verify the placement of the format symbol.

Use Orphan Control [Options](#) to specify characters or text for display on lines normally left blank and to set the paragraph style which determines the margin, justification and font style when using the Orphan Control from symbol.

### Example:

<Parenthetical><Orphan Control 3 lines><Scanstop Begin>WITNESS

<Scanstop End>,<New Line>having been first duly sworn testified as follows:

<Centered Paragraph>DIRECT EXAMINATION

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

1. Open Reveal Codes; press **Ctrl + Shift + r** (**View/Reveal Codes**).
2. Position the cursor, on the screen, after the first paragraph style. Do not place the cursor in Reveal Codes.
3. Press **Shift + F4** to display the Insert Format Symbol dialog box.
4. Highlight **Orphan Control** and press **Enter**. The Select Number of Lines dialog box displays.
5. Select the number lines and press **Enter** (**OK**). This is the number of blank lines that must be available on a page before moving the text to the next page.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. At the location you want to insert orphan control, press **Alt + f** to display the Format Symbol list. Highlight **Orphan Control** and press **Enter** to insert the format symbol into the definition. The Select Number of Lines dialog box displays.
4. Select the number lines. This is the number of blank lines that must be available on a page before moving the text to the next page.
5. Press **Enter** (**OK**). When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Parenthetical

Use the Parenthetical paragraph style to indicate where a Parenthetical paragraph begins. You can insert the Parenthetical format symbol in Edit or make it part of a dictionary definition.

The Parenthetical paragraph information set in the applied [Layout](#) affects the formatting values that determine how the Parenthetical text displays in Edit. You can customize these values in the Layout function.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

Position the cursor before the word where you want to create a parenthetical paragraph and press **Shift + F4** to display the Format Symbol list. Select **Parenthetical** and press **Enter**.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, press **Alt + f** to display the Format Symbol list. Highlight **Parenthetical** and press **Enter** to insert the format symbol into the definition. Type the text of the definition.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Pause Time

Use the Pause Time format symbol is used during realtime to pause the timestamps. This format symbol is most likely used when working with a videographer and you need to temporarily stop the recording. For example, let's say you are reporting a deposition that is being videotaped. The videographer needs to stop recording. You would use the Pause Time command so when the videographer goes back on the record, the CATalyst timestamps and videotape timestamps match. Use the [Resume Time](#) format symbol to restart the recording of timestamps.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert into the Transcript

1. Press **Shift + F4** or **F4,F4 (Edit/Insert/Insert Format Symbol)** where you want to pause the time. From the format symbol list, select **Pause Time**. The time pauses from the beginning of the line where you insert the format symbol.
2. Use the [Resume Time](#) format symbol to restart the recording of timestamps.

[Keyboard Map](#) Function: Insert Pause Time

## PDF Bookmark Text On and Off Format Symbols

The PDF Bookmark Text format symbols are a pair (an On and Off format symbol). The PDF Bookmark Text format symbols are used in an index template to create bookmarks for items (such as examinations, exhibits, requested documents, etc.) that need to be bookmarked in the PDF. For example, let's say your jurisdiction requires a PDF to have bookmarks when examinations occur, exhibits are marked, requests for documentation occur, etc. Once the transcript is printed to PDF, the bookmarked text displays in the PDF pane and allows a user to click a bookmark and go directly to that location in the transcript. PDF Bookmarks are compatible when building a [master index](#) that is in the same file as the transcript.

The CATalyst <PDF Bookmark Text On/Off> format symbols are inserted into an [Index Template](#) and need to surround the indexing format symbols related to the items that need to be bookmarked. Then when you use CATalyst's [Build Index](#) feature and print the transcript to PDF, the bookmarked indexed text displays in the Bookmarks pane of the PDF.

In addition to the PDF Bookmark Text On/Off format symbols being paired, the PDF Bookmark Text On format symbols have associated numbers to indicate the "level" of the bookmark.

The following is the example of a PDF bookmark pane of the Examination of John Doe by Perry Mason. With the PDF Bookmarks, the person viewing the PDF can click “By Perry Mason” and move the cursor to the location where Perry Mason started questioning John Doe.

If you use Index Templates to create your transcript index page, it is as simple as adding the PDF Bookmark Text formats symbols to your index template. Remember, once you create your index template, it is used over and over again.

PDF Bookmarks can be as simple or as detailed as you need. Using the example above, here is what the Examination part of your Index Template would look like:

<PDF Bookmark Text On 1>EXAMINATION<PDF Bookmark Text Off>  
PAGE

<PDF Bookmark Text On 2><Index Heading On W><PDF Bookmark Text Off>		
<PDF Bookmark Text On 3><Index On W><PDF Bookmark Text Off>		<Index Page>

As a result, the EXAMINATION is level 1, the Index Heading On FS (which is replaced with the witness name when the index is built) is level 2 and the Index On FS (which is replaced with your attorney by lines) is level 3. That final level will be bookmarked in the PDF file when you print to PDF. If you wish to bookmark Exhibits or any other item in your index, start over with <PDF Bookmark Text On 1> format symbol for level 1 and so on for each item/table in your index.

The PDF Bookmark Text Off format symbol does not require a number; it automatically turns off any previous <PDF Bookmark Text On #> format symbol. Valid numbers for the <PDF Bookmark Text On #> format symbols are 1- 5.

#### To insert the PDF Bookmark Text On and Off format symbols:

1. Open the Index Template that you want to add the PDF Bookmark Text format symbols, make sure that you are in Page View and Reveal Codes are displayed. Locate the indexing format symbol you want to surround with the PDF Bookmark Text On/Off format symbols and double click it.
2. Access the Format Symbol list either by pressing F4 twice and then selecting PDF Bookmark Text On or clicking the format symbol (FS) icon on the toolbar. You could also assign key combinations in your [Keyboard Map](#) or modify your [Format Symbols options](#) to insert via a key combination.
3. Double click or press Enter on the PDF Bookmark Text On entry. The Enter bookmark level dialog box displays:

4. Type the number of the bookmark level and press Enter. The <PDF Bookmark Text On #> (displays selected number) and the <PDF Bookmark Text Off> format symbols surround the selected indexing code.
5. Repeat as necessary.

Keyboard functions: Insert PDF Bookmark Text On  
Insert PDF Bookmark Text Off

## Question

Use the Question format symbol to indicate where a Question begins. You can insert the Question format symbol in Edit or make it part of a dictionary definition.

Question symbols display in Edit in the [user selected](#) color. The formatting values, which determine how the Question symbol and Question text display in Edit and Print, are determined by the Question paragraph information set in the applied Layout function. You can customize these values as necessary. For example, some of the formatting values you can customize determine:

- the position of the Question symbol.
- the position of text immediately following the Question symbol.
- whether or not a period prints after the "Q".
- the font type for the "Q".
- to insert punctuation at the end of the line before the Question symbol when none exists.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

Position the cursor to the left of where you want the Question bank and press **F4 q**.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, press **F4 q**. If appropriate, type any remaining text to complete the definition.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Redaction On/Off

Some jurisdictions require court reporters to edit sensitive information before releasing the transcript to the public. Sensitive information may include social security numbers, the full name of a juvenile, date of birth, etc. Using the Redact feature in Edit, you can "block out" this text in a transcript. The integrity of the transcript remains in place and the sensitive information is not readable in the printed or exported document.

The Redact feature surrounds text with Redaction format symbols. The text is hidden when printing a hard copy or to PDF and when exporting to ASCII, HTML, RTF/CRE, PTX, PTF and CaseViewNet. The hidden portion replaces the original text with the redaction option you select and takes up the same amount of space as the original text. Line spacing and line breaks are unaffected. You can change the appearance of redacted text to black rectangle, white space, lines (///) or Xs in [Advanced Edit Options](#).

**Redacted text appears as follows in the following delivery methods:**

Redaction Setting	Print Hard Copy or PDF	Export to RTF/CRE	Export to ASCII	Export to HTML	Export to PTX or PTF	Export to TextMap	Export to CaseViewNet
Black Rectangle	(████)	( )	( )	( )	( )	( )	( )
Lines	(/////)	(/////)	( )	( )	( )	( )	(   )
White Space	( )	( )	( )	( )	( )	( )	( )
Xs	(XXXX)	(XXXX)	(XXXX)	(XXXX)	(XXXX)	(XXXX)	(XXXX)

[Compress Print](#), by default, shows redacted text as white space throughout the transcript with the exception of the initial and final pages. To have Compress Print use an alternative redacted text appearance throughout the transcript, choose the setting in Advanced Edit Options, *Redacted text displays as* option and in Compress Print, select the [Document](#) option and select the *Use the transcript's layout settings instead of these settings* option.

Assigning [keyboard commands](#) to Redaction Selection and Insert Redaction On and Insert Redaction Off format symbols allow you select and turn Redaction on and off from the keyboard.

**Example**

You have the following Social Security number in the transcript: 123-12-1234.

You surround 12-1234 with Redaction On//Off format symbols. The text prints as:

123-████

**Insert the Format Symbol**

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

**Insert into the Transcript**

1. Place the cursor immediately before the word or mark the block of text you want to redact.
2. Do one of the following:
  - Press **Shift + F4** to display the Format Symbol list. Select **Redaction On**. Press **Enter**. If the text was marked/highlighted, the Redaction Off format symbol is automatically inserted at the end of the marked text.
  - Press **Alt + s, d** (**Special Edit/Redact**).

## Reset Time

Use the Reset Time format symbol to restart the Elapsed timestamps to 00 hours, 00 minutes, 00 seconds. Case CATalyst resets the timestamps beginning on the following line where you insert the Reset Time format symbol and continues forward through the file. This may be useful when a new witness begins testifying and it is necessary to track the amount of time the witness testifies. This command does not affect Clock timestamps.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

#### Insert into the Transcript

1. Press **Alt + v, s, p (View/Show/Timestamps)** and select **Elapsed** to display timestamps in Elapsed format.
2. Position your cursor where you want to change the time.
3. Press **Shift +F4 (Edit/Insert/Insert Format Symbol)**. From the format symbol list, select **Reset Time**. The timestamps change beginning on the next line.

[Keyboard Map](#) Function: Insert Reset Time

## Right Margin Release

Use the Right Margin Release format symbol to force a word to the end of the previous line. This allows you to print additional characters beyond the right margin.

For example, during the final proof of the transcript, you make a change in the middle of page 45 that changes the page and line numbering for all the remaining text. This means you need to reprint the last 36 pages. Using the Right Margin Release format symbol, you may be able to fit an extra word on a line. The ability to "squeeze" a word on a line may restore the original page and line information for most of the remaining transcript. Instead of reprinting 36 pages, you may only need to reprint one or two pages.

Use the Print Preview function to ensure all the characters of the word fit in the printable portion of the margin.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

#### Insert into the Transcript

1. Position the cursor immediately before the word you want to force to the end of the previous line and press **F4 r**.
2. Preview the file. Press **Alt + f, v (File/Print Preview)**. To exit the Print Preview screen and return to Edit, press **Alt +c (Close)**.

## Resume Time

The Resume Time format symbol is available during realtime and is used to begin timestamps after the timestamps have been paused using the [Pause Time](#) format symbol. For example, let's say that you are reporting a videotaped deposition and the videographer needs to stop and replace the tape. You would need to pause the timestamps in Case CATalyst while the videographer changes the video tape. Once the videographer is ready to go back on the record, you use the Resume Time format symbol so the CATalyst timestamps and the videotape timestamps match.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert into the Transcript

1. Press **Shift + F4** or **F4,F4 (Edit/Insert/Insert Format Symbol)**. From the format symbol list, select **Resume Time**.

[Keyboard Map](#) Function: Insert Resume Time

## Scanstop Begin/End

Use the Scanstop Begin and End format symbols to indicate where you want to create a Scanstop and where the Scanstop should end. The text in between the format symbols is part of the Scanstop. You may want to use the Scanstop format symbols around text you want to review or modify later, such as "check spelling" and then set Case CATalyst to stop on Scanstop in [Scan For](#) options.

The Case CATalyst default color for Scanstops is different from the text. If necessary, you can [change](#) the default color. During Edit, when Case CATalyst moves to a Scanstop, pressing Enter, removes the Scanstop, leaving the text and changing the color back to the default text color.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert During Edit

Do one of the following:

- Position the cursor immediately to the left of where you want the Scanstop to begin and press **F4 O**, then move the cursor to the position where you want to end the Scanstop and press **F4 o**.
- Mark the text you want as a Scanstop and press **F4 O**. The Scanstop End format symbol automatically inserts at the end of the marked text.

## Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.

2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition.
4. At the location you want to begin the Scanstop, press **F4 O**.
5. Type the text you want to contain in the Scanstop. At the location you want to end the Scanstop, press **F4 o**. If appropriate, type any remaining text to complete the definition.
6. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Set Time

Use the Set Time format symbol to change Elapsed timestamps. You may want to use this format symbol when you need to synchronize timestamps with a videographer. When you insert the Set Time format symbol, Case CATalyst starts the timestamp beginning from the line where you insert the format symbol and continues forward through the file. To apply the time starting with a specific line, insert the Set Time format symbol at the beginning of the line. If you insert the Set Time format symbol in the middle of a line, the time begins with the next line. Case CATalyst only displays the time in Edit when Elapsed [format](#) is selected.

To print Elapsed timestamps, the Print Timestamps option must be set to Elapsed in the Draft or Final [Print Options](#), depending on your selection for printing.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table

### Insert into the Transcript

1. In Edit, press **Alt + v, s, p (View/Show/Timestamps)** and select **Elapsed** to display timestamps in Elapsed format.
2. Position your cursor at the beginning of the line where you want to change the time.
3. Press **Shift +F4 (Edit/Insert/Insert Format Symbol)**. From the format symbol list, select **Set Time**. The Set Time dialog box displays.
4. In the *Enter Time* field, highlight the hours, minutes, and seconds fields as necessary and adjust the time. You can type the new numbers, use the Up and Down arrow keys on your keyboard, or with the mouse, use the Up and Down arrow keys in the dialog box. To remove the format symbol, use [Reveal Codes](#) to locate and delete it.
5. Press **Enter (OK)**. The changed time displays on the screen.
6. Verify the Print Timestamps option is set to **Elapsed** in the Draft or Final [Print Options](#).

[Keyboard Map](#) Function: Insert Set Time

## Single Space On/Off

Use the Single Space On/Off format symbols to single space text in the job. When single spacing is On, Case CATalyst displays the screen in single spaced lines in Page View and half lines in Normal View. For example, in Normal View with Single Space on, the screen displays lines 1, 1 ½, 2, 2 ½, 3, 3 ½, etc. When you turn single spacing Off, Case CATalyst resumes transcript line numbering to whole numbers. For example, the cursor is on line 14 ½ and you insert the <Single Space Off> format symbol, F4 s. The next numbered transcript line is 15.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table

### Insert into the Transcript

Position the cursor on the line where you want single spacing to begin and press **F4 S**, then move the cursor where you want to end single spacing and press **F4 s**.

Use [Reveal Codes](#) to delete a Single Space On format symbol that is in the wrong location.

## Sticky Space

Use the Sticky Space to create a space between two words and keep the words together on the same line. Case CATalyst uses built in rules so it does not create an extra space in definitions such as Mr. <Sticky Space> but keeps the words together on the same line.

Sticky Space is similar to the Keep Together format symbol in Case CATalyst 3.x.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table

### Insert During Edit

Position the cursor immediately following the first word of the two words you want to keep together and press **F4 k**.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the word or steno you want to define. Use a Mark command to highlight multiple steno outlines.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text and then press **F4 k**. Type any additional text.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Strikeout On/Off

Use the Strikeout On/Off format symbols to strikeout marked text. Strikeout text has a line that appears through the middle of the words. Strikeout text displays on the Edit screen and prints with the strikeout.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table

### Insert During Edit

Do one of the following:

- Position the cursor immediately to the left of where you want the Strikeout to begin. Press **Shift + F4** and select **Strikeout On** from the Format Symbol list. Move the cursor to the position where you want to end the Strikeout. Press **Shift + F4** and select **Strikeout Off** from the Format Symbol list.
- Mark the text you want to Strikeout. Press **Shift + F4** and select **Strikeout On** from the Format Symbol list. Case CATalyst automatically inserts the Strikeout Off format symbol at the end of the marked text.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition.
4. At the location you want to begin the Strikeout, press **Alt + f** to display the Format Symbol list. Highlight **Strikeout On** and press **Enter**.
5. Type the text you want to Strikeout. At the location you want to stop the Strikeout, press **Alt + f** to display the Format Symbol list. Highlight **Strikeout Off** and press **Enter**.
6. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Subscript On/Off

Use the Subscript On/Off format symbols to print text in subscript format. Subscript text prints and displays on the screen slightly lower than the regular text. For example, you could have a dictionary definition for H<sub>2</sub>O.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table

### Insert During Edit

Do one of the following:

- Position the cursor immediately to the left of where you want the Subscript to begin and press **F4 Y**, then move the cursor where you want to end the Subscript and press **F4 y**.
- Mark the text you want to Subscript and press **F4 Y**. The Subscript Off format symbol automatically inserts at the end of the marked text.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition.
4. At the location you want to begin the Subscript, press **F4 Y**.
5. Type the text you want to Subscript. At the location you want to stop the Subscript, press **F4 y**. If appropriate, type any remaining text to complete the definition.
6. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Superscript On/Off

Use the Superscript On/Off format symbols to print text in superscript format. Superscript text prints and displays on the screen slightly higher than the regular text. For example, you could have a dictionary definition for CO<sub>2</sub>.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table

### Insert During Edit

Do one of the following:

- Position the cursor immediately to the left of where you want the Superscript to begin and press **F4 W**, then move the cursor to the position where you want to end the Superscript and press **F4 w**.
- Mark the text you want to Superscript and press **F4 W**. The Superscript Off format symbol is automatically inserted at the end of the marked text.

## Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition.
4. At the location you want to begin the Superscript, press **F4 W**.
5. Type the text you want to Superscript. At the location you want to stop the Superscript, press **F4 w**. If appropriate, type any remaining text to complete the definition.
6. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Tab

Use the Tab format symbol to move text to the next tab setting based on the page [layout](#) for the job.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table

### Insert During Edit

Press **Tab** to move the text to the next tab setting.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. At the position you want the Tab, press **F4 T**. If appropriate, type any remaining text to complete the definition.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

### Uncap Next

Use the Uncap Next format symbol to lower case the first letter of the following word. This command is most useful when capitalization is controlled by an embedded command, such as punctuation.

When the Uncap Next format symbol is used at the end of a definition, it prevents the capitalization of the first letter of the next word. For example, in the Personal Dictionary, there is a definition for "Mr. and Mrs." If the definition does not contain the Uncap Next format symbol after the period of "Mr.", the entry translates as "Mr. And Mrs." Including the Uncap Next format symbol as part of the definition for "Mr." (Mr. F4 F5), "and" translates in lowercase to produce "Mr. and Mrs."

Defining abbreviations containing multiple periods such as "a.m." do not require an Uncap Next format symbol after the last period to prevent capitalization of the next word. The Uncap Next format symbol is necessary at the end of the definition when defining abbreviations with a single period to prevent capitalization of the next word. For example, "etc." or "Corp."

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table

### Insert During Edit

Move the cursor to the beginning of the word you want to lower case and press **F4 F5**.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. At the position you want to uncap the next word, press **F4 F5**. If appropriate, type any remaining text to complete the definition.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Underline On/Off

Use the Underline On/Off format symbols to underline marked text. Underlined text displays on the Edit screen and prints underlined.

### Insert During Edit

Do one of the following:

- Position the cursor immediately to the left of where you want the Underline to begin and press **F4 U**, then move the cursor to the position where you want to end the Underline and press **F4 u**.
- Mark the text you want to Underline and press **F4 U**. The Underline Off format symbol is automatically inserted at the end of the marked text.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a [dictionary definition](#) type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition.
4. At the location you want to begin the Underline, press **F4 U**.
5. Type the text you want to underline. At the location you want to stop the Underline, press **F4 u**. If appropriate, type any remaining text to complete the definition.
6. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## User Defined Paragraph

A User Defined Paragraph style is often used for special paragraph formatting within a transcript. For example, often times when material is quoted from another document, the text is indented and surrounded by quotes. You might set up a User Defined Paragraph so you can easily format the quoted material. The quotes and formatting would be a part of the paragraph style. Use the User Defined Paragraph format symbol to insert a User Defined Paragraph Style when no other style, such as Question, Answer, or Colloquy applies. Insert the User Defined Paragraph format symbol in Edit or make it part of a dictionary definition.

The User Defined paragraph information set in the applied [layout](#) affects the formatting values which determine how the User Defined Paragraph text displays in Edit. You can customize these values in the Layout function.

While editing, you can change a current paragraph to a User Defined Paragraph Style by selecting Format/Modify Current Paragraph (**Alt + o, p**) and then choose the User Defined Paragraph Style you want.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table

### Insert During Edit

1. Position the cursor before the word where you want to insert User Defined Paragraph Style and press **F4 e**. The Set User Defined dialog box displays.
2. In the Enter Value field, type the number of the User Defined Style you want to apply.
3. Press **Enter (OK)**.

### Create a Dictionary Definition While Editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. At the location you want to insert the User Defined Paragraph, press **F4 e**. The Set User Defined dialog box displays. Type the number of the User Defined Paragraph style and press **Enter (OK)**. If appropriate, type any remaining text to complete the definition.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Tools and Options

The Tools menu in Case CATalyst provides access to audio playback options, when audio is available; Edit options; recording and managing macros; keyboard customizations; and several features that assist you in managing the post editing tasks of your transcript such as Spell Check and creating an index.

### Audio

Recording audio during realtime is available using the AudioSync option. During audio recording, the audio file is synchronized with the realtime transcript and is available for playback in Edit. You may want to use the [Auto Pause Audio](#) feature to pause the audio when no new steno is being sent.

[Play Audio](#) plays the synchronized audio file from the cursor location in the transcript file. Once you invoke the Play Audio command, the audio file plays until you invoke the [Stop Audio](#) command. You can also [suspend the playback](#) of audio when you open a dialog box and then resume the playback with the dialog box closes. [Play Audio with Scroll Text](#) allows Case CATalyst to scroll through the synchronized playback of the audio track and corresponding text. Additional audio commands include:

- [Set Audio Delay](#)
- [Associate Audio File](#)
- [EZ Sync](#)
- [EZ Sync at Cursor](#)

### Play Audio

Play Audio is an Edit command that plays the synchronized audio file from the cursor location. The audio file synchronizes with the text during realtime writing. You can position your cursor anywhere in the file and playback the audio file from that location. Once you invoke the Play Audio command, the audio file plays until you invoke the Stop Audio command. If the [Advanced Edit Option, Stop audio when dialog opens](#), is active, the audio pauses when a dialog box opens and automatically resumes when the dialog box closes. You can playback the audio during realtime without pausing AudioSync. For volume control during audio playback, refer to your Windows documentation.

Playback speed is adjustable on the Audio Playback Speed toolbar. You can also assign keys to increase and decrease the audio playback speed using the Increase Audio Playback Speed and Decrease Audio Playback Speed assignments in a [keyboard map](#).

Dead air may result when there is a pause in the conversation or proceedings. It may be noticeable when a longer silence occurs without the pausing the audio, either automatically or manually. Use the *Skip Quiet Audio* option in the Audio Playback Speed dialog to adjust the amount of dead air that plays back.

If you re-translate a file with audio, Case CATalyst retains the audio synchronization. The synchronization may not be as accurate as the original translation.

[Keyboard Map](#) Function: Play Audio

Pause Audio

Increase Audio Playback Speed

Decrease Audio Playback Speed

## Play Audio

To start the playback of the synchronized audio file:

1. Move the cursor to the location in the job where you want to begin the playback.
2. Press **Shift + F9 (Tools/Audio/Play Audio)**. The Audio Playback Speed toolbar displays.

### Horizontal Bar

Use the mouse cursor to adjust the play back speed. Moving the indicator to the left slows the speed; to the right increases the speed. You can also create key assignments to increase and decrease the audio playback speed using the Increase Audio Playback Speed and Decrease Audio Playback Speed commands in a [keyboard map](#).

### Skip Quiet Audio

Use the mouse cursor to determine the level of noise that is considered dead air during playback. This does not affect volume level. Move the indicator up to indicate a lot of background noise is considered silence. You might use a higher vertical setting when a lot of background noise occurs during the recording but no one was speaking. Move the indicator down when little background noise occurs during the recording. **If you feel the audio is "skipping" during playback, adjust vertical bar lower.**

### Normal Speed

Reset the audio playback speed to the original speed setting. A "Set Normal Audio Speed" keyboard function is available in the keyboard map.

3. When finished press **Ctrl + F9 (Tools/Stop Audio)** to stop the audio playback.

## Play Audio Error Messages

The following messages may display when you invoke Play Audio:

### "No Audio information available for this text"

This usually results from pausing and never resuming the audio recording during realtime writing. It can also result from deleting the underlying steno for that portion of the text using Steno Delete command.

### "no Audio"

There is no associated Audio subfile for the current job. This is not a realtime job, you re-translated the job, or you did not use AudioSync in this realtime job.

### Audio File Path dialog box displays

Play Audio will first look for the audio file in the location where the audio was recorded and if found, will automatically play the audio. If the audio file in the transcript file information doesn't match the current transcript name but there is an audio file with the correct name in the same folder as the current job, CATalyst will automatically link the audio and start audio playback. If still not found, CATalyst will look for an audio file with the same name as the job in the same user folder and then automatically link the audio file and start audio playback. If the audio file still cannot be located, the Choose Audio File dialog box displays allowing you to select the audio file and link it to the transcript and begin audio playback.

If prompted, click the Browse button to search for and select the audio file or type the path for the new location or new name of the Audio subfile and press **Enter** to begin the playback.

## Play Audio with Scroll Text

Play Audio with Scroll Text is an Edit feature that combines the [Play Audio](#) feature with the [Scroll Text](#) feature, allowing Case CATalyst to scroll through the synchronized playback of the audio track and corresponding text.

## Play Audio While Scrolling Text

1. Press **Alt + t, a, x (Tools/Audio/Play Audio with Scroll Text)**. The Audio Playback Speed dialog box displays as the audio and scroll text begins.

You can increase or decrease the playback speed by moving the Playback Speed indicator with the mouse pointer or using assigned keyboard commands in a keyboard map.

## Stop Audio

The Stop Audio feature stops the audio playback. To stop the playback, press **Ctrl + F9**

**(Tools/Audio/Stop Audio)** or, if the Edit toolbar is showing, click the Stop Audio  icon. You can also set CATalyst to automatically [suspend the audio playback](#) with a dialog box opens. When the dialog box closes, the audio will resume playing.

[Keyboard Map](#) Function: Stop Audio

## Set Audio Delay

Set Audio Delay is an Edit feature used to hear the context of the transcript a few seconds before the actual cursor position or used to adjust the synchronization between the cursor location in the job and the playback of the audio file. When you invoke the Play Audio command, Case CATalyst checks the Audio Delay value before playing the associated audio. These settings affect both regular CATalyst translation and CATalyst BCS captioning.

Audio capabilities are only available on systems that have the optional AudioSync software.

## Adjust Audio Values

1. In Edit, press **Alt + t, o, u** (**Tools/Options/Set Audio Delay**). The Set Audio Delay dialog box displays.
2. Review the Current delay setting. Make a change to the setting by typing a new setting number in the New delay field. The maximum number of seconds is 99.
3. Press **Enter (OK)** to accept the changes.

## EZ Sync at Cursor

EZ Sync at Cursor feature may be an alternative to using the [EZ Sync](#) feature. When attempting to synchronize the audio playback of an associated audio file (not the realtime file's audio file), you can play the audio and while the audio is playing, position your cursor anywhere in the file. When you hear the audio playback for that portion of the file, use the EZ Sync at Cursor command. The EZ Sync at Cursor command is available from the Tools and then Audio menu.

1. Open the transcript and [associate the audio](#), if not already done.
2. Position your cursor anywhere in the file and play the audio.
3. When you hear the audio playback for the portion of the file at the cursor location, select Tools, Audio and then EZ Sync at Cursor.

[Keyboard Map](#) function: EZ Sync at Cursor

## Associate Audio File

Associate Audio File allows you to associate an audio file (.wav) after translation that was not simultaneously recorded with the current transcript but contains timestamps. For example, you are on a job without your notebook. To record the job, you use your digital tape recorder which creates .wav files. You copy the .wav file to your computer, read your steno notes and translate the file. After translation, you use the Associate Audio File to associate the .wav file with the transcript. Once the .wav file is associated with the transcript, you can use the [Play Audio](#), [EZ Sync at Cursor](#), [Stop Audio](#) and Set Audio Delay features.

## Associate a .wav File

1. Press **Alt + t, a, f** (**Tool/Audio/Associate Audio File**). The Choose Audio File dialog box displays.
2. Select the .wav file and press **Enter (Open)**.
3. At the *Was this audio file recorded using Case CATalyst* prompt, do one of the following:
  - If the audio was simultaneously recorded in Case CATalyst with the current transcript, before using the Associate Audio feature, you may want to make sure the audio file has the same name as the transcript and is located in the same folder. Then, just click Play Audio and the audio should play without using the Associate Audio file. If that solution does not work for you, you can use the Associate Audio command and select Yes at the prompt.
  - Select No if the audio recording is from a source other than Case CATalyst..

If you select to associate audio with a file that already has an audio file associated with it, Case CATalyst displays the message: "The file *file name.WAV* is already associated with this transcript. Are you sure you want to associate a new audio file with this transcript?" Select Yes to associate the new audio or No to Cancel and retain the audio already associated with the file.

4. Use [EZ Sync at Cursor](#) or [EZ Sync](#) to adjust the synchronization if necessary.

## EZ Sync

Use the EZ Sync feature to enhance the synchronization of an audio (wav) file [associated](#) with a text file after translation. You may need to repeat the EZ Sync synchronization multiple times throughout the job as you are editing. You can also try the [EZ Sync at Cursor](#) command as an alternative to EZ Sync. The [Set Audio Delay](#) option also affects the audio playback context.

## Enhance Synchronization of a .wav File

1. In Edit, press **Alt + t, a, z** (**Tools/Audio/EZ Sync**). The EZ Sync dialog box displays.
2. Use the options as necessary:

### Audio is playing earlier than the text at the cursor position

Select this option if the audio is playing significantly in front of your current cursor location in the text, click the left arrow.

### Audio is playing later than the text at the cursor position

Check this option if the audio is playing significantly behind your current cursor location in the text, click the right arrow.

### Move the audio by

Use the spin arrows or type the number of minutes and seconds you want to move the audio so the playback is more synchronized with the text at the cursor location.

### The current time difference

Displays the current time difference between the timestamp of the audio playback and the timestamp at the cursor location.

### The new time difference

Displays the current adjustment to the time difference.

3. Press **Enter (OK)** when finished. To clear the synchronization changes, open EZ Sync and select **Reset**.

[Keyboard Map](#) Function: EZ Sync

## Attachments

The Attachment feature allows you to attach an electronic form of a file to an exhibit. For example, one of the exhibits offered is a picture of the accident scene. When the exhibit is offered, marked and received into evidence, you can have that electronic version of the picture available for viewing in an electronic version of the transcript. That allows the reader to be able to double click the attachment and see the electronic document. An electronic version of the transcript might be a PDF (portable document format) or XMEF (TextMap compatible) file. Electronic versions of the transcript eliminate carrying bulky documents.

The Attachments feature also provides the ability to automatically link exhibit references to multiple references in the transcript using exhibit aliases. The aliases feature allows for varied wording throughout the transcript that is made to the same exhibit. For example, during the proceedings, Deposition Exhibit Number 43 was marked for identification. Throughout the transcript, there are several references to the exhibit but they are not always referenced as Deposition Exhibit Number 43. In various occurrences the exhibit was referred to as Exhibit 43, Deposition Exhibit 43 and Deposition 43. You can [manually link exhibits](#) or use the [Autolink](#) feature. By default, the *Autolink after selecting attachment* option is active when you select the attachment, Case CATalyst automatically associates the other references with the same attachment based on the existing aliases, Deposition Exhibit, Exhibit and Deposition in your [Autolink Options](#).

When you use the [Export to TextMap](#) feature to export the transcript in LexisNexis® TextMap® Evidence format (.xmef), the transcript attachments are retained. Although [LexisNexis TextMap Exhibit Linker](#) also uses aliases and automatically creates hyperlinks for each exhibit reference, you can use the Case CATalyst Autolink feature to create additional exhibit aliases. You can also print the transcript to [PDF](#) and include attachments.

Autolink automatically inserts an Attachment Point format symbol when one does not exist next to the exhibit number. To effectively use Autolink, ensure the position of existing Attachment Point format symbols in exhibit Include files or dictionary entries immediately follow the exhibit number or placeholder text. You may want to consider removing the Attachment Point format symbols from your Include files and simply allow Autolink to insert it.

[Keyboard Map](#) Function: Autolink Exhibits

Autolink Exhibits Options

Manual Link

Remove Link

## Autolink Exhibits

Autolink Exhibits, one of the [Attachments](#) features, allows you to automatically link exhibit attachments to multiple references in the transcript using exhibit aliases. The aliases allow for varied wording throughout the transcript that is made to the same exhibit.

Once you fill in the exhibit number and position the cursor immediately following the exhibit number for the first occurrence, select [Autolink Exhibits](#). Case CATalyst automatically inserts the Attachment Point format symbol and displays the Open dialog box where you select the attachment. If the option [Autolink after selecting attachment](#) is active when you select the attachment, Case CATalyst automatically associates the other references with the same attachment based on the existing aliases in your [Autolink Options](#). The Autolink Exhibits dialog displays after making the attachment. You can review the links and choose to remove any if necessary. By default, the option *Autolink after selecting attachment* is active.

## Using Autolink Exhibits

1. Replace the placeholder text for the exhibit number or type the exhibit number. For example, you use a # as the placeholder text for the exhibit number. You replace the pound sign for your included parenthetical with the exhibit number 58.

*Exhibit Number # was marked for identification.*

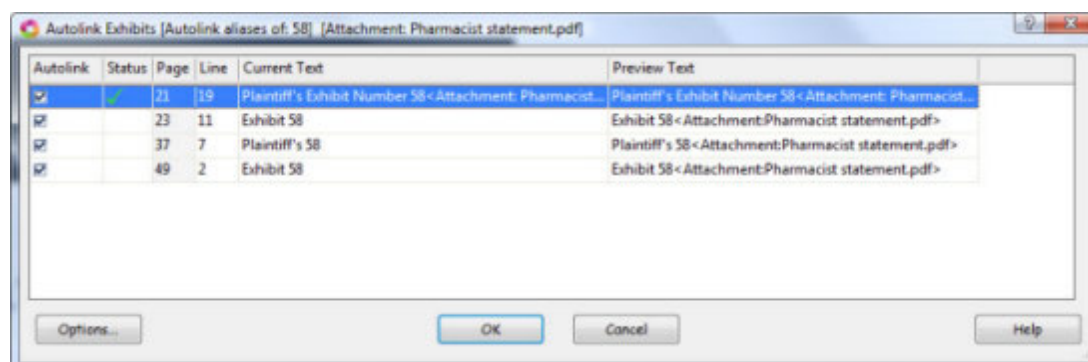

*Exhibit Number 58 was marked for identification.*

2. Position the cursor immediately after the exhibit number and select **Autolink Exhibits**. Case CATalyst automatically inserts the Attachment Point format symbol at the beginning of the associated text., if one does not already exist. For example:

 *Exhibit Number 58 was marked for identification.*

3. The Open dialog box displays. Navigate to the necessary location, select the attachment and press **Enter (Open)**. The Autolink Exhibits dialog box displays once you select the attachment.

When you make the attachment and the option [Autolink after selecting attachment](#) is active, Case CATalyst automatically associates the other references with the same attachment based on the existing aliases in your [Autolink Options](#). A message displays if no Autolink alias exists and prompts you to continue or cancel. Select Yes to continue and open the Autolink Exhibits dialog box. Select No to cancel the process.

4. The Autolink Exhibits dialog box shows linked exhibits. To verify an exhibit occurrence, double click an entry to move the cursor to that location in the transcript. The Autolink Exhibits dialog box remains open.

Review the Auto Exhibit dialog box information and make changes as necessary:

### Autolink

A check mark displays in the box to indicate the item is Autolinked once you click OK. To remove an item from Autolink, click the box to remove the check mark.

### Status

The current status of the item shows one of three icons.

The item is Autolinked.

There is a conflict with the attachment. For example, you attempt to Autolink an attachment that is different from one already Autolinked to the same exhibit number.

The entry cannot be Autolinked. This can occur if you attempt to Autolink text that is partially Autolinked to another attachment.

### Current Text

How the item currently displays in the transcript. You can view the attachment name from the transcript using [Reveal Codes](#).

### Preview Text

The Autolinked text.

### Options

Displays the [Autolink Options](#) dialog box where you can add, delete, import and export Autolink aliases. If you make and accept alias changes, Case CATalyst reloads the data in the Autolink Exhibit dialog box. Any changes previously made in the Autolink Exhibit dialog box are lost.

5. Press **Enter (OK)** to confirm the Autolinked exhibits. All Autolinked exhibits are surrounded by <Attachment Text Begin> and <Attachment Text End> format symbols.

To cancel the process, click **Cancel**.

[Keyboard Map](#) Function: Autolink Exhibits

## Manually Link Exhibits

Manual Link, one of the [Attachments](#) features, allows you to manually link an exhibit when an appropriate alias does not exist or an exhibit is referred to for one occurrence that you do not want to [Autolink](#). For example, the transcript contains "State's Exhibit No. 95 is marked for identification." There is an alias for "State's Exhibit" but later in the transcript the attorney refers to the exhibit as "95" in the statement, "I now show you 95, can you describe it for me." You do not want to Autolink only to the number "95". In another example, you want link a photo to the witness name for the first occurrence of the name only. The witness name does not have an alias and you want to only associate the photo with the first occurrence of the name.

You can print a [transcript containing attachments](#) (electronic files) to PDF. In the [Print](#) or [Finish 'em](#) dialog box, select to include attachments. You can also export a transcript to [TextMap](#) and any attachments are included with the exported file.

## Manually Link an Attachment

1. Position the cursor after the exhibit number. Using the above example, you would position the cursor after "95."
2. Insert an Attachment Point format symbol, if one does not currently follow the exhibit number. Press **Shift + F4**, (**Edit/Insert/Insert Format Symbols**), select **Attachment Point** and press **Enter**.
3. Double click the Attachment Point icon. The Open dialog box displays.
4. Select the attachment and press **Enter**.
5. Do one of the following:
  - If the Advanced Edit option [Autolink after selecting attachment](#) is active, the *following* message displays, *The selected text does not contain an autolink alias: want to autolink anyway?* If you only want to link this one occurrence, select **No**. If you want to create an Autolink for all occurrences, select **Yes**. By default, the option, *Autolink after selecting attachment*, is active. Case CATalyst automatically inserts the Attachment Point format symbol at the beginning of the associated text., if one does not already exist.
  - If the Advanced Edit option, *Autolink after selecting attachment*, is set to No, position the cursor immediately after the exhibit number and press **Alt + t, h, m** (**Tools, Attachment, Manual Link**). Using the above example, you would highlight "95."

The current exhibit is surrounded by &ltAttachment Text Begin> and &ltAttachment Text End> format symbols.

If you attempt to link text with an empty Attachment Point format symbol or no Attachment Point format symbol, a message displays prompting you to associate an attachment with the text. Click **OK** to close the message and repeat the steps to manually link.

[Keyboard Map](#) Function: Manual Link

## Remove Autolink

Remove Link, one of the [Attachments](#) features, allows you to manually remove an Autolink at one location.

1. Position your cursor anywhere in the linked text.
2. Press **Alt + t, h, r** (**Tools, Attachment, Remove Link**). The &ltAttachment Text Begin> and &ltAttachment Text End> format symbols that surrounded the text and the attachment are deleted from Reveal Codes.

[Keyboard Map](#) Function: Remove Link

## Autolink Options

Autolink options are part of the [Attachments](#) feature. These options allow you to create a new alias or delete an existing alias used by the [Autolink Exhibits](#) feature. A set of preset aliases are provided. Autolink recognizes any alphanumeric string that includes digits and capped letters for exhibit labels.

If you access Autolink Options from the Auto Exhibits dialog box while creating an Autolink and make alias changes, Case CATalyst reloads the data in the Autolink Exhibit dialog box. Any changes made in the Autolink Exhibit dialog box are lost and it is necessary to redo them.

Access Autolink options from Edit. Select **Alt + t, h, o (Tools/Attachments/Autolink Options)**

### Manage Aliases

Use the options as necessary. Press **Enter (OK)** when finished.

Click the **New** icon to create a new Autolink alias. A blank entry displays. Type the new alias and press **Enter**.

Highlight an existing alias and click the **Delete** icon to remove the alias from the list.

Highlight an existing alias and click the **Move Up** icon to move the entry higher in the list. Highlight an existing alias and click the **Move Down** icon to move the entry lower in the list. Although the order in which entries appear in the list have no effect on the Autolink functionality, you may want to position the most common used aliases at the top for viewing ease.

### Import

Import a list of Autolink aliases from a .txt file. For example, you want to use aliases from Exhibit Linker or similar litigation software. Export the list of exhibit aliases from that software to a .txt file. The import the list.

### Export

Export the current list of Autolink aliases to a .txt file for sharing with another reporter or scopist or imported into Exhibit Linker or similar litigation software.

[Keyboard Map](#) Function: Autolink Exhibits Options

## Change Job Dictionary

Change Job Dictionary is Translate & Edit and Edit feature that allows you to change the job dictionary to which you send J-Defines. The default job dictionary for each job is the job dictionary of the same name as the job. When you select to change the job dictionary, all job dictionary defines during for the current job you are editing are sent to the chosen dictionary. The dictionary remains the same until you change your selection again using the Change Job Dictionary feature.

You can place a define into another dictionary without changing the default job dictionary assignment. When defining, select a different dictionary in the Pick Other Dictionary field of the [Global](#) dialog box.

### Change Job Dictionary While Editing:

1. Press **Alt + t, g (Tools/Change Job Dictionary)**. The Change Job Dictionary dialog box displays with current job dictionary name in the File name field.
2. Select a dictionary from the list. The name displays in the File name field.  
If you want to select a dictionary from another user, first change to that user in the Look In field.
3. Press **Enter (Open)**.

## Change Keyboard Map

Change Keyboard Maps is an Edit function that allows you to switch the [Keyboard Map](#), permitting you to use different keyboard commands. When you start a Case CATalyst session and open Edit, the Default keyboard map is active. The name of the active keyboard map displays on the Status bar at the bottom of the screen.

To change keyboard maps, press **Alt + t, y, y (Tools/Keyboard Customization/Change Keyboard Map)**. The Keyboard Map submenu displays the keyboard maps available in your user name. From the Keyboard Map menu, select a Keyboard map. The selection displays on the Status bar. You can also click the keyboard map on the Status bar to display a list of available keyboard maps from which you can choose. Optionally, you can press \ (backslash) (**Tools/Cycle Keyboard Maps**) to cycle through the available keyboard maps.

If you always want Edit to open with a specific keyboard map active, you can set the Keyboard Map Options in the [Advanced Edit options](#).

## Cycle Keyboard Maps

Cycle Keyboard Maps in Edit allows you to switch the active [Keyboard Map](#), permitting you to use different keyboard commands while working in Edit. When you start a Case CATalyst session and open Edit, the Default keyboard map is active. You can use [Advanced Edit Options](#) to change which keyboard map defaults to active when Edit opens. The name of the active keyboard map displays on the Status bar at the bottom of the screen.

To change keyboard map while working in Edit, press \ (backslash) (**Tools/Cycle Keyboard Maps**). You can continue to press \ and cycle through all the available keyboard maps in your user name.

## Set Custom Keyboard for Edit

Keyboard Map Options allow you to select the [keyboard map](#) that displays when starting translation and/or editing. For example, you modify the Default keyboard map to have key assignments you want when editing. In the Keyboard Map function you save the keyboard map as Sally's keyboard map. In the Advanced Edit options in the Keyboard Map Options section, you can select Sally's keyboard map. Every time you translate or edit a file, Sally's keyboard map will be the active keyboard map.

This Help topic only covers the Keyboard Map options. For more information on the additional options available, see the [Advanced Edit Options](#) topic.

### Keyboard Map Options

#### Default Keyboard map

Select the [keyboard map](#) that is active when Translate and Edit and Edit starts. Case CATalyst comes with the Default and CAT4 keyboard maps located in your System Files case. The Default keyboard map is not initially visible in the System Files case until it is opened by typing *default* in the File name field. You can create multiple keyboard maps.

The default setting uses the Case CATalyst Default keyboard map. Choose a keyboard map from the drop down list which displays customized keyboard maps located in your User System Files case. Use the Browse button to locate a keyboard map in outside your System Files case. For example, you are a scopist and work for six reporters. You use a customized a keyboard map, named MY KBD and want it active in every user. You open the Advanced Edit Options for each user and select the MY KBD keyboard map using the Browse button. When you make a change to the keyboard map, the change is available in all users.

### **Additionally Display Keyboard Maps located in**

Select a keyboard map outside of your System Files case to add to the list of available keyboard maps while Editing. Available keyboard maps are accessible when using the *Change Keyboard Map* command and when you click the current keyboard map name on the Status bar in Edit.

Use the Browse button to add keyboard maps located outside of your System Files case. The path for the selected keyboard map displays in the field. For example, you have multiple users on your system. In your user name, you have several specialty keyboard maps and want them readily available when editing in your other users. Select your user System Files case as the location of the keyboard maps. The Keyboard Maps list display.

### **Keyboard to open when assigning recorded macros**

When saving a recorded [macro](#) and the *Assign to key in keyboard map* option is active, you are immediately prompted to select a keyboard map for the macro's key combination assignment. If you always assign macros to the same keyboard map, you can designate a keyboard map to automatically open.

Choose a keyboard map from the drop down list which contains customized keyboard maps located in your System Files case. Use the **Browse** button to locate a keyboard map outside of your System Files case. For example, you have multiple user on your system and want to select a keyboard map from another user.

## **Concordance Index**

A concordance, or "all-word" index is a list of every word in one or several transcripts organized by page and line number. The Build Concordance Index feature creates a concordance index using an [exclude list](#) to prevent including common words in the index. In addition to the Exclude list, the Build Concordance Index feature contains a [phrase list](#) which contains specific phrases you want to in the concordance index. You can modify both the Exclude and Phrase lists.

The Build Concordance Index reports capped and lower case words separately. If the same word occurs in the transcript in different cases, the report includes the upper most cased version and the mixed or lower case version. For example, McMillan appears in the transcript three different ways; MCMILLAN, McMillan and McMILLAN. The concordance index reports MCMILLAN and McMillan. Acronyms also report separately when they appear in the transcript with and without periods. For example, the transcript contains IBM and I.B.M. Case CATalyst reports both occurrences.

Depending on the option selected, Case CATalyst creates the concordance index in a new section at the end of the file or in a new file. When creating the concordance index within the same file, you can select continuous numbering for the index or restart the numbering. You can also select to use a specific page layout to change the headers and footers on the concordance index. Concordance index pages print in full page format when printing in Compress print.

When creating a concordance index in a new file, current field values are automatically copied to the new file. This applies to a concordance index generated for a single transcript only.

Each user can determine their own layout of the index setting margins, box thickness and other options. You can also modify certain properties of the concordance index after building it. Use the [Concordance Index Properties](#) feature to make changes to columns and margins. To remove a concordance index, use the [Delete Concordance Index](#) feature instead of Undo.

Case CATalyst Version 5.x is not able to view a concordance index built in Case CATalyst Version 6.x and above. If you need to send a Version 6.x or above file with a concordance index to Version 5.x, delete the concordance index and rebuild it in Version 5.x.

## Build a Concordance Index

1. In Edit, open the file for which you want to create a concordance index.
2. Press **Alt + t, r, u** (**Tools/Concordance Index/Build Concordance Index**). The Concordance Index Options dialog box displays.
3. Make necessary entries.

### Concordance Format

#### Columns

Indicates the number of columns or vertical rows of indexed words that appear in the concordance index.

#### Box Thickness

Indicates the thickness of the line between columns. The lower the number, the thinner the line.

#### First Line Indent

Indicates the amount of space, measured in inches, from the edge of the column border to the first character of the indexed word.

#### Other Line Indent

Indicates the amount of space, measured in inches, from the edge of the column border to the first character of lines listing the occurrences of the indexed word.

#### Internal Margin

Indicates the amount of space, measure in inches, for the right margin within the border.

### More Options

Displays a dialog box which allows you to select to set specific information for building the concordance index. Click the radio button next to the item and check Include to include the item in the concordance index. Uncheck the box to exclude the item from the index. Options selected apply to all files included in building the concordance index.

#### Compress Occurrences

Check this box to reduce the amount of line space in a concordance index entry. For example:

Pappas [3] 13:2, 13:7, 13:24

Pappas [3] 13:2, 7, 27 (compressed)

#### Concordance Items

### Section Header

Click the radio button and check the box **Include** to include the section header where the word occurs. To set the Font attributes, click **Font**. Make entries in the Font dialog box and then press **Enter (OK)**.

Uncheck the box to exclude the section header from the concordance index.

### Word

Words are always included in the concordance index. You cannot exclude the Word item.

### Occurrence Count

Click the radio button and check the box **Include** to include the occurrence count. Occurrence count indicates the number of times the word occurs in the job. To set the Font attributes, click **Font**. Make entries in the Font dialog box and then press **Enter (OK)**.

Uncheck the box to exclude the occurrence count from the concordance index.

### Section

Click the radio button and check the box **Include** to include the section number where the word occurs. In the Number Format field, select a display format. Font is not available for the Section item.

Uncheck the box to exclude the section number from the concordance index.

### Page

Click the radio button and check the box **Include** to include the page numbers on which the word occurs. In the Number Format field, select a display format. To set the Font attributes, click **Font**. Make entries in the Font dialog box and then press **Enter (OK)**.

Uncheck the box to exclude page numbers from the concordance index.

### Line

Click the radio button and check the box **Include** to include the line numbers where the word occurs. In the Number Format field, select a display format. Font is not available for the Line item.

Uncheck the box to exclude line numbers from the concordance index.

### Timestamp

Click the radio button and check the box **Include** to include the timestamp for the line on which the word occurs. In the Number Format field, select a display format. To set the Font attributes, click **Font**. Make entries in the Font dialog box and then press **Enter (OK)**.

Uncheck the box to exclude timestamps from the concordance index.

### Include

Click the radio button for the item you want to include in the concordance index and then check Include. Uncheck this box to exclude the item from the index.

### Font

You can select specific fonts and font styles for certain transcript elements on the compressed transcript. Click the radio button for the item you want to include in the concordance index, check **Include** and select **Font**. The Font dialog box displays.

### Paper Margins

Adjust the page margins for the concordance index as necessary by modifying any of the following values: **Left, Right, Top, and Bottom**. The number is a measurement taken from the edge of the paper in inches. It is typed in decimals. A setting of .75 is  $\frac{3}{4}$  of an inch; 1.25 is  $1\frac{1}{4}$  inches.

### Use Headers From Layout

Check this box to include headers in the concordance index. The Select Layout to Use dialog box displays. If Use Headers is already selected, click **Browse**. Select the layout which contains the headers you want to use and press **Enter (Open)**.

### Layout Path

The location of the layout to which you are applying headers to the concordance index. This field is only active when you select Use Headers.

### Sources and Ranges

The window displays with the current file name. Files displayed in the window are used to build the concordance index.

#### Add Files

Display the Select Files dialog box where you can add additional files for building the concordance index. Check the box next to each file you want add to the concordance index. Checking the box next to a Case name selects all the files in the case. When finished selecting files, press **Enter (OK)**. The Select Files dialog box closes and the files display in the Sources and Ranges window.

Numeric volume names, such as Vol. 1, are automatically assigned to each file in the order you select them. You can change the volume description using the *Volume* field.

#### Remove Files

Highlight the file in the Sources and Ranges field you want do not want to include in the concordance index and select **Remove File**.

#### Volume

The volume description for the highlighted file in the Sources and Ranges window. Type any necessary changes. The volume description displays before the reference number on the concordance index to indicate the volume where the word or phrase is located.

### Ranges

The following options determine the range of pages you want to include in the concordance index. If you are creating a concordance of multiple files, any options selected apply to all files. For example, if you select to skip the first three pages, then the first three pages are excluded for all selected transcripts.

#### Entire Document

Create a concordance index from the entire document.

#### Skip First

Exclude specific pages at the beginning of the job from the concordance index. Type the number of beginning pages to exclude in the field. For example, the first three pages of the transcript is the title page, appearance page and index page. You want to exclude words from those pages in the concordance index. Type 3.

### **And Last**

Exclude specific pages at the end of the job from the concordance index. Type the number of ending pages to exclude in the field. For example, the last two pages of the transcript is the certificate page and errata sheet. You want to exclude words from those pages in the concordance index. Type 2.

### **Section**

Create a concordance index for a section. Select a section from the drop down list. To print specific pages within a section, use the Pages field.

### **Pages**

Create a concordance index for specific pages in the file. Do **one** of the following:

#### **Index individual pages**

Type the page numbers separated by a comma. For example, to print page 5 and page 25, type: 5, 25

#### **Index a series of pages**

Type the beginning page number, followed by a hyphen, and then followed by the ending page number. For example, to print page 5 through 10, type: 5-10

#### **Index a combination of individual and consecutive pages**

Type the individual page number separated by a comma, and then beginning page numbers for the consecutive pages, followed by a hyphen, and then the ending page number and all separated by commas. For example, to include page 5, pages 15 through 20, and page 29, type the following: 5, 15-20, 29

#### **Index pages within a section**

Type the section number followed by the page range. For example, to print pages 25-40 in section two, type: 2:25-40.

### **Misc**

#### **Create in new file**

Check this box to create the concordance index in a new file.

#### **Restart Page Number in Concordance Index**

Check this box when creating the concordance index in the same file as the job and you want to restart page numbering. Case CATalyst places the index in a new section at the end of the job.

### **Exclude List**

Display the [Exclude list](#) in Notepad which contains words you do not want to report in the concordance index. You can modify the list.

### **Phrase List**

Display the [Phrase list](#) in Notepad to which you can add phrases from the transcript you want to report in the concordance index.

4. Press **Enter (OK)**. Case CATalyst builds the concordance index.

Build Concordance Index

## Concordance Index Properties

Use [Concordance Index](#) Properties to modify margins and other user preferences for an existing concordance index within Case CATalyst. Case CATalyst retains settings for each user.

### Modify Properties of an Existing Concordance Index

1. In Edit, open the file in which you want to modify the concordance index.
2. Press **Alt + t, r, r (Tools/Concordance Index/Concordance Index Properties)**. The Concordance Index Options dialog box displays. The Concordance Index Properties feature is only available when a concordance index exists in the file.
3. Type new values in the fields as necessary.

#### Concordance Format

##### Columns

Indicates the number of columns or vertical rows of indexed words that appear in the Index.

##### Box Thickness

Indicates the thickness of the line between columns. The lower the number, the thinner the line.

##### First Line Indent

Indicates the amount of space, measured in inches, from the edge of the column border to the first character of the indexed word.

##### Other Line Indent

Indicates the amount of space, measured in inches, from the edge of the column border to the first character of lines listing the occurrences of the indexed word.

##### Internal Margin

Indicates the amount of space, measure in inches, for the right margin within the border.

#### Paper Margins

Adjust the page margins for the concordance index as necessary by modifying any of the following values: **Left, Right, Top, and Bottom**. The number is a measurement taken from the edge of the paper in inches. It is typed in decimals. A setting of .75 is  $\frac{3}{4}$  of an inch; 1.25 is  $1\frac{1}{4}$  inches.

#### Exclude List

Display the [Exclude list](#) in Notepad which contains words you do not want to report in the concordance index. You can modify the list.

### Phrase List

Display the [Phrase list](#) in Notepad to which you can add phrases from the transcript you want to report in the concordance index.

4. Press **Enter (OK)**. The settings remain, for the current user, until changed.

## Print Concordance Index

When creating a concordance index within the job Case CATalyst places the index at the end of the transcript file. Depending on the option selected, Case CATalyst inserts the index into a new section which begins with Section x, Page 1 or places it at the end of the last page in the last section with continuous numbering. You can print the concordance index of the transcript file, by selecting the section number and, if appropriate, the page numbers as the print Range in the [Print](#) dialog box.

You can print headers on the transcript pages while turning headers off on the concordance index. Disable [page headers](#) in Compress Print to turn concordance index headers Off. Disabling headers in Compress Print turns headers Off when printing the concordance index and a Compress Print file.

Concordance index pages print in full page format when printing in Compress print.

## Print a Concordance Index

1. From anywhere in Case CATalyst, press **Alt + u, p (Function/Print)**. The Print dialog box displays.
2. Highlight the transcript file which contains the concordance index you want to print.
3. In the Output field, select the printer you want to use, **Draft** or **Final**. Set [printer options](#) as necessary.
4. In the Range field, select the section or pages which contain the concordance index. Choose **one** of the following:

### Section

Print the section of the file which contains the concordance index. Select the section from the drop down list.

### Pages

When no section exists in the transcript file, print the pages which contain the concordance index. Enter the page range in the field below. Type the beginning page number, followed by a hyphen, and then followed by the ending page number. For example, to print page 5 through 10, type: 5-10.

To print a portion of the concordance index when it occurs in a section, type the section number followed by the page range. For example, to print pages 25-40 in section two, type: 2:25-40.

5. Press **Enter (Print)** to print the file.

## Delete Concordance Index

Delete Concordance Index is an Edit feature that allows you to remove the concordance index from the current transcript. For optimum results, use the Delete Concordance Index feature to remove a concordance index instead of using the Undo feature.

Position the cursor anywhere in the current transcript and press **Alt + t, r, i (Tools/Concordance Index/Delete Concordance Index)**. Case CATalyst locates and deletes the concordance index.

## Add First/Last Word to Concordance Header

When building a Concordance Index, you can include the first and last indexed word of each page into the header/footer lines of that page. The applied layout must contain the appropriate fields in the header line text for Case CATalyst to include the first and last indexed words. When building the Concordance Index, you select the appropriate layout.

### Add First and Last Indexed Word fields to the selected layout

1. From anywhere in Case CATalyst, press **Alt + u, L (Function/Layout)**. The Open Existing Document dialog box displays.
2. Select the layout and press **Enter (Open)**. The Layout function opens with sample text.
3. In the Page Layout dialog pane, select **Headers & Footers**.
4. Select a header line on which you want to place the first indexed word of the page.
5. Press **Alt + i (Insert Field)**. The Insert Field dialog box displays.
6. Select **First Indexed Word on Page** and press **Enter (OK)**. The field displays in the Header/Footer text box.
7. Make necessary font or placement changes for the header line and select **Apply**.
8. Select a header line to associate on which you want to place the last indexed word of the page.
9. Press **Alt + i (Insert Field)** and select **Last Indexed Word on Page**.
10. Press **Enter (OK)**. The field displays in the Header/Footer text box.
11. Make necessary font or placement changes for the header line and select **Apply**.
12. Press **Ctrl + s (File/Save)**.

### Building a Concordance Index including the first and last indexed word

When building a Concordance Index, include the layout which contains the headers with the necessary First and Last Indexed Word field.

1. From anywhere in From the Concordance Index Options dialog box, check the option **Use Headers**. The Select Layout to Use dialog box displays. If the Use Headers option is already selected, click **Browse**.
2. Choose the layout and press **Enter (Open)**. The path name displays in the Layout Path field.

## Exclude List

The Build Concordance feature uses a default exclude list (exclude.lst). Words contained in the exclude list do not appear in a Concordance Index. For example, "the", "an", and "of". You can add, delete or modify words in the list. The file, exclude.lst, is stored in the System Files case.

### Access the Exclude List

1. From the Build Concordance Index dialog box, select **Exclude List**.
2. The list displays in alphabetical order in Notepad. Add, modify or delete words as necessary. When entering new words to the list, place each word on a new line. You cannot have multiple words on a line.
3. When finished making changes, press **Alt f, s (File/Save)**.

4. To print the Exclude list, press **Alt + f, p (File/Print)**.
5. Press **Alt f, x (File/Exit)** to close Notepad.

## Phrase List

The Phrase list (phrase.lst) is a file that contains specific phrases you want to appear in a Concordance Index. For example, you want to know how many times the phrases "St. Louis" and "Busch Stadium" appear in the transcript.

When you add a phrase to the phrase list, Case CATalyst includes occurrences of the entire phrase in the concordance index. It does not include any of the individual words, unless they occur separately. For example, you add St. Louis to the phrase list. St. Louis displays in the concordance index, but St. and Louis do not. If, however, Louis, a person's name is also in the transcript, then Case CATalyst includes it in the concordance index because it does not occur with word St. When entering phrases into the list that contain punctuation, such as St. Louis, type the entry without the period. For example, type "St Louis" as the phrase, omitting the period after the abbreviation St.

Each user creates their own Phrase list. The list (Phrase.lst) is stored in the System Files case. You can add, delete or modify phrases in the list.

## Add a Phrase

1. Do one of the following:
  - Highlight the words in the transcript. Right click and select **Add Selection to Phrase List** or press **Alt + t, r, h (Tools/Concordance Index/Add Selection to Phrase List)**.
  - From the Build Concordance Index dialog box, select **Phrase List**.
2. The list displays in alphabetical order in Notepad. Add, modify or delete phrases as necessary. Place each new phrase on a new line. If a phrase you want to add contains punctuation, such as a period or comma, do not include the punctuation in the entry.
3. When finished, press **Alt + f, s (File/Save)**.
4. To print the Phrase list, press **Alt + f, p (File/Print)**.
5. Press **Alt f, x (File/Exit)** to close Notepad.

[Keyboard Map](#) Function: Add Selection to Phrase List

## Convert All Fields to Text

Convert All Fields to Text allows you to change [fields](#) in a job into plain text for use Case CATalyst version 4.x. Since Case CATalyst version 4.x does not support fields you must convert the fields to edit, print, create ASCII, etc. in Case CATalyst version 4.x. You may also want to convert all fields to text if you are appending, including or merging files together that may have different values for the same fields.

When you use Convert All Fields to Text, Case CATalyst converts the fields to plain text and creates a new text file which contains the converted fields. You are able to view the converted fields in the new text file, but they no longer perform field functions. Convert All Fields to Text also copies all the subfiles from the original file to the name of the converted file. The original file with the fields remains intact.

Convert All Fields to Text does not convert Index page, line and section numbers to text. You can [change](#) a setting in your UserSettings file to change this setting and convert the Index page, line and section numbers to text.

If you are exporting a file to ASCII or to RTF/CRE, it is not necessary to convert fields.

If you only want to convert some fields to text, you can highlight the fields and then use the [Convert Selected Fields to Text](#) command.

## Convert All Fields

1. Open the file that contains fields which you need to convert to text.
2. Press **Alt + t, v** (**Tools/Convert All Fields to Text**). The *Select a new name for the job* dialog box displays.
3. Case CATalyst assigns a default name in the File name field: NoFields\_*original file name*.sgnpl. Use the default name or type a new name. The new name must be different than the original file name.
4. Press **Enter** (**Save**). Case CATalyst creates the new the file.

[Keyboard Map](#) function: Convert Fields to Text

## Convert Index Field Information to Text

To have the Convert Fields to Text feature convert Index page, line and section numbers to text, it is necessary to change a setting in your UserSettings file. Do the following:

1. Be sure you are in your User name.
2. From Manage Jobs, open the **System Files** case.
3. Double click the **UserSettings.sgxml** file. The Settings Manager dialog box displays.
4. Click in the dialog box and press **Ctrl + f**. The Find dialog box displays.
5. Type **Edit-Settings** and press **Enter** to move to the *Edit-Settings* section.
6. Locate the option **ConvertIndexInfoWithFields** and click **Edit**.
7. Type the number **1** in the field and click **OK**. To restore the default setting, click **Default**.
8. Press **Alt + s** (**Save**) to save the setting and close the dialog box.

## Convert Selected Fields to Text

The Convert Selected Fields to Text feature is available on the Edit's Tools menu and/or right click menu. Unlike the [Convert All Fields to Text](#) feature, which changes all the fields in the file to text and creates a new file leaving the original file intact, tThis feature allows you to fill in fields, then highlight one or more fields and convert the field/fields to text only for the current selection, current page, the current section or the entire transcript. This feature may be most helpful in situations where there are multiple proceedings in one transcript (file).

For example, let's say you are an official reporter and you have multiple proceedings back-to-back and you create one transcript for the day. While you were writing, you included your title and appearance page for each of the proceedings as necessary. You have now gone through the transcript and made a new section for each proceeding. You want to be able to fill in the fields in the first section but you don't want those fields to apply to every matching field in the transcript. You can now fill in the fields, mark the fields that you wish to apply to only this section and convert them to text so they do not change any other matching fields in other sections of the transcript.

So, you go to the first title page and appearance page in the transcript and you fill in the appropriate fields and then select your "Cremer and Reid" firm for the first appearance. It automatically fills in the Firm1, Address1, etc., fields as usual. You fill in the attorney for the Attorney1 field and the fields are filled in for the current appearance and matching fields and fill in fields throughout the transcript/file are filled in also. You do the same for Firm2, etc. You then mark your title page and appearance page and select Tools, Convert Selected Fields to Text, This Section. Because you marked fields from the fill in field list, you are prompted with the following message: Do you want to clear the currently selected field groups? Yes/No.

Yes – changes the selected fill-in-fields to text in This Section (using the example above) and any remaining matching fill-in-field groups become "empty" or no longer filled in.

No – changes the selected fields to text in This Section (using the example above) and all remaining matching field groups (on all subsequent pages) remain filled in with the information you selected and remain a fill-in-field (they are not converted to text). When you get to the next proceedings in the transcript, you can repeat the process for those fields you wish to change, if applicable.

You can use this feature on any field and you can leave out those fields you don't want changed to text such as date fields. This feature affects all matching fields based on your selection but will not change to text any matching fields in headers/footers to text.

#### **How to Convert Selected Fields to Text:**

1. Fill in the field/fields as you normally would.
2. Mark (highlight) the fields you want to convert to text and then right click and select the **Convert Selected Fields to Text** (or select Tools, Convert Selected Fields to Text).
3. Select **one** of the following:
  - Selection Only – changes only the selected fields to text.
  - This Page – changes all fields matching the selected fields to text on the current page.
  - This Section – changes all fields matching the selected fields to text in the current section. Sections can be created while in Translate & Edit by selecting Format, Set Page/Paragraph and typing a page number in the New Page Number field. In most cases, a new section starts with page 1 but there may be circumstances where it could be a page number other than 1.
  - Entire Document – changes all fields matching the selected fields to text in the entire transcript.

If you have selected a field or fields from the fill in field list, the following prompt displays after selecting the one of the above actions:

*Do you want to clear the currently selected field groups? Yes/No.*

Yes – changes the selected fill-in-field groups to text (based on your choice of action) and any remaining matching fill-in-field groups become "empty" or no longer filled in.

No – changes the selected fields to text (based on your choice of action) and all remaining matching fill-in-field groups (on all subsequent pages) remain filled in with the information you

selected but also remain-fields (not converted to text). When you get to the next proceedings in the transcript, you can repeat the process for those fields you wish to change if applicable.

 Selected Fields to Text on this Page

## Create Core List in Edit

The Create Core List feature in Edit allows you to create a list of unique words from your transcript, excluding words that are in the Concordance Index Exclude list. The core list may contain lower case and upper case occurrences of the same word. For example, "mark" and "Mark." Words or phrases with hyphens and no spaces are listed as one word. For example, 25-mile-per-hour or K-u-r-k-o-w-s-k-i. An entry appears only once in the core list, regardless of the number of occurrences in the job.

The core list is a .txt (ASCII) file. Case CATalyst assigns a default file name using the job name plus the words, "core list". You can change the name before saving the file. If the file name already exists when the core list is generated, Case CATalyst prompts you to overwrite the existing core list. The core list is viewable in Notepad, WordPad or other ASCII viewers.

## Generate a Core List

1. Open the edit file in which you want to create a core list.
2. Press **Alt + t, c, c** (**Tools/Create Core List**). The Select Page to Build Core List dialog box displays.
3. If you want a list of only initial capped word and phrases, select the **List Initial Cap Words Only** option.
4. Choose **one** of the following:

### Entire Document

Create the core list from all pages in the transcript.

### Skip First *nn* Pages and Last *nn* Pages

Exclude a specific number of pages at the beginning and end of the transcript from the core list. For example, you do not want to include words from the title and appearance page at the beginning of the transcript; or you do not want to include words from the certificate page.

You can exclude pages from the beginning of the job only, the end of the job only or both the beginning and the end. In the *Skip First Pages* field, type the number of pages, if any, to skip at the beginning of the job. In the and *Last Pages* field, type the number of pages, if any, to skip at the end of the job.

### Section

Specify a specific section of the file from which to create the core list. This option is only available when there is more than one section in the file.

### Pages

Select specific pages from which to create the core list. Do one of the following:

### Individual Pages

Type the page numbers separated by a comma. For example, to create a core list from page 5 and page 25, type: 5, 25.

### Series of pages

Type the beginning page number, followed by a hyphen, and then followed by the ending page number. For example, to create a core list from pages 5 through 10, type: 5-10.

### Combination of individual and consecutive pages

Type the individual page number separated by a comma, and then beginning page numbers for the consecutive pages, followed by a hyphen, and then the ending page number and all separated by commas. For example, to create a core list from page 5, pages 15 through 20, and page 29, type the following: 5, 15-20, 29.

### Pages within a section

Type the section number followed by the page range. For example, to create a core list from pages 25-40 in section two, type: 2:25-40.

5. Press **Enter (OK)**. The Save Core List as dialog box displays with the default core list name in the File name field. If desired, type a new name for the core list.
6. Case CATalyst, by default, saves the core list to the same folder as the transcript file. Use the Browse button to save the core list to a different folder.
7. Press **Enter (Save)**. The core list is created using the same name as the current file with core list.txt added on to the end of the file name.

## EZ Text Table

The [EZ Text table](#) allows you to create up to 20 strings of text which you can insert into the transcript while editing. Each text line can contain up to approximately 900 characters including conflicts, scan stops, format symbols, etc. From Edit you can create and modify EZ Text Table entries and insert text directly into the transcript from the [EZ Text pane](#).

Access the EZText table:

- in Edit. Press **Alt + t, y, e (Tools/Keyboard Customization/EZ Text Table)**.
- in Manage Jobs. Press **Alt + f, o, i, e (File/Open/List/Table/EZ Text Table)**.
- in Edit from the EZ Text pane. Press **Alt v, e, e (View/Panes/EZ Text)**.

## Format Symbols Options Table

The [Format Symbols Options](#) table contains Case CATalyst translate commands, Case CATalyst format symbols and CATalyst BCS format symbols along with the default shortcut key assignments.

Access the Format Symbol Options table:

- in Edit. Press **Alt + t, y, f (Tools/Keyboard Customization/Format Symbol Options)**.
- in Manage Jobs. Press **Alt + f, o, i, e (File/Open/List/Format Symbols Options)**.

## Hyperlink

You can add Hyperlinks to your transcripts for web addresses and email addresses. The Hyperlinks will be clickable in the PDF print of the transcript. For example, let's say Amazon was mentioned during a deposition in reference to Amazon.com. You may want to include a hyperlink to [www.amazon.com](http://www.amazon.com) in the PDF copy of the transcript for one or more occurrences of Amazon. To create the hyperlink you can use the [Hyperlink right click menu](#) option, the [Tools menu Hyperlink option](#) and/or make a [dictionary definition containing the hyperlink](#).

## Insert/Edit

You can add Hyperlinks to your transcripts for web addresses and email addresses. The Hyperlinks will be clickable in the PDF print of the transcript. For example, let's say Amazon was mentioned during a deposition in reference to Amazon.com. You may want to include a hyperlink to [www.amazon.com](http://www.amazon.com) in the PDF copy of the transcript for one or more occurrences of Amazon. To create the hyperlink you can use the Hyperlink Right-Click Menu option, the [Tools menu Hyperlink option](#) and/or make a [dictionary definition containing the hyperlink](#).

### Creating a Hyperlink in Edit:

1. With your cursor on the word you'd like to hyperlink or with the phrase you'd like to hyperlink highlighted, select to Insert/Edit a hyperlink in one of the following ways:
  - a. Right click on the text and select **Hyperlink, Insert/Edit...** from the right click menu.
  - b. Click **Tools, Hyperlink, Insert/Edit...**
2. In the Hyperlink dialog, type the web address or email address you'd like to link to inside of the *Link to:* field.
 
  - Click the **Test This Link** button to test the hyperlink. For a web address, your default web browser will open to the specified link. For an email address, your default email software will open with the email address in the To: field.
  - The Insert Field button is available for you to use when the *Link to:* text is a field. For example, you may have an Email field for your attorney fields. If you'd like to use the email address that filled in the Email field for an attorney as a hyperlink for the attorney name, you can click **Insert Field**, then select the appropriate Email field.
3. Click **OK**.

### Modifying Hyperlinks in Edit:

There may be times when you want to modify the text or link of an existing hyperlink. Modifying a hyperlink follows the same procedure as creating a hyperlink.

1. With your cursor on the hyperlink you'd like to modify or with the hyperlink highlighted, do one of the following:
  - a. Right click on the text and select **Hyperlink, Insert/Edit...** from the right click menu.
  - a. Click **Tools, Hyperlink, Insert/Edit...**
2. In the Hyperlink dialog, modify the *Text to Display*; field and/or the *Link to:* field as needed.
3. Click **OK**.

### Hyperlink Colors in Edit:

To change the Hyperlinks color, access the [Colors dialog](#) in Edit by selecting **View, Display, Colors...** "Hyperlinks" is a choice on the item drop down list inside of the Colors dialog. If you have Show Font Colors selected for the Page View colors, the hyperlink text will not display in the Hyperlinks color selected. To view the Hyperlinks color in your transcript while using Page View, select Show Display Colors. The display color you select in Case CATalyst will not influence the hyperlink color when viewed in the PDF. The color of the Hyperlink in the PDF version of the transcript is controlled by the PDF viewing software used to view the PDF transcript.

## Remove

You can add Hyperlinks to your transcripts for web addresses and email addresses. The Hyperlinks will be clickable in the PDF print of the transcript. For example, let's say Amazon was mentioned during a deposition in reference to Amazon.com. You may want to include a hyperlink to [www.amazon.com](http://www.amazon.com) in the PDF copy of the transcript for one or more occurrences of Amazon. To create the hyperlink you can use the Hyperlink Right-Click Menu option, the [Tools menu Hyperlink option](#) and/or make a [dictionary definition containing the hyperlink](#). Removing an existing Hyperlink is also possible without also removing the transcript text.

### Removing Hyperlinks in Edit:

1. With your cursor on the word you'd like to remove the hyperlink or with the phrase you'd like to remove the hyperlink highlighted, select to Remove a hyperlink in one of the following ways:
  - a. Right click on the text and select **Hyperlink, Remove** from the right click menu.
  - b. Click **Tools, Hyperlink, Remove**.

## Test

Enter topic text here.

## Index

Index menu provides access to transcript indexing features that include Build Index and Build [Master Index](#). The [Build Index](#) feature generates an index page for your transcript once you complete the final edits. [Build Master Index](#) is an Edit feature generates one transcript index from multiple transcripts.

### Build Index

The Build Index feature allows you to generate an index page for your transcript once you complete the final edits. Build Index scans the transcript for Index Heading On/Off and [Index On/Off](#) format symbols and copies the text between the format symbols to create the transcript index page. To use the Build Index command, you need Index Heading On/Off and/or Index On/Off format symbols around the transcript text you want to copy to the index page. You can manually insert the format symbols, have the format symbols in include files, dictionary definitions or inserted by macros. Individual indexed text cannot exceed 900 bytes.

Case CATalyst places the index page at the end of the file unless you place the [Index Position](#) format symbol at the location in the transcript where you want the index built. Then Case CATalyst inserts the transcript index page at the position of the format symbol. Only one Index Position format symbol can exist per job or section. When you build the index, Case CATalyst removes the Index Position format

symbol from the job. If you use the [Delete Index](#) command to remove the index from the file, the Index Position format symbol is reinserted at the same location.

When Build Index encounters an issue that may affect the indexing results, a [message displays](#) prompting you to continue or cancel the build. Click the Details button to review the [error log](#). The error log file is an RTF subfile of the current transcript and is also accessible from Manage Jobs.

Use an [Index Template](#) in conjunction with the Build Index feature to customize the placement of information on the index page. When Case CATalyst builds a transcript index page without an Index Template, it creates tables in which it places the indexed text. Case CATalyst requires indexing information on a transcript index page be placed within the cells of a table. Table grid lines display in the file but do not print unless you change the [table property](#) option. You can use the [Index Template Options](#) to further customize the generated index.

Index page and line number references are dynamic. If you insert or modify existing text in the transcript which causes the indexed information to move to a different page or line number, the page and reference numbers in the built index adjust automatically. After building an index you can position your cursor on an indexed item and use the [Go To Index Entry](#) to locate the entry in the transcript. If you copy and paste information from an index, the reference information is no longer dynamic.

Refer to [Transcript Indexing](#) for additional information about indexing terminology, templates, guidelines and format symbols.

## Generate an Index

1. Open the edit file in which you want to generate an index. Editing on the job should be complete.
2. Press **Alt + t, n, b (Tools/Index/Build Index)**. The Build Index dialog box displays.
3. Make necessary entries. Available options depend on your choice to build the index page with or without an Index Template.

### Build Index For

Select **one** of the following:

#### Entire Document

Create an index of the entire document including all sections.

#### Selected Section

Create an index for a specific section of the document. Select a section number.

### Index Information

These options are not available if you are using an Index Template. When using an Index Template, the values in the template control the reference number information.

#### Show Section Number

Check this box to include section numbers along with the page number of the indexed items on the index page. Build Index automatically generates page numbers for indexed items.

#### Show Line Number

Check this box to include line numbers along with the page number of the indexed items on the index page. Build Index automatically generates page numbers for indexed items.

### Template

### Use Index Template

Select this option to use an Index Template. The Browse for Index Template dialog box displays. Select a template and then press **Enter (Open)**. The path to the selected template displays in the field below. Use **Browse** to select a different Index Template.

Index Information and Page Layout options are not available when you use an Index Template. Case CATalyst uses the layout settings contained in the index template to set the format for the index page.

### Bring Fields

Select this option to bring field values (if any) from the selected index template into the current transcript. If the field values from the index template conflict with existing field values in the current transcript, Case CATalyst prompts to select the field value you want to use. By default, this option is not selected and the state of the option is not remembered.

### Index Template Options

Display the Index Template [Options](#) dialog box where you can set options for the selected index template.

### Layout

Page layout options are not available if you are using an index template. If you are using an index template, Case CATalyst uses the layout settings contained in the index template to set the format for the index page.

### Include Layout

Check this box to apply a page layout to the index page. The Browse for Page Layout dialog box displays. Select a page layout and press **Enter (Open)**. The path name to the selected file displays in the field below. Use **Browse** to select a different Page Layout. This option is grayed out if the Use Index Template option is selected.

4. Press **Enter (OK)** to run the Build Index feature. Case CATalyst places the index page at the end of the file or at the location of [Index Position](#) format symbol position.

If Build Index encounters an issue that may affect the indexing results, a message displays prompting you to continue or cancel the build. Click the **Details** button to review the error log. The error log file is an RTF subfile of the current job and is also accessible from Manage Jobs.

## Build Index Error Messages

When using the [Build Index](#) feature, if CATalyst determines there is a minor issue with the build process or if the index can't be build, a message box displays. If minor problems were found, it means that the index can continue to build but you may want to look at the error log for more information. If the index cannot build, the message displays *Error: followed by information*. You can open the index log file by clicking the **Details...** button to see the contents of the error log. The error log displays page and line number information so you can toggle between your transcript and the log file to correct any errors that may have resulted in an incomplete index. An index error log has a .sglog extension and displays as Index log in the job's subfiles. [Backup](#) options include a Never auto-select index log files option which is selected by default.

When the Build Index feature encounters an issue that may affect the indexing results, the Build Index Error dialog box displays depending on the issue. Click the **Details** button to open view the error log in WordPad. The log file displays warnings and errors along with the page and line number where the issue occurred.

**Possible Error Messages:**

*No index information was found in this transcript file. No index will be created.*

No indexing format symbols were found in the selected transcript. Check to see if the correct transcript was selected and try again.

*The index template file \_\_\_\_\_ is currently open. Please close the template file and try Build Index again.*

The selected index template is open. You need to close the selected index template and select Build Index again.

*No indexing information was found in the template file.*

No indexing format symbols were found in the selected Index Template. Check to see if the correct Index Template was selected and try again.

*Unable to create the Index Log File. Close any open log files and then click OK. To proceed without creating the log file, click Cancel.*

Build Index is unable to create an index log file because a log file is currently open. Close all open log files and then click OK to continue. Or to ignore the log file error and not create a log file, click Cancel.

*The Template file was empty. Please try again with a different template.*

The selected Index Template contains no text or indexing format symbols. Check to see if the correct Index Template was selected and try again.

*None of the index information found is used by the template.*

The transcript indexing format symbols are not a match to the indexing information in the Index Template. Check to see if the correct Index Template and transcript were selected and try again.

**Some index build errors are minor and the index will still be built but it is important to review errors.**

*Minor problems were found. Would you like to see the log file for more information?*

CATalyst can successfully build an index but finds indexing information in the transcript that you might want to be aware of, a message displays giving you the following options:

- Click **Details...** to open the log file (the log will open in Notepad/WordPad®). You can review the information before proceeding with the Build Index action. (Be sure to close the log file before proceeding.)
- Click **OK** to continue with the building of the index.
- Click **Cancel** to stop the Build Index process.

**An example of an index error log:**

If there are unresolved errors in the Index Template, the errors may prevent the building of the index and may cause the program to crash.

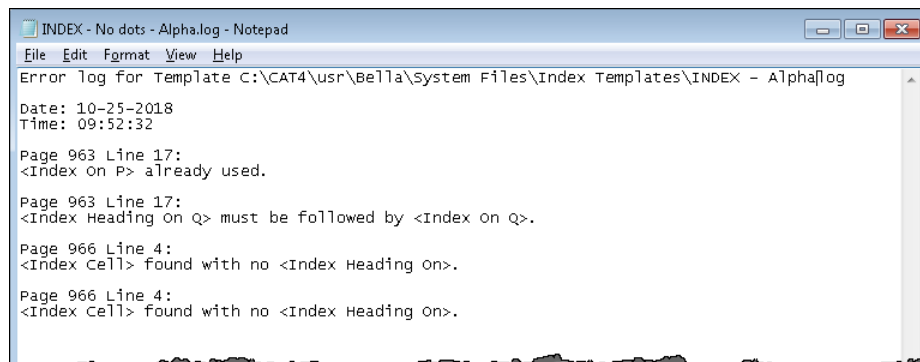

In the event you receive the build index error message, do **one** of the following:

- Select **Yes** (recommended action) to cancel the Build Index feature. Look at the Index Template Log file to determine what needs to be changed or corrected in your Index Template that you used to build the index and make those changes. The log file automatically opens in Notepad or Wordpad.
- Select **No** to attempt to continue with the Build Index feature knowing that there is something wrong and it could mean your index information is incomplete or you could cause CATalyst to unexpectedly close.

**The following is an example of an Index Error log for the Index Template being used:**

The log now displays the page and line number where an issue occurs that could negatively affect the Build Index results. It also corrects the display of Index Heading On categories correctly:

## Build Master Index

Build Master Index is an Edit feature that allows you to generate one transcript index from multiple transcripts. You can create the Master Index in the same file as the transcript or you can create a new file that contains only the master index. [PDF Bookmarks](#) are compatible when building a master index in the same file as the transcript. You may want to create an index template to use specifically when building a master index.

In the Build Master Index dialog box, files available for selection display on the left side. Files selected for indexing display in the indexing list located on the right side of the dialog box. All transcript files for the current user are available for selection. If the current open file is in a Case when you select to build the master index, all the files in the case display as selected. Files in a Case display with the earliest dated files first and the most recent files last.

The display order of the files in the indexing list is the order in which Case CATalyst builds the index. Case CATalyst automatically lists files by job date, earliest date listed first. You can change the order. When you select the transcripts you want to index and the order in which they should be indexed, CATalyst remembers the selected transcripts and the order in which they were indexed. Files must display in the indexing list in order for Case CATalyst to include them in building the master index. When Case CATalyst builds the master index, it places the index pages *automatically at the end of the open file*.

If you build a master index with volume numbers or designations, use the [Index Template Options](#) to set the page format. You can place a hyphen preceding the page number or use only the page number, omitting the hyphen.

Once a master index is built, if for some reason you need to delete the index, you can place your cursor on an index page and use the [Delete Index](#) function to remove the master index.

## Generate a Master Index

1. Open the file where you to build the Master Index.
2. Press **Alt + t, n, e** (**Tools/Index/Build Master Index**). The Build Master Index dialog box displays.
3. All the transcript files for the current user display in the left window. To select files for indexing, check the box next to each individual file in the left window. Files selected for indexing display in the right window. If the current open file is in a case, all the files in that case display selected. Use the following options as necessary:

### Move Up

Move a file selected for indexing higher in the list. Case CATalyst uses this list to determine the order in which the master index is built. Highlight the file and select **Move Up**.

### Move Down

Move a file selected for indexing lower in the list. Case CATalyst uses this list to determine the order in which the master index is built. Highlight the file and select **Move Down**.

### Remove

Remove a file from the indexing list. Highlight the file and select **Remove**. The file is no longer included in the master index.

### Change Volume Info

Create or modify a description that identifies the indexed contents of a file when building a master index. For example, you may want Volume | Witness Name to separate each index within the master index. You must use the [Index Volume Information](#) format symbol on the master index template in conjunction with this feature. If you build a master index with volume numbers or designations, Case CATalyst separates the volume and page number with a hyphen.

Highlight the file for which you want to enter a description and select **Change Volume Info**. The [Index Volume Description](#) dialog box displays.

### Template

Select the index template you want to use to build the Master Index. Use **Browse** to search for a template. Index templates are stored in the Index Templates case located in the System Files case.

### Index Template Options

You can set Index Template options for each index template. Use the following options as necessary:

#### **Ignore Indexed Information not used by Template Yes/No**

Select Yes to have the Build Index feature overlook transcript text that is surrounded by index format symbols not found in the selected index template. Select No to attempt to use all transcript text surrounded by index format symbols in the index. The default is No.

#### **Warn me about ignored index information Yes/No**

This option is only active if the Ignore Indexed Information not used by Template option is set to Yes.

Select No to prevent the Index Error Checking feature from reporting a minor issue when ignored index format symbols are found in the transcript but not in the index template.

Select Yes to see the minor warning. The default is Yes.

#### **Warn me about template information not found in the transcript Yes/No**

Select No to prevent the Index Error Checking feature from reporting occurrences of <Index Off> format symbols in the transcript without <Index On> format symbols preceding it.

Select Yes to see the minor warning. The default is Yes.

#### **Ignore Paragraph Formatting Yes/No**

Select Yes to have the Build Index feature overlook paragraph format symbols that occur within the indexed transcript text. Select No to include the paragraph format symbols and copy them to the index. The default is No.

#### **Number Index Separately**

Select Yes to set the first page of the index to page 1 (depending on your page number format). Transcript page numbers are not affected. Select No to number the index page the next consecutive page number based on the transcript page numbers. The default is No.

#### **Cell Separation Text**

Type a character, punctuation symbol or insert a format symbol to separate multiple page number references for the indexed item.

This field is only available if you select the Allow Duplicate Cells option.

#### **Master Index Page Column Format**

When using a master index template, select Index Volume Information – <Index Cell> to have the Volume number followed by a hyphen followed by the page number. Select <Index Cell> to display only the page number.

### Combine Into One

Check this box to create a one master index which includes all the files indexed. Leave this box blank to create a separate master index for each file indexed.

### Bring Fields (from template)

Select this option to bring field values (if any) from the selected index template into the current transcript. If the field values from the index template conflict with existing field values in the current transcript, Case CATalyst prompts to select the field value you want to use. By default, this option is not selected and the state of the option is not remembered.

4. Press **Enter (OK)**. Case CATalyst builds the Master index and places it at the end of the file or at the location of the Index Position Format symbol.

## Build Index Error Log

When using the Build Index feature, if CATalyst determines there is a minor issue with the build process or if the index can't be build, a message box displays. If minor problems were found, it means that the index can continue to build but you may want to look at the error log for more information. If the index cannot build, the message displays *Error: followed by information*. You can open the index log file by clicking the **Details...** button to see the contents of the error log. The error log displays page and line number information so you can toggle between your transcript and the log file to correct any errors that may have resulted in an incomplete index. An index error log has a .sglog extension and displays as Index log in the job's subfiles. [Backup](#) options include a Never auto-select index log files option which is selected by default.

Minor issues: CATalyst can successfully build an index but finds indexing information in the transcript that you might want to be aware of, a message displays giving you the following options:

- Click Details... to open the log file (the log will open in WordPad®). You can review the information before proceeding with the Build Index action. (Be sure to close the log file before proceeding.)
- Click OK to continue with the building of the index.
- Click Cancel to stop the Build Index process.

Error: CATalyst cannot build the index, a message displays giving you two options.

- Click Details... to see the error (s) along with the page and line number the issue occurred. The log file opens in WordPad®. You can toggle back and forth between the error log and your transcript to fix any problems (Be sure to close the log file before proceeding.)
- Click OK to close the message and the index is not built.

### Delete Index

Delete Index is an Edit option that allows you to delete an index created using the [Build Index](#) or [Build Master Index](#) feature. The Delete Index feature is only accessible when you place your cursor on an index page created using the Build Index feature.

When you use an [Index Position](#) format symbol to identify the placement of the index in the file, Case CATalyst removes the format symbol from the file when it build the index. When you delete the index, Case CATalyst reinserts the Index Position format symbol into the file at the original location. If the file did not contain an Index Position format symbol when you used the Build Index command, Case CATalyst places an Index Position format symbol at the end of the file when you delete the index.

### Delete an Index

1. Open the file that contains the index you want to delete.
2. Place your cursor on an index page.
3. Press **Alt + t, n, n** (**Tools/Index/Delete Index**). Case CATalyst deletes the index pages.

### Index Volume Description

Index Volume Description is an Edit feature that allows you to create a label which identifies the indexed contents of the current file. You may want a label to separate indexed information when using the [Build Master Index](#) feature to create one index from multiple files. For example, 3 - 923 indicates Vol. 3 on page 923. You can create a volume description for each file contained in the master index.

An Index Volume Information format symbol must exist in the Master Index Template for this feature to work. When Case CATalyst builds the master index, it places the volume description in the position of the format symbol.

### Assign a Volume Description for the Current File

1. Press **Alt + t, n, v** (**Tools/Index/Index Volume Description**). The Index Volume Description dialog box displays.
2. Type a description in the Text field, including any necessary format symbols. Press **F9** to add [extended characters](#) as necessary. To insert a format symbol, select **FS**. Double click a symbol from the list to insert at the location of the cursor.
3. Press **Enter** (**OK**).

## Index Template Wizard

Use the [Index Template Wizard](#) to quickly and easily build an index template using a step-by-step process. The index Template Wizard is available once open or create a text file in the Index Templates Case (System Files, Index Templates). Once a file is open in the Index Templates case, select **Tools, Index, Index Template Wizard...**

## Macros

A macro is a recorded series of keystrokes, mouse clicks and associated keyboard commands. A filename assigned to the macro allows for playback. Playing back a macro performs the series of recorded commands which reduces the amount of keystrokes required to perform a task or process.

Macros are recordable in Edit and Manage Dictionary. It is possible to begin the recording or playback of a macro in one of the functions and have it continue in the other function. For example, you can begin a macro in Edit and continue the macro within a dictionary. You may want to use a separate naming convention for macros created for Manage Dictionary that identifies them from other macros. For example, "dict - modify entry."

When recording a macro, you can use the mouse and keyboard commands to select menus or icons, however, within a dialog box, only keyboard commands are recorded, such as Alt + a (Cap) in a Global Define dialog box. Mouse clicks within a dialog box are not recognized and are not recorded as part of the macro. Once a dialog box opens, you can Pause recording the macro to select a file name or option using the mouse. When you close the dialog box, by pressing Enter or an Alt key combination, the macro continues to record and you can return to using mouse clicks. When the macro plays back, it pauses once the dialog box is open, allowing you to select the file or option and then continues once you press Enter. For example, you want to record a macro to Include a file and choose a file while using the macro. When the Include dialog box display, click Pause and select a file. File selection is not recorded as part of the macro. After selecting the file, press Enter in the Include dialog box. The macro continues recording once you press Enter.

You can playback a macro by selecting it from a list, pressing a user assigned keyboard command or writing a steno stroke on your writing machine during realtime. To quickly invoke a macro, you can assign it to a [keyboard command](#) or [AccelerWriter](#) dictionary definition. Keyboard command assignments and AccelerWriter definitions can be made immediately after saving the macro or at a later time. Stenograph recommends you set up a realtime session when creating a macro for an AccelerWriter definition to assure the macro works as intended.

Macro files have a .sgmac extension and are stored in a Macros case within the System Files case. You can quickly view the list of existing macros by pressing, **Alt + f, o, m (File/Open/Macros)**. Recorded commands for an existing macro can be viewed or modified using the [Macro Editor](#). You can add and remove functions, text and key combinations allowing you to make changes without re-recording the entire macro. Manage Dictionary functions end with - Dict." when viewing them in the Macro Editor or a Keyboard Maps.

The Macro feature contains a submenu of features that include Record, Playback and Playback Last Macro. You can [create a toolbar](#) from the submenu to float or dock it like any other toolbar.

[Keyboard Map](#) Function: Record Macro

Play Macro

Play Last Macro

## Macro Pull Away Toolbar

The Macro submenu contains the commands necessary to record and playback macros. You can create a toolbar which contains the three Macro menu commands: Record, Playback Macro and Playback Last Macro. The Macros toolbar can be docked at the top or side of the screen like any other tool or function bar. You can also customize the bar, adding or removing icons.

### Display the Macro Submenu Toolbar

1. Press **Alt + t, m** (**Tools/Macro**). The Macro submenu displays.
2. Place the cursor on the dotted line at the top of the submenu.

3. Press and hold the left mouse button. Drag the cursor away from the menu. The submenu displays as a floating toolbar.

4. Place the Macros toolbar anywhere on the screen or position along with other toolbars on the top or side of the screen. Once you create the Macros toolbar, the toolbar displays with a check mark in the Show list (**View/Show**).

5. You can [customize](#) any toolbar if necessary. To close the toolbar, deselect it from the Show list. Once the Macros toolbar closes, it is no longer available in the list. You must drag it from the Macro submenu to redisplay it.

## Record a macro

The Macro Record feature allows you to record a series of commands and save them as a [macro](#). Once the macro is recorded and named, you can assign a [keyboard command](#) or define an [AccelerWriter](#) to the macro as desired. Stenograph recommends creating a macro for an AccelerWriter dictionary definition during setup for the realtime session to ensure the macro works in realtime as intended.

Recorded commands for an existing macro can be viewed or modified using the [Macro Editor](#). This allows you to add and remove functions, text and key combinations without recording the entire macro again.

[Keyboard Map](#) Function: Record Macro

## Create and Assign Macro

1. Place your cursor in the most logical position where you would want the commands of the macro performed.
2. Press **Alt + t, m, r (Tools/Macro/Record)**. The RecordMacro toolbar displays at the top of the screen with Pause and Stop buttons.
3. Record the commands for the macro. Use the mouse and keyboard commands to select menus or icons, however, in a dialog box, only keyboard commands are recorded. Mouse clicks within a dialog box are not recognized and are not recorded as part of the macro.

When in a dialog box, click **Pause** on the RecordMacro toolbar to suspend the macro in order to select a file or type text. For example, you are recording a macro to include a file and want to be able to select any file while using the macro. When the Include dialog box display, click **Pause** and select a file. File selection is not recorded as part of the macro. After selecting the file, press **Enter** in the Include dialog box. The macro continues recording once you press Enter.

4. When finished, click **Stop** on the RecordMacro toolbar. The Save Macro dialog box displays.

If you attempted to record commands that are not recordable functions, the following error message displays: *The actions you took are not recordable. There are no actions that can be saved for a macro.* Press **Enter (OK)** to close the message.

5. In the *File name* field, type a name for the macro. Use the following options as necessary:

#### **Assign to key in keyboard map (Alt + a)**

Check this box to assign a key combination in your keyboard map to the macro after you save the macro. This allows you to invoke the macro from a keyboard command.

#### **Define in dictionary to invoke macro from writer (Alt + f)**

Check this box to create an AccelerWriter definition for the macro after you save the macro. This allows you to invoke the macro from your writing machine while in a captioning session.

6. Press **Enter (Save)**. One of the following occurs:
  - The Save Macro dialog box closes if no additional options are selected.
  - The Open Keyboard Map dialog box displays if you selected to *Assign to key in keyboard map*. If the option, [Keyboard to open when assigning recorded macros](#), is active, the selected default Keyboard map opens. Make necessary entries to [assign a keyboard command](#) to the macro.
  - The Insert AccelerWriter Entry dialog box displays if you selected the option, *Define After Saving*. Make necessary entries to [define the AccelerWriter](#).
7. Test the macro. Do the following:
  - Playback the macro using the Playback Macro feature. Press **Alt + t, m, p (Tools, Macro, Playback Macro)** or click **Playback Macro** on the Macros toolbar. The Choose Macro dialog box displays. Select the macro just recorded and press **Enter (Open)**.
  - If you created an AccelerWriter definition, use the **Add/Remove Dictionaries** command to reload the dictionaries and then write the steno outlines for the AccelerWriter definition.
  - If you assigned the macro to a keyboard command, press the assigned keys.

## Define in dictionary to invoke macro from writer

When you [record a macro](#) and then stop the recording, the Save Macro dialog box displays. The Save Macro dialog box allows you name the macro, assign it to a key combination in a Keyboard Map and/or create an [AccelerWriter definition](#) to invoke the macro from your writing machine during realtime. An AccelerWriter is simply a macro that is invoked from your writing machine during realtime. You only want to assign a dictionary macro to a Keyboard Function to to a dictionary definition.

## Assign to key in keyboard map

When you [record a macro](#) and then stop the recording, the Save Macro dialog box displays. The Save Macro dialog box allows you name the macro, assign it to a key combination in a Keyboard Map and/or create an [AccelerWriter definition](#) to invoke the macro from your writing machine during realtime. When you select the option, *Assign to key in keyboard map (Alt + a)*, you can immediately assign a key combination to invoke the macro. One of the following occurs after you press **Enter** (Save) in the Save Macro dialog box:

- The Open Keyboard Map dialog box displays. Select a keyboard map to open and press **Enter**. Macros are stored in a Macros case within the System Files case. The Keyboard map displays.
- If the Advanced Edit option, [Keyboard to open when assigning recorded macros](#), is active and a keyboard is specified, the selected default Keyboard map opens with the recorded macro highlighted in the *Functions* list of the Assign Key to Function dialog box.

## Assign to key in keyboard map

1. Make necessary entries, select a key combination, in the Assign Key to Function dialog box.
2. The newly created macro displays highlighted in the Functions field under the MACROS section. When you have selected the key combination, press **Enter (Assign)** and then click **Close**. The entry displays in the Keyboard Map list.
3. If you don't want to make any other additions or changes to the Keyboard Map, do any of the following to save and close the keyboard map.
  - Double click the "tab" for the Keyboard Map and then select Yes to save the changes.
  - Click the Save () icon on the toolbar and then close the keyboard map.
  - Select the File menu, select Save and then close the keyboard map.

## Playback Macro

You can Playback a recorded macro using an assigned keyboard command, writing the steno outlines during realtime that are assigned to an AccelerWriter definition, by selecting a playback option from the Macro menu or selecting a macro from the [Macro toolbar](#).

To playback a macro, do one of the following:

### Use Assigned Keyboard Command

If you [assigned](#) a key command to the macro in the active keyboard map, press the assigned key combination to play the specified macro.

### Use AccelerWriter

If you created an [AccelerWriter](#) definition for the macro, stroke the keys on your writing machine to play the specified macro.

## Use Macro Menu Options

### Playback Macro

Press **Alt + t, m, p (Tools/Macro/Playback Macro)**. The Open dialog box displays. Select a macro and press **Alt + o (Open)**. The selected macro plays back.

Macro files have a .sgmac extension and are stored in the Macro case within the System Files case.

### Playback Last Macro

Press **Alt + t, m, L (Tools/Macro/Playback Last Macro)**. The last macro played back using a keystroke plays again. It is recommended to use this command after first using the Playback Macro command.

The last macro remembered is user specific, not job specific.

## Macros Toolbar

In addition to using the keyboard and AccelerWriters to invoke macros, a [Macros toolbar](#) feature is available to invoke macros via the toolbar. You might want to assign seldom used but important macros to the Macros toolbar while invoking common macros with keyboard combinations and using AccelerWriters to invoke those macros during realtime. By default, the Macros toolbar displays in Translate and Edit / Edit. To hide the display of the Macros toolbar, right click on any toolbar and deselect Macros.

[Keyboard Map](#) Function: Play Macro

Play Last Macro

## Macros Toolbar

In addition to using the keyboard and AccelerWriters to invoke macros, a Macros toolbar feature is available to invoke macros via the toolbar. You might want to assign seldom used but important macros to the Macros toolbar while invoking common macros with keyboard combinations and using AccelerWriters to invoke those macros during realtime. By default, the Macros toolbar displays in Translate and Edit / Edit. To hide the display of the Macros toolbar, right click on any toolbar and deselect Macros.

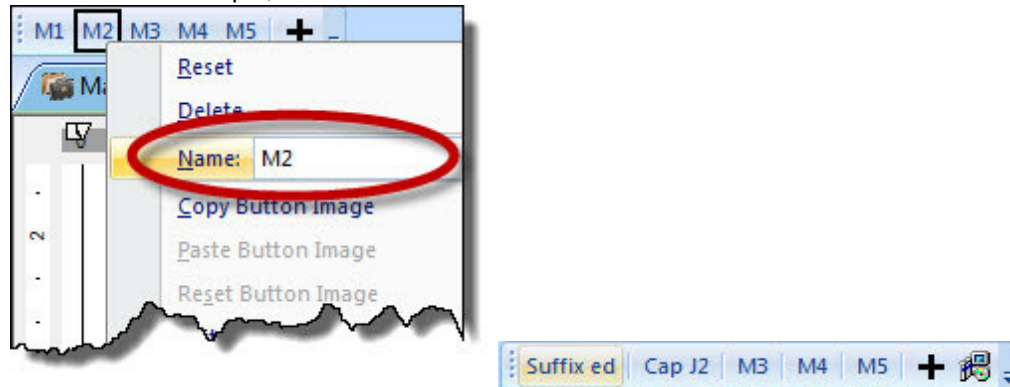

The default Macros toolbar includes five icons along with a **+** and  (Setup) icons.

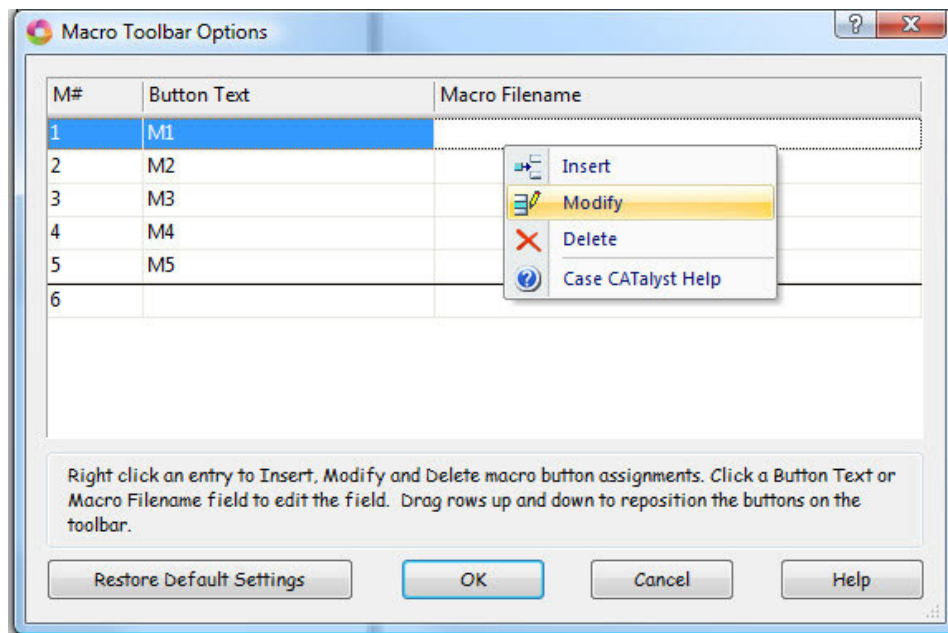

Do any of the following:

- If there is no macro assigned to the macro button on the toolbar, you can click the available M# icon on the Macros toolbar. In the Choose Macro dialog box, locate the macro you want to assign, highlight it and then click Open. The macro is assigned. To add more than the five default macro buttons with macro assignments, click **+**, select the macro and click Open. The next consecutive number is assigned to the macro icon. To personalize the macro button name or add an image, right click anywhere on the Macros toolbar and select Customize. With the Customize dialog box open, right click on the macro icon you want to modify. In the Name field, type the name of the

macro. In the example, both M1 and M2 have been renamed.

- To assign a macro to a toolbar button, modify an existing macro, delete a macro, add more macro buttons to the Macros toolbar or change the order of the macro buttons, click the Setup (  ) icon.

- To add another button to the Macros toolbar and assign a new macro, press Ctrl + i or right click on the M# field and select Insert. The next consecutive numbered macro is created with the cursor focus in the Macro Filename field. Click the down arrow to select from the current user's Macro folder or click the browse button to navigate to another location. Highlight the macro and click Open.
- To modify an existing macro's Button Text or macro assignment, click the field and type the appropriate text.  
If you position your cursor on the M# field, you can press Ctrl + m or right click select Modify. Your cursor defaults to the Macro Filename field.
- To delete an existing macro button and assignment, right click either the Button Text or Macro Filename field and select Delete. You are prompted to confirm you want to delete the entry. Select Yes to delete the assignment. The button is removed from the list and the Macros toolbar. The Macros Toolbar Options dialog box displays it as an unassigned entry at the bottom of the list.

- To reset the default settings, click Restore Default Settings. All assignments are removed and the five buttons display on the Macros toolbar.

Independent Macros toolbars are available in [BCS and caption edit](#) but do not display by default.

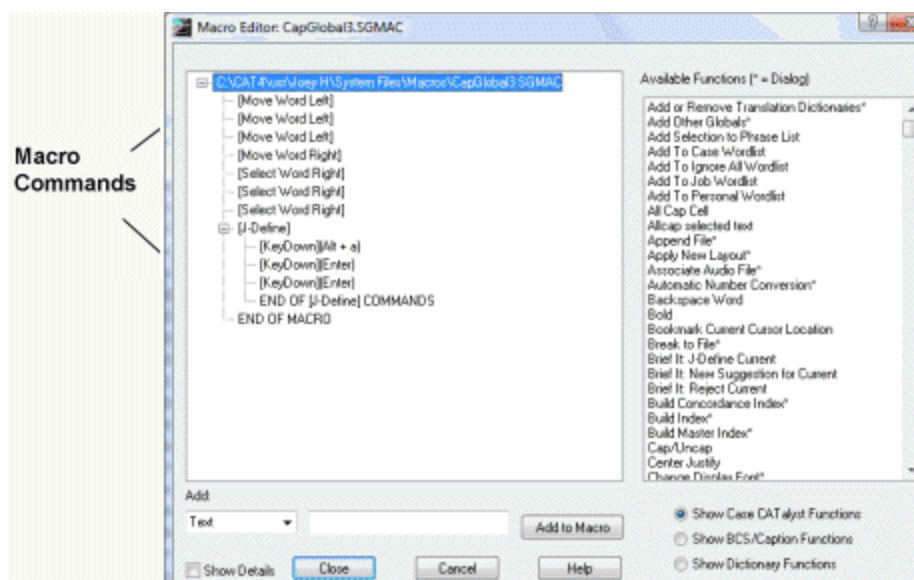

## Editing Macros

You can modify the recorded commands for an existing macro. Using the Macro Editor, add and remove Case CATalyst, CATalyst BCS or Dictionary [functions](#), [text](#) and dialog box [key combinations](#). Macros are stored in the Macros case within the System Files case. Macro files have a .sgmac extension.

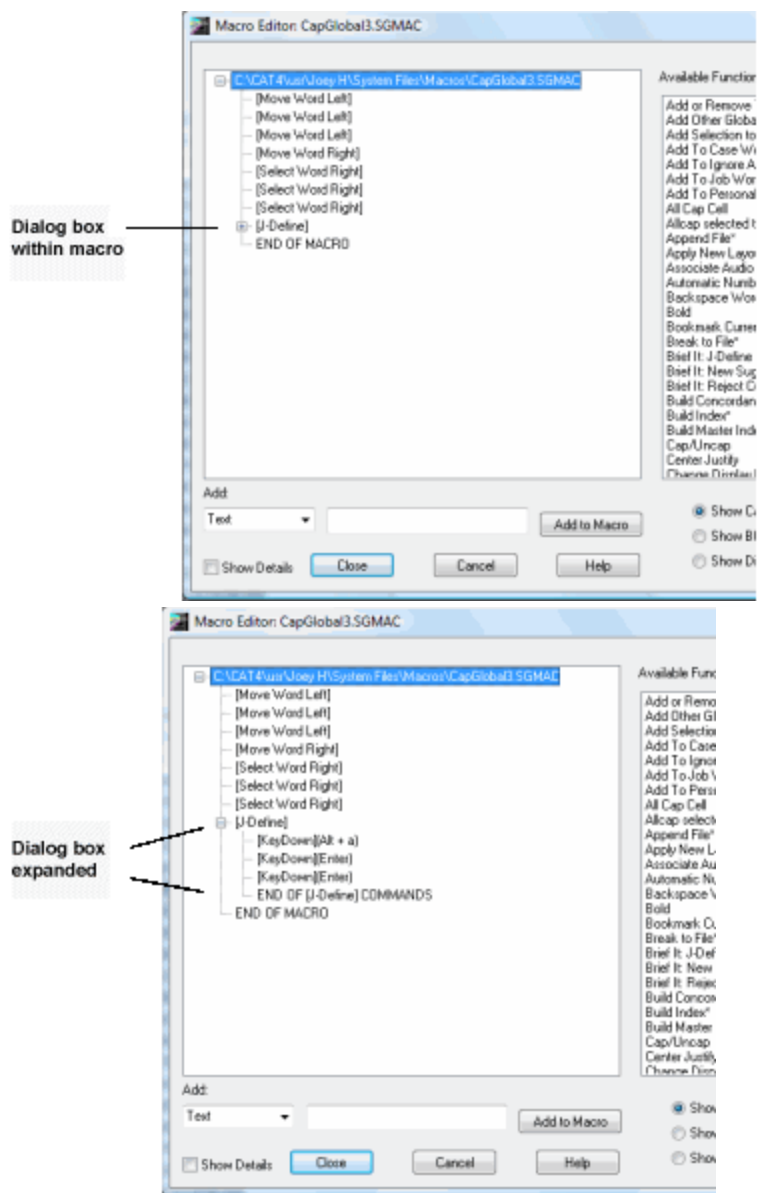

- From anywhere in Case CATalyst or CATalyst BCS, press **Alt + f, o, m (File/Open/Macro)**. The Open Existing Document dialog box displays with the Macros case open. Select the macro and press **Enter (Open)**.
- In Manage Jobs, open the System Files case and then open the Macros case. Double-click a macro to open it.

## Macro Editor

The Macro Editor dialog box opens with the selected macro name in the title bar. The recorded macro commands display in the window.

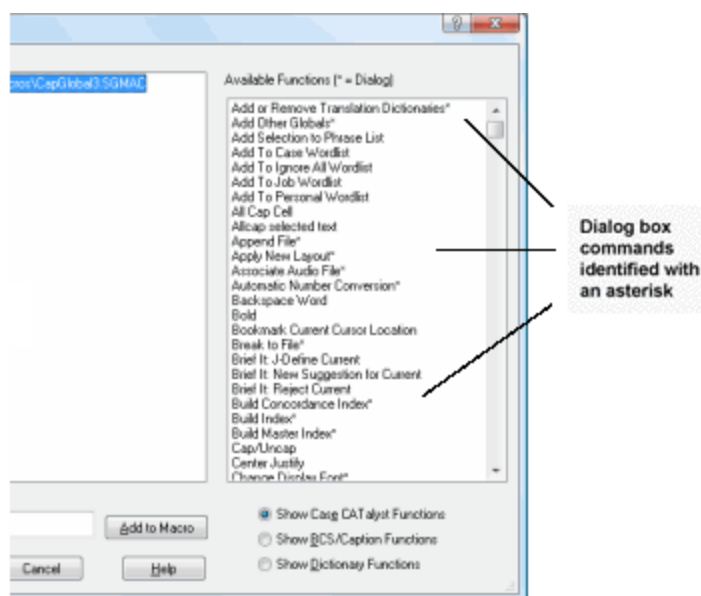

A command that invokes a dialog box within a macro displays with a plus sign. Click the plus sign to display the commands within the dialog box.

### Available Functions

The Available Functions list displays commands for insertion into the macro. Selecting the option *Show Case CATalyst Functions* below the list displays all the valid editing commands available for insertion into the macro. Selecting *Show CATalyst BCS/Caption Functions* displays all the available CATalyst BCS commands. Selecting *Show Dictionary Functions* display all available Manage Dictionary commands.

Functions in the list marked with an asterisk are commands that invoke a dialog box. You cannot insert these commands into a dialog box within the macro.

## Add

### Text

The Add fields allows you to insert text or key combination into the macro. Selecting *Text* from the drop down list allows you to type the text in the field which you want to add to the macro. Once the text is typed, the *Add to Macro* option inserts the text into the macro following the highlighted line.

### Key Combination

Selecting *Key combination* from the drop down list, allows you to enter a key combination into the field by pressing the appropriate keys on the keyboard. Key combinations can only be added to a dialog box that is part of the macro. The *Add to Macro* option inserts the key combination into the macro following the highlighted line.

## Remove

To remove the function, text or key combination from the macro, highlight the line and press **Delete**.

### Show Details

Display the key stroke details of the macro (KeyUp/KeyDown). This option is typically used to troubleshoot the macro.

### Close/Save/Done

The option that displays depends on the editing state of the macro:

#### Close

Displays when you open the macro and allows you to close the Macro Editor dialog box without making any changes.

#### Save

Displays after you make changes to the macro allowing you to save them.

#### Done

Displays after saving the macro allowing you close the Macro Editor dialog box.

#### Cancel

Close the Macro Editor dialog box without applying any changes since the last save.

## Add Functions to an Existing Macro

1. Do one of the following:
  - From anywhere in Case CATalyst or CATalyst BCS, press **Alt + f, o, m (File/Open/Macro)**. The Open Existing Document dialog box displays with the Macros case open. Select the macro and press **Enter (Open)**.
  - In Manage Jobs, open the System Files case and then open the Macros case. Double-click a macro to open it.
2. In the Macro Editor dialog box, select one of the following to determine the type of functions to display in the Available Functions window:

#### Show Case CATalyst Functions

Display Case CATalyst or CATalyst BCS transcript editing functions.

#### Show BCS/Caption Functions

Display CATalyst BCS and captioning functions.

#### Show Dictionary Functions

Display Manage Dictionary functions.

3. Highlight the line in the macro that precedes the position where you want to insert the command and double click the desired function. The command inserts after the highlighted item. You cannot insert a function at the end of the macro.

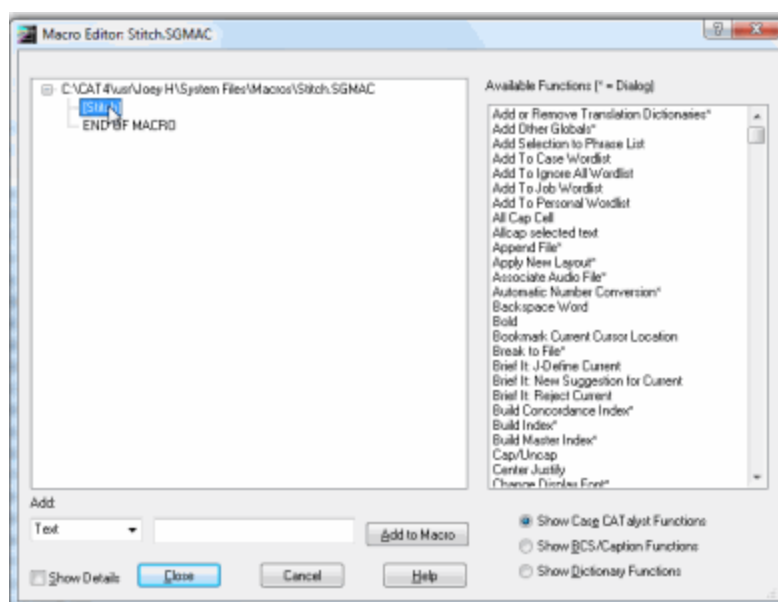

To insert more than one function, it is necessary to highlight the position where you want to insert the command each time. The message, *Please select an item in the macro. The item will be inserted after the selection.* indicates the position for inserting the line is deselected. Highlight the line in the macro that precedes the position where you want to insert another function.

Functions in the list marked with an asterisk are commands that invoke a dialog box. You cannot insert a function marked with an asterisk into an active dialog box. If you attempt to insert a function

into an active dialog box, The following message displays; *A function cannot be inserted at this point in the macro, because a dialog is active. Functions can only be inserted when no dialog is active in the macro.* To add commands containing a key combination use the [Add](#) field.

### Example

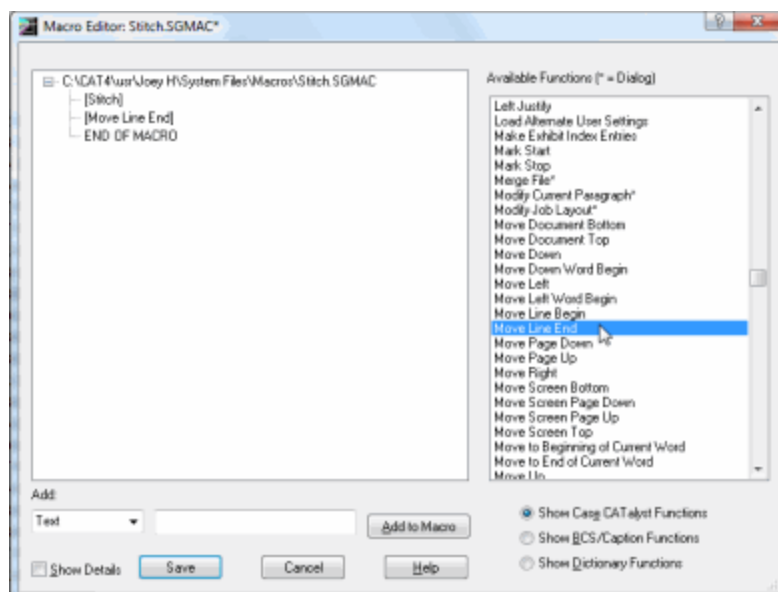

In the following Stitch macro, you want to add the command, Move Line End, to move the cursor to the end of the line. You highlight the last command line of the macro.

4. In the Available Functions field, double-click the command you want to insert. Functions followed by an asterisk invoke a dialog box. The position you highlight is remembered even though the highlight does not appear once you click in the Available Functions window.

### Example

Continuing with the Stitch macro, The Move Line End command inserts after the [Stitch] line.

5. If necessary, add other functions, [text](#) or [key combinations](#). To remove a command, highlight the line and press **Delete**.
6. Press **Enter (Save)**. A confirmation message may display, depending on your save options. The Macro Editor dialog box remains open.
7. Select **Done** to close the Macro Editor dialog box.

## Add Key Combinations to an Existing Macro

Key combinations can only be added to a dialog box that is part of the macro. Dialog boxes display with a plus sign if the view of the dialog box commands is collapsed or a minus sign if the view is expanded with the commands displayed in an indented list.

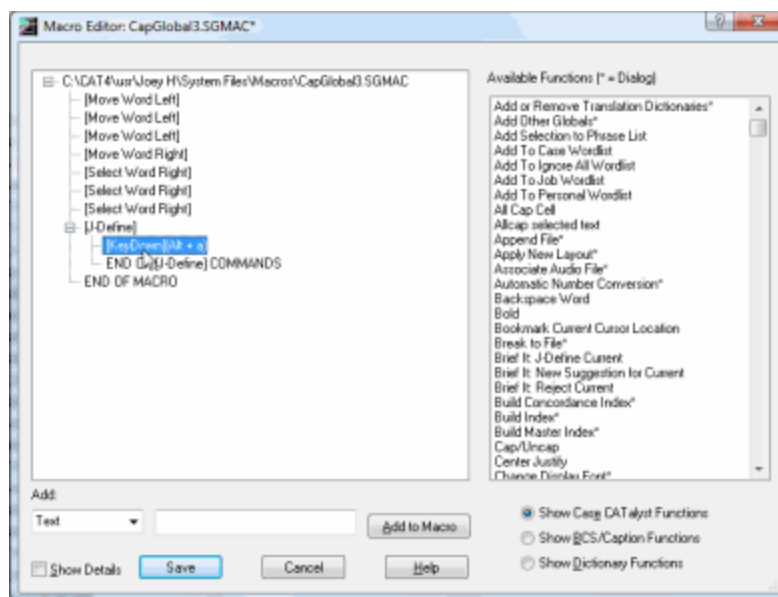

## Add Commands

1. Do one of the following:
  - From anywhere in Case CATalyst or CATalyst BCS, press **Alt + f, o, m (File/Open/Macro)**. The Open Existing Dialog Document dialog box displays with the Macros case open. Select the macro and press **Enter (Open)**.
  - In Manage Jobs, open the System Files case and then open the Macros case. Double-click a macro to open it.
2. In the Macro Editor dialog box, highlight the line within a dialog box that precedes the position where you want to insert the key combination. The command inserts after the highlighted item.

Dialog boxes display with a plus sign if the view of the dialog box commands is collapsed or a minus sign if the view is expanded. If there are no commands in the dialog box, highlight the dialog box name.

### Example

In the following CapGlobal3 macro, you want to add Enter to the end of the J Define, so the dialog box closes at the end of the macro. You highlight the last command line in the J Define dialog box.

3. In the Add field:

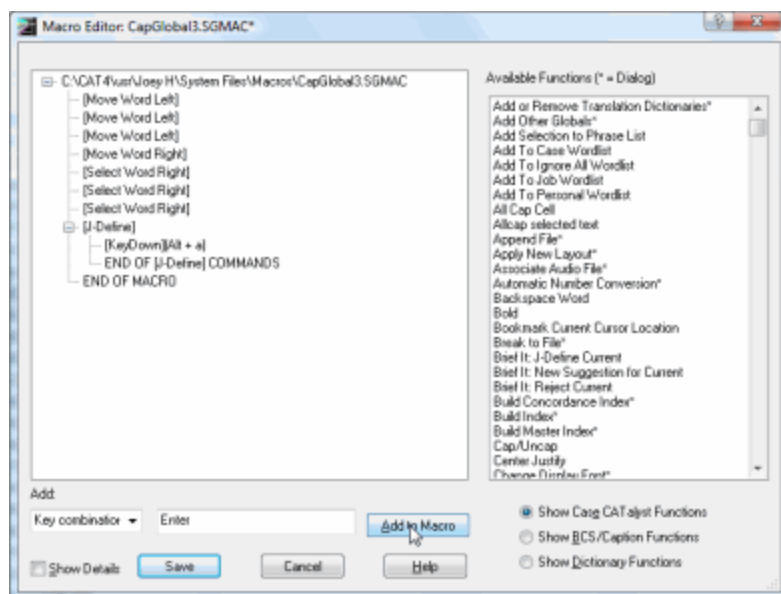

- Select **Key combination** from the drop down list. The position you highlight is remembered even though the highlight does not appear once you click in the Add field.
- Place the cursor in the command field to the right and press the key combination you want to add. The key combination displays in the field.
- Select **Add to Macro**. The key combination inserts after the line you highlighted.

If you did not highlight a line within a dialog, the following message displays; *In order to insert keystrokes onto a dialog in the macro, some part of the dialog needs to be selected.* Select a line within a dialog and select **Add to Macro**.

### Example

Continuing with the CapGlobal3 macro, you select **Key combination** from the drop down list.

With your cursor in the command field, you press **Enter** and then select **Add to Macro**.

The Enter command inserts after the line you highlighted, [KeyDown](Alt + a).

4. If necessary, add other key combinations, [text](#) or [functions](#). To remove a command, highlight the line and press **Delete**.
5. Press **Enter (Save)**. A confirmation message may display, depending on your save options. The Macro Editor dialog box remains open.
6. Select **Done** to close the Macro Editor dialog box.

### Add Text to an Existing Macro

1. Do one of the following:
  - From anywhere in Case CATalyst or CATalyst BCS, press **Alt + f, o, m (File/Open/Macro)**. The Open Existing Document dialog box displays with the Macros case open. Select the macro and press **Enter (Open)**.
  - In Manage Jobs, open the System Files case and then open the Macros case. Double-click a macro to open it.
2. In the Macro Editor dialog box, highlight the line within a dialog box that precedes the position where you want to insert the text. The text inserts after the highlighted item. You can insert text anywhere in the macro. You cannot insert text at the end of the macro.

Dialog boxes display with a plus sign if the view of the dialog box commands is collapsed or a minus sign if the view is expanded with the commands displayed in an indented list.

3. In the Add field:
  - a. Select **Text** from the drop down list. Text is the default. The position you highlight is remembered even though the highlight does not appear once you click in the Add Field.
  - b. Place the cursor in the command field to the right and type the text you want to add.
  - c. Select **Add to Macro**. The text inserts after the line you highlighted.
4. If necessary, add other text, [key combinations](#) or [functions](#). To remove a command, highlight the line and press **Delete**.

5. Press **Enter (Save)**. A confirmation message may display, depending on your save options. The Macro Editor dialog box remains open.
6. Select **Done** to close the Macro Editor dialog box.

## Mistran Minder

The Mistran Minder feature allows you to quickly find and fix (if needed) all occurrences of your personal mistranslates. Personal mistranslates are usually words that are valid words but not the word you want. An example of a personal mistranslate might be when you write the steno outline for *generally* but slightly misstroke it and get *gently*. Or when you write the steno outline for *except* but misstroke and get *exempt*. You simply create your unique list (words and/or phrases) of mistranslates (either by typing them in the [MistranMinderList](#) or using the [Send to Mistran Minder List](#) command while editing). For example, let's use the sample words listed before. The words were generally, gently, exempt and except which are all reasonable words you would find in a transcript. In your Mistran Minder List, on a separate line for each word, you type the word *gently*, *generally*, *exempt* and *except*. You save and close the Mistran Minder List file. When you have finished editing your transcript and are still in the file, select Mistran Minder from the Tools menu to see if any of the words in your Mistran Minder List occur in the transcript. Mistran Minder results display in the Search Results dialog pane and are underlined for easy identification. The Search Results pane allows you to scroll through the results which scrolls the transcript at the same time. You can double click an entry and immediately move to that location in the transcript.

The [MistranMinderList](#) applies to every job unless you create a case or job Mistran Minder list. There may be times you'd like to add unique mistranslates that are only occurring in a particular job or case. For example, let's say you are working on a job that you created a case for and you have taken 10 depositions already. There are a lot of case specific initials and acronyms in the jobs so there is the potential of some misstrokes. You can add the misstroked initials or acronyms to a Case Mistran Minder List rather than adding them to your System Files MistranMinderList which applies to all jobs. When you run Mistran Minder, the entries in the case Mistran Minder List only apply to the files in the case and it will continue to also look at your user specific Mistran Minder List as well. If you don't use cases but want to have specific words/phrases for a job, you can also send words to a Job Mistran Minder List.

Some users add their common mistran minder entries to their Homophone list. Using the [Cycle Homophones](#) feature, they can quickly switch to the correct word/phrase they desired. Using the examples from above, since "generally" and "gently" are two common misstrokes this the user, both words are in the user's Mistran Minder list and are also in the Homophone list as homophones of each other. So, when reviewing the Mistran Minder results, if the user comes across an occurrence of "gently" when it should have been "generally," the user invokes the Cycle Homophones command and quickly changes "gently" to "generally" without retyping anything.

If you are searching for a way to double check particular items that fall into a category, such as dates, you might want to use the [Search \(Ctrl + f\)](#) command, select Regular Expression (**Alt + r**), List Results (**Alt + L**) and then select Dates from the Regular Expression list.

If you select Mistran Minder from the Tools menu and you do not have any entries in the Mistran Minder List, the following message displays:

1. Do **one** of the following:

- a) Press **Enter** or click **Yes** to create a User Mistran Minder List. The following message displays:  
Go to Step 2.
  - b) Click **No**, to cancel creating a User Mistran Minder List.
2. If you select **Yes**, the following message displays, press **Enter** to continue.

3. Type each word or phrase on a separate line. For more information, see [Create/Add entries to the Mistran Minder List](#).

[Keyboard Map](#) Function:

- Mistran Minder
- Send to Mistran Minder List
- Send to Case Mistran Minder
- Send to Job Mistran Minder

## Send to Mistran Minder List

The Send to [Mistran Minder](#) List (User, Case, Job) is available from the Edit menu, the right click menu and are available for assignment in a keyboard map. While editing, you can position your cursor in front of a word or highlight multiple words, right click and select Send to Mistran Minder List and then select User, Case or Job. If you have assigned a key combination to the Send to Mistran Minder, Send to Case Mistran Minder or Send to Job Mistran Minder function in a keyboard map, press the key combination. The word or words are added to the appropriate MistranMinderList. The Mistran Minder List should not be open at the time you are editing and adding words.

1. While editing, position your cursor immediately before a word or highlight a phrase and do any of the following:
  - a) Press **Alt + e, m** (Edit, Send to Mistran Minder) or click the Edit menu, then Send to Mistran minder and do **one** of the following:
    - Press **u** to send the word/phrase to the User Mistran Minder List.
    - Press **c** to send the word/phrase to the Case Mistran Minder List.
    - Press **j** to send the word/phrase to the Job Mistran Minder List.
  - b) If you have assigned a key combination for Send to Mistran Minder List, Send to Case Mistran Minder or Send to Job Mistran Minder, press the appropriate key combination for the action you want.
  - c) Right click, press **m** (Send to Mistran Minder List) and then do **one** of the following:
    - Press **u** to send the word/phrase to the User Mistran Minder List.
    - Press **c** to send the word/phrase to the Case Mistran Minder List.

- Press **j** to send the word/phrase to the Job Mistran Minder List.
2. When appropriate, select press **Alt + t, i** (Tools, Mistran Minder) to check the transcript. Results display in the Search Results dialog pane.
  3. Once you have reviewed the results, you can close the Search Results dialog pane.

[Keyboard Map](#) Function:

- Send to Mistran Minder List
- Send to Case Mistran Minder
- Send to Job Mistran Minder
- Mistran Minder

## Options

Several Case CATalyst Edit options are available to help you customize certain editing features. Many Edit options can also be set from Manage Jobs by selecting Tools, Options and then Edit. You can also access Edit options by selecting Tools, Options and then All Options. All Options can be accessed by clicking the All Options () icon on the Standard toolbar.

## Pane Options

Pane Options submenu allows quick access to the following pane options: Brief It, Cat Scratch, Hotspots and Speaker List. These same options are also available by clicking the Options icon () on the respective pane's toolbar.

1. In Translate & Edit / Edit, select Tools, Options, Pane Options.
2. Select one of the following:
  - a. [Brief It...](#)
  - b. [Cat Scratch...](#)
  - c. [Hotspots...](#)
  - d. [Speaker List...](#)
3. Make any desired changes and click **OK** to save your changes.

## Themes...

Themes affect the display of the toolbar background color, open file tab colors, dialog pane margins and the format of the open file tabs. There are a variety of pre-made themes available. You can preview a theme by selecting a theme and then clicking the Preview button (Alt + p). The current theme name is displayed at the top of the dialog box.

To Access Themes...

- in Manage Jobs, Translate and Edit and Manage Dictionary, press **Alt + t, o, h** (**Tools/Options/Themes...**).
- anywhere in CATalyst, click the All Options icon () on the toolbar.

**To select a theme:**

1. From Manage Jobs or Translate and Edit, press **Alt + t, o, h** (Tools/Options/Themes...).
2. In the Themes dialog box, highlight a theme and do any of the following:
  - a. To preview the theme, press **Alt + p** (Preview).
  - b. To apply the current theme and close the Theme dialog box, press **Enter** (OK).
  - c. To close the theme box and keep your current theme, click **Cancel**.

**Auto Recover/Save Options**

Translate and Edit's Auto Recover feature, automatically saves transcript or dictionary changes to a temporary file every 30 seconds, by default, or whatever time increment you have selected. If you exit the transcript or dictionary abnormally (such as a crash or power outage), there will be an auto recovered copy of the transcript or dictionary in Manage Jobs. Simply double click the original dictionary name to open the recovered dictionary. Auto Recover Options determine whether or not Case CATalyst automatically creates a temporary file (text and/or dictionary) and makes a copy in the AutoArchive case if the option is selected. [Auto Save](#) saves the changes to the open transcript or dictionary every X seconds based on the time increment you have selected. No temporary file is created when using the Auto Save option. These settings affect both regular CATalyst translation and CATalyst BCS captioning. By default, the Auto Recover option is selected and set to 30 seconds.

Please note, if you do not use the Auto Recover or Auto Save feature for transcripts, no dictionary recover file will be created.

**You can access Auto Recover/Auto Save options:**

- from Manage Jobs. Press **Alt + t, o, e, r** (Tools, Options, Edit, Auto Recover).
- from Manage Jobs. Press **Alt + t**, click **All Options**, navigate to the **Edit** section and click **Auto Recover**. (Tools, All Options, navigate to the Edit section, Auto Recover).
- from the Standard toolbar, click the **All Options** icon (  ), navigate to the **Edit** section and click **Auto Recover**.
- from Edit. Press **Alt + t, o, r** (Tools, Options, Auto Recover).

**Auto Recover/Auto Save Options**

Make necessary entries. When finished, select **OK**.

**Use Auto**

---

Check this box to activate the Auto Recover or Auto Save option. You can only select one of the options to be active at a time. Click the option you want to use.

### Recover

Automatically save the transcript or dictionary to a temporary file at the specified interval. From the drop down list, select the frequency at which you want to automatically save the transcript or dictionary to the temporary file. If you exit the Edit file or dictionary abnormally, a recovered file is created with the most recent saved changes. To open the file with the most recently saved changes, simply double click the original transcript or dictionary file name. CATalyst opens the most recent recovered file and names it the original file name, renames the original file to filename\_Original#.sgnfl (# in the file name is for a unique name if necessary) and allows you to continue editing in the most recently saved changes transcript or dictionary file with all the associated subfiles. The following message displays when this process is successful:  
Transcript or Dictionary successfully recovered. Press Enter to continue editing in your recovered file.

Old file location: *path for the renamed original file*

For example, you have Auto Recover active, you are editing the Smith vs Jones 12-16-12 file and the power goes out. Twenty minutes later, you start Case CATalyst, you see the original file, Smith vs Jones 12-16-12 and you double click it. In the background, CATalyst renames the Smith vs Jones 12-16-12 (1) file to be Smith vs Jones 12-16-12 and renames the Smith vs Jones 12-16-12 to Smith vs Jones 12-16-12\_Original1. As a result, the Smith vs Jones 12-16-12 file with the most changes is opened and you can begin editing as usual (with all existing subfiles since you are continuing with the same original name).

If for some reason the CATalyst renaming function takes too long or the auto recovered file cannot be renamed, the following message displays:

Your file was successfully recovered but we are unable to complete the renaming process due to an error *error description*.

Press Enter to open your original transcript. Click Cancel to correct the issue and try again. The recovered file location: *path for the renamed recovered file*.

### Keep Auto Recover Files in Archive

When Use Auto Recover is selected, check this box to automatically save up to four copies of the transcript or dictionary file when you select an action at the Save Changes dialog box upon exiting a file. Case CATalyst automatically stores up to four copies of the transcript subfile (.sgnfl) or dictionary (.sgnfl) in the [AutoArchive](#) case when you select an action at the Save Changes prompt upon exiting Edit or Manage Dictionary. The AutoArchive case is created the first time you are prompted to save changes as you exit a file. Copies of the transcript subfile (.sgnfl) or dictionary subfile (.sgdct) are the only files saved.

Uncheck this box to not make a copy of the temporary file when you select an action at the Save Changes prompt. When you select No at the Save Changes prompt, all unsaved changes in the transcript/dictionary are lost.

For detailed instructions on recovering a transcript or dictionary from the AutoArchive Case, see the [AutoArchive Case](#) topic.

### Save

Automatically save changes to the transcript file at the specified interval but does not auto save a dictionary. If editing a dictionary and your option is Auto Save, if there is an abnormal exit, a recovery file is created. From the drop down list, select the frequency at which you want to automatically save the transcript. Changes are saved to the same file at the timed intervals. If you exit the file abnormally, reopen the same file. Since changes are saved to the same transcript file, there may be times when you select to exit a transcript file and you are not prompted to save changes because an automatic save was performed. If a lot of changes were made to the transcript file, you will not be able to exit without saving to "undo" all the changes.

### Archive File on Close

If you select Auto Save and select the Archive File on Close option, when you close a transcript or dictionary, a copy of the file will be saved in the AutoArchive case whether you selected to save or not save the file upon closing.

## Advanced Edit Options

Advanced Edit Options determine certain Edit settings. You can access Advanced Edit Options:

- in Manage Jobs. Press **Alt + t, o, e, a** (**Tools, Options, Edit, Advanced Edit**).
- in Edit. Press **Alt + t, o, a** (**Tools, Options, Advanced Edit**).

### Advanced Edit Options

To make a change, click an option. Depending on the field, make a selection from the drop down box, type an entry or use the Browse button. When finished with your changes, select **OK**.

The *Restore Default Settings* option returns all the Advanced Edit Options to their original Case CATalyst default selection.

### Search feature "restart from top" defaults to Yes

Set the default action for the cursor focus in the Search prompt, "Would you like to restart from the top of the document?" When Case CATalyst reaches the end of Edit file while performing a search, the prompt displays.

Select **Yes** to have the cursor focus on the Yes option in this dialog box. Pressing Enter continues the Search at the beginning of the file. Select **No** to have the cursor focus on the No option in this dialog box. Pressing Enter ends the Search. You can always click a choice when the prompt displays.

### Retain Steno when pasting

Select to include underlying steno or use only the text when cutting or copying text in Edit. If you need the timestamps for cut or copied text, include the underlying steno to retain the timestamps.

The Case CATalyst default includes the underlying steno with the cut or copied text. Select **Yes** to include the underlying steno; **No** to not include the steno; or **Ask** to have Case CATalyst automatically prompt to include the underlying steno.

### Default Internet search engine

Specify the Internet Search engine when using the [Internet Search](#) command. The Edit, Internet Search feature allows you to search the Internet for a word or series of words you highlight in the job.

Select a search engine from the drop down list. The list contains popular search engines and includes the Default IE Search Engine. The default uses the search engine specified in your Windows Registry. If Case CATalyst cannot locate the registry information, Google is used. International customers will likely want to select, Default IE Search Engine.

### Definition Search

Specify the search engine to use with the [Definition Search](#) command in Edit.

### Surround search phrase with quotes

Surround words and phrases with quotes for an Internet or Definition search. When using the Edit, [Internet Search](#) or [Definition Search](#) feature, Case CATalyst automatically surrounds the words in the Search field of the Search engine in quotes. Case CATalyst considers all the words together, narrowing the search.

Select **Yes** to use quotes. Select **No** to have words considered individually for the Internet Search. This broadens the scope of the search, increasing the possibility of identifying sites that contain only one of the words. The default is Yes.

### Keyboard Map Options

#### Default Keyboard map

Select the [keyboard map](#) that is active when Translate and Edit and Edit starts. Case CATalyst comes with the Default and CAT4 keyboard maps located in your System Files case. The Default keyboard map is not initially visible in the System Files case until it is opened by typing *default* in the File name field. You can create multiple keyboard maps.

The default setting uses the Case CATalyst Default keyboard map. Choose a keyboard map from the drop down list which displays customized keyboard maps located in your User System Files case. Use the Browse button to locate a keyboard map in outside your System Files case. For example, you are a scopist and work for six reporters. You use a customized a keyboard map, named MY KBD and want it active in every user. You open the Advanced Edit Options for each user and select the MY KBD keyboard map using the Browse button. When you make a change to the keyboard map, the change is available in all users.

#### Additionally Display Keyboard Maps located in

Select a keyboard map outside of your System Files case to add to the list of available keyboard maps while Editing. Available keyboard maps are accessible when using the *Change Keyboard Map* command and when you click the current keyboard map name on the Status bar in Edit.

Use the Browse button to add keyboard maps located outside of your System Files case. The path for the selected keyboard map displays in the field. For example, you have multiple users on your system. In your user name, you have several specialty keyboard maps and want them readily available when editing in your other users. Select your user System Files case as the location of the keyboard maps. The Keyboard Maps list display.

#### Keyboard to open when assigning recorded macros

When saving a recorded [macro](#) and the *Assign to key in keyboard map* option is active, you are immediately prompted to select a keyboard map for the macro's key combination assignment. If you always assign macros to the same keyboard map, you can designate a keyboard map to automatically open.

Choose a keyboard map from the drop down list which contains customized keyboard maps located in your System Files case. Use the **Browse** button to locate a keyboard map outside of your System Files case. For example, you have multiple user on your system and want to select a keyboard map from another user.

### Words to suppress capping when found in middle of phrase

Case CATalyst comes with a default list of articles and conjunctions to leave lower cased when using the Edit Cap/[Uncap](#) feature, the Cap command in a Global dialog box and the [Cap Previous](#) translation commands. You can specify articles or conjunctions that Case CATalyst should not initial cap when they occur in between a series of words that are initial capitalized, such as United States of America, State of the Union or Halls of the Senate. Case CATalyst does initial cap the article or conjunction when it occurs at the beginning of a phrase such as The Main Store.

Click the  button to display the Capitalization dialog box which contains the list of words Case CATalyst does not capitalize when using the Edit Cap/Uncap feature, the Cap command in a Global dialog box and the Cap Previous translation commands. To add a word to the list, click the New  button and type the entry in the field that displays. To remove a word from the list, highlight the word and click the Delete  button. Press **Enter (OK)** when finished to save the changes.

### Stitch characters in cycle order

Customize the character selection and cycle order of characters that separate characters when using the [Stitch](#) command. Type the punctuation in the order you want it to cycle when using the Stitch command. The default characters are hyphen, space and period.

### Stitch Spaces

The Stitch Spaces option allows you to select how a "space" is handled if a "space" is part of your Stitch characters in cycle order options. The available options apply to the "space" in your cycle order of the stitch command. Three options on handling a space are available and explained below:

- **<Sticky Space> and regular space** which means a <Sticky Space> format symbol will be inserted between the characters/words and if you cycle again, a regular space (no format symbols) will be inserted between the characters/words.
- **regular space** which means a "regular space" (no format symbols) will be inserted between the characters/words.

The default setting for the Stitch Spaces option is <Sticky Space>.

### Include Delete Space

The Include Delete Space option is the second option available for the Stitch command. If this option is set to Yes, then the very last cycle of the Stitch command will insert a <Delete Space> format symbol between the characters/words. For example, during the testimony the witness refers to WITC and it translates as W I T C. During editing you highlight W I T C and if a <Delete Space> was at the end of the stitch cycle, then the result would be WITC and Reveal Codes would show W<Delete Space>I<Delete Space>T<Delete Space>C.

The default setting for Include Delete Space option is No

### Hide Caption-specific format symbols

Caption specific format symbols are included in the Case CATalyst format symbol list. You can hide the captioning format symbols to reduce the number of format symbols in the list. If you are not using the CATalyst BCS optional software, selecting to hide the captioning format symbols hides the captioning format symbols in both the Edit and Dictionary format symbol list. If you are using CATalyst BCS and select to hide the captioning format symbols, the captioning format symbols are hidden in the Edit format symbol list but continue to display in the Dictionary format symbols list.

### **Redacted text displays as**

Select the appearance of [redacted](#) transcript text in Edit and Print, including PDF format. Redaction eliminates the display of sensitive text such as social security numbers but retains the integrity of the transcript. In other words, a transcript with redacted text matches line for line with the same transcript where there isn't redacted text. The Case CATalyst default is Black rectangle. From the drop down list, choose **Black rectangle**, **White space**, **Lines** and **X's**.

### **Remember last folder used for Save As**

Select **Yes**, the default, to have Case CATalyst remember the last folder in which you saved a file using the Save As function. Select **No** to use the folder location of the current file.

### **Stop audio when dialog opens**

Select **Yes** to suspend the audio playback while a dialog box is open and automatically resume playback when the dialog box closes. Select **No**, the default, to have the audio play continuously, regardless of an open dialog box, until you use the Stop Audio command.

### **Play Audio command starts/stops audio playback:**

Select **Yes** to press one key to play the audio and the same key to stop the audio playback. You can use the Play Audio keyboard map function, menu item or play audio icon to toggle between playing audio and stopping audio. The default setting for this option is No.

### **Cat Scratch scope**

Determine the availability of information in the Cat Scratch dialog pane. Choose one of the following:

#### **Case**

Items in the Cat Scratch pane are available for any job related to the case and the information is stored in the Case History. The default scope setting is Case. When the job is not in a case, the CAT Scratch information is available in the job and Case CATalyst creates a Username\_Case file.

#### **Job**

Items in the Cat Scratch pane are available for that job and the information is stored in the Job History.

#### **User**

Items in the Cat Scratch pane are available for any job in the current user and the information is stored in the User History, System Files\_Case.

### **Detect Caps Lock**

Select **Yes** to automatically turn Off Caps Lock and correct the typed word when it results with the initial letter lower case and the remaining letters upper case. This feature applies to text typed in the body of the transcript and in the Text field of dialog boxes. For example, the Caps Lock is On and you type, "rOBERT." Case CATalyst automatically corrects the word, changing it to "Robert" and turns Caps Lock Off. This setting applies to editing captioning files if you have BCS on your e-key.

### Autolink after selecting attachment

Select **Yes** to automatically link exhibit references and attachments to multiple locations in the transcript. The [Autolink Exhibits](#) dialog box displays after selecting an attachment which contains Autolinked exhibit information.

Select **No** to not Autolink the attachment. The Autolink Exhibits dialog box does not display. You can [manually link](#) the attachment at a later time if necessary.

### Match ending punctuation with inserted style

Select **Yes** to change the current ending paragraph punctuation to match that of inserted or globalled paragraph style. Select **No** to retain the current ending paragraph punctuation regardless of the paragraph style of the inserted or globalled text. The default is Yes.

### Use Enhanced Smart Punctuation

A Use Enhanced Smart Punctuation option has been added to the Advanced Edit options. When set to Yes, you are able to remove existing punctuation by typing the same Smart punctuation while continuing to be able to add or modify punctuation by typing the desired punctuation. Regardless of your cursor position, the action will take place at the end of a word and never in the middle. **This option may work best for those users that have transitioned from a previous CAT system that allowed you type the same punctuation to insert or remove it.** The default setting is set to No.

[Smart Punctuation](#) is designed to help reduce steps when typing and removing certain punctuation. When you press the selected keyboard command, Case CATalyst inserts the punctuation, preset spacing, and when appropriate, capitalizes the next word. Case CATalyst inserts only the amount of spaces needed for the selected punctuation. For example, the default Smart Punctuation setting for a period inserts two spaces after the period.

If the *Use Enhanced Smart Punctuation* option is selected, the following is an example of how it affects Smart Punctuation. For example, let's use the sentence: I believe so, yes, it was a home improvement store.

If your cursor is positioned immediately after the comma following the word 'yes' or immediately before the 'i' in the word "it", and you press comma (,) the results is: I believe so, yes it was a home improvement store. (The comma after the word "yes" is removed.)

If your cursor is positioned **in** the word "yes" and you type a period (.), then the result is: I believe so, yes. It was a home improvement store. (The comma after the word "yes" is replaced by the period, a space is added and the 'i' in 'it' is initial capped.)

To get the desired results with the Use Enhanced Smart Punctuation option, the option needs to be set to Yes and the punctuation you want to use needs to be assigned to "Smart" punctuation in the keyboard map being used. For example, period (.) needs to be assigned to Smart Period, question mark (?) needs to be assigned to Smart Question, etc.

#### **Valid punctuation:**

- Period
- Question mark
- Comma
- Semi colon
- Colon
- Exclamation mark

**NOTE:** If this option is set to Yes and you need to add punctuation in the middle of a word, you will need to use another method such as the Insert dialog box or switching to a keyboard map where the punctuation is not assigned to Smart Punctuation. In other words, the punctuation mark is defined as the punctuation and not Smart Period, Smart Question, etc.

When this option is set to Yes and you are typing into the cells of a table, make sure there is a new paragraph format symbol following the table.

### Reporter's dash removes punctuation

Reporter's Dash removes punctuation option, when set to Yes, means the Reporter's Dash (Ctrl + / by default) when inserted immediately after a question mark, period, comma, colon, semi colon or exclamation mark, the punctuation will be removed and the first letter of the word following is lower cased.

If you change the setting to No, when inserting the Reporter's Dash immediately after a question mark, period, comma, colon, semi colon, or exclamation mark ending, the dash will be inserted, the punctuation will **not** be removed and the initial letter of the word following the dash, if appropriate, will be lower cased. This setting also applies to the Surround with dash (Ctrl + = by default) command when there is punctuation. If the option is set to Yes, punctuation will be deleted. If the option is set to No, the punctuation will not be deleted. See examples below.

For example, let's say the questioner is asking a question and pauses long enough for the reporter to think the question is over, so the reporter writes a question mark but then immediately the questioner continues but with a change of subject. The following sentence is in the transcript:

Q. And there's what's her last name? She's 43.

If the *Reporter's Dash removes punctuation* option is set to Yes and you positioned your cursor before the "s" in She and pressed Ctrl + /, the result is:

Q. And there's what's her last name -- she's 43.

If you highlighted 'what's her last name?' and pressed Ctrl + =, the result would be:

Q. And there's -- what's her last name -- she's 43.

If the *Reporter's Dash removes punctuation* option is set to No and you position your cursor before the "s" in She and press Ctrl + /, the result is:

Q. And there's what's her last name? -- she's 43.

If you highlighted 'what's her last name?' and pressed Ctrl + =, the result would be:

Q. And there's -- what's her last name? -- she's 43.

**Note:** If you positioned your cursor after a colon (:) with two spaces and pressed Ctrl + /, the Reporter's Dash would be inserted and the colon will not be removed. If you positioned your cursor after a colon (:) followed by one space and press Ctrl + /, the Reporter's Dash would be inserted and the colon will be removed. The setting of this option has no affect on how the Reporter's Dash works when used after a colon.

### Cursor location after Inserting Text

When Before is selected (default setting) when you use the Insert Conflict/Text command (**Alt + e, i c**) while editing, once you type the text in the Insert Conflict/Text dialog box and press Enter, the conflict/text is inserted and your cursor is positioned **before the text you just inserted**. For example, let's say you open the Insert Conflict/Text dialog box, insert <Colloquy><Bold On>THE REPORTER: <Bold Off> and press Enter. By default, the cursor is positioned immediately before the <Colloquy>. If you find that the majority of the time you insert plain text using the Insert Conflict/Text command, you may want to always position the cursor after the inserted text. Select After to have the cursor positioned after the inserted conflict or text. Select one of the following:

- **After** to have the cursor positioned after the inserted text when using the Insert Conflict/Text command.
- **Before** to have the cursor positioned before the inserted text when using the Insert Conflict/Text command. This is the default setting.

### **Index Placeholder Assignments**

Index Placeholder Assignments allow you to create text and assign an index category to that text for situations that where the part of the text varies (where you might create a conflict) and is also indexed based on the selection. For example, if you need to mark exhibits by party (State's, Plaintiff's, Defendant's, etc.), you might want to use an [Index Placeholder Text format symbol](#) so you can pick the party name from the list and automatically have the correct indexing format symbols automatically inserted. The Index Placeholder format symbol is not limited to exhibits, some reporters use it in the sworn statement when it states that the witness is appearing on behalf of the State, Plaintiff, Defendant, etc.

The selected Index Placeholder text will apply to multiple adjacent paragraph styles of the same type including Continuation paragraph styles and New Line (not New Line Paragraph) that contain the Index Placeholder Text # format symbol. All other paragraph styles prevent the selection from automatically changing Index Placeholders in subsequent paragraphs. Adjacent paragraphs applies to the direction you are scanning. In other words, if you are scanning forward, the adjacent paragraphs are the paragraphs following the current paragraph. If you are scanning backwards, the adjacent paragraphs are before the current paragraph.

Click the [+] sign next to one of the nine Placeholder Index fields. Make necessary entries. You can have up to nine replacement names as indicated by the number in each Placeholder Index field.

#### **Placeholder Index (1 - 9)**

Select the index category to assign to the Placeholder text. For example, the first category of exhibits you mark is Plaintiff's exhibits and you typically use Index Heading On B and Index On B with Plaintiff's exhibits. Select B as the category.

If you assign an indexing category, Case CATalyst automatically assigns the category to the Index Heading # or Index # format symbols when you insert the replacement name into the job.

If you do not use automatic indexing, select None from the list. Assigning a category is optional.

#### **Placeholder Text (1 - 9)**

Double click or click the **Browse** button in the field next to Placeholder Text. The Enter Placeholder Text dialog box displays. Make necessary entries and then press **Enter (OK)**.

##### **Text**

Type the name of the placeholder text, e.g. Plaintiff's.

##### **FS**

Display the list of available [format symbols](#). To always display the format symbol list, check the box, Always Show Format Symbols. Double click the format symbol to insert. You can insert a format symbol at any point in the *Text* entry.

### Insert Field

Display the [Insert Field](#) dialog box from which you can select a field to insert into the *Text*.

## Brief It Options

Brief It is a translation feature that suggests conflict free brief forms for words and phrases that you write during a realtime job. When you write three or more steno strokes, Case CATalyst generates a brief form or reminds you of an existing brief form in one of your dictionaries (or your Personal Briefs file) and displays it in the Brief It dialog pane. You can write the suggested/reminder brief to reduce writing multiple stroke outlines.

[Brief It](#) options (Realtime Aid Options dialog box) contain certain customized settings that control how briefs are suggested, what briefs are displayed, where used briefs go, what steno characters are included/excluded in briefs and how briefs are displayed in the Brief It dialog pane during realtime. [Live Suggestions](#) options are also available in the Realtime Aid Options dialog box when selecting Brief It options. The Brief It and/or [Live Suggestions options](#) need to be selected on the Case CATalyst Translate Options [Realtime tab](#) in order for Brief It and/or Live Suggestions to be active. By default, the Brief It and Live Suggestions options are checked and active.

Brief It options affect both regular CATalyst translation and CATalyst BCS captioning.

Access Brief It Options:

- at Manage Jobs. Press **Alt + t, o, e, b** (**Tools/Options/Edit/Brief It**).
- at Manage Jobs or anywhere in Case CATalyst. Click the All Options icon () in the All Options dialog box select Edit Panes and then Brief It.
- at Manage Jobs. Press Alt + t, select All Options, in the All Options dialog box select Edit Panes and then Brief it.
- in Edit. Press **Alt + t, o, b** (**Tools/Options/Pane Options/Brief It**).
- in the Brief It dialog pane. Click the Brief It Settings  icon.

## Brief It Options

### Max Words Per Brief

Set the maximum number of words for a brief that Brief It suggests. Select between 1 and 10 words. For example, if the setting is 7 and you write "...first date you contacted Rockford Credit Union," a brief may be generated for the entire phrase. If the setting is 3, a brief might be suggested for "Rockford Credit Union." The default is 5.

This setting is also used when generating phrases for the [Case Prep](#) feature.

This option does not affect marking a phrase and using the Suggest a Brief command.

### Show Phonetic Steno

When selected, this option will change steno character combinations into the “phonetic” sound of the combined letters when offering a suggestion. The option simply changes the display of the steno characters and still keeps the normal Brief It logic. For example, let’s say you select the Show Phonetic Steno option and you write the phrase “large imbalances”, Brief It would display the suggestion as “LARJ” instead of “HRARPBLG.” Another example might be if you wrote “to the extent that” and Brief It offered “TO\*EX” instead of “TO\*EBGS”.

The Show Phonetic Steno option includes two options for words starting with Z and ending with X. The options are selected by default. If the SWR=Z option is selected, then suggested briefs for words/phrases starting with Z will display as Z. If the option is deselected, suggested briefs for words/phrases starting with Z will display as SWR. If you write SWR for the Z sound, then you most likely will leave the option selected. Since the initial Z sound can be written differently depending on the steno theory, if you write different steno for the initial Z, you may want to deselect the option. For example, let’s say the reporter doesn’t write SWR for the initial Z and the option is selected. During the job the name “Zimmerman” (STKEUPL/ER/PHAPB) is written several times and Brief It suggests Z\*IM. Since the reporter doesn’t write SWR for initial Z (the reporter writes STK for Z), the reporter automatically writes STK\*EUPL (not SWR\*EUPL) and the steno does not translate as Zimmerman because CATalyst is expecting SWR\*EUPL. The reporter can deselect the SWR=Z option and when a Brief It suggests a brief for a word/phrase starting with Z, the steno will display SWR instead of showing a Z.

With the BGS=X option selected, suggested briefs for words/phrases ending in the X sound will display an X. If the option is deselected, the suggested briefs for words/phrases ending in the X will display as BGS (KS). For example, let’s the reporter writes the word “hoax” several times or the reporter uses the Suggest a Brief command to get a brief suggestion. If the BGS=X option is selected, Brief It might display a suggestion using an X like HO\*X. If the BGS option is deselected, the suggestion might display as HO\*KS.

The Show Phonetic Steno option can be selected or deselect at any time. During realtime or in previous jobs, you can open the Brief It pane, then select Options and select or deselect the Show Phonetic Steno option to see the difference in how the suggestions display. The option also affects how steno outlines display in the Text/Steno section of the Cat Scratch pane.

While writing realtime with the Show Phonetic Steno option selected, Personal Briefs display the steno outline(s) as it appears in the Personal Briefs table. For example, if you have an entry such as “as a result of the accident” with the steno “SRUFBGS” that is how the steno will appear in the Brief It pane during realtime. If you close the realtime file and reopen it, the Personal Brief steno will display phonetically since the Personal Brief table is only used during realtime. For this example, when reopening the file, the steno for “as a result of the accident” will display as “VUFX”.

**Note:** If you decide to change the status of one or both of the Show Phonetic Steno options during a session, the already suggested briefs will not change/display the suggested steno differently.

### **Only Suggest 1 Stroke Briefs**

Check this box to have Brief It suggest only one stroke Suggested briefs. By default, Brief It always suggests a one stroke brief with the asterisk before suggesting a two stroke brief. Selecting this option also affects Reminder and Personal briefs. For example, you write “neurotoxicity” in 4 or 5 strokes. When this option is active, Brief It does not remind you that you have “TPHEOR/TOX” in your Personal Dictionary as a two stroke entry for “neurotoxicity.”

### **Write Twice to Define**

Brief It, by default, automatically creates a J-Define or a K-Define (Define to Case Dictionary) the first time you use a Suggested brief. Checking this box requires you to consecutively write a brief twice before Brief It creates a J-Define or K-Define. You may want to use this option to try a Suggested brief before making it a definition.

For example, Brief It suggests /A\*BT for "Abbott Labs." If the Write twice to Define option is active, you would need to write /A\*BT/A\*BT to have Case CATalyst create the define, /A\*BT for "Abbott Labs." Once defined, you write A\*BT for "Abbott Labs" for the remainder of the job. By default, this option is not active.

When you have the Write Twice to Define option selected and the Allow Double First Syllable option selected, if the suggested brief has two identical strokes, Brief It will behave as if "Write Twice to Define" option was not active. (In other words, you do not need to write the brief 4 times to use it.) If the brief is one stroke or is multiple (not identical) strokes, briefs will need to be written twice to be used.

### **Define to Case Dictionary**

Check this box to place a Suggested brief in the case dictionary once it is written. This is the default. If the current job is not in a case, then the brief is placed in the job dictionary.

### **Personal/Reminders Only**

Check this box to display only Reminder (shorter definitions in your Personal Dictionary) and Personal (entries in your Personal Briefs file) briefs in the Brief It dialog pane. Suggested briefs are not created. When using the Suggest a Brief, Transcript Brief It or Text List Brief It commands, Brief It only displays Reminders or Personal Briefs. When using Suggest a Brief and no Reminders or Personal Briefs are available, a message displays indicating that a brief cannot be suggested.

### **1 Stroke Reminders for 2 Strokes**

Check this box to have Brief It offer one stroke Reminders or Personal briefs when writing two stroke entries. For example, you write "you don't" in two strokes and there is a one stroke version in your Personal Dictionary. Brief It shows the one stroke brief as a Reminder. If Brief It finds two one stroke dictionary entries for the matching text, Brief It suggests the most frequently used matching one stroke entry. If the matching one stroke entries have been used the same many times, then Brief It suggests the matching one stroke entry with the least amount of steno keys.

### **Auto Open Brief It**

Check this box to automatically display the Brief It dialog pane when starting realtime. By default, this option is selected.

### **Send Used Briefs To Cat Scratch**

Check this box to automatically send a Suggested brief you use to the Steno/Text section of the [Cat Scratch](#) dialog pane.

### **Steno Include/Exclude**

Displays the Brief It Options table where you can [modify](#) the Require and Exclude entries. If you select Steno Include/Exclude, you will be prompted to save your changes and Brief It options open. The Require entry contains the steno character or steno combination that you want included in every Suggested brief Brief It generates. There is only one Require entry. By default, the asterisk (\*) is set as a required character.

Exclude entries contain steno characters or steno combinations to exclude from every Suggested brief. In other words, you can add steno characters or steno combinations that may be difficult for you to write or you don't want offered in a suggestion. You can have multiple Exclude entries.

### **Personal Briefs**

Display the Briefs.txt file where you can [create](#) and [modify](#) Personal brief entries. If you select Personal Briefs, you will be prompted to save your changes and the Realtime Aid Options dialog box will close and the Personal Briefs file will open. Personal briefs are brief forms you create which contain words and phrases along with the steno. These may be briefs received from magazines or another reporter which you did not want to put in a dictionary. Brief It does not use a personal brief that conflicts with dictionary entries.

### CommonWords

The CommonWords list contains words that prevents Brief It from suggesting a phrase that begins or ends with any word in the list. For example, let's say you write "after all was said" several times in the transcript but a brief is not suggested. If you look in the CommonWords list you see that all the words in the phrase are in the CommonWords list. Display the [CommonWords.txt](#) file in Notepad or WordPad to review, delete, add or [modify](#) entries. This file is also used for [Case Prep](#).

### Allow Briefs with Numbers

An Allow Briefs with Numbers option has been added to Brief It. Perhaps you have been in that court proceeding or deposition where Bates numbers or dollar amounts are repeated and you wished Brief It would give you a brief for those repeated number sequences. An additional option is available in the Steno Include/Exclude list, where a Required for Numbers entry is available. The Required for Numbers entry allows you to specify particular steno characters that will be included in the number brief suggestion. For example, let's say that the Required for Numbers entry is EU. You write 23925 several times throughout the transcript, Brief It might suggest 23EU9 incorporating the first, second and third numbers along with the required entry steno characters for numbers. By using the Required for Numbers entry, you will have a consistent steno outline with a suggested numbers brief. By default, EU is the steno assigned to the Required for Numbers entry in the Brief It Include/Exclude List. The Required for Numbers steno can be modified to fit your writing style or deleted so that no steno is required for numbers.

Brief It will remove the digits and use the normal Brief It logic for a suggestion and if no suggestion is found, Brief It will suggest a brief using up to 3 digits that were written in the order the digits were written (along with the required steno from your Brief It options) and if no suggestion is found, Brief it will continue to suggest numbers written in order with non-digit sounds or digits in any order with non-digit sounds.

By default, the following number/steno key combinations are excluded in the Brief Include/Exclude Options:

#1K, #2K, #3W, #4R, #6-R, #7-B, #8-G, #9-S

To prevent any number bar number from being suggested, press **Ctrl + i** and type **#** and press **Enter**.

### Allow Double First Syllable

Many reporters learned to brief speaker names and terminology by writing the first syllable of the name/terminology twice. For example, let's say the word "neurotoxicity" is used multiple times in the transcript. A reporter might write "neurotoxicity" as TPHUR/OE/TOBGS/EUS/TEU and since it is appearing multiple times in the job, the reporter might write TPHAO\*UR/TPHAO\*UR as a brief. The Allow Double First Syllable option has been added to the Brief It feature for those reporters that might want Brief It to offer the first syllable twice as a suggestion. When the Allow Double First Syllable option is selected, Brief It may offer the first syllable of the text (single word or phrase) written twice as the suggested brief. For example, the word "fluorescent" is used multiple times in the transcript. You write "fluorescent" in multiple strokes and Brief It suggests TPHRAOU/TPHRAOU. In other words, it suggests doubling the first syllable of the word "fluorescent."

When you have the Write Twice to Define option selected and the Allow Double First Syllable option selected, if the suggested brief has two identical strokes, Brief It will behave as if "Write Twice to Define" option was not active. (In other words, you do not need to write the brief 4 times to use it.) If the brief is one stroke or is multiple (not identical) strokes, briefs will need to be written twice to be used.

When this option is selected, it has the highest priority over other selected options for words and a later priority for phrases.

To select or deselect the Allow Double First Syllable option, do any of the following to display the Realtime Aid Options dialog box:

- At Manage Jobs, select Tools, Options, Edit, Brief It.
- During realtime, click the Options icon on the Brief It toolbar.
- Select Tools, Options, Pane Options, Brief It...

**PLEASE NOTE: If you do not want the asterisk (\*) as a part of any double first syllable brief suggestions, you need to put the asterisk in as an exclude stroke in the Steno Include/Exclude table. Excluding the asterisk means that asterisk will not be a part of any brief suggestion.**

## Live Suggestions

### Insert Oops when replacing with a live suggestion

By default, when you select to replace an untranslate and/or text with a Live Suggestion, an [Oops](#) format symbol (Oops-10 category) is inserted into the transcript at the location of the replacement. If you use the [Hotspots](#) pane, you can display all locations of the Oops format symbols in the transcript or you can set your [Scan For](#) options to stop on Oops format symbols. If you do not want the Oops format symbol inserted when replacing an untranslate and/or text with a Live Suggestion, deselect this option.

If you define an untranslate and/or text with a Live Suggestion, the Oops format symbol is not inserted into the transcript at the location. The define will be in the transcript's Global Table.

### Number of suggestions

By default, up to three Live Suggestions will display in the Brief It pane. You can adjust the number of suggestions that display from 2 to 5. To make a change, use the up/down arrows to increase or decrease the amount of Live Suggestions that display for a particular untranslate.

### Dictionary Defines go to:

Select the destination dictionary you want a defined suggestions to go to when using the Define With LS1 - LS5 commands. When this option is set to Case dictionary, if the transcript is not in a case, the destination dictionary is the job dictionary. When defining a Live Suggestion, the global is applied to the entire file. When defining with a Live Suggestion, the definition is placed in the transcripts Global Table in addition to the respective dictionary. If your [Dictionary Options](#) are set to have D-defines go to the Update Area, then if this option is set to Personal Dictionary, the Live Suggestion definitions will go to the Update Area.

### Show "translated" text as first Live Suggestion

By default, this option is active and Drag/Drop, Suffix Drag/Phrase Maker and phonetic translated text will be the first choice in the Live Suggestions list (and Quick Suggest). If Spell Check thinks the "translated" text is misspelled and this option is selected, the misspelled translation will not be offered as the first suggestion. If you do not want the Drag/Drop, Suffix Drag/Phrase Maker or phonetic "translated" text offered in the Live Suggestion and Quick Suggest list, deselect this option.

### Live Suggestions Favor

By default, the Live Suggestions feature is set to Balanced. Depending on many factors, you may want to adjust the Live Suggestions Favor option. For example, let's say you have a very fast computer and you want to improve the quality of your Live Suggestions, you may want to try the Quality setting. Or, let's say your realtime is a little sluggish on your old notebook, you may want to try the Speed setting to reduce the time Live Suggestions looks for suggestions.

- **Quality**  
Quality settings are set to spend up to 5 seconds looking for suggestions and will wait up to 5 steno strokes before ending the search for suggestions.
- **Balanced**  
Balanced is the default setting with settings to spend up to 2 seconds looking for suggestions and will wait up to 3 steno strokes before ending the search for suggestions.
- **Speed**  
Speed settings are set to spend up to 1 second looking for suggestions and will wait up to 3 steno strokes before ending the search for suggestions. If you are running Case CATalyst on older hardware and your realtime is a little sluggish and you want to use Live Suggestions, you may want to try this setting.

### Contraction Rules

The [Cycle Contraction](#) command expands a contraction into whole words and contracts whole words into a contraction. Expansion and contraction rules determine how the Cycle Contraction command handles the expansion and contraction of words. You can modify these rules.

Expansion rules determine how a contraction becomes two words. As an example, the expansion rule for the apostrophe d ('d) contains the words "would" and "had." The Cycle Contraction command presents the words "would" and "had" when expanding a contracted word ending in 'd. If you used the Cycle Contraction command on the word "you'd" it cycles through "you would" and "you had."

Contraction rules determine how two words become a one word contraction. As an example, the contraction rule for the word "had" contains, apostrophe d ('d). The Cycle Contraction commands uses the "'d" when making two words into one contracted word. If you used the Cycle Contraction command on the words "she had," it presents "she'd."

You can specify exceptions to the rules. The Contraction Rule dialog box, by default, contains two exceptions to the rules. For example, there is a rule for the word "us" and to have it only contract when preceded by the word "let" to make the word "let's." In another example is a rule that correctly cycles "will not" to "won't" but never to "willn't."

Access Cycle Contraction Rule dialog box:

- in Edit. Select **Tools/Options/Contraction Rules**.
- in Manage Jobs. Press **Alt + t, o, e, c** (**Tools/Options/Edit/Contraction Rules**).

### Contraction Rules

Create or modify a contraction rule:

1. On the Contraction Rules tab, do one of the following to create or modify a rule. If you want to remove an entry from the list, highlight it and click the Delete icon.
  - Click the New icon to create a new rule.
  - Double click an entry to modify an rule.

2. The Edit Contraction Rule dialog box displays. Make necessary entries:

### Root Word

Type the whole word of the contraction. For example, if adding the contraction “not” you would type “not” (without the quotes).

### Contracted from

Type the abbreviated version of the root word. For example, using the root word “not,” type “n’t”.

3. Press **Enter (OK)** to complete the entry and close the Edit Contraction Rule dialog box.
4. Press **Enter (OK)** to save the entry or create an Exception or Valid Precedent for the entry. Do one of the following:

### Exceptions

Use Exception when there is an exception to the contraction rule for a specific word.

- a. Click the **Exception** radio button.
- b. In the Exception text box, click the New  icon. The Edit Contraction Exception dialog box display.
- c. In the *Exception Text* field, type the root word that, when combined with the contraction, forms an unexpected word. For example, when “will” and “not” contract, the correct contracted form of the word is “won’t” not “willn’t.” You type the root word “will” (without quotes).
- d. In the *Cycle to* field, type the correct contracted word. Using the previous example, you type “won’t” (without quotes).
- e. Press **Enter (OK)** to complete the entry and close the Edit Contraction Exception dialog box.
- f. Press **Enter (OK)** in the Cycle Contraction Rules dialog box to save the entries.

### Valid Precedents

Use Precedents when there is an exception to the contraction rule because it is only used as a contraction when a specific word precedes it, such as “us” contracting to “s” only when preceded by “let.”

- a. Highlight an entry and click the **Valid Precedent** radio button.
- b. In the Exception text box, click the New  icon.
- c. In the blank field, type the word that precedes the contraction. Using the same example, type the word “let” (without quotes).
- d. Press **Enter** to complete the entry.
- e. Press **Enter (OK)** in the Cycle Contraction Rules dialog box to save the entries.

## Expansion Rules

Create or modify an expansion rule:

1. On the Expansion Rules tab, do one of the following to create or modify a rule. If you want to remove an entry from the list, highlight it and click the Delete icon.

- Click the New icon to create a new rule.
  - Double click an entry to modify an rule.
2. The Edit Expansion Rule dialog box displays. Make necessary entries:

#### Contraction

Type the contracted form of the word. For example, if adding the contraction “not” you type “n’t” (without quotes).

#### Expansion

Type the whole word the contraction represents. Using the previous example, you type “not” (without quotes). To add additional root words, click the New icon and type the new word and press **Enter**.

3. Press **Enter (OK)** to save the entry or create an Exception or Valid Precedent for the entry. Do one of the following:

#### Exceptions

Use Exception when there is an exception to the expansion rule for a specific word.

- a. Click the **Exception** radio button.
- b. In the Exception text box, click the New  icon. The Edit Contraction Exception dialog box display.
- c. In the *Exception Text* field, type the contracted form of a word. For example, you want to create an exception for the expansion rule to expand "can't" to "cannot" instead of "can not." Type "can't" (without quotes).
- d. In the *Cycle to* field, type the words the expansion of the contraction represents. Using the same example, type “cannot” (without quotes).
- e. Press **Enter (OK)** to complete the entry and close the Edit Contraction Exception dialog box.
- f. Press **Enter (OK)** in the Cycle Contraction Rules dialog box to save the entries.

#### Valid Precedents

Use Precedents when there is an exception to the expansion rule when a specific word precedes it the contraction.

- a. Highlight an entry and click the **Valid Precedents** radio button.
- b. In the Exception text box, click the New  icon.
- c. In the blank field, type the word that precedes the contraction.
- d. Press **Enter** to complete the entry.
- e. Press **Enter (OK)** in the Cycle Contraction Rules dialog box to save the entries.

### Fill In Timestamps

Fill In Timestamps is an Edit option that allows you to generate timestamps for lines without timestamps, such as lines in an include file or typed text. When Fill In Timestamps is active, Case CATalyst automatically generates timestamps for five lines or less using the timestamp closest to the typed lines or include file. For example, if you bring in a three line include file, generated timestamps

display for the included file. If you include a title page, Case CATalyst does not generate timestamps because it contains more than five lines.

Timestamps generated using the Fill in Timestamps option become part of the file. They display in the file and are included when you print the file, create an ASCII or print a compressed transcript. To retain generated timestamps in the file, the Fill In Timestamps option must remain selected.

To remove the timestamps from a file, deselect the Fill in Timestamps option. Case CATalyst removes the generated timestamps and they no longer display in the file, print, or can be included in an ASCII or Compress Print.

## Fill in the Timestamps

1. In Edit, press **Alt + t, o** (**Tools/Options**). The Edit options menu displays.
2. A check next to the feature indicates it is active. No check mark indicates it is inactive. If no check mark displays next to the Timestamp feature, press **i** (**Fill In Timestamps**) to select it. Case CATalyst closes the Options menu and activates the feature.

## Global Options - Advanced

Advanced Global Options determine the selection of certain settings used when making defines in Edit. These settings affect both regular CATalyst translation and CATalyst BCS captioning. You can access Advanced Global Options:

- in Manage Jobs. Press **Alt + t, o, e, g** (**Tools/Options/Edit/Global**).
- in Edit. Press **Alt + t, o, g** (**Tools/Options/Global**).
- in Edit. Press **Alt + t, o, g** (**Tools/Options/Intuitive Replace**).
- in Edit from the Global Define dialog box. Select **Options**.

## Intuitive Replace Options

To make a change, click an option. Depending on the field, make a selection from the drop down box or type an entry. When finished with your changes, select **OK**. The *Restore Default Settings* option returns all the settings in the Advanced Global Options dialog box to their original default selection.

### Intuitive Replace Active in    Replace and all defines    Only in Replace    Disabled

Determine when Intuitive Replace suggests a word when you Replace or Define words in Edit. Suggestions are based on previous replacements and defines. Choose one of the following:

#### Replace and all Defines

Suggest a replacement word in the New Text field of the Global Define dialog box for a Replace or any type of define.

#### Only in Replace

Suggest a replacement word in the New Text field of the Global Define dialog box for Replace only.

#### Disabled

Make no suggestions for the text in the Old Text field of the Global Define dialog box.

**Intuitive Replace shows suggestions only if old text was previously replaced    Yes No**

Select **Yes** to suggest a replacement word in the New Text field only if the word was previously replaced. Select **No** to not have suggested replacement words. You can toggle through previous replacements by pressing Ctrl + r with the cursor in the New Text field.

**If New Text is empty, show currently selected text    Yes No**

If you have text selected (marked) and based on your Intuitive Replace options, the field would be empty, selecting Yes would put the currently selected text in the *New Text* field. If you want the New Text field to remain empty and not be populated by the selected text, select No. The default setting for this option is No.

**Scope of Intuitive Replace    User/ Case/ Job**

Determine when to apply the replacement for Intuitive Replace. Select one:

**User**

Intuitive Replace is active in all jobs, remembering and suggesting all replacements made in any User job.

**Case**

Intuitive Replace is active across jobs in a case, remembering and suggesting all for jobs in the same case. When Case is selected and you are editing jobs that are not in an existing case, Intuitive Replace treats the scope as a User. A new case with the User name, *username\_Case.ini*, is created to store the Intuitive Replace information.

**Job**

Intuitive Replace is active only for the current job, remembering and suggesting replacements for the open job.

**Expiration (in months)**

Designate the number of months that eligible Intuitive Replace entries must remain unused before identified as expired and automatically deleted. The expiration timer for an entry starts from the time the entry was last used.

The scope of an Intuitive Replace entry determines eligibility. All entries with an Intuitive Replace scope of *User* are deleted. Expiration does not apply to entries with a scope of *Job* or with a scope of *Case* when the entry is located in a Case. If an entry with a scope of *Case* is not located in a Case, then expiration applies. For example, the scope for an entry is set to Case. You do not create a Case for the *Anderson040511* job and Edit without one. Since no Case exists, the Intuitive Replace entries are not placed in a Case and the expiration applies.

**Control + R displays last number of replacements    10**

Pressing Ctrl + r cycles through the last text replacements when the cursor is in the *New Text* field of the Global dialog box. The default cycles through the last 10 text replacement. To change the number of replacements, type a number.

Intuitive Replace remembers the last three replacements for the same word and adds them to the replacement cycle before other replacement cycle words. For example, Intuitive Replace remembers the words "too," "to" and "tote" for the word "to" and displays them before other words in the cycle list.

## Advanced Global Options

To make a change, click an option. Depending on the field, select a choice from the drop down box or type an entry. When finished with all your changes, select **OK**. The *Restore Default Settings* option returns all the settings in the Advanced Global Options dialog box to their original default selection.

### **Apply dictionary defines to included text**

Select **Yes** to have all the Global Table's D, J, and K-defines apply to included, appended, multi-file appended and merged text. The globals apply from the point of the include, appended or merge text to the end of the file. E-defines (which are not dictionary definitions) always apply to included, appended, multi-file appended and merged text regardless of the status of the "Apply E-defines to typed-in text" option. The default setting for this option is No.

### **Apply E-Defines to typed-in text**

Select **Yes** to apply [E-define](#) globals to text that is typed, inserted via EZ Text, Text/Conflict dialog, Cat Scratch, replaced, pasted and resolved conflicts. For example, you often mistype the word "and" as "adn". You E-define "adn" to be "and". The next time you type "adn" and press **Spacebar** to apply the E-define "adn" to "and". This example could also be a [Personal Global](#) entry. An E-define applies only to words that contain the exact characters of the definition. Using the previous example, the E-define would not apply to the typed word "ad nauseam".

If this option is not selected and you E-define a word/phrase to be a conflict where the original word/phrase is a choice of the conflict, throughout the transcript you will be allowed to select any choice in the conflict. If the Apply E-Defines to typed-in text is selected and you E-define a word/phrase to be a conflict where the original word/phrase is a choice of the conflict, you will only be able to select conflict choices that are not the original word/phrase. For example, the word *your* translates and you E-define "your" to be ^ your ^ you're. If the option is deselected, you will be able to select conflict choice 'your' or 'you're'. If this option is active, you will only be able to select conflict choice 'your' in this file unless you open the Global Table and delete the conflict global.

### **Use Personal Globals    Yes No**

Select **Yes** to automatically correct mistyped words while editing using the [Personal Globals](#) table. A default Personal Globals table, located in your System Files case, contains common mistyped words with the correctly spelled equivalent. You can insert new and modify existing entries in your Personal Global table.

### **Remember selected options for E-Defines    Yes No**

Select **Yes** to retain the *Entire File*, *Case Sensitive* and *Selective* settings in the Global Define dialog box when making an E-Define. The Global Define dialog box opens with the settings used in the previous E-Define. Select **No** to always return the options to the default settings after making an E-Define.

### **Remember selected options for D-Defines    Yes No**

Select **Yes** to retain the *Entire File* and *Selective* settings in the Global Define dialog box when making an D-Define. The Global Define dialog box opens with the settings used in the previous D-Define. Select **No** to always return the options to the default settings after making an D-Define.

### **Remember selected options for J-Defines    Yes No**

Select **Yes** to retain the *Entire File* and *Selective* settings in the Global Define dialog box when making an J-Define. The Global Define dialog box opens with the settings used in the previous J-Define. Select **No** to always return the options to the default settings after making an J-Define.

**Remember selected options for K-Defines    Yes No**

Select **Yes** to retain the *Entire File* and *Selective* settings in the Global Define dialog box when making an K-Define. The Global Define dialog box opens with the settings used in the previous K-Define. Select **No** to always return the options to the default settings after making an K-Define.

**Remember selected options for O-Defines    Yes No**

Select **Yes** to retain the *Entire File* and *Selective* settings in the Global Define dialog box when making an O-Define (Other Dictionary). The Global Define dialog box opens with the settings used in the previous O-Define. Select **No** to always return the options to the default settings after making an O-Define.

**Generate Misstrokes for D-Defines    Yes No**

Select **Yes** to retain the *Generate Misstrokes* setting in the Global Define dialog box when making an D-Define. The Global Define dialog box opens with the setting used from the previous D-Define. Select **No** to always return the option to the default setting after making an D-Define.

**Generate Misstrokes for J-Defines    Yes No**

Select **Yes** to retain the *Generate Misstrokes* setting in the Global Define dialog box when making an J-Define. The Global Define dialog box opens with the setting used in the previous J-Define. Select **No** to always return the option to the default setting after making an J-Define.

**Generate Misstrokes for K-Defines    Yes No**

Select **Yes** to retain the *Generate Misstrokes* setting in the Global Define dialog box when making an K-Define. The Global Define dialog box opens with the setting used in the previous K-Define. Select **No** to always return the option to the default setting after making an K-Define.

**Generate Misstrokes for O-Defines    Yes No**

Select **Yes** to retain the *Generate Misstrokes* setting in the Global Define dialog box when making an O-Define (Other Dictionary). The Global Define dialog box opens with the setting used in the previous O-Define. Select **No** to always return the option to the default setting after making an O-Define.

**Remember last O-Define Browse location    Yes No**

Select **Yes** to retain the last *Pick Other Dictionary* path in the Global Define dialog box when making an O-Define (Other Dictionary). The Global Define dialog box opens with the setting used in the previous O-Define. Select **No** to always remember the default setting after making an O-Define. Set a default folder by making an entry in the *O-Define browse location* field.

**O-Define browse location**

Select the default folder location for the job dictionary when making an O-Define (Other Dictionary). This option is only available when the option, *Remember last O-Define Browse location*, is set to No.

**Open Global Dialog with Suggestions    Yes No**

Select **Yes** to automatically display a list of up to ten [suggested](#) text definitions for the steno in the *Steno* field when the Global Define dialog box opens. This option does not apply to E-Defines or Replace.

Select **No** to manually display the list by selecting *Suggest* in the Global Define dialog box. If you are using macros or AccelerWriters to open a Global Define dialog box, do not select this option. Use a key combination, such as, Alt + u (Suggest), to manually display the suggestion list. The default setting is No.

#### **Add Other Globals go to dictionaries    Yes No**

When using the [Add Other Globals](#) feature, all selected D, J and K-defines are added to the current Global Table and added to the respective dictionary. If you would only like the selected defines to go to the current Global Table, select No. The default setting is Yes.

#### **Open Global Dialog when no Quick Suggest available    Yes No**

When using the [Quick Suggest](#) feature, if a suggestion cannot be generated, a *No Suggestions were found* message displays. If, rather than having the No Suggestion message display, you want the J-define Global dialog box to display, select Yes. The default setting is No.

Please note: The Quick Suggest feature is not available while editing a voice produced transcript.

## **Include Options**

Include options determine certain settings when using the [Include](#) feature. Set the folder location from which to select a file and determine how to apply the page layout for the included file.

Access Include options:

- in Manage Jobs. Press **Alt + t, o, e, i** (**Tools/Options/Edit/Include**).
- in Edit. Press **Alt + t, o, i** (**Tools/Options/Include**).

## **Include Options**

To make a change, click an option. Depending on the field, make a selection from the drop down box, type an entry or use the Browse button. When finished with your changes, select **OK**. The *Restore Default Settings* option returns all the Advanced Edit Options to their original Case CATalyst default selection.

### **Remember Bring Layout setting**

The default setting of **Yes** has Case CATalyst remember the status of *Bring Layout* field along with the state of the Keep Inc (Include) File Page Numbering and Keep Orig (Original) File Page numbering options and will retain the settings the next time the selected include file is included. For example, you include your Title page and check the *Bring Layout* box. You then include your Mark Exhibit file and do not check the *Bring Layout* box. Case CATalyst remembers that *Bring Layout* is checked for the Title page and unchecked for the Mark Exhibit. The next time you Include the Title page, Case CATalyst displays the Included dialog box with *Bring Layout* checked. The next time you Include the Mark Exhibit file, Case CATalyst displays the Include dialog box with *Bring Layout* unchecked. If you do not want CATalyst to remember the state of the Bring Layout option, set this option to **No**. The default setting is Yes.

### **Remember last include folder**

Select **Yes** to have Case CATalyst remember the last folder location from which you selected an Include file. The next time the Include command is used, the Include dialog box defaults to the last folder location. Select **No** to have Case CATalyst always default to the current user folder unless you choose a different default location, by selecting Yes in the *Use default include folder* field and identifying a location in the *Default Include Folder* field. The default is Yes.

### Use default include folder

Select **Yes** to choose to a default location from which you select Include files when using the Include command. You must also identify the location in the *Default Include Folder* field. For example, if you work in a network environment, you have one location to store all the Include files for reporters and scopists to share. Select Yes and then identify the location in the Default Include Folder field. Select **No** to not use a default folder. Case CATalyst always defaults to the current user folder.

This option is only available when the *Remember last include folder* option is set to No.

### Default Include Folder

This option is only available when the *Remember last include folder* option is set to No. Click the Browse  button to select the default folder that the Include command automatically opens. The setting is remembered until you change it.

## Field Options

Field Options determine how Case CATalyst handles certain parameters when working with fields.

Access Field Options:

- in Manage Jobs. Press **Alt + t, o, e, f** (**Tools/Options/Edit/Field**).
- in Edit. Press **Alt + t, o, f** (**Tools/Options/Field**).
- in Edit. From the Speaker List dialog pane, click the Settings  icon. From the Choose Speaker List Fields dialog box, click **Options**.

## Field Options

To make a change, click an option. Depending on the field, make a selection from the drop down box, type an entry or use the Browse button. When finished with your changes, select **OK**. The *Restore Default Settings* option returns all the Advanced Edit Options to their original Case CATalyst default selection.

### Time separated by

Determine how to format the time in Time fields, such as [!Static Time] or [!Current Time]. Select **None**, **Colon (:)** or **Period (.)**. The default setting is Colon (:). Select None to the time display without a separator, for example, when using the Static Time - 24 Hour predefined field.

### Time display morning/afternoon

Fields that indicate time are followed by the morning or afternoon designation. Select the format to display with or without periods. The default is a.m./p.m., with the periods.

### Fill-In-Field in current user

Select **Yes** to open the Fill-In-Field List in the current user when using the Scan and Fill in Fields command or when double clicking a List Group field. Select **No** to open the Fill-In-Fields list from another location. You may want to use another location in a network environment when all users share a Fill-In-Fields List. Specify the path for the alternate location in the *Fill-In-Field path* field. The default is Yes.

### Fill-In-Field List path

This option is only available when the *Fill-In-Field in current user* option is set to No. Click the Browse  button to select the location of the Fill-In-Fields List. The setting is remembered until you change it.

### Fill-In-Field cursor location in

Set the default position for the cursor when opening the Fill in Fields dialog box. Place the cursor focus in either the **Field Value** text box or the **Select List**. Having the cursor location in either field allows you to quickly locate an entry by typing the first few letters. If the cursor is in the Select List section, capitalization of entries is ignored. Field Value is the default location.

### Retain Fields when Pasting

Select **Yes** to retain the field value and functionality of fields when pasting cut or copied text containing fields. Select **No** to paste fields as plain text without field functionality. The default is No.

### Sort attorney names using Attorney Sort column

Select Yes to display attorney names last name first in the [Fill In Field](#) dialog box for easy selection. Case CATalyst inserts the name into the transcript as it appears in the Attorney field of the [Fill-In-Fields List](#). For example, in the Fill-In-Fields List, you have the Attorney field entry as Jessica M. Sordillo. In the Attorney Sort field it displays as Sordillo, Jessica M. The name is inserted into transcript as Jessica M. Sordillo.

Yes is the default. When this option is active, the cursor focus defaults to the Select List section of the dialog box. Case CATalyst displays (*Attorney Sort Active*) in the Fill in Field dialog box when this option is set to Yes.

You may want to review entries in the Fill-In-Field List to make sure the names are sorted correctly when using this option. There may be occasions where Case CATalyst cannot properly sort the name. For example, you have an attorney JOHN VAN DEN TILLAAR listed in the Attorney field. Case CATalyst sorts the name as TILLAAR, JOHN VAN DEN because it does not know "Van Den Tillaar" is the entire last name. Modify the Attorney Sort field to reflect the correct sorting order, VAN DEN TILLAAR, JOHN. Case CATalyst ignores certain suffixes when filling in the Attorney Sort field, such as Jr., Sr. and Esq.

### Common Speakers

Specify default [EZ Speaker](#) names, those that do not change from job to job, to display in the [Speaker List](#). Common speakers, for example, might be THE BAILIFF, THE CLERK or THE WITNESS. The Speaker List allows you to easily insert speaker names into a transcript in Colloquy or By Line format. You can add job specific speaker names to the Speaker List before translating or during Edit.

Click an EZ Speaker and type a new name or modify the name in the field on the right. Click the down arrow to display the color pallet and click a color. The speaker name displays in the transcript with the selected color.

## Intuitive Replace

Intuitive Replace suggests a word in the New Text field of the Replace or Define dialog box when you replace or define a word. For example, you Replace the word "buy" with the correct word "by". The steno outline is correct for the word "buy" but you need to use the word "by" in this occurrence. The next time you Replace the word "buy", the word "by" displays in the New Text field of the Replace dialog box. Set Intuitive Replace to suggest for any words you Replace or Define, only for words when using Replace or only for words previously replaced.

When you replace a word not previously replaced, the last word replaced displays in the New Text field. Cycle through the last ten replacement words by pressing **Ctrl + r** with the cursor in the New Text field. Press **Ctrl + Shift + r** to cycle backwards through the selection. The default number of available replacement words when you press Ctrl + r is 10. You can change the default number in [Global Options](#).

Depending on the option selected, you can have Intuitive Replace suggest replacements made in any User job; only for jobs in the same case; or only within an individual job. When Intuitive Replace is active for all jobs in a User, Case CATalyst stores the replacement words in the System Files\_Case.ini. This file is located in the System Files case. When Intuitive Replace is active in a case, the words are stored in the Case History (*casename\_case.ini*) file. If Case is selected without cases being used, Case CATalyst creates a new case with the User name, *username\_Case.ini* to store the Intuitive Replace information. When you select to have Intuitive Replace active only in a job, the words are stored in the Job History (*jobname.sgxml*) file. You can view the Intuitive Replace list.

[Intuitive Replace Options](#) determine when suggestion are made in the New Text field based on the type of Global define and in type of jobs the feature is active.

### Orphan Control Options

Orphan Control Options is an Edit option that allows you to specify characters or text to display on lines normally left blank when using the [Orphan Control format symbol](#). For example, you have an examination include file that contains an Orphan Control format symbol to prevent the examination and speaker name from being separated on two pages. The Orphan Control format symbol creates two blank lines in the transcript by moving the examination to the next page.

### Set the Orphan Control Options

1. Press **Alt + t, o, o** (**Tools/Options/Orphan Control Options**). The Orphan Control Options dialog box displays.
2. Make necessary entries:

#### **Show character/text on empty lines created by Orphan Control**

Check the box and type the text that indicates the lines are intentionally left blank. Case CATalyst inserts specific text on the blank lines, such as three slashes (///), to indicate the lines are intentionally left blank as required by some jurisdictions.

#### **Use font and margins from paragraph style**

Select a paragraph style to control the margin, justification and font style when using Orphan Control.

3. Press **Enter (OK)**.

### Plural Endings Options

Plural Endings Options is an Edit option that allows you to use the final S, final Z or both for plural endings when the [Suffix Drag](#) translate option is active. The Plural Options are also used when selecting the [Endings button](#) in a Global dialog box. The Plural Options are also used when selecting the [Endings button](#) in a Global dialog box.

Suffix Drag translates steno outlines that would result in an untranslate if a dragged letter, -G, -S or -D is stroked. For example, you write the word "paper" as PAEUP and "papers" as PAEUP/-S. If you accidentally wrote PAEUPS all in one stroke and had the Suffix Drag option selected, the result would be "papers" even though that stroke is not defined in your dictionary as "papers."

[Brief It](#) will also use this setting for suggesting singular and plural briefs for regular translate and CATalyst BCS captioning.

Suffix Drag translates steno outlines that would result in an untranslate if a dragged letter, -G, -S or -D is stroked. For example, you write the word "paper" as PAEUP and "papers" as PAEUP/-S. If you accidentally wrote PAEUPS all in one stroke and had the Suffix Drag option selected, the result would be "papers" even though that stroke is not defined in your dictionary as "papers."

When creating a global and you type a word in the *New Text* field, Case CATalyst analyzes the word to determine if a " G", " S" or " D" steno outline could be added to the word. If so, then Case CATalyst activates the Endings button. Edit's [Plural Endings](#) Option setting also applies to the Endings feature. The Plural Endings option allows you to set the final S, final Z or both as keys you write to indicate a plural.

The Global Endings dialog box displays when the Endings button is selected. You can choose any of the suggested definitions to add to your dictionary. For example, you have REPT in the Steno field and type "represent" in the Text field. The following suggested entries display when you select Endings and you have the plural endings option set to both final S and final Z:

REPTD = represented

REPTS = represents

REPTZ = represents

## Set Plural Endings Options

1. In Edit, press **Alt + t, o, e** (**Tools/Options/Plural Endings Options**). The Plural Word Endings Options dialog box displays.
2. Select one of the following:
  - Use /-S
  - Use /-Z
  - Use both /-S and /-Z
3. Press **Enter (OK)** to accept the changes.

## QuickFix Suffix Options

QuickFix Suffix Options displays the Suffixes dialog box which contains the current A - Z assignments. QuickFix Suffix attaches a suffix to a word using the [EZ Link](#) rules of spelling. QuickFix Suffix also uses the [Prefixsuffixrules.ini](#) file when the Prefixsuffixrules.ini file is located in your System Files case. Case CATalyst attaches a suffix you select from the list of suffixes and attempts to correctly spell the combined word, first checking the Spell Check wordlist for a match. If no match exists then Case CATalyst attaches the combined root word and suffix without any spelling changes.

Access QuickFix Suffix options:

- in Manage Jobs. Press **Alt + t, o, e, s** (**Tools/Options/Edit/QuickFix Suffix**).
- in Edit. Press **Alt + t, o, s** (**Tools/Options/QuickFix Suffix**).
- in Edit. From the QuickFix dialog box, select **Suffix** and then select **Options**.

## QuickFix Suffix Options

Type in a field to modify the entry. To remove an entry, highlight the existing text and press **Del** (**Delete**). When finished press **Enter (OK)**. The changes display in the QuickFix Suffix list.

## QuickFix Prefix Options

QuickFix Prefix Options displays the Prefixes dialog box which contains the current A - Z assigned entries that. The QuickFix Prefix command attaches a prefix to a word using the [EZ Link](#) rules of spelling. QuickFix Prefix also uses the [Prefixsuffixrules.ini](#) file when the Prefixsuffixrules.ini file is located in your System Files case. Case CATalyst attaches the prefix you select from the list of prefixes and attempts to correctly spell the combined word, first checking the Spell Check wordlist for a match. If no match exists then Case CATalyst attaches the combined root word and prefix without any spelling changes.

To Access QuickFix Prefix options:

- in Manage Jobs. Press **Alt + t, o, e, p** (**Tools/Options/Edit/QuickFix Prefix**).
- in Edit. Press **Alt + t, o, p** (**Tools/Options/QuickFix Prefix**).
- in Edit. From the QuickFix dialog box, select **Prefix** and then select **Options**.

## QuickFix Prefix Options

Type in a field to modify the entry. To remove an entry, highlight the existing text and press **Del** (**Delete**). When finished, press **Enter** (**OK**). The changes display in the QuickFix Prefix list.

## Scan For Options

The Scan For Options allow you to determine the criteria on which the cursor stops when using the [Scan](#) and [Scan Backwards](#) Edit commands. These settings affect both regular CATalyst translation and CATalyst BCS captioning.

## Set the Scan For Options

1. From the Edit menu, press **Alt + t, o, c** (**Tools/Options/Scan For Options**). The Scan For Options dialog box displays.
2. Check the box next to **any** of the options you want Scan or Scan Backwards to stop on. Uncheck the box to have Scan and Scan Backwards not stop on that criterion in the job.
  - **Untranslates** - steno outlines in which no dictionary entry was found to translate the steno.
  - **Conflicts** - steno outlines that have multiple text definitions.
  - **Scan Stops** - text surrounded by Scan Stop format symbols.
  - **Hidden Text** - text that has been inserted via the Insert Hidden Text command. Hidden text does not print.
  - **Prefix/Suffix Translations** - translations that include a dictionary defined prefix and/or suffix.
  - **Drag/Drop Translations** - translations that have resulted from the Drag/Drop Analysis and/or [TrueStroke Drag/Drop](#) translate options being selected.
  - **Suffix Drag Translations** - translations that have resulted in the [Suffix Drag](#) translate option being selected.
  - **Bench** - occurrences in transcript where the Bench Mode On/Off format symbols were inserted.
  - **Field (Empty)** - stops on an empty field including those contained in headers. To display the Fill in Field dialog box when scanning an empty field, check the box Fill in Fields.
  - **Fill in Fields** - this option is only available when you select the Field (Empty) option. When scanning to empty fields, automatically display the Fill in Field dialog box except when Case

CATalyst stops on an empty field in a header, Reveal Codes opens for you to view the field, but the dialog box does not display.

The cursor does not automatically scan to the next item after filling in the field. Use the [Scan and Fill in Fields](#) command to open the Fill in Field dialog box and automatically scan to the next empty field.

- **Indexed Items** - stops the cursor on Index Heading On and/or Index On format symbols.
- **Index Placeholders** - stops the cursor on occurrences of the Index Placeholders Text format symbol.
- **Oops** - stops the cursor on occurrences of the [Oops](#) format symbol.
- **Attachment Points** - stops on Attachment Point format symbols without an attachment. The Open dialog box automatically displays where you can navigate to select a file to attach.
- **Attachments** - stops on attachments. It does not stop on an Attachment Point format symbol without an attachment.
- **Changes** - stops on changes or comments made in the transcript. The [Track Changes](#) feature must be active when making changes and comments.
- **Deselect All** - deselect all the options. You may want to use this option when creating a macro to select a specific Scan For Option. To run a macro for a specific Scan For Option you would first need to deselect all the other options. By using Deselect All, you can deselect all the options at once and then select the specific one you want to use.
- **Automatically open Quick Suggest for** -- automatically opens the [Quick Suggest](#) dialog box with possible suggestions when Scan stops on an untranslate, Drag/Drop and/or Suffix Drag translation. Select the items you want Scan to stop on and automatically open the Quick Suggest dialog box. The scan options selected in this section must also be selected in the section above the Quick Suggest section.

3. To save your changes, press **Enter (OK)**.

## Set Audio Delay

Set Audio Delay is an Edit feature used to hear the context of the transcript a few seconds before the actual cursor position or used to adjust the synchronization between the cursor location in the job and the playback of the audio file. When you invoke the Play Audio command, Case CATalyst checks the Audio Delay value before playing the associated audio. These settings affect both regular CATalyst translation and CATalyst BCS captioning.

Audio capabilities are only available on systems that have the optional AudioSync software.

## Adjust Audio Values

1. In Edit, press **Alt + t, o, u (Tools/Options/Set Audio Delay)**. The Set Audio Delay dialog box displays.
2. Review the Current delay setting. Make a change to the setting by typing a new setting number in the New delay field. The maximum number of seconds is 99.
3. Press **Enter (OK)** to accept the changes.

## Set Words Per Folio

Set Words Per Folio is an Edit feature used to determine the number of words that comprise a folio. The default setting is 72 words per folio. View the number of words and folios in a file during Edit by selecting View/[Folio Count](#).

## Set the Words Per Folio

1. In Edit, press **Alt + t, o, w** (**Tools/Options/Set Words Per Folio**). The Words Per Folio dialog box displays.
2. In the Enter Value field, type the number of words you want in a folio.
3. Press **Enter (OK)** to accept the changes

## By Line Options

By Line Options allow you to set the line format for the By Line when inserting a speaker name from the [Speaker List](#) while editing whether during realtime or after translation is complete. A speaker name automatically inserts as a By Line when inserted into the transcript immediately before or after a <Question> format symbol from the Speaker List or when using the Search Next Missing By Line feature.

The By Line paragraph formatting is controlled by By Line paragraph style of the current layout for the file. By Line Options also determine the search criteria for the [Search Next Missing By Line](#) feature.

Access By Line Options in Edit. Press **Alt + t, o, L** (**Tools/Options/By Line Options**). The By Line Options dialog box displays.

## By Line Options

Make entries in the fields as necessary. Select **OK** to save Save your change when finished.

### Place By Line

Determine your By Line position in the transcript. The current Layout for the file controls the paragraph formatting of the By Line.

#### Before Q

Place the Speaker By Line before the Question. The results are:

<By-line>BY SPEAKER NAME:

Q

#### After Q

Place the By Line after the Question on the same line as the Q. When After Q is selected, the Format section allows you to customize the appearance of the By Line following the Q. The default setting is:

Q. By (SPEAKER NAME:)space space

#### When inserting BY SPEAKER from the Speaker List, change Question to <By Line>

This option is active when *After Q* option is selected.

Check this box to have Case CATalyst insert a speaker from the list and automatically change the existing Question paragraph style to a By Line. It may be necessary to modify the current layout for the file to include a Q symbol as part of your By Line paragraph style.

Uncheck this option to have Case CATalyst insert a speaker from the list and retain the paragraph style as a Question. The Search Next Missing By Lines feature, when invoked, is likely to stop on these occurrences. Although the speaker information is correct, the paragraph style is a Question and not a By Line paragraph style.

### Format

Make necessary changes to the defaults in the Before and After fields. Use format symbols as needed. Select **FS** to double click a [format symbol](#) from the list for insertion into the By Line format. Case CATalyst assumes the Q and [!EZ SPEAKER ##] field in the format.

### Example

To format the By Line as: *Q BY SPEAKER NAME:* In the Before field, remove the ( and in the After field remove the ).

## Search Next Missing By Line Options

Determine the criteria the Search Next Missing By Line feature considers when a By Line is missing. Check any of the following:

### Between Colloquy + Question

The feature stops when Colloquy is followed by a Question with no By Line paragraph between the two paragraphs.

### Between Parenthetical + Question

The feature stops when a Parenthetical is followed by a Question with no By Line paragraph between the two paragraphs.

### After Colloquy + Answer

The feature stops when Colloquy is followed by an Answer with no By Line paragraph within the next two paragraphs and before a Question. In most cases, this applies to specific transcript formatting where an Answer symbol is used instead of Colloquy, such as THE WITNESS.

### Between Centered and Question

The feature stops when no By Line paragraph exists between a Question paragraph followed by a Centered paragraph.

## Timer Information

The Timer feature allows you to track the amount of time a speaker examines a witness or the amount of time for a specific event in a realtime job. For example, Direct Examination. To use the Timer feature and track the speakers or events, you create dictionary entries that include the [Start Timer](#) translate command. A [Stop All Timers](#) definition is also used to stop all active Timers in the realtime job such as when there is an off the record discussion, a break or at the end of the proceedings. The following are examples of speaker definitions with the Timer command included:

<Colloquy>MR. SMITH{Start Timer}[1]:

<Colloquy>[!EZ SPEAKER 01]{Start Timer}[1]:

<Colloquy>[EZ SPEAKER 00]{Start Timer}[0]

<By-Line>BY MR. SMITH{Start Timer}[1]:

<By-Line>BY [!EZ SPEAKER 01]{Start Timer}[1]:

<By-Line><Question>(BY MR. SMITH{Start Timer}[1])

<By-Line><Question>(BY [!EZ SPEAKER 01]{Start Timer}[1])

Using the Timer Information feature, you can set up Timer names, Timer Groups and automatically display the Timer dialog box when Timers are active during realtime writing. Timers can be used to track individual and you can group specific timers together as a Timer Group to track the cumulative time for multiple speakers. For example, you have two defense attorneys. You can track the individual time for each attorney and the total time for the defense team.

The Timers dialog box, when selected, allows you to view the Timer Information during realtime. You can select to show or hide the Timer information before beginning translation by selecting the [Timers translate option](#), setting an option in the Timer Information feature or during realtime by pressing **Alt + v, s, r (View/Show/Timers)**.

## Timer Names and Groups

The Timer Information feature allows you to set up Timer names, Timer Groups and automatically display the Timer dialog box when Timers are active during realtime writing.

A Timer tracks the amount of time for each speaker or specific event during a realtime job. Timer names, by default, display as Timer 1, Timer 2, etc. You can [customize](#) the default Timer name for each job by entering new Timer names or by using EZ Speaker fields. Using [EZ Speaker fields](#) in Timers names allows you to use the Create EZ Speakers feature for each job to automatically fill in the Timer names. For example, you use the Create EZ Speaker feature which includes the [!EZ Speaker] fields in the dictionary definitions. In the Timer Information dialog box, you substitute the [!EZ SPEAKER 01] field for "Timer 1." Before the job begins, you use the [Create EZ Speakers](#) feature and type "MR. JONES" for "EZ Speaker 01." When you start translation, "MR. JONES" automatically displays in place of "Timer 1." You can also designate a separate text color to identify each Timer while viewing the job during realtime.

A Timer Group contains multiple Timers listed under one group name for the purpose of tracking their cumulative time. For example, you have one attorney representing the plaintiff and two attorneys representing the defendant. You assign Timer 1 to the plaintiff's attorney and Timer 2 for one of the defendant's attorneys and Timer 3 for the second defendant's attorney. You then assign Timer 2 and Timer 3 to a Group to view the total time for both defense attorneys. You track the individual time for each defense attorney and the total time for both of them.

The default Timer Group names are Timer Group 1, Timer Group 2, Timer Group 3, etc. You can use the default names, create a generic name, or change the names of groups for every job. You can also designate a separate text color to identify each Timer group while viewing the job during realtime. You can create fields and use them in Timer Group names allowing you to use the field value to identify the name of the Timer Group.

Timers start and stop with steno strokes from your writing machine. A dictionary definition with the [Start Timer](#) translate command is necessary to start each individual Timer and a definition with the [Stop All Timers](#) translate command to stop all Timers. The Start Timer and Stop Timer definitions must exist in a dictionary that you are using for translation. Only one Timer can be active at a time. Although you can have individual dictionary definitions to start the time for each speaker, you may want to modify your [EZ Speakers dictionary](#) to include the Start Timer translate command for each speaker.

Inserting [Timer fields](#) into the transcript or Include file allows you to view the cumulative time for each speaker. If you also use Timer Groups, you can insert a TimerGroup field to view the cumulative time for the group of speakers in their specified Timer Group.

Timer information is job specific. Case CATalyst saves and displays all Timer information for each job in the Job History file, on the Translation tab.

Create Timer and Timer Group names during realtime or while editing. Press **Alt + t, o, m** (**Tools/Options/Timer Information**) to display the Timer Options dialog box.

[Keyboard Map](#) Functions: Timer Information

## Timer Settings

Select **OK** when finished to save the changes and close the dialog box.

### Available Timers

The list of Timers identified for this job. You can set up default Timer names to display in the Available Timer section.

### New Timer

Add a new Timer to the Available Timers list. New Timers use a default name of Timer followed by a sequentially assigned number. You can rename the Timer to include EZ Speaker fields. For example, you may want to substitute the [!EZ SPEAKER 01] field for the Timer 1 name if you use the EZ Speakers feature and the EZ Speaker fields are used in the speaker definitions. When you use the Create EZ Speakers feature, the field value identifies the name and the Timer.

To insert a field, press **Ctrl + f** when naming the Timer. The [Insert Field](#) dialog box displays where you can select a field.

### Delete Name

Remove a Timer name from the Available Timers list. Highlight the Timer and then select Delete Name. The current timer name is replaced by the default Timer name and number.

### Rename

Highlight a Timer and then select Rename. A rectangular box displays around the Timer name. Type a new name and then press **Enter**. To insert a field after selecting Rename, press **Ctrl + f**. The [Insert Field](#) dialog box displays where you can select a field.

### Set as Default

Have the Timers always default to the currently assigned names until the names are changed. You may want to use the other names, such as Plaintiff 1, Plaintiff 2, Defense 1 or EZ Speaker fields instead of Timer names to save as your default.

### Groups

Create [Timer Groups](#) to track the total time for a group of speakers along with the time for each individual.

### LED Color

Highlight a Timer and choose a text color to associate with the name.

### Display timers window when a timer is started

Check this box to have the Timers dialog box open with the name of the initial Timer used in the job. Timers are added to the dialog box as they are used.

## Timer Group Settings

Access Timer Group settings from the Timer Options dialog box. Press **Alt + g (Groups)**. The Timer Groups dialog box displays. Make changes and select **OK** when finished.

### Timer Groups

Select a Timer group from the list to modify, rename, or delete. If no names display, no Timer groups exists for this job. To create a new Timer group, select **New Group**.

To use a field as a Timer Group name, press **Ctrl + f** when naming the Timer Group. The [Insert Field](#) dialog box displays where you can select a field to insert.

### LED Color

Choose a text color for the current Timer group.

### Rename Group

Change the name of an existing Timer group. Select a group name from the Timer Groups drop down list and then select **Rename**. Type the new name Press **Enter**. For example, type Plaintiff, Defendant, Expert Witness, Recess or press **Ctrl + f** to select and [insert](#) a Field as the group name.

### New Group

Create a new Timer group. Case CATalyst automatically creates the new group using the default naming convention and the next consecutive number. To insert a field as a Timer Group name, press **Ctrl + f** when renaming the Timer Group. The [Insert Field](#) dialog box displays allowing you to select a field.

### Delete Group

Remove a Timer group from the job. Select a group name from the Timer Groups drop down list and then select **Delete**. A confirmation message displays. Press **Enter (Yes)** to complete the deletion.

### Available Timers

The list of existing individual Timers for the job.

### Add

Highlight the desired available Timers to add to a Group and then click **Add**.

### Remove

Highlight the desired Timers to remove from the select Group list and then click **Remove**.

### Timers in Group

The individual Timers associated with the group name displayed in the Timer Groups field.

### Set as Default

Set the group name displayed in the Timer Groups field as the default for all jobs.

## Edit Timers

There are many jurisdictions that are requiring the court reporter to track the time of witness' testimony or the time of the proceedings. CATalyst uses the [Timer feature](#) to make it easy for you to track the time whether it is one speaker, multiple speakers or the total of time of speakers for each side. In rare cases, however, there may be times when you forget to start the timers after a break or you accidentally started the timer before the proceedings actually started. You can edit a Timer by hours, minutes or seconds. You can add or subtract time. If you edit a Timer that is part of a [Timer Group](#), the Timer Group time will automatically adjust. You cannot edit a Group Timer's time.

Undo is not available when changing Timers' times.

Timers must be paused or stopped before editing is available.

To edit a Timer:

1. Open the Timers dialog box, if the Timers are not displaying. Select View, Show, Timers (**Alt + v, s, r**).

2. The Timer number, name and the current value of the timer displays at the top of the dialog box. Double click the time indicator for the Timer you want to edit.

3. Do any of the following:
  - a) Hours field - to change the current number of hours, type the number of hours that you want to increase or decrease the time.
  - b) Minutes field - to change the current number of minutes, type the number of minutes that you want to increase or decrease the time.
  - c) Seconds field - to change the number of seconds, type the number in the seconds that you want to increase or decrease the time.

4. Once you have typed a number in any one of the Hours, Minutes or Seconds fields, the Add and/or Subtract fields are active and the new time displays above the Add and Subtract buttons.

Do **one** of the following:

- Click Add (**Alt + a**) to increase the Current time for the Timer. Based on the numbers you typed in the Hours, Minutes, Seconds fields, you will see the Resulting time above the Add button to indicate what the Timer will display if the time is added to the current time.
  - Click Subtract (**Alt + b**) to decrease the Current time for the Timer. Based on the numbers you typed in the Hours, Minutes, Seconds fields, you will see the Resulting time above the Subtract button to indicate what the Time will display if the time is subtracted from the current time.
5. When closing the file, if the only change you made was to adjust a Timer's time and you have not saved the file, you will be prompted to save the changes.

## Transcript Spell Check Options

Transcript Spell Check Options determine the Spell Check settings used when spell checking in Edit. You can select automatic Spell Check features, choose Wordlists, set the number of Suggestions and choose the language type. For example, you can add a job wordlist, choose the Wintertree Medical Wordlist, activate the option to have Spell Check ignore all capped words and single characters, display notification when Spell Check completes in a text field and set the number of suggested words to display at 10. Additional Transcript Spell Check options are available by selecting the [Advanced](#) button in the Transcript Spell Check Options dialog box.

Spell Check uses a default wordlist along with any provided wordlists you select. Spell Check will also use the Personal Wordlist and case and/or job wordlist when spell checking. If, in the rare case, there is a word you feel is misspelled in the default wordlists, you can put the word in your [Personal Wordlist](#) with the exclude attribute.

Use [Dictionary Spell Check options](#) to set Spell Check parameters for spell checking the text portion of dictionary entries in Manage Dictionary. Dictionary Spell Check options are set independently from Transcript Spell Check options.

The priority of the wordlists are as follows: Ignore All (which is in memory only), Job, Case, Personal, Exclude List (if selected), optional "other" wordlists, main language wordlists provided by Wintertree, Wintertree medical (if selected), Stedman's medical (if selected), Wintertree legal (if selected) and Black's legal (if selected).

These settings affect both regular CATalyst translation and CATalyst BCS captioning.

Access Transcript Spell Check Options:

- in Manage Jobs. Press **Alt + t, o, e, t** (**Tools/Options/Edit/Transcript Spell Check**).
- in Edit. Press **Alt + t, o, t** (**Tools/Options/Transcript Spell Check**).

## Transcript Spell Check Options

To make a change, click an option. Depending on the field, check or uncheck the box or select a choice from the drop down list. When finished with all your changes, select **OK**.

## Language

Select the language set to use when running Spell Check. Selecting a language set for Spell Check affects the language set for the general WinterTree [Wordlist](#). Black's Law and Stedman's Medical wordlists are only available in English.

- **American English**
- **British English**
- **French** — When using French, Spell Check considers words beginning with a letter followed by an apostrophe, such as "c'est" to be misspelled and suggests a space following the apostrophe, "c' est." Change the [Advanced Spell Check](#) option, *Spell Check contractions as separate words* to prevent Spell Check from stopping on these words.
- **Italian** — When using Italian, Spell Check considers words beginning with a letter followed by an apostrophe to be misspelled and suggests a space following the apostrophe. Change the [Advanced Spell Check](#) option, *Spell Check contractions as separate words* to prevent Spell Check from stopping on these words.
- **Spanish**
- **Brazilian Portuguese**

## Options

Check the boxes next to the features you want active when Spell Check runs.

### Pause after change

Suspend Spell Check after an action is taken, such as Change or Ignore. You must press **Resume** to move to the next item. If you do not select this option, Case CATalyst performs the action and scans to the next item.

### Autocorrect

Automatically correct a word with the specified alternative contained in a selected [Wordlist](#). For example, Spell Check recognizes "teh" as misspelled and automatically replaces it with "the" because the entry in the selected Wordlist is: "teh" Autocorrect "the."

### Ignore Allcapped Words

Do not stop on words or abbreviations that are all capitalized and not recognized by Spell Check.

### Ignore Mixed Case

Do not stop on mixed case words that have more than one initial capped letter and are not recognized by Spell Check. For example, Spell Check does not stop on "CATalyst ", "McNeal", or "OZpc."

### Ignore Mixed Digits

Do not stop on combinations of digits and numbers not recognized by Spell Check. For example, Spell Check does not stop on 12F, t3sting, or 500th.

### Report Repeated Words

Stop on repeated words unless the words have been added to your Personal, Case or Job wordlist.

### Strip Possessives

Spell check only the root word.

### **Suggest Split Words**

Offer two separate words as a Suggestion for a single word that can legitimately be two words. For example, Spell Check stops on "someperson" and offers the Suggestion "some person."

### **Ignore Single Characters**

Do not stop on individual characters. For example, do not have Spell Check stop on the X in "X marks the spot."

### **Add Changes To Wordlist**

Add the highlighted word and its replacement to the job Wordlist as a Suggest, when the Change action is used. For example, Spell Check stops on the word "someperson". You select "some person" from the Suggestions list and the Change action. In the job's Wordlist, the following entry is added: "someperson" Suggest "some person."

### **Check Punctuation**

Stop on multiple punctuation that is not recognized and suggest correct ending punctuation for Question and Answer paragraph styles. Ending punctuation includes question mark, period or dashes.

### **Check Colloquy Punct.**

Check for a period at the end of a Colloquy paragraph.

### **Check Spacing**

Stop on incorrect spacing following punctuation, abbreviations, between words or at the beginning of a paragraph. Spell Check does not stop on a space at the beginning of the paragraph created by a <Tab> format symbol. [Advanced Spell Check Options](#) affect how Spell Check handles spaces after a colon and an abbreviation.

### **Check Fields**

Spell check text typed when filling in fields. This option is active when you also select the Spell Check While Defining option or while Spell checking the transcript.

### **Report Repeated Paragraphs**

Stop on repeated paragraph styles. Spell Check suggests specific names from the Speaker List when repeated Colloquy is reported.

### **Report Empty Pages**

Stop on pages with no text. You can select to Ignore the empty page or click in the transcript and delete the New Page format symbol from Reveal Codes.

### **Check for missing By Lines**

Stop on possible missing By Lines. The Fix Missing By Line dialog box displays where you can determine how to handle the possible error. See [Search Next Missing By Line](#) for additional information.

### **Report Empty Q/A/C Paragraph**

When selected, Spell Check will stop on empty Question, Answer and Colloquy paragraphs. If you select Ignore All on an empty Colloquy paragraph, Spell Check will not stop on empty Colloquy occurrences with the same name. For example, if Spell Check stops on an empty <Colloquy>MR. WILSON: and you select Ignore All, Spell Check will not stop on any remaining empty occurrences of <Colloquy>MR. WILSON:. Ignore All is not available when Spell Check stops on an empty Q or A.

### **Deselect All**

Deselect all options. By using Deselect All, you can deselect all the options at once and then select the specific one you want to use. For example, you may want to use this feature when creating a macro to select a specific Spell Check Option. To run a macro for a specific Spell Check Option, first deselect all the other options.

### **Additional Wordlists**

Use the **Add** button to display the locate and include additional [Wordlists](#) for use with Spell Check. Once added to the list, you must check the box next to each Wordlist you want to apply during Spell Check. Uncheck the box to inactivate the Wordlist but keep it in the list for later use. Use **Remove** to delete the Wordlist from the list. You can Add it again if necessary.

Wordlists are applied during Spell Check in a [priority](#) order. Additional Wordlists are applied before all other Wordlists except the Ignore All Wordlist which is a temporary Wordlist that is not viewable. Wordlists contained in the Additional Wordlists are applied in display order. Use the **Move Up** and **Move Down** buttons to reorder the list.

### **Match Common Word Processors**

The Match Common Word Processors option uses an exclude list that contains all common words from the Wintertree American wordlist or Wintertree British wordlist that some commonly used spell checkers (i.e. word processor software) report as being misspelled. Although there are words in the Wintertree American wordlist or Wintertree British wordlist that commonly used spell checkers mark as misspelled, many of those same words may be recognized spellings in other spell checkers. By checking this option, you are setting CATalyst's spellchecker to stop on these words even though the built-in wordlist says these words are correct.

When you select the Match Common Word Processors option, the listed legal and medical wordlists are automatically deselected (to give you the most desired results). Deselecting the Match Common Word Processors option does not automatically reselect all the wordlists listed below. You will need to select each wordlist you want to use. All commonly used spell checkers may not have medical and legal terminology as a part of their wordlists. If all the medical and legal wordlist are deselected, you most likely will need to add some medical and legal words to your Personal Wordlist (with the Ignore attribute) so Spell Check doesn't stop on them. For example, if you select the Match Common Word Processors option and deselect the medical and legal words, you may have to add "Voir" (Voir Dire) to your Personal Wordlist so Spell Check doesn't stop on it. There may be medical words you will need to add also. If you select this option and continue to select all medical and legal wordlists, you may still find some words that commonly used spell checkers would consider misspelled. You can select all, some or none of the wordlists, it is your decision.

*This option is grayed out if American English or British English is not selected in the Language field.*

### **Use Wintertree Medical Wordlist**

Check this box to use the Wintertree Medical Wordlist.

### **Use Stedman's Medical Wordlist**

Check this box to use Stedman's Medical Wordlist.

### **Use Wintertree Legal Wordlist**

Check this box to use the Wintertree Legal Wordlist.

### **Use Black's Legal Wordlist**

Check this box to use Black's Legal Wordlist.

### **Display Red Squiggle Under Misspelled Words**

Check this box to display a red squiggle underline on words that Spell Check considers misspelled. You can add the red squiggle underlined word to the Personal, Job, Case or Ignore All Wordlist. Selecting Ignore All prevents Case CATalyst from stopping on any occurrence of the word in this job during this Edit session. If you exit or close the session and reopen the file, Spell Check stops on the text previously identified in the Ignore All. By default, this option is turned on.

Move to the next red squiggle and Move to the previous red squiggle keyboard commands allow you to move directly to the next or previous red squiggle. Once you create a [keyboard assignment](#) for the commands, you can invoke them from the keyboard or include them in a macro.

### **Spell Check While Defining**

Check this box to invoke Spell Check automatically when the spelling of text in the Global dialog box and inserting text. When you type in the Text field and then press Enter in the dialog box, Spell Check automatically checks the word or words for correct spelling. If Spell Checks detects a possible error, the Spell Check dialog box displays. The spell check while defining options affects the following dialog boxes: Global/Replace, Filling in a field, Change Header Text, Hidden Text - insert/modify, Insert Conflict/Text, Modify Header/Footer in Layout, Make Exhibit Index Entries, define from Vertical Notes and define from Brief It. This option is active by default.

### **Spell Check While Defining during Realtime**

Spell Check While Defining during Realtime automatically checks the spelling of text in the Global dialog box and inserting text and applies strictly while writing realtime. The Spell Check While Defining during Realtime is selected by default. If you don't want Spell Check to interrupt the define process while writing realtime, deselect the option. If you only want spell check while defining active while editing, select the Spell Check While Defining option and leave the Spell Check While Defining during Realtime option unselected. The spell check while defining options affects the following dialog boxes: Global/Replace, Filling in a field, Change Header Text, Hidden Text - insert/modify, Insert Conflict/Text, Modify Header/Footer in Layout, Make Exhibit Index Entries, define from Vertical Notes and define from Brief It. This option is active by default.

### **Scan While Spellcheck**

Check this box to use the selected Scan options during Spell Check. Use the Scan Options feature to select the options.

### **Scan Options**

Set [Scan For Options](#) for Spell Check to recognize. Changes made here are also reflected in the Scan For options accessed in Edit from Tools/Options/Scan For.

### **Notify me when spellcheck completes in a text field**

When the Spell Check while Defining option is Off and you manually spell check text in a field within a dialog box using Spell Check (Shift + F7), the No Spelling Errors dialog box displays.

### **Maximum Number of Suggestions**

Enter a number between 10 and 100 to determine the maximum number of alternative words that display in the Suggestions field. The smaller the number of suggestions, the more accurate the suggestions.

## Advanced

Display the [Advanced Spell Check Options](#) dialog box where you can make additional Spell Check settings.

## Warnings

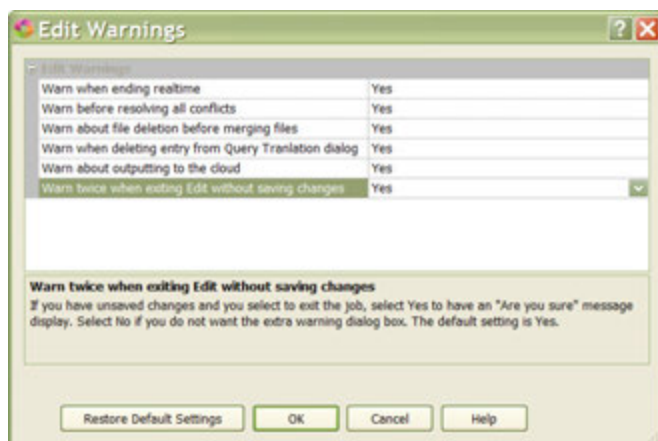

Warnings is a Translate and Edit option that allows you to select to display warning messages. These settings affect both regular CATalyst translation and CATalyst BCS captioning.

Translate and Edit warning messages display when you:

- [end realtime](#).
- choose to resolve conflicts using the [Resolve All Chosen Conflicts](#) feature.
- [merge](#) files.
- deleting an entry through the [Query Translation](#) dialog.
- outputting to [CaseViewNet Cloud](#).
- exit without saving.

## Set Warning Options

1. In Edit, press **Alt t, o**, select **Warnings (Tools/Options/Warnings)**. The Warnings in Edit dialog box displays.
2. On the right side of the option box, double click to toggle between **Yes** and **No**. Each warning has a brief description when the warning is highlighted.

You can also turn these warnings off when the warning dialog box displays by checking the option: *I understand the consequences of my actions. Please stop asking.*

3. Press **Enter (OK)**.

## Word Definition Options

Word Definition Dictionary Options allow you to confirm the version of Merriam-Webster dictionary being used, confirm the location of the Merriam-Webster wordlist and definition files and change the colors for the Word Definition dialog box. These settings affect both regular CATalyst translation and CATalyst BCS captioning.

Access Word Definition Options:

- in Manage Jobs. Press **Alt + t, o, e, w** (**Tools/Options/Edit/Word Definition**).
- in Edit. Press **Alt + t, o, n** (**Tools/Options/Word Definition**).
- in Edit. From the Word Definition dialog box, click the **Setup** icon.

## Word Definition Options

To make a change, select a choice from the drop down box or navigate to a folder location using the Browse button. When finished with your selection, click **Apply**. When finished with all your changes, select **OK**.

### Dictionary Tab

#### Available Word Dictionaries

The default dictionary, Merriam-Webster Dictionary, comes with the Case CATalyst software. The most current Merriam-Webster dictionary displays. Click the down arrow to display other available versions.

#### Words Path

Displays the current location for the Merriam-Webster wordlist file, MWWords.bin. The default location for this file is the same location where Case CATalyst was installed. To change the location, click  and navigate to the new location.

#### Definitions Path

Displays the current location for the Merriam-Webster definitions file, MWDef.bin. The default location for this file is the same location where Case CATalyst was installed. To change the location, click  and navigate to the new location.

### Colors tab

Using the options on the Color tab, modify the Background Color, Text Color, and Link Color in the Word Definition Dictionary dialog box. For each option, select a color from the drop down menu or create a customized color. To create your own color, consult your Windows documentation for more information.

## Application/Computer Options\_2

Application/Computer Options allow you to set certain defaults for Case CATalyst. Access Application/Computer Options in Manage Jobs press **Alt + t, o, a** or Edit press **Alt + t, o, /** (**Tools/Options/Application Computer Options**).

## Application/Computer Options

To make a change, click an option. Select a choice from the drop down list. When finished with your changes, select **OK**. The *Restore Default Settings* option returns all the Advanced Edit Options to their original Case CATalyst default selection.

### Start-up Settings

#### Start-up Size

Start-up size determines the size and location of the Case CATalyst window when Case CATalyst opens. This setting affects all users on this computer. By default, Case CATalyst is set to open maximized.

### Last Known Size

Case CATalyst opens with the last customized size and position of the Case CATalyst window. It is necessary to manually resize and position the window. Do not use Windows Aero to resize the window.

It may be necessary to change the Windows settings for the Case CATalyst shortcut icon in order for the *Last Known Size* option to function properly. Some versions of Case CATalyst install with this setting set to *Maximized*. The shortcut setting must be set to *Normal window*. To modify the Case CATalyst shortcut setting, right click the Case CATalyst icon and select **Properties**. On the Shortcut tab, in the *Run* field, select **Normal window**.

### Maximized

The Case CATalyst window opens to the size of your screen.

### Full Screen

The Case CATalyst window opens with only the Menu bar and Full Screen toolbar displayed. The Function Bar and all other toolbars are not shown.

### Renew expiring e-Key license

Your e-Key, keyless access, requires reauthorization every 90 days. By default, reauthorization is set to automatically renew. Optionally, you can choose to manually reauthorize via renewal notification. This setting affects the current Case CATalyst application.

#### Without Asking

By default, this option is active to automatically reauthorize e-Key, keyless access, when the renewal date falls within 29 days. e-Key requires reauthorization every 90 days. When reauthorization successfully completes, a message displays indicating successful reauthorization. Close the message box by pressing **Enter**. The 90 days of reauthorization is added to the amount of authorized days currently remaining. Automatic reauthorization requires an Internet connection.

A reauthorization reminder message displays if automatic reauthorization is unavailable. For example, this may happen if you do not have Internet access at the time of automatic reauthorization.

#### At User Direction Only

Display a reauthorization reminder message that requires you to [manually respond](#) to renew keyless access. Internet access is necessary to respond to the notification message for reauthorization. If you do not have an Internet connection, follow the instructions in *e-Key Activation* for [No Internet Access](#).

### Check for Updates

#### Check for Updates Enabled

The Check for Updates Help menu item or the Check for Updates button in the [About Case CATalyst](#) dialog box allows all users in this application to check for Case CATalyst updates. Select **Yes** to have the Check for Updates menu item and the Check for Updates button in the About Case CATalyst dialog box active and to receive update reminder messages when you haven't checked for updates for three months. There are some situations where Network Administrators or Instructors, for example, control the Case CATalyst version being used and do not want individuals updating. Select **No** to disable automatic update check reminders and gray out the Check for Updates menu item and button in the About Case CATalyst dialog box. The default is Yes.

### Track Changes

### Editor ID

Designate a name to associate with changes and comments made to a transcript with the [Track Changes](#) feature. When this option is left blank, the current user name is used as the Editor ID. The entry in this field applies to all files for all users on the system. The default is blank. To fill in the Editor ID field, click in the blank field to the right of the option and type the name.

### Always Track Changes in Edit

The Always Track Changes in Edit option, when set to Yes, automatically sets the Track Changes option tap be active when editing. If you are writing realtime and making editing changes in the file, realtime is active and track changes is not active. Once you stop translation (Ctrl + \ or File, Stop Translation) with this option set to Yes, the Track Changes feature is automatically active. This option may be ideal for a scopist who wants to track their changes in every file. If you manually turn Track Changes off in the file, it will remain off until you turn it back on or until you open the file in Edit again. The Always Track Changes in Edit option setting affects all Case CATalyst users on the current computer.

## Edit

### Fast Save

Save settings works with the widest range of hardware configurations and in most situations, the selection for this option should remain Yes. Yes is the default. In a rare situation, Stenograph Technical Support may recommend changing the option to No. The selection in this field works in conjunction with Auto Save and Auto Recover and has no effect on manual saves made with Ctrl + s (File/Save) or File/Save As.

## Scroll Text

Scroll Text Forward is an Edit feature that allows you to automatically scroll the cursor forward in the text. To scroll forward, press **Ctrl + a (Tools/Scroll Text/Scroll Text Forward)**.

You can adjust how fast the cursor scrolls through the job using the [Scroll Text Speed](#) option.

### Scroll Text Backward

Scroll Text Backward is an Edit feature that allows you to automatically scroll the cursor backward in the text. To scroll backward, press **Shift +Ctrl + a (Tools/Scroll/Text/Scroll Text Backward)**.

You can adjust how fast the cursor scrolls through the job using the [Scroll Text Speed](#) option.

### Scroll Text Speed

Scroll Text Speed is an Edit option that allows you to set cursor movement speed for the Scroll Text feature. The speed setting determines the number of seconds the cursor remains on a line before moving to the next line.

To set Scroll Speed:

1. In Edit, press **Alt + t, t, s (Tools/Scroll Text Speed)**. The Scroll Speed dialog box displays.
2. Adjust the speed by moving the indicator Slower or Faster. The number of seconds selected for the cursor to remain on the line when Scroll Text is invoked displays in the dialog box.
3. Press **Enter (OK)** to accept the changes.

## Spell Check

The Spell Check feature in Edit checks the spelling of transcript text, text in a Global Definition dialog box when the Spell Check while Defining option is active and text in certain dialog boxes. Once Spell Check identifies a misspelled or repeated word, it highlights the word and displays it in the Spell Check dialog box where you can choose to:

- change the word as suggested by Spell Check.
- view alternative words. The original word's actual and phonetic spelling is the basis for the alternative words suggested by Spell Check for the misspelled word.
- define the word and add it to a Personal, case, or job dictionary.
- ignore the word for this occurrence only.
- ignore the word for all occurrences during this Spell Check session.
- add the word to a Personal, Case or Job [Wordlists](#) so that Spell Check ignores the word for all occurrences.
- delete the word.
- look up the definition of the word or a suggested alternate word. The Spell Check Definition feature uses the Merriam Webster Dictionary. You can also access definitions while using [Spelling Lookup](#).

You can invoke Spell Check manually for a word in the *Text* field of certain dialog boxes. With your cursor in the *Text* field, press **Shift + F7**. The Spell Check dialog box displays when a word is misspelled. If there is no misspelling, a message displays indicating no spelling errors were found. When multiple words display, Spell Check considers the cursor location in the *Text* field when looking for misspellings. To check the definition of a word, position the cursor in the *Text* field and press **Ctrl + F7**. The Spell Check - [Lookup] dialog box displays. When [Spell Check While Defining](#) option is active, Spell Check automatically checks the word in the *Text* field when you press Enter in the dialog box. The Spell Check dialog box displays when Spell Check identifies a misspelled or repeated word.

[Wordlists](#) and [Transcript Spell Check options](#) allow you to customize Spell Check for your writing style or job. Using wordlists, you can identify words for Spell Check to automatically ignore as a misspelling. Spell Check options allow you to select automatic Spell Check features, choose Wordlists, set the number of Suggestions and choose the language type. For example, you can add a job wordlist, choose the Wintertree Medical Wordlist, activate the option to have Spell Check ignore all capped words and single characters, display notification when Spell Check completes in a text field and set the number of suggested words to display at 10.

Spell Check uses a default wordlist along with any provided wordlists you select. Spell Check will also use the Personal Wordlist and case and/or job wordlist when spell checking. If, in the rare case, there is a word you feel is misspelled in the default wordlists, you can put the word in your [Personal Wordlist](#) with the exclude attribute.

Spell Check stops on a space that occurs before a colon, semi-colon, comma, question mark, exclamation mark and a period, except when the period is followed by numbers. Spell Check also stops on incorrect spacing following punctuation, abbreviations, between words or at the beginning of a paragraph when the Spell Check, Check Spacing option is active. Spell Check does not stop on a space at the beginning of the paragraph created by a <Tab> format symbol. [Advanced Spell Check Options](#) affect how spaces after a colon and an abbreviation are handled. An ellipsis is recognized when it is defined as: <Sticky Space>period<Sticky Space>period<Sticky Space>period

[Spell Check in Manage Dictionary](#) allows you to check the spelling of the text portion of dictionary entries or check words when you are inserting and modifying entries. Spell Check options are set separately for Edit and Manage Dictionary.

## Spell Check Your Transcript

Spell checking your transcript is generally done after you make final edits in the job. Spell Check uses a default wordlist along with any provided wordlists you select. Options and wordlists are selected in the [Transcript Spell Check](#) dialog box. Spell Check will also use the Personal Wordlist and case and/or job wordlist when spell checking. If, in the rare case, there is a word you feel is misspelled in the default wordlists, you can put the word in your [Personal Wordlist](#) with the exclude attribute.

### Start Spell Check

1. Open the file you want to edit.
2. Start a Spell Check session, press **Shift + F7 (Tools/Spell Check)**. When Spell Check identifies a possible error, the Spell Check dialog box opens. The Title Bar displays the error type such as Misspelled Word, Repeated Word, Incorrect Spacing, or Repeated Paragraph Type.
3. The following information displays in the Spell Check dialog box:

#### Steno

The steno, if any, associated with the text identified as misspelled.

#### Text

Text identified as misspelled or repeated.

#### Change To

An alternative suggestion for the misspelled or repeated word; or incorrect punctuation. Depending on the possible error, use the current suggestion, type new text, click an item from the Suggestions list or Delete the repeated text. Click **Suggest** to display additional suggestions. When words are available in the Suggestions field, Case CATalyst highlights the closest match to the typed change.

#### Suggestions

Alternative words or actions to the suggestion in the Change To field. Click a suggestion to select it.

4. Use the following options as necessary:

#### Change

Change the text to the text in the Change To field for this occurrence only. Do **any** of the following:

- Accept the word or action in the Change To field.
- Select a word or an action from the Suggestions list to display in the Change To field.
- Type a change in the Change To field.

#### Ignore

Leave the text as misspelled, repeated, or incorrect punctuation for this occurrence only. If Spell Check encounters this text again in this job, it stops. Ignore is the default. You can [change](#) the default to do any of the following: Change, Global, Ignore All, or Wordlist.

#### Resume

Resume spell checking the transcript. This option displays when you place your cursor outside of the Spell Check dialog box and when you have the Spell Check option, Pause after change, selected.

#### Global

Display the Global dialog box.

### **Ignore All**

Leave the text as misspelled, repeated, or incorrect punctuation for all occurrences in this job during this Edit session. If you exit or close the session and reopen the file, Spell Check stops on text previously identified as Ignore All.

### **Wordlist P, K, J**

Add the text directly to one of the wordlists without displaying the Add to Wordlist dialog box. Select **one** of the following:

#### **P**

Press **Alt + p** to add the word to your Personal Wordlist.

#### **K**

Press **Alt + k** to add the word to the case wordlist.

#### **J**

Press **Alt + j** to add the word to the job wordlist.

### **Delete**

Delete the text that displays in the Change To field from the job.

### **Ignore Page**

Do not Spell Check the current page for incorrect spacing. Case CATalyst ignores spacing issues on the page but still checks for spelling errors.

### **Wordlist**

Add the word to your personal, case or job Wordlist. The [Add to Wordlist](#) dialog box displays where you can select to automatically ignore the word, correct the word or suggest a specific word.

### **Definition**

Check the definition of the word in the Change To field. The Merriam-Webster Dictionary dialog box displays. When connected to the Internet, in the Merriam-Webster Dictionary dialog box click the Definition Search (  ) icon to connect to the web site specified in the [Definitions Search option](#) where you can view additional definitions and information. Press **Esc** to return to the Spell Check dialog box.

Press **Esc** to return to the Spell Check dialog box.

### **Suggest**

Suggests an alternative word(s) from the Suggestions list for the word in the Change To field.

### **Undo**

Restores the last Spell Check action. Not all actions are reversible.

### **User Def**

Displays the customized definition, if one exists, for the word in the Change To field. This option is available when the word exists in the [User Definitions table](#) and has been added to a Wordlist set to Suggest.

### Options

Determine how Spell Check looks at words. The Transcript Spell Check [Options](#) dialog box displays where you can set spelling options and select wordlists. When you change options from within the Spell Check dialog box, you must close Spell Check and restart it for the option changes to take effect.

5. Spell Check continues until you press **Esc (Cancel)** to exit the Spell Check feature and close the dialog box or Spell Check reaches the end of the transcript and displays the message: *Spell Check has reached the end of the document. Would you like to restart from the beginning?* Do one of the following:

### Continue Spell Check

Click **Yes** or with the cursor focus on Yes, press Enter. Spell Check continues from the beginning of the document until finished. Upon completion, Spell Check displays the message: *Spell Check complete*. Press **Enter** to select **OK**.

### End Spell Check

Click **No** or with the cursor focus on No, press Enter. You can change the cursor default to No in [Advanced Spell Check Options](#).

[Keyboard Map](#) Functions: Spell Check

Move to the next red squiggle

Move to the previous red squiggle

## Spell Check While Defining

You can set Spell Check to automatically check a word that is typed in the Global Definition dialog box or a hidden text entry. When you type text and press Enter, Spell Check automatically checks the word or words for correct spelling. If Spell Checks detects a possible error, the Spell Check dialog box displays. Spell Check applies to headers and footers and text fields.

### Set Spell Check to be Active While Defining

1. Do **one** of the following to display the Transcript Spell Check Options dialog box.
  - From Edit, press **Alt + t, o, s (Tools/Options/Spell Check Options)**.
  - From Manage Jobs, press **Alt + t, o, s (Tools/Options/Settings/Transcript Spell Check Options)**.
2. Check the box, **Spell Check While Defining**.
3. Press **Enter (OK)**.

## Spell Check While Defining during Realtime

Spell Check While Defining during Realtime automatically checks the spelling of text in the Global dialog box and inserting text and applies strictly while writing realtime. The Spell Check While Defining during Realtime is selected by default. If you don't want Spell Check to interrupt the define process while writing realtime, deselect the option. If you only want spell check while defining active while editing, select the Spell Check While Defining option and leave the Spell Check While Defining during Realtime option unselected. The spell check while defining options affects the following dialog boxes: Global/Replace, Filling in a field, Change Header Text, Hidden Text - insert/modify, Insert Conflict/Text, Modify Header/Footer in Layout, Make Exhibit Index Entries, define from Vertical Notes and define from Brief It. This option is active by default.

## Spelling Lookup

Spelling Lookup (Alt + t, L) allows you to look up the correct spelling for words or steno. You can also access word definitions by pressing **Alt +v, w (View/Word Definition)** or selecting **Definitions** from the Spell Check dialog box. You can do any of the following:

- change the word to one of the suggested words.
- view alternative words. The original word's actual and phonetic spelling is the basis for the alternative words suggested the misspelled word.
- define the word and add it to a Personal, case, or job dictionary.
- ignore the word for this occurrence only.
- ignore the word for all occurrences during this Spell Check session.
- add the word to a Personal, Case or Job [Wordlists](#) so that Spell Check ignores the word for all occurrences.
- exclude the word in one of the Wordlists so Spell Check thinks it is misspelled.
- delete the word.
- look up the definition of the word or a suggested alternate word. The Spell Check Definition feature uses the Merriam Webster Dictionary.

Spelling Lookup uses the following wordlists: Personal, Case, Job wordlists along with any selected wordlists such as Wintertree, Stedman's, Blacks, etc. When the Definition feature is selected, Spelling Lookup uses Merriam-Webster dictionary.

## Using Spelling Lookup

1. Open the file you want to edit.
2. Position your cursor in front of the word you want to look up or use a Mark command to highlight the words or steno.
3. Press **Ctrl + F7 (Spelling Lookup)**. The Spelling Lookup dialog box displays.
4. Use any of the [Spell Check](#) commands to change the word(s), add the words to a wordlist or ignore for the current job or current session.
5. Press **Alt + e (Definition)**. The Merriam-Webster Dictionary dialog box displays. If you receive the "no definition found" message, you can type a new word in the field and click Find Word. If you have an internet connection, in the Merriam-Webster Dictionary dialog box click the [Definition Search](#) () icon to connect to the web site specified in the [Definitions Search option](#) where you can view additional definitions and information.

6. When finished, press **Esc** to return to the Spelling Lookup dialog box.
7. Press **Esc (Cancel)** to exit the Spelling Lookup dialog box.

## Wordlists

A wordlist contains words you decide Case CATalyst ignores as a misspelling when using Spell Check. There are three types of Case CATalyst wordlists: personal, case, and job. Case CATalyst uses the personal wordlist every time you invoke Spell Check. Words you enter into this wordlist are entries you want to apply when spell checking every job. You can also [apply](#) a wordlist from another job or user. Case CATalyst can only use wordlist types that have a .clx or .tlx extension.

Case CATalyst automatically creates a job wordlist when you spell check a file in Edit or use the [Make Wordlist](#) feature in Manage Dictionary. If the job is in a case, Case CATalyst also creates a case wordlist. Use a case or job wordlist when you encounter words you want Spell Check to ignore as a misspelling just for the current case or job. For example, Spell Check may stop on a proper name. You can add this word to the case or job wordlist, so that Spell Check recognizes the word for this case or job.

You can [add](#) entries to any wordlist while using Spell Check in Edit or Manage Dictionary. New entries apply immediately in the open transcript or dictionary. Entries added to a job wordlist have priority over entries entered in a case or personal wordlist. For example, if you set a word for Suggest in the job wordlist and then put the same word in a personal wordlist as an Auto-Correct, Case CATalyst does a Suggest and never an Auto-Correct.

You can only add a single word at a time to a Wordlist. If you attempt to add two words at once to a Wordlist, Spell Check continues to stop on both words. For example, if you have a speaker name that Spell Check does not recognize, such as MS. CASHEN, Spell Check sees each word separately, MS. and CASHEN. You cannot add both words together into a Wordlist.

Spell Check corrects multiple punctuation when the entry is in a wordlist. For example, you want to change any occurrence of an ending quoter followed by a period (".") to a period followed by an ending quote ("."). You add the incorrect punctuation to a wordlist and have Case CATalyst Autocorrect the entry with the correct punctuation.

Case CATalyst comes with Wintertree Medical and Legal, Stedman's Medical and Black's Legal wordlists. Wintertree Medical and Legal is available in the language set selected for Spell Check. Black's Legal and Stedman's Medical is only available in English. You cannot add words to these wordlists. You can choose to apply any of these wordlists.

Spell Check uses a default wordlist along with any provided wordlists you select. Spell Check will also use the Personal Wordlist and case and/or job wordlist when spell checking. If, in the rare case, there is a word you feel is misspelled in the default wordlists, you can put the word in your Personal Wordlist with the exclude attribute.

## Viewing a Wordlist

When you open a wordlist, the Status Bar located at the bottom of the screen provides information about the current display of entries and certain keyboard options. The column headings on the screen identify the following for each entry:

### Word

The word Spell Check takes an action upon.

### Action

The selected [action](#) you want Case CATalyst to perform on the word: Ignore, Suggest, AutoCorrect, or Exclude.

### Suggestion/Replacement

The text you want Case CATalyst to suggest or use to replace the text in the Word column.

You can change the width of a column. Place the cursor on the line dividing the column headings and hold the left mouse button down. The cursor becomes a double headed arrow. Move the line left or right to the desired position. Release the button. When you exit the Wordlist function, the column widths return to the default settings.

To open a wordlist, from the Menu Bar, select **File/Open/Wordlist**.

### File - New - Wordlist

The File, New, Wordlist feature allows you to open a blank wordlist in which you can insert names or punctuation combinations you want Spell Check to consider spelled correctly, automatic stop on them and/or offer an alternative spelling. When you select File, New, Wordlist, the submenu lists the following wordlists you can create: Personal, Job, Case. If more than one wordlist is grayed out, it means that a wordlist of that type already exists. For example, only one Personal wordlist can exist in the System Files case.

To create a new wordlist file:

1. Press **Alt + f, n, w** (File, New, wordlist).
2. Do one of the following:
  - a) [Personal](#) - this option is only available if there is no Personal Wordlist in the current user's System Files case. If the option is available, CATalyst opens a wordlist named Personal and when changes are saved, it is automatically stored in the System Files case. Go to Step 4.
  - b) [Case](#) - creates a Case Wordlist. If available, the Create New Document dialog box displays with the File name field blank and Files of field set to Wordlist Files (\*.tlx). You can double click an existing Case name or create a new case. . Go to Step 3.
  - c) [Job](#) - this option is always available. When selected, the Create New Document dialog box displays with the File name field blank and Files of field set to Wordlist Files (\*.tlx).. Go to Step 3.
3. In the Create New Document dialog box, type the name of the case or job wordlist and press **Enter** (Open) to create the wordlist. A blank wordlist displays. You can insert entries to [ignore](#), [autocorrect](#) or [exclude](#).
4. When finished, save and close the dictionary.

### Add To Wordlist

Add To Wordlist is an Edit feature that allows you to highlight a word in the transcript and add it to a Wordlist so that Spell Check does not stop on it. You can only add a single word at a time to a Wordlist. If you attempt to add two words at once to a Wordlist, Spell Check continues to stop on both words. For example, if you have a speaker name that Spell Check does not recognize, such as MS. CASHEN, Spell Check sees each word separately, MS. and CASHEN. You cannot add both words together into a Wordlist.

### Add a Word to a Wordlist During Edit

1. Highlight the word you want to add to a Wordlist.
2. Select **Tools/Add To Wordlist** or right click on the highlighted word and select **Add To Wordlist**.

3. From the Add To Wordlist menu, select one of the following actions:

### **Personal Wordlist**

Add the word to the Personal Wordlist. Spell Check uses the Personal Wordlist for every job.

### **Job Wordlist**

Add the word to the Job Wordlist. Spell Check uses the Job Wordlist on a specific job.

### **Case Wordlist**

Add the word to the Case wordlist. This option is only available when the job is in a Case. Spell Check uses the Case Wordlist for every job in the specific case.

### **Ignore All Wordlist**

Add the word to the Ignore All Wordlist so Spell Check does not stop on it.

You can also add words to Wordlists [during](#) Spell Check.

## **Add Wordlist Entries During Spell Check**

Add a word to your personal, case, or job [wordlist](#) while using Spell Check. Spell Check uses the case of a word entered in the wordlist to determine when it recognizes a word for future spell checks. If a word is entered in a wordlist in all lower case, Spell Check does not stop on it regardless of the case; if a word is entered as initial capped, Spell Check stops on it if it displays in all lower case; if the word is entered in all capital letters, Spell Check stops on it if it displays as initial capped or all lower case.

1. Start a Spell Check session. From an open file in Edit or open dictionary in Manage Dictionary, press **Shift + F7 (Tools/Spell Check)**.
2. When Case CATalyst identifies a possible error, the Spell Check dialog box displays. The Title Bar displays the error type such as Misspelled Word, Repeated Word, Incorrect Spacing, or Repeated Paragraph Type.

Do one of the following:

- To add the word to the Personal wordlist, press **Alt + p**.
- To add word to the Case wordlist, press **Alt + k**. This option is only available when the job is in a case.
- To add the word to the Job wordlist, press **Alt + j**.
- To add the word to a wordlist and apply special instructions, press **Alt + w**. The Add to Wordlist dialog box displays. Highlight the wordlist to which you want to add the entry and select **one** of the following actions. When finished, press **Enter (OK)** to redisplay the Spell Check dialog box.

### **Ignore**

Add the word to the selected wordlist so Spell Check does not stop on it again.

### **Suggest**

Spell Check continues to stop on the word and automatically suggests the word entered in the Autocorrect/Suggestion field as the first suggested word. Erik, for example, may be an alternative for Eric.

**Autocorrect**

Add the word to the selected wordlist and automatically change the word to an alternative specified in the Autocorrect/Suggestion field. For example, you often type "teh" for "the". Spell check automatically corrects the misspelling.

**Autocorrect/Suggestion**

Enter the word that Spell Check uses for Suggest or Autocorrect when it encounters the highlighted word. This option is available if you have selected Suggest or Autocorrect in the Choose Action field.

3. Spell Check continues.

**Apply Wordlists**

Case CATalyst applies [wordlists](#) in priority order during Spell Check in the following order:

- Ignore All — when Ignore All is selected during Spell Check, Case CATalyst creates a temporary wordlist. You cannot view this wordlist.
- Additional Selected Case CATalyst Wordlists in priority order which have been added from other jobs and users.
- Job Wordlist with the same name as the job.
- Case Wordlist if you are using a case.
- Personal Wordlist.
- Wintertree Medical Wordlist.
- Stedman's Medical Wordlist.
- Wintertree Legal Wordlist.
- Black's Legal Wordlist.

You can deselect any wordlist so that it does not apply during Spell Check. You can also reset the priority order, add and delete wordlists in the Additional Wordlist field. Words can be added to wordlists selected from other jobs and users but not to the Wintertree Medical and Legal, Stedman's Medical and Black's Legal wordlists.

**Select and Deselect Wordlists**

1. From the Edit menu, press **Alt + t, o, t** (**Tools/Options/Transcript Spell Check**). The Transcript Spell Check Options dialog box displays.
2. In the Additional Wordlists section, use the following options at necessary:

**Add**

Add an additional Case CATalyst wordlist to apply during Spell Check. The Open dialog box displays. Browse for and highlight the desired wordlist and then press **Enter (Open)**. Wordlists have a .tlx extension. The wordlist is added to the Additional Wordlists selections. Check the box to apply the wordlist. You can only use Case CATalyst wordlists.

**Remove**

Remove a wordlist from the Additional Wordlists selections. Highlight the wordlist and click **Remove**.

### Move Up

Move a wordlist up in priority. Highlight the wordlist and click **Move Up**.

### Move Down

Move a wordlist down in priority. Highlight the wordlist and click **Move Down**.

3. Check the box next to any of the following wordlists to apply it during Spell Check. Uncheck the box to not apply the wordlist.
  - Use Wintertree Medical Wordlist
  - Use Stedman's Medical Wordlist
  - Use Wintertree Legal Wordlist
  - Use Black's Legal Wordlist
4. Press **Enter (OK)** when finished.

## Copy and Cut Wordlist Entries

Use the Copy, Cut, and Paste commands to merge entries from one wordlist to another. Select individual or group entries to cut or copy using the Windows selection conventions. Case CATalyst also allows you to paste copied entries into other word processing applications.

To quickly [combine](#) the entire contents of two wordlists, drag and drop one file into another in Manage Jobs.

## Cut, Copy and Past Wordlist Entries

1. From anywhere in Case CATalyst, press **Alt + f, o, w (File/Open/Wordlist)**. From the Wordlist menu, select the type of wordlist to open. The Open Existing Document dialog box displays.
2. Select the wordlist and press **Enter (Open)**. Verify the wordlist name on the Title Bar.
3. Select entries. Do **one** of the following:

### Select one entry at a time

Highlight the entry for selection.

### Select specific entries

Press and hold **Ctrl** while you click the individual entries to highlight.

### Select a consecutive group of entries

Click to highlight the first entry of the group. Locate the last entry you want to select. Press and hold **Shift**, while you click the last entry. Case CATalyst highlights all the entries in-between for selection.

### Select all the entries

Press **Ctrl + a** to highlight all the entries for selection.

4. Do **one** of the following:
  - Cut and remove the entries by pressing **Ctrl + x (Edit/Cut)**.
  - Copy the entries by pressing **Ctrl + c (Edit/Copy)**. The entries remain in the source wordlist.
5. Open the destination wordlist, where you want to place the selected entries. Do **one** of the following:

**Select an existing wordlist**

Press **Alt + f, o, w (File/Open/Wordlist)**. Select a wordlist and press **Enter (Open)**.

**Create a new wordlist**

Press **Alt + f, n, w (File/New/Wordlist)** and select the type of wordlist to create. When the Create New Document dialog box displays, type a new name in the File name field and press **Enter (Open)**.

6. In the destination wordlist, press **Ctrl + v (Edit/Paste)** to add the entries. Depending on your Options settings, a message may display if Case CATalyst encounters duplicate entries. Select Yes or No to overwrite the existing entry and press **Enter (OK)**.
7. Press **Ctrl + s** to save the wordlist.  
To display the source wordlist, press **Alt + w**, and then the associated file number. To save the changes, press **Ctrl + s**.
8. To close the function, press **Ctrl + F4**.

**Create a New Wordlist**

You can create a new Personal, Case, or Job [Wordlist](#) from Manage Jobs; however, you can only have one Personal Wordlist in each user folder. Once a Personal Wordlist exists, the option to create a new one is no longer available. When creating a new Personal Wordlist, Case CATalyst automatically places the Personal Wordlist in the System Files case when you save it or close the Wordlist function. Once created, you can reopen a Wordlist to make additional entries. You can also add entries while using the Spell Check feature in Edit or Manage Dictionary.

**Create a Wordlist**

1. In Manage Jobs, select **Alt + f, n, w (File/New/Wordlist/)** and then select the type of Wordlist you want to create. When you create a Case or Job Wordlist, the Create New Document dialog box displays.
2. Type a name in the File name field and press **Enter (Open)**. Case CATalyst opens the Wordlist function with an empty Wordlist.
3. Insert new entries using the [Insert/Modify](#), and [Cut/Copy/Paste](#) Wordlist features.
4. When you are finished, press **Ctrl + s (File/Save)**.
5. Press **Ctrl + F4 (File/Close)** to close the Wordlist.

**Delete Wordlist Entries**

1. From anywhere in Case CATalyst, press **Alt + f, o, w (File/Open/Wordlist)**. From the Wordlist menu, select the type of wordlist. The Open Existing Document dialog box displays.
2. Select the wordlist and press **Enter (Open)**. Verify the wordlist name on the Title Bar.
3. Do **one** of the following to select entries for deletion:

**Select one entry at a time**

Highlight the entry for selection.

**Select specific entries**

Press and hold **Ctrl** while you click the individual entries to highlight.

### Select a consecutive group of entries

Click to highlight the first entry of the group. Locate the last entry to delete. Press and hold **Shift**, while you click the last entry to highlight all the entries in-between.

### Select all the entries

Press **Ctrl + a** to highlight all the entries for selection.

4. Press **Delete** to delete the selected entries. A confirmation message with a Yes/No option to continue deleting displays if you checked the *Warn Before Deleting Entries* option in Wordlist Options.
5. Press **Ctrl + s (File/Save)** to save the wordlist when finished deleting entries.
6. Press **Ctrl+ F4** to close the wordlist. If another wordlist is open, it displays. If no other wordlist is open, the function closes.

## Insert/Modify Wordlist Entries

1. From anywhere in Case CATalyst, press **Alt + f, o, w (File/Open/Wordlist)**. From the Wordlist menu, select the type of wordlist. The Open Existing Document dialog box displays.
2. Select the wordlist and press **Enter (Open)**. Verify the wordlist name on the Title Bar.
3. Do either of the following:

### Insert an Entry

Press **Ctrl + i (Edit/Insert)**. The Insert Wordlist Entry dialog box displays. In the *Word* field, type the word you want to add to the wordlist.

### Modify an Entry

Highlight the entry you want to modify and then press **Ctrl + m (Edit/Modify)**. The Modify Wordlist Entry Dialog box displays with the selected entry in the *Word* field. Type any necessary changes.

4. Make entries in the fields as necessary:

### Action To Take

Select **one** of the following options:

#### Ignore

Adds the word to the selected wordlist so Spell Check does not stop on it again.

#### Suggest

Spell Check continues to stop on the word and automatically suggests the word entered in the Autocorrect/Suggestion field as the first suggested word. Erik, for example, may be an alternative for Eric.

#### Autocorrect

Adds the word to the selected wordlist and has Spell Check automatically change the word to the alternative you specify in the Autocorrect/Suggestion field. For example, you often type "teh" for "the". Spell check automatically corrects the misspelling.

#### Exclude

Add the word to the wordlist so Spell Check always stops on it. For example, you have a person's name that is also a common word. Spell Check recognizes the word and does not stop on it. You want Spell Check to always stop on the word, so you select Exclude. If, in the rare case, there is a word you feel is misspelled in the default wordlists, you can put the word in your Personal Wordlist with the exclude attribute.

### Autocorrect/Suggestion

Enter the alternative word you want Spell Check to either Suggest or Autocorrect when it encounters the highlighted word. This option is available when you select Suggest or Autocorrect in the Choose Action field.

5. Press **Enter (OK)** to confirm the action. The Modify Wordlist Entry dialog box closes automatically. If you are inserting entries, press **Esc** to exit the Insert Wordlist Entry dialog box.

## Wordlist Options

1. From anywhere in Case CATalyst, press **Alt + f, o, w (File/Open/Wordlist)**. From the Wordlist menu, select the type of wordlist. The Open Existing Document dialog box displays.
2. Select the wordlist and press **Enter (Open)**. Verify the name on the Title Bar.
3. Press **Alt + t, o (Tools/Options)**. The Wordlist Options dialog box displays.
4. Make changes as necessary:

### Warn Before Deleting Entries

Check this box to display a confirmation message when deleting wordlist entries. A Yes/No option to continue deleting displays.

Uncheck this box to not display a confirmation message when you delete entries. You cannot Undo deleted entries unless you exit the file without saving.

### Paste Options

This option applies when pasting entries from another wordlist and an entry conflicts with an existing entry. Select **one** of the following:

#### Keep Old Text

Automatically retain the original text in the wordlist and ignore all new entries.

#### Keep New Text

Automatically delete the original entries and insert the new entries.

#### Stop for Decision

Prompt to Keep Old or Keep New on every entry that conflicts.

5. Press **Ctrl + s (File/Save)** to save the wordlist when finished.
6. Press **Ctrl + F4** to close the wordlist. If another wordlist is open, it displays. If no other wordlist is open, the function closes.

## Include Wordlist in Manage Jobs

In Manage Jobs, drag and drop one wordlist on top of another wordlist to bring the entire contents of the first file into the second file. Entries merged into the wordlist for a current job are immediately recognized. Once you combine the wordlists, you cannot undo the change.

1. In Manage Jobs, click and hold the left mouse button on the wordlist name you want to include into another wordlist.
2. Move the source wordlist name over the destination wordlist, highlighting the destination wordlist.
3. Release the mouse button. A confirmation message displays. Select **one** of the following:

**Yes**

Include the entries from the source wordlist into the destination wordlist. You cannot undo the include.

**No**

Cancel the include.

## Print

The Case CATalyst Print function allows you to [print transcript files](#) to a printer or PDF and set transcript printer options. [Print Options](#) allow you to select specific items for printing, such as a box or timestamps. You can make separate settings for your draft and final printer. To view a transcript in the printed format before sending it to the printer, use the [Preview](#) option in the Print dialog box.

The Print option, accessible from within a Case CATalyst function, allows you to [print non-transcript files](#) such as a dictionary, table or steno note file. You must open the desired dictionary, note file or table to print from the open file. Available Print features vary depending on the type of file selected to print. To preview non-transcript files, use the Print Preview feature from within the Case CATalyst function.

When printing steno notes, the steno notes display in three columns. The beginning of each fold in the steno notes is highlighted. Timestamps, by default, are not included. You can change the number of columns that display and include timestamps by changing the settings in [Manage Notes Options](#).

You can [print a layout settings report](#) using the Print Layout Settings option in the Layout function. The Transcript Layout Detail Report lists the current values for Paragraph Styles, Page Setup and Headers and Footers values for a layout.

Once you send a file to Print, Case CATalyst sends the file to the Windows print handler. To [cancel or pause](#) the printing of a job, you must use Windows controls.

## Print Files

The Print function allows you to print transcript and non-transcript files such as a dictionary, table or steno note file, to a printer or to a PDF. [Printer options](#) allow you to set specific parameters separately for your draft and final printer. To view a transcript in the printed format before sending it to the printer, use the [Preview](#) option in the Print dialog box.

### Print a Transcript File

Access a transcript file to print:

- from Manage Jobs. Highlight the desired file and click the Print  icon or press **Alt + f, p** (**File/Print**). The Print dialog box displays with the file selected.
- from Edit. Press **Alt + f, p** (**File/Print**). The Print dialog box displays with the current Edit file selected.
- from anywhere in Case CATalyst. Press **Alt + u, p** (**Function/Print**) or click the Print  icon. The Print dialog box displays. Navigate to the desired file.

### Print Options

#### Printer

Select an available printer from the list. Select **Stenograph PDF Printer** to create a .pdf file. The selected printer may or may not be the destination printer depending on whether Draft, Final or Compressed is selected. To change the printer, click the arrow and select another available printer from the list and then modify your Draft, Final and/or Compressed Print Options to reflect the selected printer. The list of available printers is based on the printers currently set up through Windows. To set a default printer or establish other available printers, refer to your Windows documentation for additional information.

### Properties

Display a printer properties dialog box for the selected printer. Set any other necessary printing options. Refer to the printer documentation for additional information.

### Select File(s) to print

Select the user location that contains the file you want to print. The default is the current user folder. The files for the selected folder displays in the window below. Highlight the file to print. To print multiple files, hold **Ctrl** and click the files.

### Copies

Enter the number copies to print. Type a number or use the arrow buttons to increase or decrease the number.

### Output

Choose One:

#### Draft

Print the file using Draft printer options. When Draft is selected, the printer selected in the Draft Print Options dialog box is the destination printer. For example, let's say you have the HP Laser Jet 4250 PCL 5 selected. When you select the Draft option, the file is going to be printed to the HP Laser Jet 4250 PCL 5 printer. To change the Draft print options, select Draft and then click [Print Options...](#)

#### Final

Print the file using Final printer options. When Final is selected, the printer selected in the Final Print Options dialog box is the destination printer. For example, let's say you have the Stenograph PDF Printer selected. When you select the Final option, the file is going to be 'printed' to the Stenograph PDF printer. To change the Final print options, select Final and then click [Print options...](#)

#### Compressed

Print in compressed print format. Select a compressed print [configuration](#) from the drop down list. When Compressed is selected, the printer selected in the Compressed Print Options dialog box is the destination printer. To change the Compressed print options, select Compressed and then click Print Options...

### Print Options

Determine [print options](#) for the Draft, Final, and Compressed printers. You can set specific settings for each printer type.

### Manual Duplex

Check this box to print the file on both sides of the paper when you do not have automatic duplexing. Select **Paper Path** to set printer values necessary for manually duplexing. Stenograph does not recommend duplex printing on printers not designed for duplex printing. This can result in paper jams and distorted print.

#### Paper Path

The Paper Path identifies how the paper enters and exits your printer to determine how to feed the paper for duplex printing.

**Printed pages come out of my printer**

Identifies how the page exits the printer **face up** or **face down**.

**The top edges of blank sheets go into the paper tray toward the**

Identifies how the top edge of the page enters the printer, with the top edge toward the **front** of the printer or toward the **back** of the printer.

**Blank paper goes into my paper tray with the side to be printed on**

Identifies the side of the paper on which the printer prints, the side that faces **up** or the side that faces **down**.

**Documents should be printed from the**

Identifies the order of how the pages should print, from the **beginning to the end** of the file or the **end to the beginning**.

**Figure this out for me**

Have Case CATalyst determine the Paper Path settings. The Paper Path Wizard displays. Follow the instructions provided in the Paper Path Wizard.

**Sign/Encrypt PDF**

This option is only available when printing to the Stenograph PDF Printer. Check this box to digitally sign a PDF document and then select the **PDF Properties** option to complete the necessary information for sending a [digital signature](#).

To use the Digitally Sign PDF option, a digital signature must be available on your computer system. You obtain a digital signature from a certifying authority. A digital signature from a certifying authority allows anyone to verify the authenticity of your digital signature. A digital signature is not available through Stenograph.

This option is unavailable when the *PDF/A Compliant* option is active.

**PDF Properties**

The *PDF Properties* field is available when you select to use a digital signature. Click this option to view or set the Signing Options.

Set necessary options.

**Signing Options****Certificate**

Select the name of the digital signature certificate with which you are signing. Digital signatures available on your computer system display in the drop down box. A digital signature is not available through Stenograph. A digital signature is not the same as an electronic signature (a picture of your signature).

**Reason for Signing**

Type the purpose of your digital signature. (optional)

**Your Location**

Type the name of your location. (optional)

**Encryption Options**

### **Password**

Type a password. Access to print or copy text and graphics is password dependent. This is an optional field.

### **Allow Printing**

Check this box to allow printing. Uncheck this box to restrict printing.

### **Allow Copying (of text and graphics)**

Check this box to allow the text and graphics to be copied. Uncheck this box to restrict copying.

### **Include Attachments in PDF**

This option is only available when printing to the Stenograph PDF Printer. Include the transcript [attachments](#), if applicable, in the PDF. Attachments display in the Bookmark pane under the Exhibit heading and in the Attachment pane, often identified by a paper clip icon. In the Bookmark pane, click the plus sign next to the Exhibit heading to display the list of attachments. Double click an attachment to move the display to the area of the file where the attachment is located. Double click the Open heading under the attachment name to open the attachment for viewing. In the Attachment pane, click an attachment in the Attachment pane to open the file for viewing. To view attachments, the program associated with the attachment file type must be installed on the computer. For example, if the attachment is a Microsoft Word document, you must have Microsoft Word installed on your computer.

If you encrypt the PDF by requiring a password or restricting the printing or copying of text in the PDF, the attachments are only available for viewing from the Attachment pane. The Open option in the Bookmark pane does not display the file.

This option is unavailable when the *PDF/A Compliant* option is active.

### **PDF/A Compliant**

This option is only available when printing to the Stenograph PDF Printer. Print the transcript in PDF/A compliant format. PDF/A format creates the PDF with certain ISO 19001 standards for long term storage, such as requiring embedded fonts and graphics but disallowing audio, video, attachments, digital encryption and digital signatures. These parameters allow the document to always be viewed, unaltered in it's original format, using an appropriate PDF viewer such as Adobe Reader.

Federal Court Reporters are required, or may soon be required, to submit their transcripts for archiving purposes in a PDF/A format.

### **Range**

#### **Entire Document**

Print all the pages in the file.

#### **First Page**

Print only the first page in the file. If you highlight more than one job to print, you can use the First Page option to print the specified number of *first pages* of each selected job.

#### **Section**

Print a section of the file. Select the section from the drop down list.

#### **Pages**

Print selected pages in the file. Enter the page range in the field below. Do **one** of the following:

#### Print individual pages

Type the page numbers separated by a comma. For example, to print page 5 and page 25, type: 5, 25

#### Print a series of pages

Type the beginning page number, followed by a hyphen, and then followed by the ending page number. For example, to print page 5 through 10, type: 5-10

#### Print a combination of individual and consecutive pages

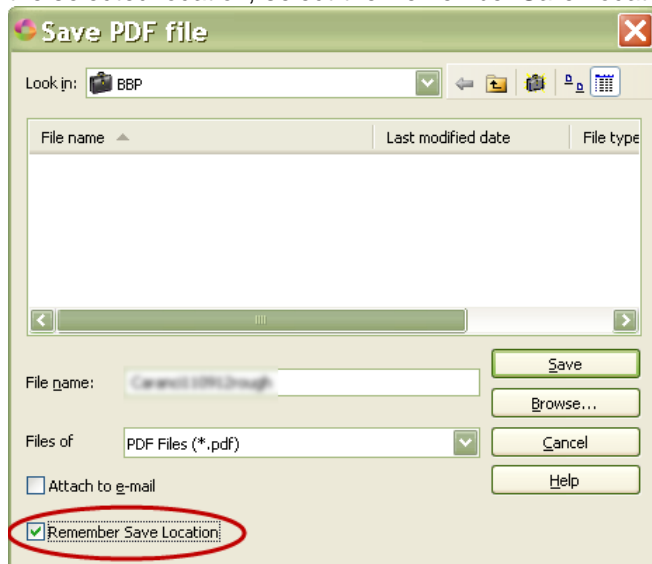

Type the individual page number separated by a comma, and then beginning page numbers for the consecutive pages, followed by a hyphen, and then the ending page number and all separated by commas. For example, to include page 5, pages 15 through 20, and page 29, type the following: 5, 15-20, 29

#### Print pages within a section

Type the section number followed by the page range. For example, to print pages 25-40 in section two, type: 2:25-40.

### Print

Send the file to print with the selected options. If you are printing a PDF, the Save PDF file dialog displays. Select the destination location for the PDF. If you always want to print your PDF files to the selected location, select the Remember Save Location option and press **Alt + s** (Save).

### Preview

Displays a [preview](#) of the file in the printed format.

## Print a Non-Transcript File

Access a non-transcript file to print:

- from Manage Jobs. Double click the desired file. The file opens in the appropriate Case CATalyst function. For example, you double click the Anderson\_041411.sgdct dictionary. Case CATalyst opens the dictionary in the Manage Dictionary function. Select **Alt + f, p (File/Print)**. The Print dialog box displays.
- from anywhere in Case CATalyst. Press **Alt + f + o (File/Open)**. Select a file category from the list. Depending in the category selected, a submenu may display. Select a specific file type. The file opens in the appropriate Case CATalyst function. Press **Alt + f, p (File/Print)**. The Print dialog box displays.

When printing steno notes, the steno notes display in three columns. The beginning of each fold in the steno notes is highlighted. Timestamps, by default, are not included. You can change the number of columns that display and include timestamps by changing the settings in [Manage Notes Options](#).

### Print Options

Make necessary entries and press **Enter (OK)** to send the file to print.

#### Name

The name of the printer selected for printing. To change the printer, click the arrow and select another available printer from the list. The list of available printers is based on the printers currently set up through Windows. The printer selected for this printing becomes the default printer for the remainder of the current Case CATalyst session. To set a default printer or establish other available printers, refer to your Windows documentation for additional information.

Select **Stenograph PDF Printer** to create a .pdf file. A PDF reader, such as Adobe<sup>®</sup> Acrobat<sup>®</sup> Reader is needed to view the file.

#### Properties

Display a printer properties dialog box for the selected printer. Set any other necessary printing options. Refer to the printer documentation for additional information.

#### Status

Indicates the status of the printer. For example, Ready or Idle.

#### Type

Displays the printer type. This may be different that the printer displayed in the *Name* field. For example, the printer name "Draft Printer" displays in the name field. The type of printer used for draft printing is HP LaserJet P2050 Series PCL6.

#### Where

Indicates through which port on your computer the data is sent to the printer.

#### Comment

Any additional information about the printer that may be available.

#### Print to file

Check this box print to a PDF file instead of the printer. The Print to File dialog box displays. Verify the folder where you want to store the file and type a name in the *File name* field. Press **Enter (Save)**.

### Print Range

#### All

Check this box to print all the pages in the file.

#### Pages

Check this box to print only selected pages in the file. Enter the page range in the *from* and *to* fields.

#### Selection

Check this box to print the highlighted or marked selection in the file. Depending on the Case CATalyst function from which you are printing, this option may not be available.

### Copies

#### Number of copies

Enter the number of copies you want to print.

#### Collate

Check this box to collate the pages as they print. This option is only available for printers with collating ability. Refer to your printer documentation for more information.

## Print Current Page

Print Current Page allows you to print the transcript page on which your cursor is located. Only one page prints.

### Print the Current Page in Edit

1. Place your cursor on the page you want to print.
2. Press **Ctrl + Shift + p (Function/Print Current Page)**. Case CATalyst sends the page directly to the printer using the last Output option selected for printing. For example, the last job you printed used the Draft option settings. The current page prints using the Draft options. You cannot cancel the print from Case CATalyst.

## Print Preview

Preview allows you to view a file prior to sending it to print. You can preview transcript and non-transcript files such as dictionaries, tables and steno notes.

### Preview Transcript Files

You can preview a text file (.sgnfl) in printed format from anywhere within Case CATalyst. Print Preview shows font color assignments that may display in the transcript. For example, you may have different font colors assigned for Q and A. The items print in color only if you select the Print Colors [option](#) and print to a color printer.

Access the Print Preview:

- from anywhere in Case CATalyst. Press **Alt + u, p (Function/Print)**. In the Print dialog box, highlight the desired file and **Preview**.

- in Manage Jobs. Highlight the desired job press **Alt + f, v (File/Print Preview)**. The Print dialog box displays with the file highlighted. Select **Preview**.

### Preview Options

If necessary, press **Alt + c (Close)** to close the print preview dialog box when finished.

#### Print

Close the Print Preview dialog box and display the Print dialog box for printing. Select any necessary settings and press **Enter (OK)**. The Print dialog box closes and the file is sent to the printer.

#### Next Page

Display the page occurs after the currently displayed page. This option is available when you select to display one page at a time.

#### Prev Page

Display the page that occurs before the currently displayed page. This option is available when you select to display one page at a time.

#### Two Page/One Page

Switch between a one page and two page preview display.

#### Zoom In

Enlarges the font size of the preview to allow you to see a specific part of the page up close. This does not affect the printed page.

#### Zoom Out

Reduces the font size of the preview to allow you to see more of the page. This does not affect the printed page.

#### Close

Close the Print Preview. The Print dialog box displays.

## Preview Non-Transcript Files

You can preview a non-transcript file, such as a dictionary, in print format prior to printing. To preview a non-transcript file type, it is necessary to open the function associated with the file type and select **Alt + f, p (File/Print Preview)**. For example, to preview a job dictionary in print format, open Manage Dictionary, open the dictionary and select **File/Print Preview**. To preview your Personal Globals table in print format, open the Personal Globals table and select **File/Print Preview**.

### Preview Options

#### Print

Close the Print Preview dialog box and display the Print dialog box for printing. Select any necessary settings and press **Enter (OK)**. The Print dialog box closes and the file is sent to the printer.

#### Next Page

Display the page that follows the currently displayed page. This option is available when you select to display one page at a time.

**Prev Page**

Display the page before the currently displayed page. This option is available when you select to display one page at a time.

**Two Page/One Page**

Switch between a one page and two page preview display.

**Zoom In**

Enlarges the font size of the preview to allow you to see a specific part of the page up close. This does not affect the printed page.

**Zoom Out**

Reduces the font size of the preview to allow you to see more of the page. This does not affect the printed page.

**Close**

Close the Print Preview.

## Print Setup

Print Setup allows you to set print parameters for any printer to which your computer is connected.

### Set Printer Options

1. Do **one** of the following to display the Print dialog box:
  - Open the Print function, press **Alt + u, p (Function/Print)**.
  - From within a selected Case CATalyst function, press **Alt + f, r (File/Print Setup)**.
2. Use the following options as necessary:

**Printer****Name**

The name of the default printer to which the file is printing. To change the printer, click the arrow and select another printer from the list. When you select a printer and send the file to print, that printer becomes the default printer for the remainder of the current Case CATalyst session.

The list of available printers is based on the printers currently set up through Windows. Refer to your Windows documentation for additional information.

**Status**

Indicates the status of the printer. For example, Ready or Idle. If you have the selected the default printer, that information also displays.

**Type**

Displays the type of the printer. This may be different than the printer in the Name field. For example, the printer name "Draft Printer" displays in the name field. The type of printer used for draft printing is HPLaserJetV.

**Where**

Indicates through which port on your computer the data is sent to the printer.

**Comment**

Any additional information about the printer that may be available.

**Properties**

Displays another dialog box with additional printing options you can set for the currently selected printer. Refer to your printer documentation for additional information.

**Paper**

**Size**

Select the size of the paper for your printer.

**Source**

Select the source of the paper.

**Orientation**

Select the direction you want text to print on the page.

**Portrait**

Print the document with the paper vertically positioned.

**Landscape**

Print the document with the paper horizontally positioned.

**Network**

Display the Connect to Printer dialog box which allows you to connect to a printer on the network.

3. Press **Enter (OK)** to accept the new settings.

## Print Options

Print Options allow you to set specific printing parameters for your Draft and Final jobs. Print Options also allow you to set a default printer for Compressed printing. [Compress Print options](#) are set in the Compress Print function. and compressed print transcripts. you to set a default printer for Compressed printing.

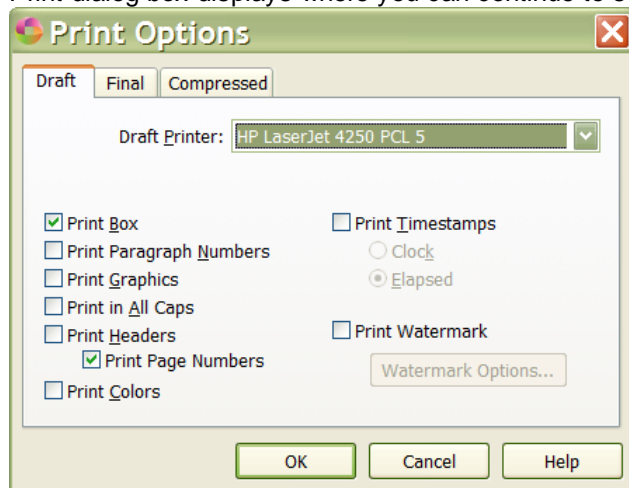

NOTE: The Preview... feature in the Print dialog box will display the watermark, if applicable. Print Preview from Edit will not show the watermark, if applicable. The watermark feature is not available for compressed print.

To access Print options, press **Alt + u, p (Function/Print)** from anywhere in Case CATalyst. In the Print dialog box, press **Print Options**.

### Draft/Final Print Options

Set Print options for Draft, Final and Compressed copies. The printer selected in the Draft, Final or Compressed Print Options is the printer that is used when printing a transcript or transcripts. Make necessary entries on each tab, **Draft**, **Final** and **Compressed** and press **Enter** when finish. The Print dialog box displays where you can continue to set other print output options.

### **Draft, Final, Compressed Printer**

The name of the default printer. To change the printer, click the arrow and select another printer from the list, if available.

### **Print Box**

Check this option to print a box around the text of your transcript. The applied [layout](#) for the selected job must contain *Box* values.

### **Print Paragraph Numbers**

Check this option to print paragraph numbers. The applied [layout](#) for the selected job must have the *Paragraph is numbered* option selected.

### **Print Graphics**

Check this option to print graphics contained in the selected file.

### **Print in All Caps**

Check this option to print the selected file in all capital letters.

### **Print Headers**

Check this option to print headers/footers (including page numbers). If you only want to print the transcript page numbers, deselect this option and select the Print Page Numbers option.

#### **Print Page Numbers**

This option is available when the Print Headers option is not selected. The transcript page numbers will print but any headers/footers will not be printed.

### **Print Colors**

Check this option to print the transcript in font color selected in the applied layout. A color printer is required.

### **Print Timestamps**

Check this option to print the transcript's and then select the timestamp format. The transcript layout must contain Timestamp values.

### **Clock**

Timestamps print based on the clock (12 hour) time.

### **Elapsed**

Timestamps print based on the elapsed (time taken for the event) time.

## **Print Watermark**

You can select to print a watermark on every page of the transcript whether the transcript is printed to a printer or the Stenograph PDF printer. Click the Watermark Options... to create a watermark or to modify an existing watermark. Once you set up your watermark settings, they will be remembered until you change them. You can customize the text, the size, the direction and the shade of the watermark. Once you make a change, the preview display on the right reflects your changes. When you are finished, click **OK** to save your changes.

### **Text**

Type the text for the watermark. Highlight the existing text (if applicable) and type the text you want.

### **Size**

To select the size of the watermark, click the down arrow. The size selections are: Very Small, Small, Medium, Large and Very Large.

### **Orientation**

To select the direction of the watermark, click the down arrow. The orientation selections are: Diagonal - bottom left to top, Diagonal - top left to bottom, Horizontal (centered vertical).

### **Shade**

To select the lightness/darkness of the watermark, click the down arrow. The shade selections are: Very Light, Light, Medium, Dark and Very Dark.

## **Compressed Print Options**

Select the Compressed Print default printer.

### **Compressed Printer**

Select a printer from the drop down list. All printers properly installed through Windows display.

## **Cancel Or Pause Printing**

To stop or pause printing a file that has already been sent to the printer you must use Windows controls. Refer to your *Windows* documentation for detailed information.

## **Windows 7**

1. From the Windows Start menu, select **Devices and Printers**.
2. Right click on the appropriate printer and select **See what's printing**.
3. Any job in the process of printing or waiting to print displays in the dialog box. Do one of the following:
  - Highlight the file and select **Document**. Select the appropriate command: **Cancel Printing** or **Pause Printing**.
  - Cancel or pause multiple files. Highlight the file or files you want to cancel or pause. Select **Document** and then the appropriate command, **Cancel Printing** or **Pause Printing**.
  - Cancel or pause all the files. Select **Printer** and then the appropriate command: **Cancel All Documents** or **Pause Printing**.
4. Press **Alt + F4 (File/Close)** to close the printer dialog box.

**Important:** Microsoft ended Windows Vista support as of April 2017. Case CATalyst, CATalyst BCS and CATalyst VP no longer supported when running Windows Vista.

## Digital Signatures

Digital signatures take the concept of traditional paper-based signing and turn it into a digital coded message or "fingerprint." This fingerprint is unique to both the document and the signer. The digital signature ensures that the signer is indeed the originator of the message/file. Changes made after the document is signed are noted.

A digital signature is the result of a cryptographic operation. The technology behind digital signatures is an industry standard known as Public Key Infrastructure (PKI), which guarantees data integrity and non-repudiation of transactions. The digital signature cannot be copied, tampered or altered.

While digital and electronic signatures are terms often used interchangeably, they are distinctly different. An electronic signature is a representation of a person in the form of a digitized image of his or her handwritten signature. It is typically attached to an electronic document or transaction and can be copied.

## Print Full justification

If you need to print a transcript with full justification, while editing you can select all the text in transcript you want justified, use the Full Justify keyboard map assignment and then select to print the transcript. The edit screen does not reflect the justification, if you want to **see** how the transcript will print, select File, Print Preview. If you save the file, the file remains in Full Justification even though the edit screen does not reflect the justification.

### Full Justify Keyboard Map Function:

1. In your keyboard map, assign a key combination to the Full Justify function.  
It is necessary to assign a key combination to invoke the Full Justify function in a keyboard map as there isn't a menu item for the function.
2. It is recommended that you have all editing changes completed and saved before using the Full Justify command.
3. Using the Mark Start and either Search or Go To commands, highlight the text you want to set to full justification.
4. With the keyboard map active that has the Full Justify key combo assignment, press the keys assigned to Full Justify.

5. To see the applied justification, go to File, Print Preview (**Alt + f, v**). The edit screen **will not display** in full justification, use the Print Preview function to see the change. To close Print Preview, click the Close button.
6. To Print the file, do one of the following:
  - Click the Print button, the Print dialog box displays. Select any options and click Print (**Alt + r**).
  - In Print Preview, click the Print (**Alt + p**) button. The Print dialog box displays, select any options and click Print (**Alt + r**).
7. To close the transcript, do one of the following:
  - To save the transcript in full justification, save and close the transcript.
  - If you do not want to save the transcript in full justification, close the transcript without saving changes. All changes from the last save command will be lost.

NOTE: Paragraph alignment settings affect paragraph format symbols only such as Colloquy, New Line Paragraph, Parenthetical, etc., format symbols. A New Line format symbol is not a paragraph format symbol, it is simply a new line (moves text to the next line) and will may not follow the previous paragraphs justification.

## PDF Files

PDF stands for Portable Document Format. A PDF file is similar to taking a "picture" of the original source material allowing you to create electronic documentation exactly as it appears on your system. The PDF can be view, searched and printed via a PDF Reader. In most cases, you cannot modify a PDF file although depending on the viewing software it may be possible. PDF files are not image files and cannot be opened or inserted as an image. To view a PDF file you must have a PDF viewer such as Adobe Acrobat Reader. Acrobat Reader can be downloaded free from [www.adobe.com](http://www.adobe.com).

In Case CATalyst, you can create PDF files from your [text](#) documents, [steno notes](#), and [dictionaries](#). PDF files made from text documents in Case CATalyst remain exactly the same as the original document, maintaining margins, fonts, spacing, etc. Create PDF files of your text documents using the [Print](#) function. You can use PDF files to create a condensed print file to e-mail to your clients or upload to a document sharing site.

PDF files made from your steno notes display the notes in three columns by default. The beginning of each fold in the steno notes is highlighted. Create PDF files from your steno notes in the Manage Notes function using the Print feature. Use the [Manage Notes](#) Options to change the number of columns that print. Printing your steno notes to PDF may be an answer to situations/jurisdictions that require you to provide your steno notes. For example, you work in a court house that has gone paperless and they ask for a copy of your steno notes for archiving. Providing your notes as a PDF may satisfy their request.

PDF files made from a dictionary in Case CATalyst display the dictionary entries with accompanying column information that are currently being displayed which could include Text, Steno, Modified Date, Usage Count, and Used Date. The information displays exactly as it appears in Case CATalyst. Use the [Manage Dictionary](#) Options to change what columns display on the screen and in what format you want the dictionary to be printed. Create PDF files from your dictionaries in the Manage Dictionary function using the Print feature. Using the [Create Core List](#) and printing to PDF is a good way to share job dictionary information with other reporters.

## Print Text to PDF File

Using the Case CATalyst Print function, you can make PDF files from your text (transcript) documents. Case CATalyst automatically saves the file in the same destination as the current file and uses the current file name with a PDF extension. You can rename the file or save it to another destination. To view a PDF file, you must have a PDF viewer installed on your computer, such as Adobe Acrobat Reader.

You can also [print your PDF with bookmarks](#) for items such as examinations, exhibits, etc., in the event your jurisdiction or clients request bookmarked items.

You can also print your [dictionary to PDF](#), a [steno note file to PDF](#) in the event that your jurisdiction requires copies of your steno notes and you can select to [print multiple steno files](#) at one time.

Access a transcript file to print:

- from Manage Jobs. Double click the desired file. The Print dialog box displays with the file selected.
- from Edit. Press **Alt + f, p (File/Print)**. The Print dialog box displays with the current Edit file selected.
- from anywhere in Case CATalyst. Press **Alt + u, p (Function/Print)** or click the Print  icon. The Print dialog box displays. Navigate to the desired file.

## Print Transcript to PDF

### Printer

Select **Stenograph PDF Printer File**.

### Properties

Displays a properties dialog box, however, you cannot modify the options.

### Select File(s) to print

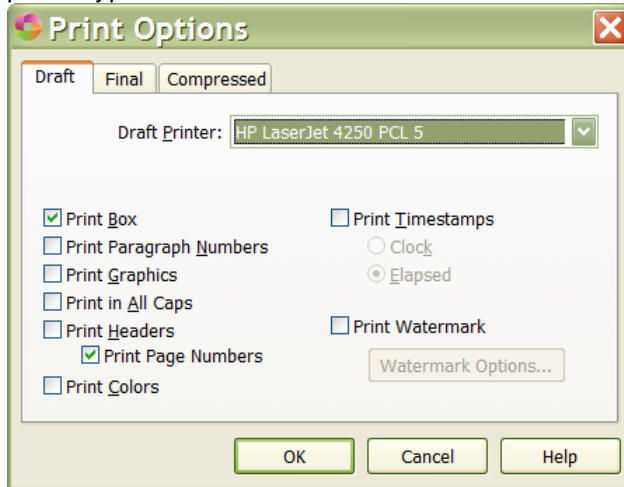

Select the location of the file you want to print. The default is the current user folder. The files for the selected folder displays in the window below. Highlight the file you want to print.

### Copies

The number of copies of the current selection you want to print. Type a number in the field. If you select more than one copy, Case CATalyst prompts you to name each copy of the PDF file.

### Options

Set [print options](#) for the Draft, Final, and Compressed printers. You can set specific settings for each printer type.

## PDF Options

### Sign PDF

Check this box to digitally sign a PDF document and then select **Signing/Encryption Settings...** to complete the necessary information for sending a [digital signature](#).

To use the Digitally Sign PDF option, a digital signature must be available on your computer system. You obtain a digital signature from a certifying authority. A digital signature from a certifying authority allows anyone to verify the authenticity of your digital signature. A digital signature is not available through Stenograph. If a digital signature is not found or you do not have one, [Do Not Sign] displays in the Certificate field.

This option is unavailable when the *PDF/A Compliant* option is active.

### Encrypt PDF

Check this box to add a password, limit printing and/or copying of text from the PDF document. Once you select the Encrypt PDF option, then select **Signing/Encryption Settings...** to complete the necessary information.

This option is unavailable when the *PDF/A Compliant* option is active.

#### + **Signing/Encryption Settings...**

The *Sign PDF* option is available when you select to use a digital signature. Click this option to view or set the Signing Settings.

Set necessary options.

### Signing Options

**Certificate**

Select the name of the digital signature certificate with which you are signing. Digital signatures available on your computer system display in the drop down box. A digital signature is not available through Stenograph. If no certificate is found, [Do Not Sign] displays in the Certificate field.

**Reason for Signing**

Type the purpose of your digital signature. (optional)

**Your Location**

Type the name of your location. (optional)

**Encryption Options****Password**

Type a password. Access to print or copy text and graphics is password dependent. This is an optional field.

**Allow Printing**

Check this box to allow printing. Uncheck this box to restrict printing.

**Allow Copying (of text and graphics)**

Check this box to allow the text and graphics to be copied. Uncheck this box to restrict copying.

**Include Attachments in PDF**

Include the transcript [attachments](#), if applicable, in the PDF. Attachments display in the Bookmark pane under the Exhibit heading and in the Attachment pane, often identified by a paper clip icon. In the Bookmark pane, click the plus sign next to the Exhibit heading to display the list of attachments. Double click an attachment to move the display to the area of the file where the attachment is located. Double click the Open heading under the attachment name to open the attachment for viewing. In the Attachment pane, click an attachment in the Attachment pane to open the file for viewing. To view attachments, the program associated with the attachment file type must be installed on the computer. For example, if the attachment is a Microsoft Word document, you must have Microsoft Word installed on your computer.

If you encrypt the PDF by requiring a password or restricting the printing or copying of text in the PDF, the attachments are only available for viewing from the Attachment pane. The Open option in the Bookmark pane does not display the file.

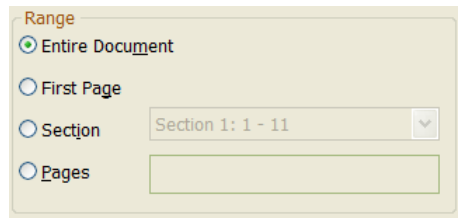

This option is unavailable when the *PDF/A Compliant* option is active.

**PDF/A Compliant**

Print the transcript in PDF/A compliant format. PDF/A format creates the PDF with certain ISO 19001 standards for long term storage, such as requiring embedded fonts and graphics but disallowing audio, video, attachments, digital encryption and digital signatures. These parameters allow the document to always be viewed, unaltered in its original format, using an appropriate PDF viewer such as Adobe Reader.

Federal Court Reporters are required, or may soon be required, to submit their transcripts for archiving purposes in a PDF/A format.

## Range

A screenshot of a software dialog box titled "Range". It contains four radio button options: "Entire Document" (which is selected), "First Page", "Section", and "Pages". To the right of the "Section" option is a dropdown menu showing "Section 1: 1 - 11". To the right of the "Pages" option is an empty text input field.

### Entire Document

Print all the pages in the file.

### First Page

Print only the first page in the file. If you highlight more than one job to print, you can use the First Page option to print the specified number of *first pages* of each selected job.

### Section

Print all pages of the selected Section.

### Page Range

Print selected pages in the file. Enter the page range in the field below. Do **one** of the following:

#### Print individual pages

Type the page numbers separated by a comma. For example, to print page 5 and page 25, type: 5, 25. If the pages are in a section, type the section number followed by a colon and then type the page numbers. For example, if the pages are in section three, type: 3:5,25.

#### Print a series of pages

Type the beginning page number, followed by a hyphen, and then followed by the ending page number. For example, to print page 5 through 10, type: 5-10. If the pages are in a section, type the section number followed by a colon and then type the page numbers. For example, if the pages are in section three, type: 3:5-10.

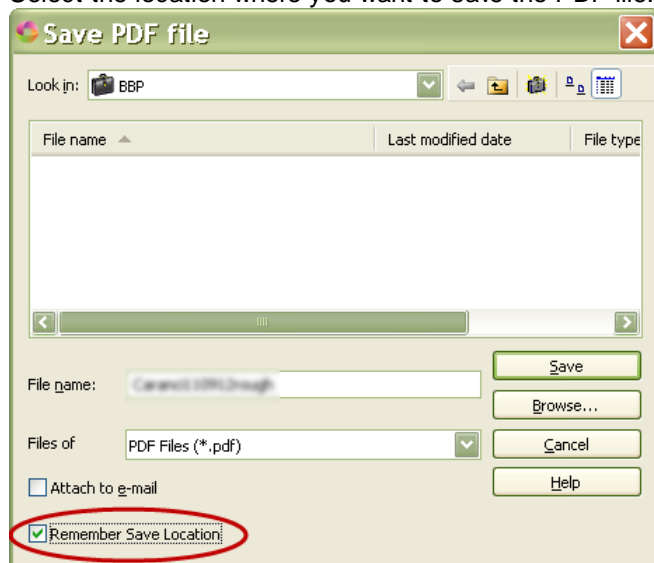

#### Print a combination of individual and consecutive pages

Type the individual page number separated by a comma, and then beginning page numbers for the consecutive pages, followed by a hyphen, and then the ending page number; all separated by commas. For example, to include page 5, pages 15 through 20, and page 29, type the following: 5, 15-20, 29. If the pages are in a section, type the section number followed by a colon and then type the page numbers. For example, if the pages are in section three, type: 3:5, 15-20, 29.

## Print

Send the selected file(s) to the printer. When printing to PDF, the Save PDF File dialog box displays. Select the location where you want to save the PDF file.

#### Attach to e-mail

Select the Attach to e-mail option to automatically open your default e-mail package with the PDF as an attachment.

#### Remember Save Location

Select the Remember Save Location to have Print remember the location for your PDFs.

#### Preview

Displays a [preview](#) of how the selected file looks when it prints.

### Print Bookmarked PDF

Some jurisdictions require a PDF version of the transcript be provided and require the PDF to have bookmarks where specific items (such as examinations, exhibits, etc.) occur in the transcript. Bookmarks allow the person viewing the PDF to click a bookmark and go directly to that location in the PDF. CATalyst has two [PDF Bookmark](#) Text format symbols that are used in an index template to generate the bookmarks in the PDF. For example, some jurisdictions may require a PDF to have bookmarks when examinations occur, exhibits are marked, requests for documentation occur, etc. The bookmarked text displays in the PDF pane and allows a user to click a bookmark and go directly to that location in the transcript.

The following is the example of a PDF bookmark pane of the Examination of John Doe by Perry Mason. With the PDF Bookmarks, the person viewing the PDF can click “By Perry Mason” and move the cursor to the location where Perry Mason started questioning John Doe.

If you use Index Templates to create your transcript index page, it is as simple as adding the PDF Bookmark Text formats symbols to your index template. Remember, once you create your index template, it is used over and over again.

PDF Bookmarks can be as simple or as detailed as you need. Using the example above, here is what the Examination part of your Index Template would look like:

<PDF Bookmark Text On 1>EXAMINATION<PDF Bookmark Text Off>

PAGE

<PDF Bookmark Text On 2><Index Heading On W><PDF Bookmark Text Off>	
<PDF Bookmark Text On 3><Index On W><PDF Bookmark Text Off>	<Index Page>

As a result, the EXAMINATION is level 1, the Index Heading On FS (which is replaced with the witness name when the index is built) is level 2 and the Index On FS (which is replaced with your attorney by lines) is level 3. That final level will be bookmarked in the PDF file when you print to PDF. If you wish to bookmark Exhibits or any other item in your index, start over with <PDF Bookmark Text On 1> format symbol for level 1 and so on for each item/table in your index.

The CATalyst <PDF Bookmark Text On/Off> format symbols are inserted into an [Index Template](#) and need to surround the indexing format symbols related to the items that need to be bookmarked. Then when you use CATalyst's [Build Index](#) feature and print the transcript to PDF, the bookmarked indexed text displays in the Bookmarks pane of the PDF. If you add information to the transcript that needs to be indexed after you have built your index page(s), you can use the [Bookmark Swap](#) command to bookmark the added information in the index.

## PDF Bookmark Text On/Off Format Symbols

The PDF Bookmark Text format symbols are a pair (an On and Off format symbol). The PDF Bookmark Text format symbols are used in an index template to create bookmarks for items (such as examinations, exhibits, requested documents, etc.) that need to be bookmarked in the PDF. For example, let's say your jurisdiction requires a PDF to have bookmarks when examinations occur, exhibits are marked, requests for documentation occur, etc. Once the transcript is printed to PDF, the bookmarked text displays in the PDF pane and allows a user to click a bookmark and go directly to that location in the transcript. PDF Bookmarks are compatible when building a [master index](#) that is in the same file as the transcript.

The CATalyst <PDF Bookmark Text On/Off> format symbols are inserted into an [Index Template](#) and need to surround the indexing format symbols related to the items that need to be bookmarked. Then when you use CATalyst's [Build Index](#) feature and print the transcript to PDF, the bookmarked indexed text displays in the Bookmarks pane of the PDF.

In addition to the PDF Bookmark Text On/Off format symbols being paired, the PDF Bookmark Text On format symbols have associated numbers to indicate the "level" of the bookmark.

The following is the example of a PDF bookmark pane of the Examination of John Doe by Perry Mason. With the PDF Bookmarks, the person viewing the PDF can click "By Perry Mason" and move the cursor to the location where Perry Mason started questioning John Doe.

If you use Index Templates to create your transcript index page, it is as simple as adding the PDF Bookmark Text formats symbols to your index template. Remember, once you create your index template, it is used over and over again.

PDF Bookmarks can be as simple or as detailed as you need. Using the example above, here is what the Examination part of your Index Template would look like:

<PDF Bookmark Text On 1>**EXAMINATION**<PDF Bookmark Text Off>  
PAGE

<PDF Bookmark Text On 2><Index Heading On W><PDF Bookmark Text Off>	
<PDF Bookmark Text On 3><Index On W><PDF Bookmark Text Off>	<Index Page>

As a result, the EXAMINATION is level 1, the Index Heading On FS (which is replaced with the witness name when the index is built) is level 2 and the Index On FS (which is replaced with your attorney by lines) is level 3. That final level will be bookmarked in the PDF file when you print to PDF. If you wish to bookmark Exhibits or any other item in your index, start over with <PDF Bookmark Text On 1> format symbol for level 1 and so on for each item/table in your index.

The PDF Bookmark Text Off format symbol does not require a number; it automatically turns off any previous <PDF Bookmark Text On #> format symbol. Valid numbers for the <PDF Bookmark Text On #> format symbols are 1- 5.

#### To insert the PDF Bookmark Text On and Off format symbols:

1. Open the Index Template that you want to add the PDF Bookmark Text format symbols, make sure that you are in Page View and Reveal Codes are displayed. Locate the indexing format symbol you want to surround with the PDF Bookmark Text On/Off format symbols and double click it.
2. Access the Format Symbol list either by pressing F4 twice and then selecting PDF Bookmark Text On or clicking the format symbol (FS) icon on the toolbar. You could also assign key combinations in your [Keyboard Map](#) or modify your [Format Symbols options](#) to insert via a key combination.
3. Double click or press Enter on the PDF Bookmark Text On entry. The Enter bookmark level dialog box displays:

4. Type the number of the bookmark level and press Enter. The <PDF Bookmark Text On #> (displays selected number) and the <PDF Bookmark Text Off> format symbols surround the selected indexing code.
5. Repeat as necessary.

Keyboard functions: Insert PDF Bookmark Text On  
Insert PDF Bookmark Text Off

## PDF Bookmark Index Template Examples

The following are common examples of index templates, indexing format symbols and the use of the PDF bookmark format symbols. (Indexing format symbol categories used in these templates are for example only and you may use whatever indexing format symbol categories you desire. The blue color of the PDF Bookmark Text format symbols are for clarity only and are normally black when inserted into an index template.) There are three [sample Index Templates](#) in your Index Templates case located in your System Files case.

**Example 1:** Let's say you have an existing index template and you want the occurrence of the word WITNESS and the witness name bookmarked in the PDF along with the word EXHIBITS and the occurrences of exhibits. Current Index Template for Witness (where Index On W will show the Witness name in your index) and Exhibits (where Index On E will show exhibit numbers in your index):

WITNESS  
PAGE

<Index On W>	<Index Page>
--------------	--------------

EXHIBITS  
PAGE

<Index On E>	<Index Page>
--------------	--------------

Changes to the Index Template with PDF bookmark format symbols surrounding the word WITNESS and the Index On W format symbol and the PDF Bookmark Text format symbols surrounding the word EXHIBITS and the Index On E format symbol:

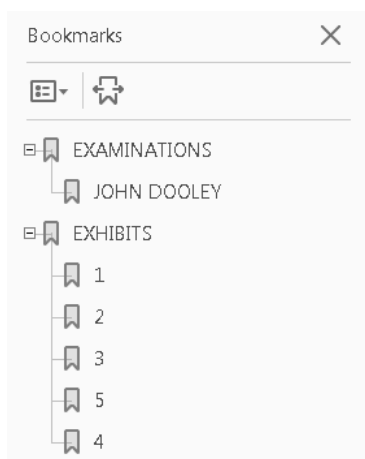

<PDF Bookmark Text On 1>WITNESS<PDF Bookmark Text Off>  
PAGE

<PDF Bookmark Text On 2><Index On W><PDF Bookmark Text Off>	<Index Page>
---	--------------

<PDF Bookmark Text On 1>EXHIBITS<PDF Bookmark Text Off>  
PAGE

<PDF Bookmark Text On 2><Index On E><PDF Bookmark Text Off>	<Index Page>
---	--------------

Example 1 – PDF Bookmarks pane:

**Example 2:** Let's say you have another index template and you want the occurrence of the word Witness, along with the Witness Name and the examining attorney's name bookmarked in the PDF along with the word EXHIBIT, the exhibit number and exhibit description bookmarked in the PDF.

Current Index Template for Witness and Attorney name (where Index Heading On W will show the witness name and Index On W will show the examining attorney's name):

WITNESS  
PAGE

<Index Heading On W>	
<Index On W>	<Index Page>

EXHIBITS

NO. DESCRIPTION  
PAGE

<Index Heading On E>	<Index On E>	<Index Page>
----------------------	--------------	--------------

Changes to Index Template:

<PDF Bookmark Text On 1>**WITNESS**<PDF Bookmark Text Off>  
PAGE

<PDF Bookmark Text On 2><Index Heading On W><PDF Bookmark Text Off>	
<PDF Bookmark Text On 3><Index On W><PDF Bookmark Text Off>	<Index Page>

<PDF Bookmark Text On 1>**EXHIBITS**<PDF Bookmark Text Off>

NO. DESCRIPTION  
PAGE

<PDF Bookmark Text On 2><Index Heading On E><PDF Bookmark Text Off>	<PDF Bookmark Text On 3><Index On E><PDF Bookmark Text Off>	<Index Page>
---	---	--------------

**Example 2:** the PDF Bookmark pane:

**Example 3:** Let's say you are an official reporter and you need show the word WITNESS, the witness name and then bookmark when each attorney conducts their examinations and you also want to show the word EXHIBITS including the exhibit numbers, exhibit descriptions and then bookmark when the exhibits are offered and received into evidence. Current Index Template for Witness, examining Attorney name, exhibit numbers including descriptions and where the exhibits were offered and received.

WITNESS EXAMINATIONS  
PAGE

<Index Heading On W>	
<Index On W>	<Index Page>

E X H I B I T S

No. Description Offered  
Received

<Index Heading On E>	<Index On E>	<Index Cell 1>	<Index Cell 2>
----------------------	--------------	----------------	----------------

Changes to the Index Template to include bookmarks for the witness and attorney examinations, exhibit numbers and descriptions along with reference to when they were offered and received:

<PDF Bookmark Text On 1>WITNESS EXAMINATIONS<PDF Bookmark Text Off>

PAGE

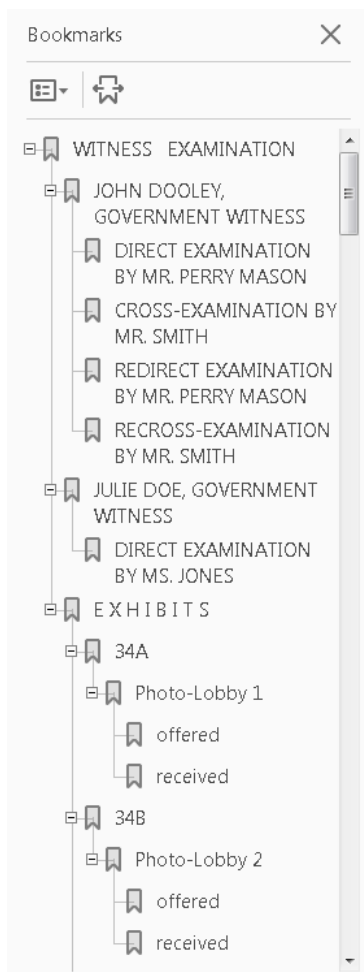

<PDF Bookmark Text On 2><Index Heading On W><PDF Bookmark Text Off>	
<PDF Bookmark Text On 3><Index On W><PDF Bookmark Text Off>	<Index Page>

<PDF Bookmark Text On 1>E X H I B I T S<PDF Bookmark Text Off>

No. Received	Description	Offered
-----------------	-------------	---------

<PDF Bookmark Text On 2><Index Heading On E><PDF Bookmark Text Off>	<PDF Bookmark Text On 3><Index On E><PDF Bookmark text Off>	*<PDF Bookmark Text On 4>offered<PDF Bookmark Text Off><Index Cell 1>	*<PDF Bookmark Text On 4>received<PDF Bookmark Text Off><Index Cell 2>
---	---	---	--

\* **USE HIDDEN TEXT** for the bookmark information: Insert Hidden Text with a word or phrase that will appear in the exhibit marking text and then surround the word/phrase with PDF Bookmark Text format symbols. The Hidden Text should be placed in the cell before the Index Cell format symbol. In the above table, you will see the <PDF Bookmark Text On 4>offered<PDF Bookmark Text Off> is placed in hidden text immediately before the <Index Cell 1> format symbol and the <PDF Bookmark Text On 4>received<PDF Bookmark Text Off>format symbol is placed in hidden text immediately before the <Index Cell 2> format symbol. You need to use Hidden Text before each <Index Cell> format symbol to prevent the text from appearing in your index in the transcript.

**Example 4:** Let's say in addition to witness and exhibit information, you also need to references when the witness was instructed not to answer, when requests were made for additional documents and the agreed stipulations.

Current Index Template for the additional information.

Direction to Witness Not to Answer

<Index On N>	<Index Page>	<Index Line>
--------------	--------------	--------------

Request for Production of Documents

<Index On R>	<Index Page>	<Index Line>
--------------	--------------	--------------

Stipulations

<Index On S>	<Index Page>	<Index Line>
--------------	--------------	--------------

Changes to the index template to include bookmark format symbols and hidden text:

<PDF Bookmark Text On 1>**Direction to Witness Not to Answer**<PDF Bookmark Text Off>

<Index On N>	*<Index Page>	<Index Line>
--------------	---------------	--------------

\* **USE HIDDEN TEXT** for the bookmark information: Insert Hidden Text with a word/phrase that will appear in the PDF bookmark pane for this indexed text and then surround the word/phrase with <PDF Bookmark Text On/Off> format symbols. In this example, you need to have page information where the witness was directed to not answer the question. We will use the text Not to Answer in the Hidden Text. The Hidden Text should be inserted before the <Index Page> format symbol.

Hidden Text reads: <PDF Bookmarked Text On 2>Not to Answer<PDF Bookmarked Text Off>

<PDF Bookmark Text On 1>**Request for Production of Documents**<PDF Bookmark Text Off>

<Index On R>	*<Index Page>	<Index Line>
--------------	---------------	--------------

\* **USE HIDDEN TEXT** for the bookmark information: Insert Hidden Text with a word/phrase that will appear in the PDF bookmark pane for this indexed text and then surround the word/phrase with <PDF Bookmark Text On/Off> format symbols. In this example, we will use the text Requests in the Hidden Text. The Hidden Text should be inserted before the <Index Page> format symbol.

Hidden Text reads: <PDF Bookmarked Text On 2>Requests<PDF Bookmarked Text Off>

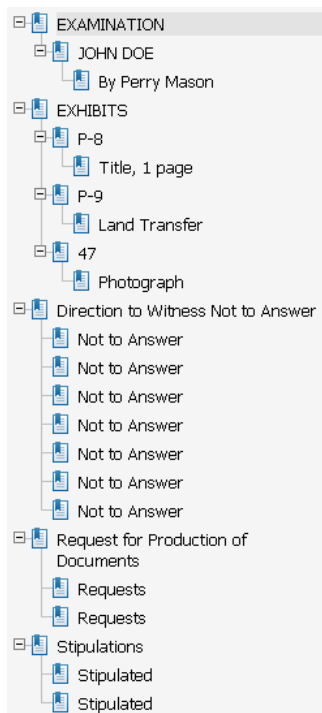

<PDF Bookmark Text On 1>**Stipulations**<PDF Bookmark text Off>

<Index On S>	*<Index Page>	<Index Line>
--------------	---------------	--------------

\* **USE HIDDEN TEXT** for the bookmark information: Insert Hidden Text with a word/phrase that will appear in the PDF bookmark pane for this indexed text and then surround the word/phrase with <PDF Bookmark Text On/Off> format symbols. In this example, we will use the text Stipulated in the Hidden Text. The Hidden Text should be inserted before the <Index Page> format symbol.

Hidden Text: <PDF Bookmarked Text On 2>Stipulated<PDF Bookmarked Text Off>

PDF Bookmarks pane:

### Print a Dictionary to PDF

Case CATalyst allows you to make PDF files from your dictionaries using the Print feature in Manage Dictionary. You must open and be in the dictionary you want to print.

Case CATalyst only allows you to print the entire dictionary when printing to PDF. PDF files made from a dictionary in Case CATalyst display the dictionary entries with accompanying column information including Text, Steno, Modified Date, Usage Date, and Used Date. Use the [Dictionary Options](#) feature to display the information about dictionary entries you want to view. Be sure to adjust column widths before sending the dictionary to print as the information displays in the PDF file exactly as it appears on the Case CATalyst screen.

### Print a Dictionary to a PDF File

1. From the Manage Dictionary function, press **Ctrl + p (Function/Print)**. The Print dialog box displays.
2. In the Printer Name field, select **Print to PDF File**.
3. Check the box **Stenograph PDF Printer**. If you do not check this box, Case CATalyst displays an error message when you attempt to print the file.
4. Press **Enter (Print)**. The Print to File dialog box displays.
5. Make entries in the following fields:

#### Save in

Select the location to which you want to print the PDF file.

#### File name

Type a file name.

6. Press **Enter (Save)**. Case CATalyst creates the PDF file, printing it to the selected location. You can view the file using a PDF viewer such as Adobe Acrobat Reader.

## Print Steno Notes to PDF

Case CATalyst allows you to print to PDF the open steno note file in Manage Notes. When printed, the steno notes display in three columns. The beginning of each fold in the steno notes is highlighted. Timestamps, by default, are not included. You can change the number of columns that display and include timestamps by changing the settings in [Manage Notes Options](#).

To print multiple steno note files to PDF at once, use the [Print Notes to PDF](#) feature in Manage Jobs.

## Print Steno Notes to a PDF File

1. From the Manage Notes function, press **Ctrl + p (Function/Print)**. The Print dialog box displays.
2. In the Printer Name field, select **Stenograph PDF Printer**.
3. Verify the box **Print to file** checked. If you do not check this box, Case CATalyst displays an error message when you attempt to print the file.
4. Press **Enter (OK)**. The Print to File dialog box displays.
5. Make entries in the following fields:

### Save in

Select the location to which you want to print the PDF file.

### File name

Type a file name.

6. Press **Enter (Save)**. Case CATalyst creates the PDF file, saving it to the selected location. You can view the file using a PDF viewer such as Adobe Acrobat Reader.

## Print Multiple PDF Note Files

The Print Notes to PDF feature in Manage Jobs allows you to batch print multiple steno notes files to PDF. By default, the steno notes display in three columns when printed. The beginning of each fold in the steno notes is highlighted. Timestamps, by default are not included. You can change the number of columns that print and include timestamps by changing the settings in [Manage Notes Options](#).

## Print Multiple Steno Note Files to PDF

1. From the Manage Jobs function, select **File/Print Notes to PDF**. The Print Multiple Steno Files to PDF dialog box displays. In the Printer Name field displays, confirm the selection **Stenograph PDF Printer**.
2. Make necessary entries:

### Select File(s) to print

If the steno note files you want to print are not visible, use the drop down box to select the location of the files. Use Windows selection commands to select the steno note files.

### Sign/Encrypt PDF

Check this box to digitally sign a PDF document. The PDF Output Options dialog box displays where you can complete the necessary PDF properties information for sending a [digital signature](#).

To use the Sign/Encrypt PDF option, a digital signature must be available on your computer system. You obtain a digital signature from a certifying authority. A digital signature from a certifying authority allows anyone to verify the authenticity of your digital signature. A digital signature is not available through Stenograph.

### PDF Properties

Make necessary entries for sending a digital signature. Press **Enter (OK)** when finished.

#### Certificate

Select the name of the digital signature certificate with which you are signing. Digital signatures available on your computer system display in the drop down box.

#### Reason for Signing

Type or select from the drop down list the reason you are signing with a digital signature.

#### Your Location

Type the name of your location.

### Encryption Options

#### Password (optional)

Type a password. Use a password to restrict the printing and copying of text and graphics to from being copied, depending on the selection of the following options. This is an optional field.

#### Allow Printing

Check this box to allow printing. Uncheck this box to restrict printing.

#### Allow Copying (of text and graphics)

Check this box to allow the text and graphics to be printed. Uncheck this box to restrict copying.

3. Select **Print**. The Save PDF file dialog box displays.
4. The Browse For Folder dialog box displays. Select the location where you want to send the steno note PDF files and press **Enter (OK)**. The Print dialog box closes when printing is complete.

## Compress Print

The Compress Print module allows you to print multiple pages of a transcript on a single sheet of paper. Compress Print uses Case CATalyst text files and allows all your formatting, such as underline, bold or italics attributes, in the text file to apply in the Compress Print format. Images do not print in compressed format.

A variety of formatting options allow you to modify the page and sheet appearance for printing in compressed format. You can create and save different configurations which you can then select directly from the [Print](#) dialog box.

You can import ASCII files into Case CATalyst and then use them with Compress Print. To use imported ASCII files, Stenograph strongly recommends you first open the imported file in Edit and save it in order for Compress Print to recognize the file.

Access Compress Print:

- From anywhere in Case CATalyst. Press **Alt + u, c (Function/Compress Print)**. The Open Existing Document dialog box displays. Select a text file and press **Enter (Open)**.
- On the Function Bar. Click the Compress Print  icon, if you selected to display this icon. The Open Existing Document dialog box displays. Select a text file and press **Enter (Open)**.
- From Manage Jobs. Highlight a text file and press **Alt + u, c**.
- From the function bar. Click the Compress Print  icon, if you selected to display this icon.

## Terminology

Page	One page of transcript.
Sheet	One sheet of paper which may have multiple pages of transcript.
Initial Pages	Any page of transcript that precedes the first Question, Answer, or Colloquy.
Final Pages	Any page of transcript which follows the last Question, Answer, or Colloquy.
Cover Page	The first page of a transcript.
Configuration	The font, margins, borders, and headers and footers for the compressed transcript.

## Configurations

A Compress Print configuration contains a specific set of [Compress Print options](#) such as border, fonts and margins, which affect how the compressed transcript prints. Configurations, the Compress Print feature, allows you to [create](#), [modify](#), delete, rename, save, and import configurations. Case CATalyst comes with one default configuration. This configuration is accessible in the Print dialog box, however, you cannot modify it.

Compress Print configurations are stored within the configuration file, CompressedPrintOptions.sgcpo for the current user. It is located in the System Files case.

## Manage Configurations

Access the Configurations feature from Compress Print. Select **Configurations**. The Change Configuration dialog box displays with the name of the currently applied configuration in the *Selected Configuration* field. To delete, rename, save or import a configuration, use the following features as necessary.

### Delete

Highlight the configuration you want to remove and select **Delete**. To delete the currently applied configuration, you must first select and apply a different configuration. You cannot undo the Delete.

### Rename

Highlight the configuration you want to rename and select **Rename**. The Rename Configuration dialog box displays. Type a new name and press **Enter (OK)**.

### Save Current

#### Save the current configuration to an existing name

Use the Save Current option to save changes when you [modify the current configuration](#).

- a. Select **Save Current**. The Save Configuration dialog box displays. The name of the currently applied configuration appears in the field.
- b. Press **Enter (OK)** to accept the name in the field or type an existing configuration name and Press **Enter (OK)**. You are prompted to replace the existing file.
- c. Select **Yes** to overwrite the existing configuration with the new changes. Select **No** to cancel the save.

#### Save the current configuration to a new name

Use the Save Current option to [create a new configuration](#) that contains several of the same options in an existing configuration.

- a. Highlight the current configuration you want to copy and select **Save Current**. The Save Configuration dialog box displays.
- b. Type a name for the new configuration and press **Enter (OK)**.
- c. Case CATalyst applies the new configuration and displays the name in the Change Configuration dialog box.

#### Import

Import an existing Case CATalyst compressed print configuration. For example, you may want to use a configuration from another user.

The Open Compress Print Options File dialog box displays the Case CATalyst default location for the configuration file in the System Files case. Locate and select the configuration you want to import and press **Enter (OK)**. Compressed Print configurations are stored within the CompressedPrintOptions.sgcpo file in the Systems File case.

#### Select

Apply a different configuration to the Compress Print file. Highlight the configuration you want to use and choose **Select**. The name displays in the Selected Configuration field.

You can also change the configuration by highlighting the desired configuration and selecting **OK**. Case CATalyst closes the Change Configuration dialog box and applies the selected configuration.

### Create a New Configuration

Compress Print allows you to create multiple [configurations](#). Once you create and save a configuration it becomes available for selection in the Print dialog box.

#### Create a Compress Print Configuration

1. Do **one** of the following:
  - From anywhere in Case CATalyst , press **Alt + u, c (Function/Compress Print)**. The Open Existing Document dialog box displays. Select a text file and press **Enter (Open)**.
  - From Manage Jobs, highlight a text file and press **Alt + u, c**.
2. The Compress Print module opens. Using the selected file, the preview window displays the current configuration.
3. In the *Printer* field on the Compress Print screen, select the printer you use for compressed print.
4. Change any of the following Compress Print options for the new configuration as necessary. Evaluate how the changes affect the compressed transcript sheet in the [preview](#) window.

### Sheets

Use the [Sheets](#) settings to set the transcript page orientation on the compressed print sheet.

### Borders

Use the [Borders](#) settings to place borders around the transcript pages.

### Notes

Use the [Notes](#) settings to select to use a note box and determine note box placement.

### Document

Use the [Documents](#) settings to customize the printing of line and question numbers, timestamps, and the text and specify the number of initial, transcript, and final pages.

### Fonts

Use the [Fonts](#) settings to determine font attributes for the different transcript elements.

### Margins

Use the [Margin](#) settings to adjust sheet margins.

### Headers

Use the [Headers](#) settings to create and modify sheet headers. Select to disable transcript headers, footers, and page numbers.

5. When finished modifying the options, select **Configurations**. The Change Configurations dialog box displays.
6. Select **Save Current**. The Save Current dialog box displays with the current configuration name.
7. Type a name for the new configuration and press **Enter (OK)**. The name displays in the Change Configuration dialog box.
8. Press **Enter (OK)** to save the new configuration. Compress Print configurations are stored within the configuration file, CompressedPrintOptions.sgcpo, located in the System Files case.

## Modify an Existing Configuration

1. Do **one** of the following:
  - From anywhere in Case CATalyst, press **Alt + u, c (Function/Compress Print)**. The Open Existing Document dialog box displays. Select a text file and press **Enter (Open)**.
  - From Manage Jobs, highlight a text file and select Compress Print by pressing **Alt + u, c**.
2. The Compress Print module opens. Using the selected file, the preview window displays the current configuration.
3. In the *Printer* field on the Compress Print screen, select the printer you use for compressed print.
4. Select **Configurations**. The Change Configurations dialog box displays. Highlight an existing configuration to modify and press **Enter (OK)**.
5. Change any of the following Compress Print options for the new configuration as necessary. Evaluate how the changes affect the compressed transcript sheet in the [preview](#) window.

### Sheets

Use the [Sheets](#) settings to set the transcript page orientation on the compressed print sheet.

### Borders

Use the [Borders](#) settings to place borders around the transcript pages.

### Notes

Use the [Notes](#) settings to select to use a note box and determine note box placement.

### Document

Use the [Documents](#) settings to customize the printing of line and question numbers, timestamps, and the text and specify the number of initial, transcript, and final pages.

### Fonts

Use the [Fonts](#) settings to determine font attributes for the different transcript elements.

### Margins

Use the [Margin](#) settings to adjust sheet margins.

### Headers

Use the [Headers](#) settings to create and modify sheet headers. Select to disable transcript headers, footers, and page numbers.

6. When finished modifying the options, select **Configurations**.
7. In the Change Configuration dialog box select **Save Current**. The Save Current dialog box displays with the current configuration name.
8. Press **Enter (OK)**. You are prompted to overwrite the replace the existing file.
9. Press **Enter (Yes)** to save the changes to the current configuration. Select **No** to cancel the Save.

## Preview the Configuration

The Compress Print document preview window uses the selected text file to display the current configuration. When you make changes to the configuration, the document preview displays the modifications.

## Compress Print Features

### First Sheet

Select View/First Sheet to display the first sheet of transcript pages in the file.

### Previous Sheet

Select View/Previous Sheet to display the of transcript pages before the currently displayed sheet in the file.

### Next Sheet

Select View/Next Sheet to display the next sheet of transcript pages in the file.

### Last Sheet

Select View/Last Sheet to display the last sheet of transcript pages in the file.

## Printer

In the Printer field on the Compress Print screen, select the printer you use for compressed print. All printers properly installed through Windows display in the list.

Case CATalyst uses this printer to determine the margins, printable area, and text placement on the compressed transcript. These parameters are reflected in the Compress Print preview window. If you use a printer different from the one you select in this field when setting the configuration options, a difference in margins, printable area and text placement may exist causing the text to print differently on the sheet.

## Zoom

Magnify or reduce the view of your document in the preview window without changing any format settings. The number in the Zoom field, below the Printer field, represents a percent. For example, .50 displays the document in the preview window at 50 percent of its normal viewing size. 1.50 changes the document preview to 150 percent of its normal viewing size. Type a number in the field or use the slide bar to change the percent.

You can also use the Zoom feature from the menu (View/Zoom) or by clicking the Zoom icon  on the Toolbar to change the viewing size. The viewing percent displays in the Zoom field.

## Compress Print Options

Compress Print options allows you to modify the appearance of the compressed print transcript. A Compress Print configuration, contains a specific selection of Compress Print options. You can create and save multiple configurations.

The following list summarizes the options that comprise a Compress Print configuration. Compress Print configurations are stored within the configuration file, CompressedPrintOptions.sgcpo, located in the System Files case. Click the link for details on each option.

<a href="#">Cover Page</a>	Print a cover page for the compressed print transcript.
<a href="#">Sheets</a>	Set the transcript page orientation on the compressed print sheet.
<a href="#">Borders</a>	Place borders around the transcript pages.
<a href="#">Notes</a>	Select and determine note box placement.
<a href="#">Document</a>	Customize the printing of line and question numbers, timestamps, and the text. Specify the number of initial, transcript, and final pages.
<a href="#">Fonts</a>	Determine font attributes for different transcript elements.
<a href="#">Margins</a>	Adjust sheet margins.
<a href="#">Headers</a>	Create and modify sheet headers. Select to disable transcript headers, footers, and page numbers.

## Borders

Borders, a Compress Print feature, allows you to select a border to print around the compressed transcript pages on the sheet.

1. From Compress Print, select **Borders**. The Compress Print Borders dialog box displays.
2. Select a border type from the drop down list:

### No Boxes

### **Thin Separated Boxes**

Surround each transcript page on the sheet with a thin lined box.

### **Thick Separated Boxes**

Surround each transcript page on the sheet with a thick lined box.

### **Thin Shadowed and Separated Boxes**

Surround each transcript page on the sheet with a thin lined box that has a shadowing affect on the bottom and right side of each box.

### **Thick Shadowed and Separated Boxes**

Surround each transcript page on the sheet with a thick lined box that has a shadowing affect on the bottom and right side of each box.

### **Thin Window Boxes**

Surround each transcript page with a thin black line so that each transcript page is separated by a thin black line and all the transcript pages on the sheet are surrounded with a thin black line.

### **Thick Window Boxes**

Surround each transcript page with a thick black line so that each transcript page is separated by a thick black line and all the transcript pages on the sheet are surrounded with a thick black line.

### **Thin Cross**

Separate each transcript page with a thin line.

### **Thick Cross**

Separate each transcript page with thick line.

3. Press **Enter (OK)**. Case CATalyst saves the changes and the dialog box closes. Your selection displays in the preview window.
4. Save the changes to the current configuration.

## **Cover Page**

Cover Page, a Compressed Print feature, allows you to add a cover page created in Edit to the Compress Print transcript.

### **Add a Cover Page**

1. From Compress Print, select **Cover Page**. The Cover Page dialog box displays.
2. Check the box **Print Cover Page**.
3. Click **Browse**. Select the file which contains the cover page(s) you want to use and press **Enter (Open)**. The path name for the file displays in the field in the Cover Page dialog box.
4. Press **Enter (OK)**. Case CATalyst includes the pages when you print the compress transcript.

## **Document**

Document, a Compress Print feature, allows you to choose settings that further customize the printing of your compressed transcript. For example, you can select to print line numbers and timestamps.

Compress Print, by default, shows redacted text as white space throughout the transcript with the exception of the initial and final pages. To have Compress Print use an alternative redacted text appearance throughout the transcript, choose the setting in [Advanced Edit Options](#), *Redacted text displays as* and select the Compress Print Document option, *Use the transcript's layout settings instead of these settings*.

## Set Document Options

1. From Compress Print, select **Document**. The Document Configuration dialog box displays.
2. Make necessary entries:

### Use the transcript's layout settings instead of these settings

Check this box to use the layout settings from the transcript. When you select this option, Case CATalyst ignores all other Document configuration Compress print settings. All compressed print documents print in the same size text.

Redacted text appears using the setting in Advanced Edit Options, *Redacted text displays as*.

### Enable Line Numbers

Check this box to print line numbers on the compressed transcript. Line numbers must be in the transcript's page layout in order for them to print on the compressed transcript.

### Enable Timestamps

Check this box to print timestamps on the compressed transcript. Timestamps must appear in the transcript in order for them to print on the compressed transcript.

When you select to print timestamps, you can also set the timestamp placement on the page.

#### Reduce size of number

This option is currently unavailable.

#### % Reduction

This option is currently unavailable.

### Alignment

#### Left Margin

Print timestamps on the left side of the compressed print transcript pages.

#### Right Margin

Print timestamps on the right side of the compressed print transcript pages.

### Enable Question/Paragraph Numbers

Check this box to print paragraph numbers for the chosen paragraph type. The Paragraph is Numbered option must be selected in the transcript's applied layout for the chosen paragraph type in order to print paragraph numbers on the compressed print transcript.

#### Reduce size of number

Check this box to print the paragraph numbers in a smaller font. Enter a percent in the % Reduction field.

#### % Reduction

Enter a number by which you want to reduce the paragraph number font from the original size. This field is only available when you select the Reduce size of number option.

### Alignment

If you number a paragraph type that does not use a paragraph symbol such as a Q, alignment has no effect on paragraph number placement.

#### Left of Symbol

Print paragraph numbers on the left side of the paragraph symbol.

Case CATalyst uses the left most margin of all paragraph styles in the layout, including headers and footers, to determine placement of the paragraph number. When you select Left of Symbol, Case CATalyst places the paragraph number immediately to the left of the left margin.

#### Right of Symbol

Print paragraph numbers on the right side of the paragraph symbol.

### Initial/Transcript/Final Page Setup

Set the number of pages to be counted as the Initial and Final pages of the compressed transcript. The appearance of the Initial and Final pages is controlled by the transcript layout and is not affected by the Compress Print settings.

Select **one** of the page types, **Initial Pages** or **Final Pages** to set the options.

#### Ignore blank single space lines

This option is currently unavailable.

#### Optimize Text Height

This option is currently unavailable.

#### Lines per page

This option is currently unavailable.

#### Page Quantity

Enter the exact number of pages you want to count as Initial or Final. Set a different number for each one.

3. Press **Enter (OK)**. Case CATalyst saves the changes and the dialog box closes. Your selection displays in the preview window.
4. Save the changes to the current configuration.

## Fonts

Fonts, a Compress Print feature, allows you to select specific fonts and font styles for different transcript elements on the compressed transcript. All fonts properly installed through Windows display in the Compress Print Font dialog box. The Sample window displays how the selected font appears.

The Fonts options do not affect initial and final pages unless your Compress Print [Document Configuration](#) file indicates no initial or final pages. Initial and final pages retain the parameters of the applied layout unless specified otherwise.

## Modify the Fonts

1. From Compress Print, select **Fonts**. The Compress Print Font dialog box displays.
2. To set the font options for a transcript element, select the element from the list. The selected transcript element displays in the field above the list. You can choose different font settings for each of the transcript elements. Select **one**:

### Text

All text other than the Question symbol and text following, Answer symbol and text following, line numbers, timestamps, and transcript page headers and footers.

If you want to bold all text, select a Bold font for Text, select Question Symbols and select the Bold Question Text option and then select Answer Symbols and select the Bold Answer symbol.

### Question Symbols

The "Q." or the "Q". When you select Question symbols an additional field, Bold Question Text, displays at the bottom of the dialog box. Check this box if you want to bold the text that follows the Question symbol.

### Answer Symbols

The "A." or the "A". When you select Answer symbols an additional field, Bold Answer Text, displays at the bottom of the dialog box. Check this box if you want to bold the text that follows the Answer symbol.

### Line Numbers

The transcript line numbers.

### Timestamps

The transcript timestamps, if any.

### Page Headers and Footers

The transcript page headers and footers, if not disabled.

3. Select a font and font style for the select transcript element. Your selection displays in the Sample window.
4. Select another transcript element for which you want to modify the font settings or press **Enter (OK)** to save the changes and close the dialog box.
5. When finished, save the changes to the current configuration.

## Headers

Headers is a Compress Print feature. Headers allows you to create and modify Compress Print sheet headers and footers and, if necessary, include special formatting codes that display information such as the current date, time and starting page number. You can also disable transcript page headers and footers, page numbers and sheet headers and footers from printing on the compressed transcript.

## Compress Print Header Options

To access the Headers feature, from Compress Print, select **Headers**.

### Sheets Headers

The current headers for a sheet.

### **Sheets Footers**

The current footers for a sheet.

### **Add, Modify & Delete Individual Headers**

#### **Line #**

The line on which the selected header or footer prints. There are three available lines for each the header and footer. Line 1 prints higher on the page. Line 3 prints the lowest. More than one header or footer can print on the same line by using different alignment options.

#### **Text Field**

The Text field is located just below the Line # field. Type the header or footer text. Use any Special Formatting codes as necessary.

#### **Alignment**

Select **one** of the following to determine placement of the header or footer on the line.

##### **Left**

Print the header or footer text flush to left margin.

##### **Center**

Print the header or footer text in the middle of the line.

##### **Right**

Print the header or footer text flush to right margin.

##### **Alternating**

Print header or footer text alternating between flush to left and flush to right margin. This option is usually selected when duplex printing.

### **Special Formatting**

Insert a formatting code at any point in the text line. Double click a code to display it in the Text field. If a field exists in a header of the applied layout for the selected transcript, that field displays in the Special Formatting field. You can select this field to include on a Compress Print sheet header or footer. Case CATalyst displays the filled-in-field value, if one already exists for the field.

#### **Current Date**

The date based on the computer system.

#### **Current Time**

The time based on the computer system.

#### **Total Pages**

The total number of transcript pages.

#### **Total Sheets**

The total number of sheets.

#### **Current Sheet**

The current sheet number.

**Start Page**

The first transcript page number on the current sheet.

**End Page**

The last transcript page number on the current sheet.

**Font**

Select the font type and style for the text in the selected header or footer.

**Location**

Select the location where you want the line of text to print:

- Header
- Footer

**New**

Create a new line of text for a sheet header or footer.

**Edit**

Modify an existing sheet header or footer. Highlight an existing line from the Sheets Headers or Sheets Footers and then select **Edit**.

**Delete**

Delete an existing sheet header or footer. Highlight an existing line from the Sheets Headers or Sheets Footers and then select **Delete**.

**Disable Page Headers**

Check this box to prevent headers in the Case CATalyst page layout from printing on the compressed transcript page. When you disable page headers in Compress Print, Case CATalyst also disables page headers on the [concordance index](#).

**Disable Page Footers**

Check this box to prevent footers in the Case CATalyst page layout from printing on the compressed transcript page. When you disable page footer in Compress Print, Case CATalyst also disables page footers on the concordance index.

**Disable Page Numbers**

Check this box to prevent transcript page numbers in the Case CATalyst page layout from printing on the compressed transcript page.

**Disable Sheets Headers**

Check this box to prevent page numbers from printing on each sheet of the compressed printout. The Sheets Headers and Sheets Footers fields are unavailable when you select this option.

**Creating Sheet Headers and Footers**

To create a new sheet header or footer for the current configuration:

1. From Compress Print, select **Headers**. The Header and Footer Configurations dialog box displays.

2. Select **New** to create a new line of text for a sheet header or footer.
3. In the Location field, select the location for the text, **Header** or **Footer**.
4. In the Line # field, select the line, **1-3**, on which you want the header or footer to print. There are three available lines for each header and footer. Line 1 prints higher on the page. Line 3 prints the lowest.

More than one header or footer can print on the same line by using different alignment options.

5. In the Text field, located just below the Line # field, type the header or footer text.  
Use any of the Special Formatting codes as necessary. Double click a code to display it in the Text field. You can insert a Special Formatting code at any point in the text line.
6. Select **Font** to set the font type and style for the text.
7. In the Alignment field, select a location to determine the placement of the header or footer text on the line.
8. Select **Save**. The header or footer displays in the appropriate Sheets Headers or Sheets Footers list.
9. Create another header or footer or press **Enter (OK)** close the dialog box.
10. When finished, save the changes to the current configuration.

### Modify an Existing Sheet Header or Footer

To modify an existing sheet header or footers for the current configuration:

1. From Compress Print, select **Headers**. The Header and Footer Configurations dialog box displays.
2. From the Sheets Headers or Sheets Footers list, highlight the header or footer you want to change. Your selection displays in the Text field.
3. Select **Edit**. The Add, Modify & Delete Individual Headers options become active.
4. Make changes to the text and options as necessary:
  - Line # —the line on which you want to place the header or footer to print.
  - Alignment —the horizontal placement of the header or footer on the line.
  - Special Formatting —double click an option to display it in the Text field. You can insert a Special Formatting code at any point in the text line.
  - Font—choose the font type and style for the text.
5. When finished making changes, select **Save**.
6. Modify another header or footer or press **Enter (OK)** close the dialog box.
7. When finished, save the changes to the current configuration.

## Margins

Margins is a Compress Print feature. The Margins settings allow you to determine how the text fits on each page and how the compressed transcript pages display on each sheet. For example, if you want to bind the compressed transcript, set a larger left margin so the text is visible when bound. If you want to duplex print and bind the compressed transcript, set the margins to alternate.

### Set Sheet Margins

1. From Compress Print, select **Margins**. The Margins dialog box displays.
2. Make necessary entries:

### **Page Size Ratio**

Select **one** of the following:

#### **Follow a standard page ratio**

Display the compressed transcript page as a miniature copy of transcript page.

#### **Do not follow a ratio (maximum space)**

Use the maximum allotted space for each transcript page on the sheet. The transcript page height and width changes to fit the sheet space.

### **Sheet Justification**

Select **one** of the following:

#### **Center (maximize space)**

Center the transcript pages on the sheet, using all available space. This does not leave margin space for binding.

#### **Define Margins for all sheets**

Set specific sheet margins. Select this option and enter the desired margin settings in the Sheet Margins field. This option is generally used when binding the compressed transcript. Usually the Left or Top margin is set to a specific number, depending on how you bind the compressed transcript.

#### **Alternate margins**

Alternate the left and right sheet margins. Select this option and enter the desired margin settings in the Sheet Margins field. This options is generally used when you duplex print and bind the compressed transcript.

### **Sheet Margins**

Enter values in the fields to set the sheet margins as necessary. The number is a measurement taken from the edge of the paper in inches. It is typed in decimals. In inches, a setting of .75 is  $\frac{3}{4}$  of an inch; 1.25 is  $1 \frac{1}{4}$  inches.

**Left**

**Right**

**Top**

**Bottom**

3. Press **Enter (OK)**. Case CATalyst saves the changes and the dialog box closes. Your selection displays in the preview window.
4. Save the changes to the current configuration.

## Miscellaneous

Miscellaneous is a Compress Print feature which contains one option, Space between Line Numbers and Text. Use this option to set the spacing between the line number and the text for Compress Print transcript lines.

### Set the Space Between Line Numbers

1. From Compress Print, select **Miscellaneous**. The Miscellaneous dialog box displays.
2. Type an entry in the field or use the arrow buttons. The range is .00 - 3.00. The smaller the number, the less space between the line number and the text. The measurement is 1/100th of an inch.
3. Press **Enter (OK)**. View the change in the preview window.
4. Save the changes to the current configuration.

## Notes

Notes is a Compress Print feature. The Notes settings allows you to print a note box on the compressed print sheet. You can also customize the appearance and placement of the note box.

Placing a note box on transcript pages or on a sheet may reduce the size of the text of the Compress Print.

### Select Note Box Settings

1. From Compress Print, select **Notes**. The Note Box Setup dialog box displays.
2. Make necessary entries:

#### Note Box Location

##### No Note Box

Indicates there is no space reserved for notes.

##### Left Edge

Display the note box on the left edge of every transcript page or sheet.

##### Right Edge

Display the note box on the right edge of every transcript page or sheet.

##### Left & Right Edge

Display a note box on both the left and right edges of every transcript page or sheet.

##### Bottom Edge

Display the note box bottom of every transcript page or sheet between the transcript pages and the sheet footer.

##### Lower Right Corner

Display the note box the lower right corner of every sheet. The note box replaces the transcript page that normally displays in this position.

#### Frequency

Determine how often the note box displays. Select **one** of the following:

**per Page**

Display the note area on every transcript page.

**per Sheet**

Display the note area on every sheet.

**Width (inches)**

Type or select a number for the width of the note box. This measurement is in inches. For example, 0.5 would indicate ½ inch.

**Ruling Height**

Enter a number to set the spacing between the "ruled" lines in the note box. The smaller the number, the closer together the lines appear.

**Outline Box**

Check this box to place a border around the note box.

**Rule Box**

Check this box to have ruled lines display in the box.

**Note box on full size initial pages**

Check this box to display the note box on any full size initial page.

3. Press **Enter (OK)**. Case CATalyst saves the changes and the dialog box closes. Your selection displays in the preview window.
4. Save the changes to the current configuration.

**Sheets**

Sheets is a Compress Print feature. The Sheets settings allow you to determine how you want the compressed transcript pages to display on a sheet.

**Modify the Sheet**

1. From Compress Print, select **Sheets**. The Sheets Configuration dialog box displays.
2. Make necessary entries:

**Paper Size**

Each paper size has preset Width and Height values. To use a paper size not listed, select Other and set the Width and Height values. Select **one** of the following paper sizes:

**Letter**

8 1/2 x 11 inches is commonly used for transcripts.

**Legal**

8 1/2 x 14 inches is commonly considered legal size.

**A4**

A metric measurement usually used in the United Kingdom and Australia.

### **Other**

Set custom Width and Height values.

### **Width**

The width of the selected paper size. These are preset values for all paper sizes except Other. When selecting Other, you must set a Width and Height value.

### **Height**

The height of the selected paper size. These are preset values for all paper sizes except Other. When selecting Other, you must set a Width and Height value.

### **Sheet Layout Dimensions**

Specify the number of rows and columns of transcript pages per sheet.

#### **Rows**

Select the number of rows per sheet. The maximum is 16.

#### **Columns**

Select the number of columns per sheet. The maximum is 16.

### **Orientation**

Select the direction you want text to print on the page.

#### **Portrait**

If you are using 8 1/2" x 11" paper, the width is 8 1/2" and the length 11".

#### **Landscape**

If you are using 8 1/2" x 11" paper, the width is 11" and the length 8 1/2".

### **Page Order**

Specify the order of the transcript pages on the sheet. The sample box displays the selected order.

#### **Vertical**

Transcript pages display on the sheet by columns. For example, on a four page sheet, pages 1 and 2 print on the left side and pages 3 and 4 print on the right side.

#### **Horizontal**

Transcript pages fill display on the sheet by rows. For example, on a four page sheet, pages 1 and 2 print on the top and pages 3 and 4 print on the bottom.

### **Full Size # of Pages**

#### **First**

Specify the number of pages you want to print full size, not compressed, at the beginning of the file. For example, if you would like the first two pages of the transcript to print full size and compress the rest of the pages, enter 2. If you select 0 (zero), the initial pages of the transcript are included in the Compress Print sheets.

The appearance of the Initial and Final pages is controlled by the transcript layout and is not affected by the Compress Print settings.

### Last

Specify the number of final pages you want to print full size, not compressed, at the end of the file. For example, if you would like the last two pages of the transcript to print full size, enter 2. If you select 0 (zero), the final pages of the transcript are included in the Compress Print sheets.

The appearance of the Initial and Final pages is controlled by the transcript layout and is not affected by the Compress Print settings.

3. Press **Enter (OK)**. Case CATalyst saves the changes and the dialog box closes. Your selection displays in the preview window.
4. Save the changes to the current configuration.

## Print a Compressed Transcript

You can [print](#) a compressed transcript from either the Case CATalyst Compress Print or Print module. When printing from Compress Print, the displayed transcript uses the currently applied configuration to print all the pages or a range of pages, depending on your selection. If you select to print a specific page or range of pages, Case CATalyst prints a full sheet that contains the selected page or pages. When printing a Section, Case CATalyst prints only the pages contained within the section. For example, your configuration prints four pages to a sheet. You select to print Section two that has 38 pages of a 120 transcript pages transcript with three sections. Case CATalyst prints four transcript pages on nine sheets and two transcript pages on one sheet.

When printing from the Print module, you can Compress Print a selected a text file, choose a configuration to apply and determine the printed page range. If you select to print a specific page or range of pages, Case CATalyst prints a full sheet of transcript pages which contains the selected page or pages. When printing a Section, Case CATalyst prints only the pages contained within the section.

Images and concordance indexes contained in a transcript do not print in condensed format. Case CATalyst prints the index pages in full page format.

## Backup the CompressedPrintOptions File

A Compress Print configuration contains a specific set of [Compress Print options](#) such as border, fonts and margins, which affect how the compressed transcript prints. Compress Print configurations are stored within the configuration file, `CompressedPrintOptions.sgcpo` for the current user. It is located in the System Files case. You may want to back up your

## Backup the CompressedPrintOptions File

The Backup feature [compresses](#) the file and saves it to a specified name with a .zip extension. You can specify a file name for the backup file in [Backup Options](#). Case CATalyst records the backup date in the Job History file.

1. From Manage Jobs, highlight the file **CompressedPrintOptions.sgcpo**, located in the System Files case.
2. Press **Ctrl + b (Tools/Backup)**. The Backup dialog box displays with the `CompressedPrintOptions.sgcpo` file checked.
3. In the *Save in* field, select a location for the backup.
4. Do one of the following:
  - If your backup options are set to save files in separate packages, the file name, *CompressedPrintOptions*, is used for the backup file name. If a file with the same name already

exists in the destination location, you are prompted to overwrite the file when you initiate the backup.

- If your backup options are set to single package, the *File name* field displays. Do one of the following:
  - Accept the default file name if one exists.
  - Change the default file name. Select Options to display the Backup Options dialog box.
  - Type a new name for the backup file.
  - Select an existing backup file from the list in the window.

To change your backup options, click Options. The [Backup Options](#) dialog box displays where you can make changes to how backup is packaged. Press **Enter (OK)** after your selection.

5. Press **Enter (OK)**. If a file with the same name already exists, you are prompted to overwrite the file when you initiate the backup. Other [Backup messages](#) may display in certain situations.
6. The Manage Jobs window displays when the backup is complete.

## Transcript Indexing

Case CATalyst contains tools to assist you in creating transcript index pages. Index pages commonly appear in the beginning of the transcript and contain specific information, such as exhibits, examinations, witnesses, and other requested information. Index pages can be placed wherever you want them in the transcript and can be formatted how you want them to look. Using specific indexing format symbols, you surround text within the transcript that you want indexed. The Case CATalyst Build Index feature copies the surrounded text, along with location information, to a specified place in the transcript. You can customize the layout information of the indexed text on the transcript index page and designate where to place the transcript index pages within the transcript. Indexed text displays in Edit in the [user selected](#) color.

Optionally, you can use a text file, called an [Index Template](#), in conjunction with the [Build Index](#) feature to customize the way indexed information appears on the index page. There are [sample index templates](#) available in the Index Template folder in the System Files case.

You may want to create a [Master Index](#) for multiple jobs. For example, let's say you need to provide an index which documents all the information from several volumes for a proceeding. The Master Index feature provides that capability.

The Case CATalyst Indexing feature contains specific [index formatting commands](#) and terminology. [PDF Bookmark format symbols](#) can be used for PDF printed transcripts. Stenograph recommends that you review the index formatting commands, terminology and [index template guidelines](#) before building a transcript index.

## Index Features, Terminology and Format Symbols

Case CATalyst contains several indexing features to assist you in building indexes. Review the following information for a brief description of indexing terminology and Case CATalyst indexing features, including indexing [format symbols](#). Click on the related link in each item for additional information.

### Index Features and Terminology

#### **Build Index**

The [Build Index](#) feature searches the transcript pages for the specific format symbol and copies the text between the specific format symbols to the transcript index page.

#### **Build Master Index**

The [Build Master Index](#) feature searches the pages of multiple transcripts for the specific format symbol and copies the text between the specific format symbols to generate one transcript index.

#### **Build Concordance Index**

The [Build Concordance Index](#) feature searches the pages of one or several transcripts to generate a list of every word in one or several transcripts. The concordance index is organized by listing the word followed by page and line number. A concordance index is also referred to as an "all-word" index.

#### **Categories**

Reporters often organize index information into specific "[categories](#)"; such as examinations, exhibits, and requested information. In Case CATalyst, you assign each category a different letter or number when using the Index Heading On/Off and Index On/Off format symbols. The Build Index feature sorts the categories and automatically places them in designated positions on the transcript index page.

### Index Page

The transcript index page is the actual page or pages generated by the Build Index feature which contains only the indexed information.

### Index Template

An [Index Template](#) is a text file containing permanent information, formatting information and indexing format symbols that works in conjunction with the Build Index feature in Edit. The Build Index feature uses the Index Template to categorize the information it takes from the transcript, such as examinations and exhibits, and places the information on the transcript index page.

### Index Template Wizard

The [Index Template Wizard](#) allows you to quickly and easily build an index template using a prompted step-by-step process.

### Permanent Information

The text that appears on an Index Template which does not change when brought into the transcript during the Build Index process. For example, in each transcript you want the word "**INDEX**" centered on the first line of the Index Page. The word "**INDEX**" is Permanent Information because it remains the same from transcript to transcript.

### Reference Numbering

The location of the section, page number and/or line number of the indexed text in the transcript. When using an Index Template, only the indexed text (text surrounded by Index On/Off format symbols) generates reference numbering. Index Headings do not. See below for more information on Index Heading and Index format symbols.

## Index Format Symbols

### Index Heading On and Index Heading Off

Index Heading format symbols are you used when you need to capture two related information. For example, if on you index page you want the exhibit number along with the exhibit description and the page in which it occurred, you would surround the exhibit number with Index Heading format symbols and the exhibit description would be surrounded by Index format symbols. Use [Index Heading](#) On and Off format symbols in two ways:

- In the transcript, include file and dictionary definition to surround text for copying to the index page. For example, in your marked exhibit include file, you might have the exhibit number placeholder surrounded by Index Heading On E and Index Heading Off E format symbols.
- On an Index Template, use only Index Heading On to indicate the placement for the Index Heading text. For example, using the same example as above, you might have the Index Heading On E format symbol in the first column of your exhibit table.

### Index On and Index Off

Index format symbols is used when you need to capture information. For example, if on your transcript index page you only want the exhibit number and the page it was found on, you would surround the exhibit number with Index On/Off format symbols. Use [Index](#) On and Off format symbols in two ways:

- In the transcript, include file, and definition to surround text for copying to the index page. For example, in your marked exhibit include file, you might have the exhibit number place holder surrounded by Index On D and Index Off D format symbols.
- On an Index Template, use only Index Heading On to indicate the placement the indexed text. For example, using the example immediately above, you might have the Index On D format symbol in the first column of your exhibit table.

Individual indexed text cannot exceed 900 bytes.

### **Index All Cap Cell**

Use [Index Allcap Cell](#) to cap all the letters within a cell on an Index Template.

### **Index Cell**

Use the [Index Cell](#) format symbol to create an index for indexed information in the transcript, placing multiple page numbers on one table row.

### **Index Allow Duplicate Cells**

Use the [Index Allow Duplicate Cells](#) format symbol to allow multiple page numbers in the same cell of an index.

### **Index End**

Use the [Index End](#) format symbol to customize the sort for alphabetized index information.

### **Index Initial Cap Cell**

Use the [Index Initial Cap Cell](#) to initial cap text in a cell on an Index Template.

### **Index Item**

Use the [Index Item](#) format symbol on an Index Template to sequentially number the indexed information surrounded by Index On/Off format symbols.

### **Index Line**

Use the [Index Line](#) format symbol on the Index Template to indicate placement of the line number for indexed text on the transcript index page.

### **Index Page**

Use the [Index Page](#) format symbol on the Index Template to indicate the placement of the page number for indexed text on the transcript index page.

### **Index Position**

Use the [Index Position](#) format symbol in the transcript to indicate where to place the transcript index pages. You can use this format symbol with or without an Index Template. If you are building a master index, the index is automatically placed at the end of the current open transcript. Using an Index Position format symbol when creating a Master Index may result in incorrect page numbering in the Master Index.

### **Index Section**

Use the [Index Section](#) format symbol on the Index Template to indicate placement of the section number for the indexed text on the transcript index page.

### Index Volume Information

Use the [Index Volume Information](#) format symbol on an Index Template or index page to specify where, on the transcript index page, you want to insert a volume description. Volume description is usually used when creating a master index page from multiple transcripts.

### Index Sort

Use the Sort Index format symbols on an index template to sort the indexed items on the transcript index page. There are five types of Sort Index format symbols:

- Index Sort – Alpha Case Insensitive
- Index Sort - Alpha Case Sensitive
- Index Sort - Alpha Word Override
- Index Sort - Numeric
- Index Sort - Alpha - Exhibit

### Index Sub Sort

- Index Sub Sort - Alpha Case Insensitive
- Index Sub Sort - Alpha Exhibit
- Index Sub Sort - Numeric

## Index Templates

An Index Template is a text file that allows you to customize the placement of indexed information on an index page. Special indexing format symbols placed in tables work in conjunction with the Build Index feature to automatically categorize examinations, exhibits, requests, etc., information from the transcript.

The [Index Template Wizard](#) walks you through step-by-step instructions to create an Index Template. You can set up index page to include examinations, exhibit and other information, selecting from a series of sample examinations, exhibits and other formats and then selecting an index category assignment. You can also customize other items that affect the layout of the index template. Once finished with the wizard, you can manually make further modifications, such as adding text attributes and modifying information to better meet your needs.

When creating or modifying an index template, Case CATalyst requires you to work in [Page view](#). Using Index Heading On and Index On format symbols within a table in an Index Template, you can specify where and how the [categorized information](#) appears on the transcript index page. To identify the text for indexing, put [Index Heading On/Off](#) and [Index On/Off](#) format symbols around text in the transcript (or in [include files](#) such as witness sworn, exhibit marking, etc.) you want to copy to the index page. The Build Index feature scans the transcript for Index Heading On/Off and Index On/Off format symbols and copies the text surrounded by these symbol to the specified position on the transcript index page. Using [Index Section](#), [Index Page](#), and [Index Line](#) format symbols within a table on an Index Template, you can copy the section, page, and line number references for the indexed text to the transcript index page. You can also sequentially numbers your indexed items using the [Index Item](#) format symbol. Stenograph recommends that you review all the index [features](#), [format symbols](#), [terminology](#) and guidelines before building a transcript index.

Case CATalyst requires that you place indexing format symbols within the cells of a table on the Index Template. Use Edit's [Insert Table](#) feature to create as many tables as necessary. When placing text in

the table cells, type the text directly in the job. Typing text in the Reveal Codes window may result in a template error. Text cannot exist between the <Table Row> and <Table Cell Start> format symbols. Table grid lines (borders) display for visual assistance in placing text but they do not print, by default. If you want the grid lines (borders) to print, select Edit, Tables, [Table Properties](#). A paragraph must exist at the end of the last table on the index template page. If a paragraph does not exist, insert a paragraph format symbol.

#### **Sample index templates are available:**

There are six default Index Templates in Case CATalyst: Index Template 1 - 2017, Index Template 2 - 2017 and Index Template 3 - 2017 and then Index Template 1 - 2017 with Bookmarks, Index Template 1 - 2017 with Bookmarks and Index Template 1 - 2017 with [Bookmarks](#) which match the first three index templates except the ones with the text "with Bookmarks" contain PDF Bookmark Text On and Off format symbols. You can modify the default index templates or you can create your own. Although index templates are text files (\*.sgnpl extension), in order for Case CATalyst to recognize the file as an Index Template, you need to create, modify, and store index templates in the Index Templates case located in the System Files case.

## **Creating an Index Template**

In order for Case CATalyst to recognize an Index Template you must open, create and store it in the Index Templates case, located in the System Files case. The Index Templates case contains six sample Index Templates: Index Template 1 - 2017, Index Template 1 - 2017 with [Bookmarks](#), Index Template 2 - 2017, Index Template 2 - 2017 with Bookmarks, Index Template 3 - 2017 and Index Template 3 - 2017 with Bookmarks. You can use, modify, and copy these template files.

When creating an index template, it is strongly recommended that you work in [Page](#) view and turn [Reveal Codes](#) On to view the format symbols. Use CATalyst editing functions and commands to create the index template page following the guidelines for inserting index format symbols and assigning [categories](#).

Indexing format symbols are placed inside the cells of a table to format the text. The [Insert Table](#) feature in Edit allows you to create tables for the indexed text. Once you create a table, you can modify it: add and delete columns or rows, change column width, set table cell margins and use leader characters. You can copy and paste existing [tables](#) along with the contents. Table grid lines display in Edit for visual assistance in placing text, however, the table grid lines (borders) do not print by default. If you want the grid lines (borders) to print, select Edit, Tables and then Table Properties.

A paragraph style must exist at the end of the last table on the index template page. If a paragraph style, such as New Line Paragraph, does not exist, press **Ctrl + End** to move to the end of the file. Insert a **New Line Paragraph** format symbol.

If you want indexed items to appear as bookmarks in a transcript that is printed to PDF, please see [Print Bookmarked PDF](#).

## **Create a New Index Template**

1. From anywhere in Case CATalyst, press **Alt + f, n, t (File/New/Text)** to open a new text file. The Create New Document dialog box displays.
2. In the File Name section of the dialog box, locate and double click the **System Files** case and then double click the **Index Templates** case.
3. In the *File Name* field, type a name for the new Index Template. For example, let's say that you need an index template for court work and an index template for two freelance firms. You are making the court index template so you name it Court Template.

4. In the Layout Name field, select a layout to apply to the new Index Template and press **Enter (Open)**. The Edit function opens. Case CATalyst automatically brings the layout with the Index template and uses it for the indexed text. If needed, you can modify the layout when you are creating/modifying the index template.
5. Press **Alt + v, p** to switch to Page view. Press **Ctrl + Shift + r** to display Reveal Codes.
6. Use the [Insert Table](#) feature to create a table for indexed text. Insert as many tables as necessary separating the tables with at least one paragraph style. [Adjust](#) table grid lines to increase or decrease the width of the columns.
7. Type the page title, permanent information and format symbols using Tabs to position text. You can also use spaces to position text when applying a fixed space font for all the printed text.
8. Review the text placement, using Print Preview and Print as necessary.
9. Verify a paragraph exists at the end of the last table. Press Ctrl + End to move to the end of the file. If necessary, use Reveal Codes to view the format symbols. To insert a paragraph format symbol, press F4L.
10. Press **Ctrl + s (File/Save)** to save the file when finished.
11. Press **Alt + f, c (File/Close)** to close and exit the Index Template file.

Case CATalyst checks for Index Template errors when closing the file. If errors are found, the following message displays: *"This Index Template has errors in it. Would you like to cancel the Save/Exit process? Yes No"*

Select **one**:

### **Yes**

**This is the recommended action.** If, you choose not to review the log file and correct the errors, you most likely will experience additional errors when attempting to build an index using this template. The [Index Template.log](#) file opens in Notepad displaying error information. Review the information and make necessary corrections to the Index Template.

### **No**

The Index Template closes. Although you can attempt to use this template with the Build Index function, **it is highly likely that the [build index function](#) will fail until you correct the errors in this template.**

To view the error log later, from Manage Jobs display the contents of the Index Templates case located in the System Files case. Highlight the Index Template and in the Subfile window, double click the Unknown (.log) subfile.

## **Index Template Wizard**

The Build Index feature scans the transcript for indexing format symbols and copies the text between the format symbols to create the transcript index page. You can use an [Index Template](#), in conjunction with the Build Index feature, to customize the placement of information on the index page. The Index Template Wizard allows you to easily build an index template using a step-by-step process.

Using the Index Template Wizard, you can set up your index page to include examinations, exhibit and other information. Select a from a series of sample examinations, exhibits and other formats and then select an index category assignment. You can also customize other items that affect the layout of the index template. Once finished with the wizard, you can manually make further modifications, such as adding text attributes and modifying information to better meet your needs.

When you select to create an examination or exhibit index, the Examination & Exhibit Wizard displays after completing the index. Depending on the type of index you selected to create, the Examination & Exhibit Wizard allows you to quickly create examination or exhibit Include files along with dictionary include entries containing accurately placed index category format symbols. The wizard displays sample files based on your index type. Choose a sample that most closely resembles your desired style. You can manually make modifications once the wizard finishes.

The Index Template Wizard feature is **only available** when creating a new or modifying an existing file in the Index Template case. The Index Template case is located in your System Files case. All index templates must reside in the Index Templates case. This is necessary for the Build Index command to recognize the file as an index template.

[Keyboard Map](#) Function: Insert Template Wizard

## Create an Index Template

To create or modify an index template using the Index Template Wizard:

1. Locate and open the **System Files** case and then open the **Index Templates** case.
2. Do one of the following:

### Create a New Index Template

- a. Press **Alt + f, n, t (File/New/Text)** to open a new text file. The Create New Document dialog box displays.
- b. In the *File Name* field, type a name for the new Index Template and press **Enter (Open)**. If you are creating multiple types of indexes such as one for a deposition and one for court, you might want to name the index accordingly. For example, "Court Index."

### Open an Existing Template

- a. Press **Alt + f, o, t (File/Open/Text)** to open a new text file. The Open Existing Document dialog box displays.
  - b. Select an existing Index Template and press **Enter**.
3. Press **Alt + t, n, t (Tools/Index/Index Template Wizard)**. The Index Template Wizard displays. Complete each step and press **Enter (Next)** to continue. If you make changes on a step and use the Back button, changes made in the current step are lost.

## Step 1 - Template Type

Determine the type of index template to create. Make necessary entries:

### What type of index will this be?

Choose one of the following:

- Examinations
- Exhibits

- Other

### Choose Index Category

Select a [category](#) from the drop down list. Once a letter or number is used, you cannot select that same letter or number for another index type in the current file. When you use the Case CATalyst [Build Index](#) feature, Case CATalyst sorts the categories, grouping all the text with the same indexing format symbol and category letter or number together on the transcript index page. For example, you assign Examinations to Index category "W." All examinations containing the index category "W" are grouped together.

### Sample

Use the arrow buttons to display different templates. Select the one that most resembles your desired format. You can make additional modifications after completing the wizard.

The <<Left Margin and Right Margin >> indicators display the left and right most margins based on the current layout for the open template. If the index table extends past either indicator, you can make column adjustments in another step during the wizard or when the wizard finishes.

## Step 2 - Template Usage

Determine how the index is used. Make necessary entries:

### Will this be used in a master index?

Select **Yes** to use this template for generating a master index. A [master index](#) creates one transcript index across multiple transcripts. The index page(s) is automatically placed at the end of the opened transcript.

Select **No** to use this template for building an index for an individual transcript.

### Include index volume information?

This field is only available when you select Yes to use a master index.

Select **Yes** to include index volume information. A volume label identifies the indexed contents of the each file contained in a master index. For example, 3 - 923 indicates the item is found on Vol. 3 page 923.

Select **No** to not include index volume information.

### Where do you want the Index Volume placed?

This field is only available when you select Yes to include index volume information.

Determine the position of the volume information. Choose one of the following:

- Top of table — Create a separate table of index information for each transcript and position the volume information above the table.
- With Page Number — Create one table of index information for all the transcripts and position the volume information in the same column as the page numbers.
- Separate Column — Create one table of index information for all the transcripts and position the volume information in a separate column before the page column.

### Step 3 - Line and Page Format

Determine the usage and format of page, line and section number references. Make necessary entries:

#### Page/Line Number usage

Choose one of the following:

- Page Number — Display the page number for each index item.
- Page Number and Line Number — Display the page and line number for each index item.
- Section and Page Number — Display the section and page number for each index item.
- Section, Page Number and Line Number — Display the section, page and line number for each line item.

#### Separate Cells

Create a separate column for the selected references item, placing each reference number in a separate cell. Columns are created based on your selection in the *Page/Line Number usage* field.

#### Same Cell, separated with:

Create one column and place the selected reference items together in one cell. Type the character to use as the separator for the reference numbers. For example, type a colon to separate the page and line number. The result is 4:15. Reference information placed in the cell is based on your selection in the *Page/Line Number usage* field.

### Step 4 - Template and Column Headings

Determine the placement of the index template heading and table column headings. Make necessary entries:

#### Change heading Text and Justification

To change the table or column headings:

- a. From the drop down list, select the heading you want to change.
- b. Type the text in field to the right. You can add text attributes such as bold and italics once the wizard finishes.
- c. Determine the justification placement for the selected heading. Choose one: **Left Justified**, **Centered** or **Right Justified**.

### Step 5 - Column Width

Adjust column widths for the heading and data rows. Make necessary entries:

#### Adjust Column

From the drop down list, select the column you want to adjust.

for

Select the row or rows on which to make the width adjustment. Choose one:

- Both rows
- Heading row
- Data row (s)

#### **Keep page and line number columns the same width**

Check this box to adjust one of the columns and have Case CATalyst automatically adjust the remaining columns to the same size. This option is available if, in Step 3, you selected the option *Separate Cells* to have separate columns.

#### **Width**

Type, in inches, the desired size of the column. You can also adjust the columns widths after the wizard finishes.

#### **Left side of table**

Adjust the placement of the table on the page. Type, in inches, the distance from the left margin you want to place the left side of the table. This adjustment does not affect the margins.

4. Click **Finish**. Depending on the type of index you selected to create, you are prompted to make examination include files, exhibit include files, dictionary include entries or the wizard closes displaying the index template in Edit. Select **Yes** at the prompt to continue with the Examination & Exhibit Wizard.

Select **No** at the prompt to close the Index Template Wizard and display the index template in Edit. If you selected Examinations when creating the Index Template, you are first prompted to create a sworn statement include file. Selecting No, displays a prompt to create Examination dictionary entries. Select **Yes** to continue or **No** to close the Index Template Wizard to display the index template in Edit.

When wizard closes, make [modifications](#) to the index template as necessary. When you do not use the Examination & Exhibit Wizard, it is important that the assigned [index category](#) for each item on your index template is consistent in any dictionary definitions and your include files, such as your examinations and exhibits. Use [Reveal Codes](#) to verify the assigned index category for each item.

5. Do one of the following:

#### **Create Sworn Statement Include Files**

When you create an index template for Examinations, the Index Template Wizard prompts you to create a Sworn Statement. Select **Yes** to display the Sworn Statement Include File dialog box. Select **No** to skip creating the sworn statement. See [Create Examination Dictionary Entries](#).

Do the following to create a sworn statement include file:

- a. Click the **Left** and **Right** arrows to select the sample that most resembles your sworn statement and then click **OK**. You can manually make modifications to the sworn statement include file once the wizard finishes.
- b. The Name Sworn Statement Include File dialog box displays with the Includes case as the default location. Type a name for the sworn statement in the *File name* field and press **Enter (Save)**. If you do not have an Includes case, the file is automatically named "Sworn" and placed in a newly created Includes case.

- c. A dialog box displays prompting you to create Examination Dictionary entries. Do one of the following:
  - Select **Yes** to create Examination Dictionary entries. The Choose Dictionary for examination entries dialog displays. Continue with the instructions, [Create Examination Dictionary Entries](#).
  - Select **No** to close the wizard and display the index template in Edit. When the Index Template Wizard closes, make [modifications](#) to the index template as necessary. If you do not use the Examination & Exhibit Wizard, it is important that the assigned [index category](#) for each item on your index template is consistent in any dictionary definitions and your include files, such as your examinations and exhibits. Use [Reveal Codes](#) to verify the assigned index category for each item.

### Create Examination Dictionary Entries

When you create an index template for Examinations, the Examination & Exhibit Wizard first prompts you to create a Sworn Statement. The second prompt is to create examination dictionary entries. Press **Enter (Yes)**. The Choose Dictionary for examination entries displays. Do the following:

- a. Navigate to the dictionary in which you want to store the Examination dictionary entries and press **Enter (Open)**. The Choose Style screen displays.
- b. Use the **Left** and **Right** arrows to select the sample that most resembles the Examination format for which you want to create a dictionary entry. You can edit the dictionary entry or entries when the wizard finishes.
- c. In the Speaker Name field, do either of the following:
  - Insert an [EZ Speakers](#) field to create the dictionary entry with your speaker identification or insert a [group list field](#) as a placeholder for the speaker name. Click the Insert Field button to display the [Insert Field](#) dialog box. Select the field to insert and click **OK**. The field displays in the entry at the cursor location.
  - Type text, such as ATTY 1 surrounded by the ScanStop format symbols or ^ Speaker 1.
- d. Press **Enter (Next)**. The Create Dictionary Definition screen displays.
- e. In the *Steno* field, type the steno you will write to insert the Examination By Line into the transcript. For example, STPHAO/STKPWHR.
- f. In the *Entry Text* field, modify the default entry as necessary. Do any of the following:
  - Type text.
  - Insert a format symbol. Double click a format symbol to insert it into the entry at the cursor location.
  - Insert a field. Click the Insert Field button to display the [Insert Field](#) dialog box. Select a field to insert and click **OK**. The field displays in the entry at the cursor location.
- g. Press **Enter (Finish)**. You are prompted to create examination definitions for additional speakers. For example, SKWRAO/STKPWHR. Select **Yes** to create another dictionary entry. Repeat the previous steps to complete the entry.

Select **No** to close the wizard. Make [modifications](#) to the index template as necessary. Open the dictionary that contains the newly created entries to make any necessary adjustments.

### Create Exhibit Include File

Some reporters use exhibit include files that are manually or automatically brought into the transcript while other use exhibit dictionary entries. When you create an index template for Exhibits, the Index Template Wizard allows you to create either exhibit include files or exhibit dictionary entries. Select **Yes** to display the Select a dictionary to add exhibit definitions screen. Select **No** to close the wizard.

Do the following to create either an exhibit include file or exhibit dictionary entries:

- a. Navigate to the dictionary in which you want to store the [Auto Include](#) dictionary entry for the Include file and click **Open**. If you do not plan on using an Auto Include, you can choose to skip the step later in the process. The Create Exhibits Include File/Dictionary Entries screen displays.
- b. Use the **Left** and **Right** arrows to select the sample that most resembles the Exhibit include file you want to create.
- c. Ensure, the **Create Include Files** option is selected and click **Next**. The Name Include Files (s) screen displays.
- d. In the *Enter filename* field, click **Browse**. The Browse for Auto Include dialog opens with the Includes case as the default location. If an Includes case does not exist, the case is created and the contents displays. Type a file name to continue.
- e. In the *File name* field, type a name for the include file you are creating and press **Enter (Open)**. The assigned name and path display in the *Enter filename* field on the Name Include Files(s) screen.
- f. Press **Enter (Next)**. The Create AutoInclude Entries screen displays.
- g. Type the steno you will write to automatically include the file or leave the field blank to skip creating an Auto Include.
- h. Check the box *Also create Auto Include files for multiple exhibits* to create a separate include file that applies to multiple exhibits. By default, this option is selected. Press **Enter (Next)** to display the Name Include File(s) screen. Repeat the steps to name the file and create the Auto Include, if applicable.  
  
Uncheck the box to skip creating another Include file and press **Enter (Next)**.
- i. Click **Finish**.
- j. The wizard closes. Make [modifications](#) to the index template as necessary. Open the newly created include file or the dictionary that contains the newly created entries to make any necessary adjustments.

### Create Exhibit Dictionary Entry

When you create an Index Template for Exhibits, the Index Template Wizard prompts you to create exhibit include files or dictionary include entries. Selecting Yes displays the Select a dictionary to add exhibit definitions to screen. Do the following:

- a. Navigate to the dictionary in which you want to store the Exhibit dictionary entries and press **Enter (Open)**. The Create Dictionary Entries screen displays.
- b. In the *Steno* field, type the steno portion of the exhibit dictionary definition.
- c. In the *Entry Text* field, modify the default entry as necessary. Do any of the following:
  - Type text.

- Insert a format symbol. Double click a format symbol to insert it into the entry at the cursor location.
  - Insert a field. Click the Insert Field button to display the [Insert Field](#) dialog box. Select a field to insert and click **OK**. The field displays in the entry at the cursor location.
- d. To create a dictionary entry for the parenthetical that applies to multiple exhibits, check the box *Also create dictionary entries for multiple exhibits*. By default, this option is selected. When you choose to create another dictionary entry, the Create Dictionary Entries screen displays. Repeat the steps to complete the dictionary entry.
  - e. Click **Finish**.
  - f. The wizard closes. Make [modifications](#) to the index template as necessary.
  - g. Open the dictionary that contains the exhibit entries to make modification if necessary.

## Index Template Options

Use Index Template Options to further customize the generated index. Index Template Options apply to the current Index Template. If you have several index templates due to different types of work or different jurisdiction requirements, be sure the appropriate index template options for each index template. Access Index Template Options from the Build Index dialog box, select **Index Template Options**. The Index Template Options dialog box displays. Use the following options as necessary.

If while building an index, you receive a Build Index Error message, you can activate or deactivate appropriate Index Template Options if the log file contains minor errors. Minor errors do not prevent the index from being built. If the [log file](#) contains major errors, the index cannot be built and the errors must be resolved before the index can be built.

## Index Template Options

The Index Template option displays on the left side of the dialog box and the setting field displays on the right. If the setting field is a Yes/No choice, double click the field to change the value. If the setting field is a drop-down list, click the field to display the list of choice and then click the desired choice. If the setting field requires user input, click the field and type the desired text.

### Ignore Indexed Information not used by Template Yes/No

Select Yes to have the Build Index feature overlook transcript text that is surrounded by index format symbols not found in the selected index template. Select No to attempt to use all transcript text surrounded by index format symbols in the index. The default is No.

### Warn me about ignored index information Yes/No

This option is only active if the Ignore Indexed Information not used by Template option is set to Yes. Select No to prevent the Index Error Checking feature from reporting a minor issue when ignored index format symbols are found in the transcript but not in the index template. Select Yes to see the minor warning. The default is Yes.

### Warn me about template information not found in the transcript Yes/No

Select No to prevent the Index Error Checking feature from reporting occurrences of <Index Off> format symbols in the transcript without <Index On> format symbols preceding it. Select Yes to see the minor warning. The default is Yes.

### Warn me about <Index Off> symbols with no preceding <Index On> symbol Yes/No

Select No to prevent the Index Error Checking feature from reporting occurrences of <Index Off> format symbols in the transcript without <Index On> format symbols proceeding it. Select Yes to see the minor warning when this situation occurs. The default setting is Yes.

**Ignore Paragraph Formatting Yes/No**

Select Yes to have the Build Index feature overlook paragraph format symbols that occur within the indexed transcript text. Select No to include the paragraph format symbols and copy them to the index. The default is No.

**Retain Fields**

By default, fields are converted to text on the index page(s). Setting this option to Yes means fields will retain their field status on the index page(s). Index Allcap Cell and Index Initial Cap Cell format symbols will have no effect on the field value. This option applies only to the Build Index function and does not apply to the Master Index function. The default setting is No.

**Number Index Separately Yes/No**

Select Yes to set the first page of the index to page 1 (depending on your page number format). Transcript page numbers are not affected. Select No to number the index page the next consecutive page number based on the transcript page numbers. The default is No.

**Cell Separation Text**

Type a character, punctuation symbol or insert a format symbol to separate multiple page number references for the indexed item.

This field is only available if you select the Allow Duplicate Cells option.

**Master Index Page Column Format - <Index Volume Information>--<Index Cell> or <Index Cell>**

When using a master index template, select Index Volume Information – <Index Cell> to have the Volume number followed by a hyphen followed by the page number. Select <Index Cell> to display only the page number.

**Delete Empty Tables - Yes/No**

When set to Yes and the Build Index feature encounters empty tables because there is no indexed information for the table's index category in the transcript, Build Index will delete the empty table. If you have text above the table to identify the columns, (such as Exhibit, Description, Page), that text will not be deleted along with the table unless the text is part of the table. Text outside of a table will not be deleted. The default setting is No.

If the Delete Empty Tables is set to Yes and the Build Index feature doesn't find any matching indexed text in the transcript, the index page will not be created.

The following is an example of column headings or text that may be above the indexed text can be positioned inside the table and if the Delete Empty Tables option is set to Yes and no indexed text is found in the transcript that matched the table's index category, the entire table would be deleted.

Exhibit No.	Description	Page

You can modify existing index templates to add a row to a table and put column heading text inside of a table.

1. Open the index template you want to modify. Index templates are stored in the Index Template case in the System Files case.
2. Position your cursor in the first row of the table you want to modify and press **Alt + e, b, r** (Edit, Tables, Insert Rows...).
3. In the Insert Rows dialog box, confirm 1 row will be inserted before the current row and press **Enter**.
4. Type the column headings in the table row you just inserted.
5. Save and close the Index Template.

## Modify an Index Template

Use Case CATalyst editing functions and commands to modify the index template page following the guidelines for inserting index format symbols and assigning [categories](#). Turn [Reveal Codes](#) On to view the hidden codes, such as format symbols, as you modify the template. When working on an index template, it is strongly recommended you work in Page view.

Indexing format symbols are placed inside the cells of a table to format the text. The [Insert Table](#) feature in Edit allows you to create tables for the indexed text. Once you create a table, you can modify it: add and delete columns or rows, change column width, set table cell margins and use leader characters. Table grid lines display in Edit for visual assistance in placing text, however, the table grid lines do not print.

You can copy and paste existing tables along with the contents. You must select the entire table including the <Table Begin> and <Table End> format symbols. Copying a portion of a table without the format symbols, copies the only text without the table or existing formatting. For steps on copying tables, see [Copying Tables](#).

A paragraph style must exist at the end of the last table on the index template page. If a paragraph style, such as New Line Paragraph, does not exist, press **Ctrl + End** to move to the end of the file. Insert a **New Line Paragraph** format symbol.

In order for Case CATalyst to recognize an Index Template you must store it in the Index Template Case, which is stored in the System Files case.

## Open an Existing Index Template

1. From anywhere in Case CATalyst, press **Alt + f, o, t** (**File/Open/Text File**) to open an existing text file. The Open Existing Document dialog box displays.
2. Locate and open the System Files case and then open the Index Templates case.
3. Type an existing index template file name in the File name field or click a template file to open. Press **Enter (Open)**. The Edit function opens with the selected file. Case CATalyst automatically brings the layout with the Index template and uses it for the indexed text.
4. Press **Alt + v, p** to switch to Page view. Press **Ctrl + Shift + r** to display Reveal Codes.
5. Add or modify any permanent information and format symbols using tabs to position the text. You can also using spaces to position text when applying a fixed space font for all the printed text. [Adjust](#) table grid lines to increase or decrease the width of the columns.
6. Review the text placement, using Print Preview and Print as necessary. Table grid lines do not print.

7. Verify a paragraph exists at the end of the file. Press **Ctrl + End** to move to the end of the file. If necessary, use Reveal Codes to view the format symbols. To insert a paragraph format symbol, press **F4L**.
8. Press **Ctrl + s (File/Save)** to save the file when finished.
9. Press **Alt + f, c (File/Close)** to close and exit the Index Template file.

Case CATalyst checks for Index Template errors when closing the file. If errors are found, the following message displays: "This Index Template has errors in it. Would you like to cancel the Save/Exit process? Yes No"

Select **one**:

**Yes**

The [Index Template.log](#) file opens in Notepad displaying error information. Review the information and make necessary corrections to the Index Template.

**No**

The Index Template closes. The template is unusable with the Build Index function until you correct the errors.

To view the error log later, from Manage Jobs display the contents of the Index Templates case located in the System Files case. Highlight the Index Template and in the Subfile window, double click the .LOG file.

## Index Template Error Log

When you close an Index Template, Case CATalyst automatically checks the file for errors. An Index Template error mostly will prevent a successful building of an index. An example of an Index Template error occurs, for example, when the Index Template contains an <Index On a> format symbol that precedes a <Index Heading On a> format symbol. Index format symbols must follow the Index Heading format symbol. In other words, let's say you were putting in the indexing codes for exhibits and you accidentally put the <Index On A> format symbol in the first table column and <Index Heading On A> in the second (description) column. In this example, the format symbols must switch places.

If errors exist, Case CATalyst creates an error log. When accessed, the error log (*indextemplatename.log*) opens in Windows Notepad/Wordpad with the following information:

- Name of the index template
- Date
- Time
- Errors found

**Example**

Error log for C:\cat4\USR\Karen\System Files\Index Templates\Index Template #1.log

Date: 08/12/2002

Time: 12:28:08

<Index Heading On C> with no <Index Heading Off> [Page 1, Line 9]

Index information was found outside a table

## Correcting Index Template Errors

Case CATalyst checks for errors when closing an Index Template file. If errors are found, the following message displays:

**This Index Template has errors in it.**

**Would you like to cancel the Save/Exit process?**

**Yes No**

### Do one of the following:

Select **Yes**, recommended action, and review the error log and fix the issues in the Index Template. Once you save and close the Index Template, CATalyst will once again check for errors. Attempting to build an index with an index template that contains errors usually results in an unsuccessful/incomplete index.

Select **No**, not recommended, to ignore the errors in the Index Template or to fix them later. Attempting to build an index with an index template that contains errors usually results in an unsuccessful/incomplete index.

### Return to the index template and correct the errors.

You can view the error log immediately by selecting **Yes**. The contents of the error log opens in Windows Notepad. You can print the error log by selecting **File/Print**. Review the information and make the necessary corrections. An Index Template must be error free before you can use it with the Build Index feature.

### Exit the index template and display the error log later.

You can view the error log later, in Manage Jobs, by selecting **No**. You must correct errors in the Index Template before you can use it with the Build Index feature in Edit.

To view the error log from Manage Jobs:

1. From the System Files case, open the Index Templates case.
2. Highlight the index template that contains the errors.
3. In the Subfile window, double click the .LOG file.
4. The error log displays in Notepad. You can print the error log by selecting **File/Print**.
5. Review the information and make the necessary corrections.

## Index Template Guidelines

Index Template Guidelines provide information on how to use Case CATalyst indexing format symbols on an Index Template. The special indexing format symbols placed in tables work in conjunction with the Build Index feature to automatically categorize examinations, exhibits and requested information from the transcript. The following guidelines details format symbol placement with examples.

### Index Template Format Symbol Guidelines

- [Index On and Index Off Guidelines](#)
- [Index Heading On and Index Heading Off Guidelines](#)

- [Index Category Guidelines](#)
- [Index Cell Guidelines](#)
- [Index Item Guidelines](#)
- [Index Line Guidelines](#)
- [Index Page Guidelines](#)
- [Index Section Guidelines](#)
- [Index Sort Guidelines](#)

### Index On/Off Guidelines

The Build Index feature searches the transcript for text surrounded by Index On and Index Off format symbols: <Index On> F4l <a-z, 0-9> and <Index Off> F4i <a-z, 0-9>. It places that text on your transcript index page in the same position you place the Index On symbol on the index template. Build Index groups all occurrences of transcript text surrounded by the same Index [category](#) letter or number together chronologically on the transcript index page. You can create up to 36 different Index indexes.

There are two ways you can insert the [Index On/Off format symbols](#) into the transcript:

- manually insert them into a transcript while editing.
- make them part of a dictionary definition or an include file so that you can automatically bring the them into the transcript.

### Using Index On in an Index Template

Use the following guidelines for Index On format symbol when creating or modifying an Index Template.

- Place the Index On format symbol within a table cell. The table grid lines provide assistance in placing text and do not print.
- Insert an Index On format symbol only. You do not need an Index Off format symbol. The end of the table cell indicates the end of the format.
- Create a location for Index text by using the Index On (F4 l) followed by a letter or single digit number.
- You can only use an Index category once on the Index Template. For example, you cannot have two occurrence of <Index a>.
- Index categories do **not** have to follow an alphabetical or numerical order. For example, you can put <Index On c> on a line and two lines below put <Index On a>.
- Index templates do not require Index Heading On format symbols. If you do use an Index Heading On format symbol, it must precede the Index On format symbol for the corresponding category (letter or number). For example, <Index Heading On c> on the Index Template must precede <Index On c>.
- Index text, which extends beyond the spacing designated by the end of the table cell on the Index Template, wraps to multiple lines when copied to the transcript index page. Always check for correct hyphenation or word breaks.
- An Index Heading On format symbol must precede Index Item and Index On format symbols if placed on the same line.

Inserting Index On/Off Format Symbols

## Index Heading On/Off Guidelines

The Build Index feature searches the transcript for text surrounded by Index Heading On and Index Heading Off format symbols: <Index Heading On> F4J <a-z, 0-9> and <Index Heading Off> F4j <a-z, 0-9>. It places that text on your transcript index page in the same position you place the Index Heading On symbol on the index template. Build Index groups all occurrences of transcript text surrounded by the same Index Heading [category](#) letter or number together chronologically on the transcript index page. You can create up to 36 different Index Heading indexes.

You can use Index Heading On and Off format symbols even if you are not using an Index Template.

There are two ways you can insert the [Index Heading On/Off format symbols](#) into the transcript:

- manually insert them into a transcript while editing.
- make them part of a dictionary definition or an include file so that you can automatically bring them into the transcript.

## Using Index Heading On in an Index Template

Use the following guidelines for Index Heading On format symbol when creating or modifying an Index Template:

- Place the Index Heading On format symbol within a table cell. The table grid lines provide assistance in placing text and do not print.
- Insert an Index Heading On format symbol only. You do not need an Index Heading Off format symbol. The end of the table cell indicates the end of the format.
- Create a location for Index Heading text by using the Index Heading On (F4 J) followed by a letter or single digit number.
- You can only use an Index Heading category once on the Index Template. For example, you cannot have two occurrence of <Index Heading a>.
- Index Heading categories do **not** have to follow an alphabetical or numerical order. For example, you can put <Index Heading On c> on a line and two lines below put <Index Heading On a>.
- Index templates do not require Index Heading On/Off format symbols. If you do use an Index Header On format symbol it must precede Index On format symbols for the corresponding category (letter or number). For example, <Index Heading On c> on the Index Template must precede <Index On c>.
- Index Heading text, which extends beyond the spacing designated by the end of the table cell on the Index Template, wraps to multiple lines when copied to the transcript index page. Always check for correct hyphenation or word breaks.
- An Index Heading On format symbol must precede Index Item and Index On format symbols if placed on the same line.
- Individual indexed text cannot exceed 900 bytes.

### Inserting Index Header On/Off Format Symbols

## Index Category Guidelines

Reporters often organize index pages into specific "categories"; such as examinations, exhibits, and requested information. In Case CATalyst, you assign each category a different letter or number when using Index Heading On/Off and Index On/Off format symbols. The [Build Index](#) feature sorts the categories and automatically places them in designated positions on the transcript index page.

A category refers to a letter "a" through "z", or a number "0" through "9". An example of an Index Heading format symbol with an assigned category of "a" is: <Index Heading On a>DAVID WESTON<Index Heading Off a>

The Build Index feature copies text from the transcript you surround by [Index Heading On/Off](#) and [Index On/Off](#) format symbols to the index page. When you insert an Index or Index Heading On format symbol, Case CATalyst prompts you to type a letter or number (category). Then when you insert the Index or Index Heading Off format symbol, Case CATalyst prompts you again. You type the same letter or number corresponding with the Index On format symbol or press Spacebar for an Index Off All or Index Heading Off All.

The Build Index feature sorts the categories, grouping all the text with the same indexing format symbol and category letter or number together on the index page. When using the Build Index feature without an Index Template, the information lists alphabetically first and then numerically. For example, entries with an "a" are first, "b" second, "c" third, through "z", followed by "0", "1", etc. Entries within each category list alphabetically. Multiple entries marked with the same indexing format symbol and character list in the order they appear in the transcript. For example, the "a" entry on page one is first, the "a" entry on page two is second, etc.

For example, in your transcript you surround the transcript text "DAVID WESTON" and "ELIZABETH YOUNG" with the <Index Heading On a> and <Index Heading Off a> format symbols. You also surround the transcript text "Direct Examination by Ms. Smith" and "Cross Examination by Mr. White" with <Index On a> and <Index Off a> format symbols. The same category character of "a" is used for the Index Heading On/Off and Index On/Off format symbols to categorize this information so that the Index Text is a sub-category of the Index Heading. The result on the index page is:

### DAVID WESTON

Direct Examination by Ms. Smith	4
Cross Examination by Mr. White	12

### ELIZABETH YOUNG

Direct Examination by Ms. Smith	16
Cross Examination by Mr. White	31

When using the Build Index process with an Index Template, the placement of indexing format symbols on the Index Template determines how the indexed text displays on the index page. Since the position of format symbols on the Index Template determines placement of indexed text, it does not matter which characters you use for the categories.

For example, you surround transcript text relating to witnesses and assign a "w" category; transcript text relating to exhibits an "e" category; and transcript text relating to requested information with an "r" category. Using the Build Index Command without an Index Template results in:

1. Exhibit entries listed first.
2. Requested information entries listed second.
3. Witness entries listed last.

Using the Build Index command with an Index Template on which you designated Index On "w" entries are placed first in the file, Index On "e" entries display next, and Index On "r" entries display next. The results are:

1. Witness entries listed first.

2. Exhibit entries listed second.
3. Requested information listed last.

If you are uncertain about using an Index Template, assign the categories to the text alphabetically or numerically, in the order you want the indexed information to display when not using an Index Template. For example, if you want witnesses to display first, they you might use index category 1 or A, if you wanted exhibits to display next, you might use index category 2 or B and if requested information displays last on the index page, you might use index category 10 or Z.

## Index Cell Guidelines

Use the Index Cell format symbol on the Index Template to identify the table cells in which you want Case CATalyst to place the reference number for the indexed information. Index Cell format symbols allow you to have multiple page references for the indexed item on one line and if necessary, in the same cell on the same line. For example, you have a witness and you want the examining attorney names and page references on the same line.

On the Index Template, the Index Cell format symbol:

- must be placed in a table cell.
- must be placed on a line that contains an Index Heading On or Index On format symbol.

The Index Cell format symbol is used on the index template and in the transcript. When using the Index Cell format symbol in a transcript, you need to use an Index Template that also contains Index Cell format symbols when using the Build Index feature. On the Index Template, the Index Cell format symbol indicates the table cell in which Case CATalyst places the reference number for the indexed information from the transcript.

In the transcript, the Index Cell format symbol identifies the location of the indexed information. It must be surrounded by Index Heading On/Off or Index On/Off format symbols or surrounded by Index Heading On/Off format symbols when the Allow Duplicate Cells option is selected for the Index Template. When you insert the Index Cell format symbol into the transcript, Case CATalyst prompts you for a number, 1 - 20. This number indicates which cell in the table row to place the reference number for the indexed information. Any text between the Index Heading or Index On/Off format symbols is also copied to the index. The Index On/Off format symbol character needs to be the same index [category](#) as the Index Heading On format symbol on the index template. See [Index Cell](#) for instructions on inserting the Index Cell format symbol into the transcript.

### Index Template Example 1

You want to index the witness and examination information. On the Index Template, you create a table with 2 rows and 5 columns. In the cells of the first row, type the heading information for each column in the table. In the first cell of the second row, insert the [Index Heading On](#) format symbol. This identifies the placement of the witness name. In the second cell, place an Index Cell 1 format symbol to indicate the page on which the indexed information occurs in the transcript. Insert three more Index Cell format symbols, one in each of the remaining table row cells. Your entry would look similar to the following:

WITNESS	Direct	Cross	Re-direct	Re-cross
<Index Heading On A>	<Index Cell 1>	<Index Cell 2>	<Index Cell 3>	<Index Cell 4>

While editing the transcript, place <Index Heading On A> and <Index Heading Off A> format symbols around the witness name you want to copy to the transcript index page.

<Index Heading On a>CHARLOTTE M. PARKER<Index Heading Off a>

For the examination occurrences, you surround the corresponding Index Cell number with the same Index On/Off format symbols as the Index Heading category. No text is included between the Index On/Off format symbols.

*DIRECT<Index On a><Index Cell 1><Index Off a>EXAMINATION*

*CROSS<Index On a><Index Cell 2><Index Off a>EXAMINATION*

*RE-DIRECT<Index On a><Index Cell 3><Index Off a>EXAMINATION*

*RE-CROSS<Index On a><Index Cell 4><Index Off a>EXAMINATION*

Build Index displays the indexed information on the transcript index page as follows:

WITNESS	Direct	Cross	Re-direct	Re-cross
CHARLOTTE M. PARKER	4	25	51	52

If there were duplicate examinations, for example, of the same witness and the [<Index Allow Duplicate Cells> format symbol](#) was present in the table before the <Index Cell>, page numbers where the examinations occurred would be placed in the same cell separated by the punctuation indicated in the Index Template Options dialog box. For example, two prosecution attorneys examined Ms. Parker. The DIRECT examination line was inserted once for each prosecuting attorney which resulted in the following index.

WITNESS	Direct	Cross	Re-direct	Re-cross
CHARLOTTE M. PARKER	4, 21	25	51	52

### **Index Template Example 2**

You want to index the examination information along with the attorney names. On the Index Template, you create a table with 3 rows and 5 columns. In the cell of the first row, type the heading information for each column in the table. In the first cell of the second row, insert an [Index Heading On](#) format symbol to identify the placement of the witness name. In the first cell of the third row, insert an [Index On](#) format symbol to identify the placement of the attorney names. In the second cell of the third row, insert an Index Cell 1 format symbol to identify the placement of the reference number on which the indexed information occurs in the transcript. Insert three more Index Cell format symbols, one in each of the remaining table cells in the third row. Your entry would look similar to the following:

WITNESS	Direct	Cross	Re-direct	Re-cross
<Index Heading On A>				
<Index On>	<Index Cell 1>	<Index Cell 2>	<Index Cell 3>	<Index Cell 4>

In the transcript, place <Index Heading On A> and <Index Heading Off A> format symbols around the witness name you want to copy to the transcript index page.

*<Index Heading On A>CHARLOTTE M. PARKER<Index Heading Off A>*

For the examination occurrences, surround the corresponding Index Cell number and selected text with the same Index On/Off format symbols as the Index Heading category.

*DIRECT EXAMINATION<Index On A>BY MR RAYMOND<Index Cell 1><Index Off A>*

*CROSS EXAMINATION<Index On A>BY MS TAYLOR<Index Cell 2><Index Off A>*

*RE-DIRECT EXAMINATION<Index On A>BY MR RAYMOND<Index Cell 3><Index Off A>*

*RE-CROSS EXAMINATION<Index On A>BY MS TAYLOR<Index Cell 4><Index Off A>*

In the following example, the witness was only examined twice by each attorney. Build Index displays the indexed information on the transcript index page as follows:

WITNESS	Direct	Cross	Re-direct	Re-cross
CHARLOTTE M. PARKER				
BY MR RAYMOND	4		51	
BY MS TAYLOR		25		52

If there were duplicate examinations, for example, of the same witness and the <Index Allow Duplicate Cells> format symbol was present in the table before the <Index Cell>, page numbers where the examinations occurred would be placed in the same cell separated by the punctuation indicated in the Index Template Options dialog box. For example, two attorneys examined Ms. Parker multiple times on re-direct and recross. Each time the RE-DIRECT and RE-CROSS examination are inserted into the transcript, the index references the locations. The following is an example of the index results.

WITNESS	Direct	Cross	Re-direct	Re-cross
CHARLOTTE M. PARKER				
BY MR RAYMOND	4		51, 53, 54	
BY MS TAYLOR		25		52, 54, 55

#### Inserting an Index Cell Format Symbol

### Index Allow Duplicate Cells Guidelines

The <Index Allow Duplicate Cells> format symbol was created as a replacement for the *Allow Duplicate Cells* option starting in Case CATalyst Version 21. The Allow Duplicate Cells option has been removed from Case CATalyst. Please use the <Index Allow Duplicate Cells> format symbol to have multiple [Index Cell](#) page numbers in a single cell of an Index Template.

#### Using Index Allow Duplicate Cells:

Let's say you want to allow multiple page numbers in the same cell of an index, like in the following example:

Two attorneys examined Ms. Parker multiple times on re-direct and recross. Each time the RE-DIRECT and RE-CROSS examinations are inserted into the transcript, the index references the locations. To have the page number references related to Re-direct and Re-cross cells of the Index Template appear in the same cell respectively, you will now add the <Index Allow Duplicate Cells> format symbol inside of the Index Template table. Using the example Index Template table below, you could insert the <Index Allow Duplicate Cells> format symbol in the same table cell as the WITNESS text appears. As long as the <Index Allow Duplicate Cells> format symbol appears once in the table on a row with an <Index Heading On> or <Index On> format symbol, before or inside of a table cell location containing an <Index Cell> format symbol, the Build Index feature will allow multiple page number references in a single cell when the index is built. A single <Index Allow Duplicate Cells> format symbol in a table is enough for all Index Cell locations to allow multiple page numbers.

WITNESS	Direct	Cross	Re-direct	Re-cross
---------	--------	-------	-----------	----------

CHARLOTTE M. PARKER

BY MR RAYMOND

4

51, 53, 54

BY MS TAYLOR

25

52, 54, 55

To modify an existing Index Template to include the <Index Allow Duplicate Cells> format symbol, do the following:

1. Open the Index Template by doing one of the following:
  - a. In Manage Jobs, double click the **System Files** case, double click the **Index Templates** case, and then double click on the Index Template file you'd like to modify.
  - b. Select **File, Open, Text File...** In the Open Existing Document dialog, double click the **System Files** folder, double click the **Index Templates** folder, and then double click the Index Template file you'd like to modify.
2. Inside of the Index Template file, place your cursor inside of the table that contains the <Index Cell> format symbol you'd like to allow duplicate cells. Your cursor should be on a row in the table with either an <Index Heading On> or an <Index On> format symbol and be before the <Index Cell> or inside of the table cell that contains the <Index Cell> format symbol.
3. Press (**F4**) twice to open the Insert Format Symbol dialog. Find the *Index Allow Duplicate Cells* entry, then double click the entry to insert it into the table at the cursor location.
4. Save and Close the Index Template file.

➤ **Note:** You will need to add the <Index Allow Duplicate Cells> format symbol to all Index Template tables you'd like to allow multiple page number references in a single cell.

## Index Item Guidelines

Use the Index Item format symbol on the Index Template to sequentially number indexed items on the transcript page. The Index Item format symbol indicates that the indexed text, copied from the transcript to the transcript index page, is numbered.

On the Index Template, the Index Item format symbol must:

- be placed in a table cell.
- display on a line that contains an Index On format symbol.
- occur only once on the same line to display the information specified by the Index On <a-z, 0-9>.

### Example

On the index template, you insert the Index Item format symbol followed by an Index On format symbol which identifies the location for the indexed text. Following the Index On format symbol, you place the Index Page format symbol to indicate the page on which the indexed information occurs in the transcript. Your entry would look similar to the following:

<Index Item><Index On a>Index A text here<Index Page>

While editing the transcript you place <Index On a> and <Index Off a> format symbols around text you want to copy to the transcript index page. Build Index displays the indexed information on the transcript index page as follows:

Item	Description	Page
1	Property deed belonging to John P. Jones	34

2	Letter belonging to John P. Jones written by Sarah Q. Doe	67
3	Last will and testament of George Smith	15

For information on the [Index Item format symbol](#), click the previous link.

## Index Line Guidelines

Use the Index Line format symbol on the Index Template to indicate placement of the line number for indexed text on the transcript index page. You can set the line justification in Index Template Options so that either the first or last column of the Index Line number aligns in the same column.

When you do not use an Index Template, the Build Index feature automatically generates Line reference numbering if you select the Show Line Number option in the Build Index dialog box.

On the Index Template, the Index Line format symbol must:

- be placed in a table cell.
- display on a line that contains an Index On format symbol.
- be positioned in the order and position you want the reference numbering to display
- occur only once on the same line to display the information specified by the Index On <a-z, 0-9>.

### Example

On the index template, you insert the Index Item format symbol followed by an Index On format symbol which identifies the location for the indexed text. Following the Index On format symbol, place the Index Section, Index Page, and Index Line format symbols to indicate the section, page, and line on which the indexed information occurs in the transcript. Your entry would look similar to the following:

<Index Item><Index On a>Index A text here<Index Section><Index Line><Index Page>

While editing the transcript you place <Index On a> and <Index Off a> format symbols around text you want to copy to the transcript index page. Build Index displays the indexed information on the transcript index page as follows:

Item	Description	Section	Page	Line
1	Property deed belonging to John P. Jones	1	34	15
2	Letter belonging to John P. Jones written by Sarah Q. Doe	1	67	7
3	Last will and testament of George Smith	2	15	22

### Inserting an Index Line Format Symbol

## Index Page Guidelines

Use the Index Page format symbol on the Index Template to indicate the placement of the page number for indexed text on the transcript index page. If you use an Index Template and do not include the Index Page format symbol on the template, Build Index does not generate page number information. On the Index Template, the Index Page format symbol must:

- be placed in a table cell.
- display on a line that contains an Index On format symbol.
- be positioned in the order and position you want the reference numbering to display
- occur only once on the same line to display the information specified by the Index On <a-z, 0-9>.

When you do not use an Index Template, the Build Index command automatically generates Page reference numbering for the indexed text.

**Example**

On the index template, you insert the Index Item format symbol followed by an Index On format symbol which identifies the location for the indexed text. Following the Index On format symbol, you place the Index Page format symbol to indicate the page on which the indexed information occurs in the transcript. Your entry would look similar to the following:

<Index Item><Index On a><Index Page>

While editing the transcript you place <Index On a> and <Index Off a> format symbols around text you want to copy to the transcript index page. Build Index displays the indexed information on the transcript index page as follows:

Item	Description	Page
1	Property deed belonging to John P. Jones	34
2	Letter belonging to John P. Jones written by Sarah Q. Doe	67
3	Last will and testament of George Smith	15

Click the link for [Index Page Guideline](#) information.

## Index Section Guidelines

Use the Index Section format symbol on the Index Template to indicate placement of the section number for the indexed text on the transcript index page. When creating the index template, you can set the line justification in Index Template Options so that either the first or last column of the Index Item number aligns in the same column.

When you do not use an Index Template, the Build Index feature automatically generates Section numbering if you select the Show Section Number option in the Build Index dialog box.

On an Index Template, the Index Section format symbol must:

- be placed in a table cell.
- display on a line that contains an Index On format symbol.
- occur only once on the same line to display the information specified by the Index On <a-z, 0-9>.

**Example**

On the index template, you insert the Index Item format symbol followed by an Index On format symbol which identifies the location for the indexed text. Following the Index On format symbol, you place the Index Section and Index Page format symbols to indicate the section and page on which the indexed information occurs in the transcript. Your entry would look similar to the following:

<Index Item><Index On a><Index Section><Index Page>

While editing the transcript you place <Index On a> and <Index Off a> format symbols around text you want to copy to the transcript index page. Build Index displays the indexed information on the transcript index page as follows:

Item	Description	Section	Page
1	Property deed belonging to John P. Jones	1	34
2	Letter belonging to John P. Jones written by Sarah Q. Doe	1	67
3	Last will and testament of George Smith	2	15

For more information about inserting an [Index Section format symbol](#), click the link.

## Index Sort Guidelines

Use the Index Sort format symbols, [Index Sort – Alpha Case Insensitive](#), [Index Sort – Alpha Case Sensitive](#), [Index Sort - Alpha Word Override](#), [Index Sort - Match Headings](#), [Index Sort – Numeric](#) and [Index Sort Alpha - Exhibit](#) in an index template to sort the indexed items on the transcript index page. Insert one of the Sort Index format symbols into a table cell to sort the desired column. There are three Index Sub Sort format symbols to fine tune your indexing results. [Index Sub Sort - Alpha Case Insensitive](#), [Index Sub Sort - Alpha Exhibit](#) and [Index Sub Sort - Numeric](#).

On an Index Template, an Index Sort format symbol can be used in the following manner:

- must be placed in a table cell.
- in most cases, occur only once in a table although you can use a Index Sub Sort format symbol in addition to the Index Sort format symbol to fine tune your indexing results.. See explanation below of multiple index sorting format symbols used more than once in a table.
- follow Index Heading On or Index On format symbols.
- occur only once on the same line to display the information specified by the Index Heading On <a-z, 0-9> or Index On <a-z, 0-9> format symbol.
- Index Sub Sort format symbols must follow an Index Sort format symbol.

### **Example 1 - Index Heading On format symbol followed by Index Sort - Numeric format symbol**

Let's say you want to sort the exhibits in numeric order regardless of how the exhibits were introduced during the proceedings. In the transcript, the exhibit number is surrounded by the Index Heading On E format symbol and the index description is surrounded by the Index On E format symbol. In the index template, you insert the Sort Index – Numeric symbol after an Index Heading On in the first column of the table. The Index On format symbol is inserted in the second column. Your table would look similar to the following:

Exhibit No.	Description	Page
<Index Heading On E><Index Sort – Numeric>	<Index On E>	<Index Page>

NOTE: The actual index formatting symbols do not appear in the table cells once the transcript index page is built but the indexing format symbols display in Reveal Codes. The above example is showing how the format symbols should appear in the Index Template. The indexing format symbols display in Reveal Codes.

### **Example 2 - Index On format symbol followed by Sort Index - Numeric format symbol**

Let's say you want to sort the exhibits in numeric order but you do not include a description in the index. In the transcript, the exhibit number is surrounded by the Index On format symbol. In the index template, you insert the Index On E format symbol followed by the Sort - Numeric format symbol in the first column. Your table would look similar to the following:

Exhibit No.

Page

&lt;Index On E&gt;&lt;Index Sort – Numeric&gt;

&lt;Index Page&gt;

***Example 3 - Index On format symbol followed by Sort Index - Number followed by Sub Sort Numeric format symbol***

Let's say you want to sort the exhibits in numeric order but you do don't include a description in the index. The exhibits contain a number and a decimal point followed by a number or numbers. In the index template, you insert the Index On E format symbol followed by the Sort - Numeric format symbol followed by the Sub Sort - Numeric format symbol in the first column. You table would look similar to the following:

Exhibit No.

Page

&lt;Index On E&gt;&lt;Index Sort – Numeric&gt;&lt;Index Sub Sort – Numeric&gt;

&lt;Index Page&gt;

**Multiple index sorting format symbols used in one table:**

You can use multiple index sorting format symbols in a table when the Index Heading On format symbol is indexed in the Index Heading On column and multiple items are reported in the Index On column. For example, let's say you wanted to sort your indexed witness names alphabetically by last name and you wanted to sort the examiners' names by first name. In the transcript, the witness name is surrounded by Index Heading On format symbols and the examiners' names are surrounded by Index On format symbols. In this example, when you build the index there would be multiple indexed entries in the Index On column for the one witness name. Since there are multiple Index On entries related to the Index Heading On format symbols, two different index sort format symbols can be used in one table. If only one item is indexed for the Index Heading On column and one item is indexed for the Index On column, the index sort format symbol can only be used with the Index Heading On format symbol in the index template.

## Manage Dictionary

The Manage Dictionary function allows you to create and maintain your Case CATalyst dictionaries. A dictionary is a file that contains steno outlines with text definitions. Dictionary definitions may be words/phrases, commands to include files or run a macro. Dictionaries are used during Translation to create a text file in Edit. Case CATalyst uses the following dictionaries:

- [Personal Dictionary](#)
- [Case Dictionary](#)
- [EZ Speakers Dictionary](#)
- [Job Dictionary](#)
- [Power Define Dictionary](#)
- [Realtime Commands Dictionary](#)
- [Update Area](#)

You can insert, modify, delete, spell check, and print dictionary entries. Refer to the [Guidelines](#) for Creating Dictionary Entries for additional information on modifying the steno or text portion of your dictionary entries.

To open Manage Dictionary, do **one** of the following:

- On the Function Bar, click Manage Dictionary 
- From the Menu Bar, select **Function/Manage Dictionary**
- Press **Alt + u, d**
- Press **Alt + f, o, d (File/Open/Dictionary)** and select the dictionary type

## File - New - Dictionary

The File, New, Dictionary feature allows you to create a blank dictionary in which you can insert or paste dictionary entries. When you select File, New, Dictionary, the submenu lists the following dictionaries you can create: Personal, Case, Job, EZ Speakers and Power Define. If one or more of the dictionaries are grayed out, it means that a dictionary of that type already exists and only one dictionary of that type can exist in a user name or if Case is grayed out, it is because you are not currently in a Case. For example, if there is a dictionary in the current user's name System Files case named Personal Dictionary, the Personal choice will be grayed out. Although the EZ Speakers choice may be grayed out, you can have more than one [EZ Speakers dictionary](#) in a user name. If you select Job, the Create New Document dialog box displays with the Files of type field set to Dictionary files (\*.sgdct).

To create a new dictionary file:

1. Press **Alt + f, n, d (File, New, Dictionary)**.
2. Do one of the following:
  - a) [Personal](#) - this option is only available if there is no Personal Dictionary in the current user's System Files case. If the option is available, CATalyst opens a dictionary named Personal Dictionary and when changes are saved, it is automatically stored in the System Files case. Go to Step 4.

- b) [Case](#) - this option is available if the cursor is currently in a Case. If available, the Create New Document dialog box displays with the current name of the case followed by an underscore Case in the File name field. For example, Main\_Case if your cursor is located in the Main case. Go to Step 3.
  - c) [Job](#) - this option is always available. When selected, the Create New Document dialog box displays. Go to Step 3.
  - d) [EZ Speakers](#) - this option is available if there is no EZ Speakers dictionary located in the current user's System Files case. Although you can not create more than one EZ Speakers dictionary from the File New Dictionary feature, you can have more than one EZ Speakers dictionary in the System Files case as long as they start with EZ Speakers but have a unique name. If the option is available, CATalyst opens a dictionary named EZ Speakers and when changes are saved, it is automatically stored in the System Files case. Go to Step 4.
  - e) [Power Define](#) - this option is available if there is no Power Define dictionary located in the current user's System Files case. If the option is available, CATalyst opens a dictionary named Power Define and when changes are saved, it is automatically stored in the System Files case. Go to Step 4.
3. In the Create New Document dialog box, type the name of the case or job dictionary and press **Enter** (Open) to create the dictionary. A blank dictionary displays. You can [insert or paste entries](#).
  4. When finished, save and close the dictionary.

## Case CATalyst Dictionary Types

There are several different CATalyst BCS dictionary types. They include:

- [Case](#)
- [EZ Speakers](#)
- [Job](#)
- [Personal](#)
- [Power Define](#)
- [Realtime Commands](#)
- [Update Area](#)

## Case Dictionary

A Case Dictionary contains entries that are specific to related jobs located within a case. These entries can be speaker names or technical terms that apply to the jobs which you do not want to place in your Personal Dictionary or individual job dictionaries. Using a case dictionary can eliminate remembering to select multiple job dictionaries for translation. Case dictionaries are used for translation in addition to using your Personal and other dictionaries.

A case dictionary uses the same name as its associated case (*casename\_case.SGDCT*). There is only one case dictionary per case. If a case does not have an associated case dictionary, Case CATalyst creates a case dictionary the first time you make a K-define, case dictionary definition. Entries in a case dictionary automatically apply to all files translated within the case of the same name. You can add entries to a case dictionary in Manage Dictionary, Manage Notes, during realtime, and in Edit.

You can create a Case dictionary in Manage Notes, Manage Dictionary and Manage Jobs. When you create a case dictionary prior to translation in the Manage Notes or Manage Dictionary function, Case CATalyst automatically uses it when you translate a job in the same case. This eliminates the need to select the case dictionary for translation. For example, you create a case named JKorne. You read in a steno note file, name it 032102 JKorne, and place it in the case called JKorne. You open 032102 JKorne in the Manage Notes function and K-define the speaker names. Case CATalyst creates a case dictionary subfile with the case name JKorne. When you translate 032102 JKorne, Case CATalyst automatically uses the case dictionary. You read another steno note file, and name it 032202 DBalser. Because it is part of the same case as 032102 JKorne, you place the job file in the case JKorne. When you translate 032202 DBalser, Case CATalyst automatically uses the case dictionary and any 032102 JKorne case defines apply.

When creating a case dictionary for an existing case in Manage Jobs, you must be in the case for which you want to create the case dictionary.

## Create a Case Dictionary

1. Do **one** of the following:
  - Open an existing case for which you want to create a case dictionary. Double click the case.
  - Open a new case for which you want to create a case dictionary. Press **Alt + f, n, c** (**File/New/Case**). Case CATalyst creates a new case with the default name New Case highlighted. For example, if the case name is "Anderson", the case dictionary name is "Anderson". In the highlighted area, type a name for the case and press **Enter**. Double click the case.
2. Press **Alt + f, n, d, c** (**File/New/Dictionary/Case**). The Create New Document dialog box displays.
3. In the File name field, type a name for the dictionary and press **Enter (Open)**. The Manage Dictionary function opens with an empty dictionary.
4. Insert new entries using the following dictionary features: [Insert/Modify](#), Cut/Copy/Paste and [Include](#). Refer to the [guidelines](#) for inserting dictionary entries if necessary.
5. When you are finished, press **Ctrl + s**, (**File/Save**).

## Realtime Commands Dictionary

Case CATalyst software includes the Realtime Commands Dictionary which contains predefined realtime and translation commands. The predefined commands consist of common number conversion, conflict resolution, mode control, translation commands and define strokes. You may want to use it when writing realtime.

You can add to, modify, and delete entries in the Realtime Commands Dictionary or copy the entries to the Personal, case, or job dictionary. If you choose to use the Realtime Commands Dictionary, Stenograph recommends that you review the entries and modify the steno outlines to reflect your writing style and theory. If you do not want to use the Realtime Commands Dictionary, you can delete it from the System Files case in your User.

Case CATalyst automatically copies the Realtime Commands Dictionary when creating a new user if you selected the Copy Default Files option in the Create New User dialog box.

For detailed information on the entries of the Realtime Commands Dictionary, go to the Help menu, select Self-Study Guides and select either the Basic Realtime Self-Study Guide and/or Number Conversion Self-Study Guide.

## EZ Speakers Dictionary

The EZ Speakers dictionary contains predefined speaker identification formatting entries with steno that can be used to quickly and easily create speaker identification definitions for a job using the Create EZ Speakers feature. EZ Speakers dictionary entries use placeholders for speaker names and depending on the type of entry, for steno. The placeholder text can be a token designated with the # sign followed by a number, such as #01 or it can be an EZ Speaker field, such as [!EZ SPEAKER 01]. Once you have set up your EZ Speaker dictionary, using the [Create EZ Speakers](#) feature allows you to quickly identify the speaker names (without inserting format symbols or punctuation) and steno (if necessary) for each placeholder. Case CATalyst then generates the speaker definitions in either the job or case dictionary. When using EZ Speaker fields, CATalyst will look for existing field values in the job history. If the job history does not have EZ Speaker field values, CATalyst will look in the case history and automatically fill in the EZ Speaker fields. See below for more information when creating EZ Speakers in a case. The actual EZ Speakers dictionary is a template and is not used during translation.

When starting a job in a case and using the Create EZ Speakers feature, the default is all entries will go to the Case dictionary. That means that every job you create in this case will use the same EZ Speaker definitions. This is very beneficial if all the jobs in the case are related such as an on-going trial or a series of related depositions. The EZ Speaker definitions are stored in the Case History file and will be used automatically if no EZ Speaker definitions are found in the Job History file. If you create generic cases based on a date/year or type of jobs (Arbitrations) and you do not want the speaker definitions the same in every future job, select Job dictionary and consider selecting the *Always default to Job dictionary* option. The EZ Speaker definitions are stored in the Job History file and will be used for translation.

There are two types of EZ Speakers dictionary entries referred to as Standard ID and Super ID:

Use a **Standard ID** when you write the same steno outline for a speaker identification on every job and then define the steno/fill in the field with the appropriate speaker's name for each job. For example, on every job, you write STPHAO for the first attorney who speaks and SKWRAO for the second attorney that speaks. You might use one of the following Standard ID entry:

STPHAO<Colloquy>#01:space

STPHAO<Colloquy>[!EZ SPEAKER 01]:space

Use a **Super ID** when you write different steno outlines to identify each speaker on every job. For example, you have Mr. Redford and Ms. Wilson in the job. You write RED/RED to identify Mr. Redford and WEUL/WEUL to identify Ms. Wilson. A Super ID entry has a placeholder for the steno and a placeholder for the speaker name. Usually there are at least two entries for each speaker identification, one for Colloquy and one for a "question by" situation. When you create an EZ Speakers entry, you include all format symbols, punctuations, and font characteristics. This allows you to type only the name when using the Create EZ Speakers feature. For example, your Super ID entry might be one of the following:

!<Colloquy>#00:space

!<Colloquy>[!EZ SPEAKER 00]:space

A total of 300 individual speaker identifications can be created using the Create EZ Speakers dictionary. One hundred unique speakers can be created using the Standard IDs (01 - 99) and two hundred unique speakers using the Super ID (100 - 299). A total of 310 unique speakers can display in the Speaker List pane when using the ten Common Speakers feature (300 - 309).

Case CATalyst comes with two EZ Speakers dictionaries. The default EZ Speakers dictionary contains EZ Speaker definitions using # (token) entries. The other EZ Speakers dictionary, EZ Speakers with Fields, contains speaker field entries. You can use [# \(token\) entries](#), <Colloquy>#01 or [EZ Speaker fields](#), <Colloquy>[!EZ SPEAKER 01], to create Standard or Super ID definitions. When EZ Speakers dictionary definitions contain # token numbers and you use the Create EZ Speaker feature, Case CATalyst generates the speaker definition in the job or case dictionary. For example, STPHAO <Colloquy>MR. JONES:

When EZ Speaker dictionary definitions contain EZ Speaker fields and you use the Create EZ Speaker feature, Case CATalyst generates the speaker definition in the job or case dictionary and inserts the field value, actual speaker name, into the job during translation. For example, the dictionary entry STPHAO <Colloquy>[!EZ SPEAKER 01]: is placed in the job or case dictionary. The name MR JONES displays in Colloquy format in the job. You can add [Timer](#) commands to EZ Speaker definitions that use fields, allowing you to apply the speaker name and Timer with the same steno stroke. The speaker names are stored with other field information for the job.

When you use the Create EZ Speaker feature to identify actual speaker names, Case CATalyst automatically places the speaker name in the [Speaker List](#). If you use EZ Speaker fields, the assigned speaker name color from the Speaker List applies during translation. If you use # (token) entries, speaker colors do not apply during translation. If you have # (token) entries in your EZ Speaker dictionary but want to have speaker names translate in an assigned color, modify your EZ Speaker with Fields dictionary definitions to use your formatting style. If [Brief It](#) is active for realtime, Brief It automatically creates a brief for the speaker name and displays it in the Brief It dialog pane.

You can create multiple EZ Speakers dictionaries for different types of jobs that require different formatting. EZ Speakers dictionaries must reside in the System Files case and begin with the name "EZ Speakers" in order for the EZ Speakers dictionary selection to function correctly. You can select an EZ Speaker dictionary for translation in Translate Options. When you use the Saved Translation Options in the Translate dialog box, Case CATalyst remembers the selection along with other saved translation settings.

## Change Speaker Colors

When using [EZ Speaker](#) fields, you can assign different colors to the speaker fields. Some reporters like the speaker names to be in different colors for easier recognition. There are two different ways you can assign speaker colors.

In the Translate dialog box, you can click the **Speaker List** (Alt + k) to display the list of speakers. To assign a different color, click the speaker and press **Alt + g** (Change Color) and select the color. Repeat as necessary

While you are in a transcript, you can display the Speaker List pane (Alt + v, e, k). Click the speaker and then click the color palette icon () and select the color.

## Job Dictionary

A Job Dictionary contains entries that are specific to a job. These entries might include speaker names or technical terms that you do not want to place in your Personal or Case dictionary. Each job has only one associated job dictionary, using the same name as the job. The steno and text definition of a [J-Define](#) made during realtime or in Manage Notes goes into the associated job dictionary unless you select to define to a different job dictionary.

If a job does not have an associated job dictionary, Case CATalyst creates a job dictionary. Case CATalyst also creates a job dictionary when you Read a steno note file that has an associated Job Dictionary created on a writing machine that allows you to make J-Defines such as the Luminex, Diamante, élan Mira or Stentura Fusion.

When an associated job dictionary is created prior to translation, in the Manage Notes or Manage Dictionary function, it is automatically used when you translate the job. For example, you read in a steno note file and name it 041902JK. You opened 041902JK in the Manage Notes function and J-defined the speaker names. Case CATalyst creates a job dictionary subfile with the job name 041902JK. When you translate 041902JK, the job dictionary is automatically used.

All entries in a job dictionary automatically apply to any future file translated with the same name. Once a Job dictionary is created, you can reopen it to make additional entries. You can also add entries while defining in Manage Notes, during realtime, and in Edit.

Use a Job dictionary in addition to using any other dictionary for translation. You can select multiple job dictionaries for use during translation. By default, the associated job dictionary has the highest priority during translation. When creating J-Defines in Edit, you can send the definitions to a different job dictionary by using the [Other](#) dictionary define or the [Change Job Dictionary](#) feature.

### Create a Job Dictionary

1. In Manage Jobs, select **Alt + f, n, d, j** (**File/New/Dictionary/Job**). The Create New Document dialog box displays.
2. Type a name in the File name field and press **Enter** (**Open**). The Manage Dictionary function opens with an empty dictionary.
3. Insert new entries using the following dictionary features: [Insert/Modify](#), Cut/Copy/Paste and [Include](#). Refer to the [guidelines](#) for inserting dictionary entries if necessary.
4. When you are finished, press **Ctrl + s**, (**File/Save**).

### Personal Dictionary

The Personal Dictionary contains steno and text definitions specific to your writing style/theory. Case CATalyst automatically uses the Personal Dictionary for translation, including realtime. If a [Personal Dictionary](#) does not already exist in the current user, you can [Import](#) it or create a new one. When you save the dictionary or close the Dictionary function, Case CATalyst automatically places the Personal Dictionary in the System Files case. Once created, you can reopen the Personal Dictionary to make additional entries. You can also add entries to your Personal Dictionary while defining in Manage Notes, during realtime, and in Edit.

The Personal Dictionary is located in the System Files case in each user folder. You can only have one Personal Dictionary (named Personal Dictionary) in each user folder. Once a Personal Dictionary exists, the option to create a new dictionary is no longer available.

The Personal Dictionary is one of the most important files in your Case CATalyst system and you should [backup](#) your dictionary on a regular basis.

To convert your Case CATalyst 3.x or RTF/CRE formatted dictionary, use the [Import](#) function. If you created your dictionary on the Case CATalyst Student version, you can backup your dictionary and restore it on your Case CATalyst full system.

### Create a Personal Dictionary

1. In Manage Jobs, select **Alt + f, n, d, p** (**File/New/Dictionary/Personal**). The Manage Dictionary function opens with an empty dictionary.
2. Insert new entries using the following features: [Insert/Modify](#), Cut/Copy/Paste, [Include](#) dictionary and [Dictionary Builder](#) features. Refer to the [guidelines](#) for inserting dictionary entries if necessary.

3. When you are finished, press **Ctrl + s**, (**File/Save**).
4. Press **Ctrl + F4** (**File/Close**) to close the dictionary. Be sure to always maintain two backup copies of your Personal Dictionary.

## Power Define Dictionary

The Power Define dictionary contains special definitions for use with the [Define](#) and [Scan Define](#) features, allowing you to make any global definition or text replacement from your writing machine during realtime. Stroking the steno outline defined as Define or Scan Define invokes the Power Define dialog box. When the Power Define dialog box is opened, CATalyst automatically loads the Power Define dictionary in the translating dictionary list at the [highest priority](#). Once you close the Power Define dialog box, the Power Define dictionary is removed from the translating dictionary list.

Command definitions contained in the Power Define dictionary provide the ability to move from field to field, select dictionaries, insert format symbols and set options in the Power Define dialog box all from your writing machine. For example, to move from the *Steno* field to *Text* field in the Power Define dialog box, you stroke the steno outline defined as [TAB] in the Power Define dictionary.

When you stroke a steno outline with the cursor positioned in the *Text* field, Case CATalyst searches the Power Define dictionary for a matching definition. If no definition is found, it searches for a definition in other dictionaries according to dictionary priority. When Case CATalyst finds a definition, the text of the definition displays in the *New Text* field. In the *Text* field, you can write a steno outline defined as a word or phrase, fingerspell the text definition or use both methods. For example, let's say that you want to define a misstroked question bank. The steno in the *Steno* field displays the misstroked steno outline, in the *Text* field, you simply write your dictionary definition for a Question back and CATalyst inserts <Question>.

The Power Define Dictionary is located in the System Files case. Stenograph recommends you review the entries in the Power Define dictionary and modify entries to match your writing style. You can add, modify, and delete entries in the Power Define dictionary the same as any other dictionary. You can also [Create EZ Speakers](#) from your writing machine and use the Power Define Dictionary commands to navigate the dialog box.

## Power Define Dictionary Definition Parameters

- Alphabetic entries in the Power Define dictionary automatically translate with no spaces between the letters when you fingerspell a word in the *Text* field of the Power Define dialog box. All letters in the *Text* portion of the Power Define entry must be surrounded by brackets, [ ] to translate without spaces. For example [a] or [N].
- The [DELETE] entry in the Power Define dictionary will delete the previous steno outline in the *Steno* field and will delete the previous character/space in the *Text* field of the Power Define dialog box. If you have a {DELETE} entry in a dictionary other than the Power Define dictionary (such as your Personal Dictionary), CATalyst will delete the previous steno outline in the transcript.
- Adding the [PASTE] command to your Power Define dictionary allows you use the copy, cut and paste features to enter steno and text. When you use the [Paste] command in the *Steno* field, the underlying steno for the text you are copying or cutting is pasted if the *Include Steno Copying/Cutting* option is On. This is the default. If this option is not set to include underlying steno, then no steno displays in this field when you paste the copy or cut text. You can change the default in [Advanced Edit Options](#).
- When you perform a command or make a typed entry from the keyboard in the Power Define dialog box, Case CATalyst resets translation, removing the automatically inserted space before the next item translated.

## Power Define Dictionary Default Commands

Power Define	Steno Equivalent	Explanation
[ABORT]	/PWO-RT	Cancels the Power Define dialog box and returns to the realtime screen. No steno or text inserts into the job.
[ACCEPTCONTINUE]	/TPH-RT	Apply the definition and keep Power Define dialog box open to continue defining.
[CAT SCRATCH]	K*S	Send the definition to the Steno-Text section of Cat Scratch dialog pane.
[CLEAR]	/KHRAOER	Clears the contents of the Steno field and/or New Text field while making a Power Define / Scan Define during translation. For example, if your cursor is in the New Text field of the Power Define dialog, meaning it is the active field, and you'd like to remove all of the text in the New Text field, simply write the stroke you defined as [CLEAR].
[DELETE]	*	When the cursor is in the Steno field, it deletes the previous steno outline.  When the cursor is in the Text field, it deletes the previous character/space.
[DOWN ARROW]	TKO-UPB	Moves the cursor down one name at a time in the dictionary and format symbol list. When using this command in the dictionary list, the dictionary number associated with the dictionary dynamically adjusts in the dictionary field. Functions the same as ↓ on the computer keyboard.
[ENTER]	TPH-T	Same as pressing Enter or OK in a dialog box from the computer keyboard.
[F4]	TPO-RPLT	Displays the <i>enter a format symbol message</i> . You must stroke the steno outline for the format symbol shortcut key.
[F4 LIST]	TPO-UR/HR-EUS	Displays the Format Symbol list. Use the Up/Down Arrows to move to the format symbol. Write the steno outline defined as [ENTER] to insert the format symbol into the <i>New Text</i> field.
[PASTE]	PAEUS/PAEUS	Pastes the last copied text or steno into the Steno or Text field.
[SHIFT + TAB]	STK-EF	Moves the cursor back to the previous field.
[SPACE]	SPA-EUS	Creates a space when you are defining more than one word.
[TAB]	TK-EF	Moves the cursor forward to the next field.

[TOGGLE CAP]	K-P	Cycles the capitalization of text in the Text field. The cycles are initial capped text, all capped text and lower case text. Uses the same cycle capping guidelines as Edit's Cap command.
[UP ARROW]	–UP	Moves the cursor down one name at a time in the dictionary and format symbol list. When using this command in the dictionary list, the dictionary number associated with the dictionary dynamically adjusts in the dictionary field. Functions the same as <b>↑</b> on the computer keyboard.
[SUSPEND]	SP*PB	Leaves the Power Define dialog box open and moves the cursor to the transcript session to allow you to continue writing. When you have time to return to the Power Define dialog box and continue with the Power Define, write the stroke to invoke the Power Define command. This command works in the Power Define, Scan Define, Create EZ Speakers Entries dialog boxes and the {Text E-Define} realtime command.

## Update Area

Case CATalyst, by default, places all new D-Defines into the Personal Dictionary. The Update Area is an optional holding area to store new [D-Defines](#) for review before moving the entries into the Personal Dictionary. In addition to other dictionaries selected for translation, you can use the Update Area to translate. To use the Update Area, select the [Dictionary Option](#), *D-Defines go to Update Area*. The Update Area is stored in the System Files case.

## Guidelines for Creating Dictionary Entries

Use the following guidelines when inserting and modifying steno or text entries in the dictionary.

### Inserting and Modifying Steno

If you are inserting or modifying the steno portion of an entry, Case CATalyst uses the [Steno Shortcut table](#) to help you type steno from the computer keyboard. For example, using the computer keyboard, you type "jan" in the Steno field of a dialog box. Case CATalyst automatically converts the typed text into steno SKWRAPB unless you modified the Steno Shortcut table.

Use the following guidelines when inserting or modifying steno in the dictionary:

- Use either upper- or lowercase letters. The steno always displays in the Steno field as uppercase.
- Separate multiple steno strokes by typing a / (slash) or pressing Spacebar. For example, TKEUS/KET (diskette). Or select Yes to the [Dictionary Option](#), *Break Steno Outlines Based on Key Order* to have CATalyst automatically insert a / (slash) between steno outlines.
- Use a – (hyphen) before the first letter to indicate a final or a right-hand stroke. For example, -RB (shall).
- Use punctuation keys to create the equivalent in a steno outline. For example, when you type "." (period), it displays as –FPLT, unless you modified your Steno Shortcut table.

### Inserting and Modifying Text

Use the following guidelines when inserting or modifying text in the dictionary:

- Type the text exactly how you want it to translate.
- Translation automatically creates a space before every word/definition in the Edit file. Do not add spaces to the beginning or end of words.
- When defining punctuation in which you need two spaces following it in the translation, add only one space to the definition. For example, to define a period that translates with two spaces following it, define it as **.Spacebar**  
For more information, see [Creating Punctuation Definitions](#).
- When creating a conflict, a ^ (caret) must precede each conflict choice and a space must follow each caret. For example, to enter a conflict for the steno outline **THR** type:

**^ Spacebar there Spacebar ^ Spacebar their Spacebar ^ Spacebar they're**

Make sure there is not a space after the last word. When you create a dictionary entry for a conflict, Case CATalyst adds a Conflict End format symbol immediately after the last word of the conflict.

- Insert the Conflict End format symbol at the end of a conflict to add text following a conflict which is not part of the conflict. For example:  
`<By-line>^ Atty1 ^ Atty2<Conflict End>:<Question>`
- You can use format symbols in the Text field either by pressing **F4** and the shortcut key or click the FS (FS) icon and select from the Format Symbol list. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol you want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry.
- Auto Include entries must begin with @  
You may also want to use the [Insert Auto Includes...](#) feature from the Dictionary Edit menu.
- AccelerWriter (dictionary definitions that invoke a macro from the steno machine) must begin with &&  
You may also want to the [Insert AccelerWriters...](#) feature from the Dictionary Edit menu.
- Number Conversion, Number Trigger, Start Timer, and Stitch On translate commands are followed by text in square brackets. For example but not limited to:

`{Number Conversion}[NNN-NN-NNNN]`

`{Start Timer}[1]`

`{Stitch On}[-]`

## Add Delete Stroke Entries to a Dictionary

Case CATalyst does not have a preset delete stroke dictionary entry. For example, many court reporters write an asterisk to delete the previous stroke. You can create dictionary entries for your delete stroke. Stenograph recommends adding your delete stroke entries to the [Personal Dictionary](#). If you import a Case CATalyst 3.x dictionary that contains a delete stroke entry; that delete stroke entry is already in your Case CATalyst 4.x or higher dictionary.

Steno outlines deleted by the delete stroke remain in the steno note file but are not used in translation.

## Define Your Delete Stroke

1. At the Manage Jobs screen, highlight the dictionary to which you want to add the delete stroke and press **Enter**.

To add the delete stroke entry to your Personal Dictionary, double click the **System Files** case and then double click **Personal Dictionary**.

2. Once the dictionary opens, press **Ctrl + i (Edit/Insert)** to display the Insert dialog box.
3. Make the following entries:

#### **Steno**

Type the steno for the delete stroke. For example, typing \* (asterisk) results in a /\* entry.

#### **Text**

Press **Alt + f** to display the list of [format symbols](#). From the Format Symbols list select **{Delete}**. If you have a separate multiple delete stroke, define that steno outline as {Delete}.

4. Click **OK**. Define any additional {Delete} strokes as necessary. For example, the number bar/asterisk combination.
5. When finished inserting entries, press **Esc (Cancel)** to exit the Insert dialog box.
6. Press **Ctrl + s (File/Save)** to save the new entries.
7. Press **Ctrl + F4 (File/Exit)** to exit the Manage Dictionary function.

## Dictionary Columns

When you open a dictionary, information displays for each dictionary entry. The column headings identify the type of information. They include:

#### **Steno**

The steno portion of the dictionary entry.

#### **Text**

The text portion of the dictionary entry.

#### **Modified Date**

The date the dictionary entry was last modified.

#### **Usage Count**

The quantity of times the dictionary entry was used for translation in Case CATalyst.

#### **Used Date**

The date the dictionary entry was last used during translation.

#### **Status Bar**

Located at the bottom of the Manage Dictionary screen, it provides information about the current display of entries. From left to right, this includes:

- Whether the display is Full View, showing all the dictionary entries or Filtered View, showing only those entries that meet the filtering criteria.
- The total number of entries currently displayed.
- The numeric location of the highlighted entry.

- If the Num Lock on your keyboard is On or Off. If NUM displays, Num Lock is turned On.

The default size of the columns depends on the size of the entries. The date columns are given first priority so that it expands to fit the complete date. The steno and text columns display based on remaining space. The size of the columns also depends on your Windows settings.

You can [modify](#) columns including column width, sorting order, and font size. When you resize the columns, Case CATalyst retains the values until you close the dictionary. Once you close the dictionary, the column sizing returns to the default settings.

## Modify Dictionary Columns

You can modify columns including column width, sorting order, and font size. When you resize the columns, Case CATalyst retains the values until you close the dictionary. Once you close the dictionary, the column sizing returns to the default settings.

### Change the column display order

From the Tools menu, select **Dictionary Options**. The Dictionary Options dialog box displays. The Column Order Display section is towards the bottom of the dialog box.

Customize the order in which you want the columns to display on the Manage Dictionary screen. Click in the Column Display Order: option and then click the Browse () button to display the Confirm Column Order dialog box. In the Choose column order section, highlight a column name and then use the arrow icons ( ) to position the order of the columns. When finished, click **OK** to save the changes.

To customize which columns display, double click the column name to toggle between Visible and Not Visible. The Text and Steno columns are inactive as those two columns will always display in a dictionary.

### Change the sorting column and sorting order

Click the column heading by which you want to sort dictionary information. The column used for sorting is identified by a triangle to the right of the column heading. Click the column heading until the triangle points up for ascending order or down for descending order.

For example, if you want dictionary entries sorted by Modified Date in descending order, click the Modified Date column heading. Click again, if necessary, to have the triangle point down.

Text	Steno	Modified Date	Usage Count	Used Date
elbow	E L PW O E	10-13-04	0	
elevate	E L S RA EU T	10-19-04	0	
elm	E L P L	10-19-04	0	
Elmer	E L P H E R	10-14-04	0	
elects	HR E B QTS	10-20-04	0	

### Change the column width

Place the cursor on the line dividing the column headings and hold the left mouse button down. The cursor becomes a double headed arrow. Move the line left or right to the desired position. Release the button.

When you exit the Manage Dictionary function, the column widths return to the default settings.

## Change the font in the columns

Press **Alt + v, f (View/Font)** to display the Font menu and select an area to change. When the [Font](#) dialog box displays, make changes as necessary and press **Enter (OK)**. You can modify the following areas as indicated:

### Column Headers

Affects the font for all the column headings.

### Steno

Affects the font in the Steno column for all dictionary entries.

### Text

Affects the font in the Text column for all dictionary entries.

### Other

Affects the font in the Modified Date, Used Date, and Usage columns., Used Date, and Usage columns.

## Manage Dictionary File menu

Manage Dictionary File menu give you access to saving a dictionary, opening a dictionary, creating a new dictionary, exporting your dictionary and [printing your dictionary](#). You dictionary can be [exported to a Stenograph writer](#) such as Luminex™, Diamante®, Mira®, Stentura® Fusion, etc. and exported to a RTF/CRE format. You can also combine other dictionaries using the [Include](#) feature.

## Export to Stenograph Writer

While you have a dictionary open in Manage Dictionary, you can select to export that dictionary to your Luminex or Diamante via a USB cable. If you select Export to Stenograph Writer from Manage Dictionary's File menu, the Export to Stenograph Writer dialog box displays, your current dictionary is selected and you can select more dictionaries to export if you want. For more information, see [Export Dictionary to Luminex or Diamante via USB](#) and/or [Export Dictionary to Luminex or Diamante via WiFi](#).

## Export to RTF/CRE...

RTF is an acronym for Rich Text Format. CRE is an acronym for Court Reporter Extension. RTF/CRE is universal file formats that retain much of the original file formatting and text attributes. RTF/CRE files allow you to exchange jobs between different CAT systems and possibly writing machines. You can exchange steno notes, job dictionaries, and text files by using the [Export to RTF/CRE feature](#). When exporting to RTF/CRE from within Manage Dictionary, only the dictionary is exported and unless you change the name or save location the RTF version of the dictionary will default to being a subfile (.rtf) of the original dictionary name.

An exported RTF/CRE file has an .RTF file extension regardless of the original file type. To provide better file recognition and avoid confusion, when exporting a dictionary from within Manage Jobs, CATalyst defaults the name of the RTF/CRE dictionary to be the *dictionaryname\_D.rtf*.

### To export a dictionary to RTF/CRE file type from Manage Dictionary:

1. Open the dictionary you want to export.
2. To select Export to RTF/CRE, press **Alt + f, e** (File, Export to RTF/CRE).
3. In the Save as dialog box, do any of the following:

- a. Navigate to the location in which you want to save the dictionary in RTF/CRE file format.
- b. To change the name of the RTF/CRE file, type the new name. By default, when exporting a dictionary to RTF/CRE, CATalyst keeps the same name of the dictionary.
- c. To export the dictionary and save it to the selected destination, click **Save**.

## Include dictionary

Case CATalyst allows you to take all the entries from one dictionary and copy them into another dictionary. You can include dictionaries from Manage Dictionary or Manage Jobs. Manage Dictionary lets you open and view dictionary entries before including them. Using the Include feature you bring in the entire contents of a different dictionary into the displayed dictionary. You cannot Undo an included dictionary unless you exit the file without saving. Any other changes made in the file that were not previously saved are lost if you select to include a dictionary and then exit without saving. Stenograph recommends that you save dictionary changes before using the Include feature.

Manage Jobs allows you to quickly move all the entries from one dictionary into another by dragging and dropping the source dictionary file into the destination file. You may want to use this feature when combining job dictionaries or moving entries from your Update Area, if selected to use, into your Personal Dictionary. If you select to combine dictionaries by dragging and dropping, you cannot undo the move.

Certain [Dictionary Options](#) affect dictionaries included from both Manage Dictionary and Manage Jobs:

- The option, *What to do with source dictionary after Include*, determines how Case CATalyst handles the dictionary selected to be included (source) into another dictionary. The options are: Delete the source dictionary, retain the source dictionary or prompt for an action after the dictionary has been included. Depending on what dictionaries you are including, you may want to be prompted as to what action should be taken after each include.
- The option, *How to treat entries with duplicate steno when Including*, determines how Case CATalyst handles any steno outlines in the source dictionary that may conflict with the entries in the destination dictionary.

## Include Dictionary in Manage Dictionary

In Manage Dictionary, use the Include (**F9**) feature to bring in the entire contents of another dictionary into the currently open dictionary. You might use the Include feature to add your Update Area entries to your Personal Dictionary or to combine two job dictionaries. Once you have selected to include a dictionary, you cannot Undo an included dictionary, except to exit the file without saving. Stenograph recommends you save changes to the destination dictionary before using the Include command.

There are two [Dictionary Options](#) settings that affect including a dictionary into another dictionary. The first option is a setting as to how to treat entries with duplicate steno. In other words, the same steno outline exists in both the source and destination dictionary but with a different text definition. The second option determines what happens after the source dictionary is included into the destination dictionary. You may want to review these settings before including a dictionary.

## Include a Dictionary from Manage Dictionary

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary you want to open. Depending on your selection, the Open Existing Document dialog box displays.
2. If appropriate, the Open Existing Document dialog box displays. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.

3. Press **F9 (File/Include)**. The Include Dictionary dialog box displays.
4. Select a dictionary to include. The file highlighted for selection displays in the File name field. To select a dictionary from another user, first select the user from the Look in field of the Include Dictionary dialog box and then select the dictionary.
5. Press **Enter (OK)**. A warning message displays if the option, "Warn before voiding undo ability when using Include", is selected in Dictionary Options. Press **Alt + y (Yes)** to continue with the Include.
6. The entries are inserted into the dictionary. Depending on your Dictionary Options selections, you may be prompted that duplicated entries exist and your action is required.
  - Keep Old Text (**Alt + o**) - the definition in the destination dictionary will be retained.
  - Keep New Text (**Alt + n**) - the definition in the source dictionary will overwrite the destination dictionary definition.
  - Create Conflict (**Alt + c**) - a conflict will be created between the source and destination dictionary definitions.
  - Keep Neither (**Alt + e**) - neither definition will be retained and the destination dictionary entry will be deleted.
  - *Apply this choice to the rest of the duplicate entries for this include* - allows to select an above action and have all remaining duplicate entries be handled by the selected action. For example, let's say that you select Create Conflict as a duplicate entry action and then select the *Apply this choice to the rest of the duplicate entries for this include* option, all duplicate entries will be included as conflicts with the destination entries and you will no longer be prompted during this include.

Depending on your Dictionary Options, you may also be prompted to delete the source dictionary.

**Yes** - deletes the source dictionary.

**No** - retains the source dictionary with all entries retained.

7. Press **Ctrl + s (File/Save)** to save the dictionary when finished.
8. Press **Ctrl + F4 (File/Close)** to close the dictionary. If another dictionary is open, that dictionary displays. If no other dictionary is open, the Manage Dictionary function closes.

## Include Dictionary in Manage Jobs

In Manage Jobs, drag and drop one dictionary on top of another dictionary to bring the entire contents of the first file into the second file. For example, you might drag your Update Area onto your Personal Dictionary or drag one job dictionary onto another job dictionary to combine them. Entries merged into the dictionary for a current job are immediately recognized for translation once the dictionary is saved. Once you combine the dictionaries in this manner, you cannot undo the change.

There are two [Dictionary Options](#) settings that affect including a dictionary into another dictionary. The first option is a setting as to how to treat entries with duplicate steno. In other words, the same steno outline exists in both the source and destination dictionary but with a different text definition. The second option determines what happens after the source dictionary is included into the destination dictionary. You may want to review these settings before including a dictionary.

1. In Manage Jobs, click and hold the left mouse button on the dictionary name (source) you want to include into another dictionary (destination).
2. Move the source dictionary over the destination dictionary, highlighting the destination dictionary.
3. Release the mouse button. A confirmation message displays prompting you that you want to include the source dictionary with the destination dictionary. Select **one** of the following:

**Yes**

Include the entries from the source dictionary into the destination dictionary. You cannot undo the include.

**No**

Cancel the include.

4. The entries are inserted into the dictionary. Depending on your Dictionary Options selections, you may be prompted that duplicated entries exist and your action is required.
  - Keep Old Text (**Alt + o**) - the definition in the destination dictionary will be retained.
  - Keep New Text (**Alt + n**) - the definition in the source dictionary will overwrite the destination dictionary definition.
  - Create Conflict (**Alt + c**) - a conflict will be created between the source and destination dictionary definitions.
  - Keep Neither (**Alt + e**) - neither definition will be retained and the destination dictionary entry will be deleted.
  - *Apply this choice to the rest of the duplicate entries for this include* - allows to select an above action and have all remaining duplicate entries be handled by the selected action. For example, let's say that you select Create Conflict as a duplicate entry action and then select the *Apply this choice to the rest of the duplicate entries for this include* option, all duplicate entries will be included as conflicts with the destination entries and you will no longer be prompted during this include.

Depending on your Dictionary Options, you may also be prompted to delete the source dictionary.

**Yes** - deletes the source dictionary.

**No** - retains the source dictionary with all entries retained.

## Print dictionary

You can print the entries in your dictionary. The current sorting order displayed on the Manage Dictionary screen determines the print output. Set the [sorting order](#) before printing.

To print the dictionary entries in crowded line format and save the number of pages needed to print the dictionary, select the [Dictionary Option](#) to Print Steno in Crowded Format.

## Print Dictionary Entries

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the dictionary type. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Do one of the following:

### Print Selected Entries

Mark the entries you want to print and press **Ctrl + p**. In the Print dialog box, choose **Selection** for the Print range.

### Print All Entries

Press **Ctrl + p** (**File/Print**). The [Print](#) dialog box displays.

4. Confirm the printer settings and press **Enter** (**OK**).

## Manage Dictionary Edit menu

Once you have a dictionary open, the Manage Dictionary Edit menu allows you [insert new entries](#), [modify existing entries](#) and [delete entries](#). You can create [Auto Include](#) and [AccelerWriter entries](#) using a simple dialog box. You can cut, copy and paste entries, [copy and move entries](#) to a specific dictionary, [search for entries](#) and [search and replace text](#) in dictionary entries.

## Insert & Modify Dictionary Entries

The Manage Dictionary Insert and Modify features allow you to create or modify dictionary entries. To create AccelerWriter definitions use the Manage Dictionary [Insert AccelerWriter](#) feature. To create Auto Include definitions, use the Manage Dictionary [Insert Auto Includes](#) feature.

1. From anywhere in Case CATalyst, press **Alt + f, o, d** (**File/Open/Dictionary**).
2. From the dictionary menu, select the type of dictionary. When you choose Case or Job, the Open Existing Document dialog box displays. Select the dictionary and press **Enter**.
3. Do **either** of the following:

### Insert an Entry

Press **Ctrl + i** (**Edit/Insert**) to create a new dictionary definition. The Insert Dictionary Entry dialog box displays with empty Steno and Text fields.

### Modify an Entry

Use Search (**Ctrl + f**) or cursor movements to find the entry you want to modify and then press **Ctrl + m** (**Edit/Modify**). The Modify Dictionary Entry Dialog box displays with the current Steno and Text for the definition.

4. Make entries as necessary:

### Steno

Type new or modify existing steno outlines. You can type either a forward slash (/) or press the Spacebar to separate steno outlines. For example, to insert a two stroke steno outline, such as "end end", you could type -EPBD -- then type / or press the Spacebar to finish with the second stroke, EPBD. When typing steno that starts with a final stroke, place a – (hyphen) before the first letter. You may have the best results when using one steno outline to invoke an Accelerwriter. Refer to the [Guidelines](#) for Creating Dictionary Entries for more information.

### Text

Type new or modify existing text for the steno outlines, including any format symbols as necessary. Do any of the following:

- Press F9 to add [extended characters](#).
- Use the [Cap/Uncap](#) command, Ctrl + F5, to quickly cycle through the capping options for all the words in the *Text* field.
- When the option, [Spell Check While Defining](#) is not active, press Shift + F7 to spell check the word in the *Text* Field.

### Insert Field

Display the [Insert Field](#) dialog box from which you can select a field to insert into the text portion of the definition.

### FS

Display the list of available [format symbols](#) and [translate commands](#). Double click the item you want to insert at any point in the text entry. You can also use shortcut keys to insert an item. Place the cursor in the *New Text* field, press **F4** and then press the appropriate letter or symbol.

### Endings

When you type a word in the Text field, Case CATalyst analyzes word to see if a " G", " S" or " D" steno outline could be added to the word. If so, then Case CATalyst activates the Endings button. The Global Endings dialog box displays. You can select any of the suggested definitions to add to your dictionary.

For example, you have REPT in the Steno field and type "represent" in the Text field. The following suggested entries display when you select Endings:

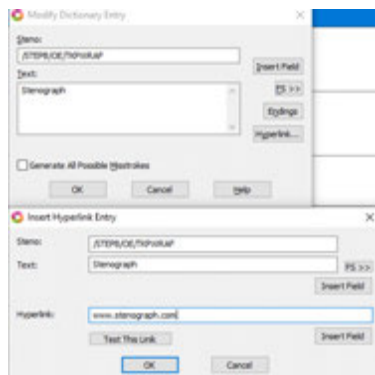

REPTD = represented

REPTS = represents

The word "representing" is not suggested because the final "g" comes before the final "t" in the original steno outline.

### Hyperlink...

You can make dictionary defines with hyperlinks already attached. You can also modify existing dictionary entries to include a hyperlink. For example, you have Stenograph defined in your dictionary and you'd like to modify the definition to include the hyperlink [www.stenograph.com](http://www.stenograph.com). Doing so will save you the time of creating a hyperlink when editing the transcript, and the hyperlink will be attached to all translated occurrences of Stenograph in the transcript.

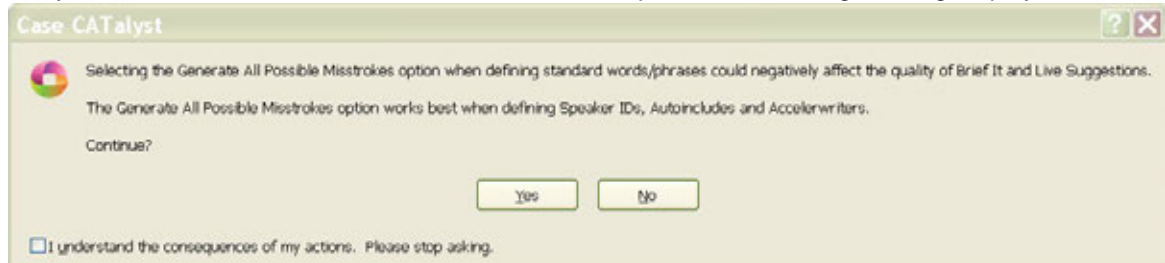

1. Inside of the Insert Hyperlink Entry dialog, provide the desired text for the *Steno:*, *Text:*, and *Hyperlink:* fields.
2. Click **OK** to accept and close the Insert Hyperlink Entry dialog.

### Generate All Possible Misstrokes

Check this box to have Case CATalyst generate definitions based on all the possible misstrokes of the original steno outline. Case CATalyst generates a definition provided one does not already exist in the Personal Dictionary for any of the identified misstrokes. For example, you define /SROEUS as "voice" with Generate All Possible Misstrokes selected. Case CATalyst also creates a dictionary

definition for the following steno outlines as "voice": /SROUS, SROES, and /SROS. The steno outline, /SRAOEUS already exists in your Personal Dictionary as "vice", so Case CATalyst did not generate /SRAOEUS as a misstroke.

If defining to the Personal Dictionary and/or inserting/modifying an entry in the Personal Dictionary and you select the Generate All Possible Misstrokes option, the following warning displays:

- Select **Yes** (Alt + y) to generate all possible misstrokes for the current steno outline.
- Select **No** (Alt + n) to return to the previous dialog box with the Generate All Possible Misstrokes option deselected.
- Select the *I understand the consequences of my actions. Please stop asking.* option to set the warning option to **No**. This is displayed because the [Dictionary Option Warn when inserting/modifying an entry and selecting All Possible Misstrokes](#) option is set to Yes, by default.

This option is not available when modifying dictionary entries from the Query Realtime Translations feature.

5. Press **Enter (OK)**. If the Spell Check option, **Spell Check While Defining** is active and Case CATalyst identifies the text portion of the entry as misspelled, the Spell Check dialog box displays. If an existing dictionary entry contains the exact steno outline as the new or modified entry, the Duplicate Entry dialog box displays. Review the steno and text, select an action and then press **Enter (OK)**.
6. Press **Ctrl + s (File/Save)** to save the dictionary when finished.
7. Press **Ctrl + F4** to close the dictionary. If another dictionary is open, that dictionary displays. If no other dictionary is open, the Manage Dictionary function closes.

## Delete Dictionary Entries

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**.
2. From the dictionary menu, select the dictionary type. When you choose Case or Job, the Open Existing Document dialog box displays. Select the dictionary and press **Enter**.
3. Use Search (**Ctrl + f**) or cursor movements to find the entry you want to delete or use [Filter \(Alt + v, i\)](#) to view specific types of entries.
4. Do **one** of the following to select entries for deletion:

### Select one entry at a time

Highlight the entry for selection.

### Select specific entries

Press and hold **Ctrl** while you click the individual entries to highlight.

### Select a consecutive group of entries

Click to highlight the first entry of the group. Locate the last entry. Press and hold **Shift** while you click the last entry to highlight all the entries in-between.

### Select all the entries

Press **Ctrl + a** to highlight all the entries for selection.

5. Press **Delete** or click the Delete  icon to delete the selected entries. You can undo the delete by pressing **Ctrl + z (Undo)**. To undo multiple deletes, repeat Undo or use the Undo arrow key to display a list of most recent actions; highlight the actions to delete and click the left mouse button.
6. A confirmation message displays, if you selected the *Warn before deleting entries* option in [Dictionary Options](#). Press **Alt + y (Yes)** to continue or **Alt + n (No)** to cancel and retain the entries.  
To turn this option Off by checking the box: *I understand the consequences of my actions. Please stop asking.*
7. Press **Ctrl + s (File/Save)** to save the dictionary when finished deleting entries.
8. Press **Alt + f, c** to close the dictionary. If another dictionary is open, that dictionary displays. If no other dictionary is open, the Manage Dictionary function closes.

## Insert Auto Includes

Auto Include definitions, in your Personal, case or job dictionaries automatically bring [include](#) files into the job during translation. For example, you have an exhibit blurb that you put in the transcript when an exhibit is marked or received. Instead of manually bringing that exhibit blurb while editing, you can write a steno outline that will automatically bring the blurb into the transcript while you are writing. Auto Include dictionary entries require a specific format so CATalyst know where to find the text (include) file. The steno portion of the auto include file is the steno that you are going to write to bring in the include file. The text portion of the Auto Include dictionary entry begins with the "at" symbol, @, followed by the Include name. The @ symbol designates the dictionary entry as an Auto Include.

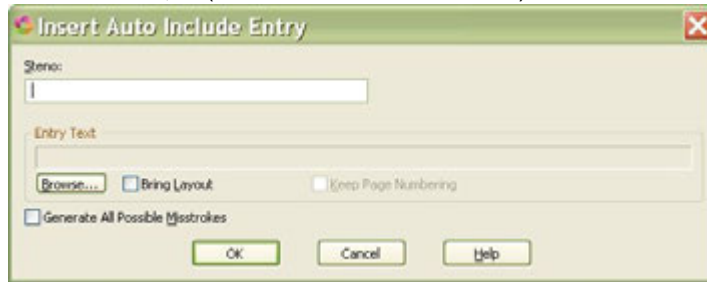

The Insert Auto Includes feature in Manage Dictionary is a wizard that allows you to quickly create an Auto Include dictionary definition. You then can Browse to select the Include file so CATalyst knows where to locate the include file. Case CATalyst creates the text portion of the Auto Include definition with the appropriate delineating character. As part of the dictionary definition, you can also easily have the auto include entry bring in the include file's page layout. For example, let's say you have a title page include file that has a different page layout than your transcript layout. Your title page doesn't have line number, timestamps and has a narrower margins. When you write your dictionary definition to include the title page into your transcript, you want the page layout to come with it. In addition to bringing the page layout, you can also have the include file retain its starting page number. For example, if you are an official reporter who has calendar day and you have multiple proceedings in one file, you can bring in an include file that automatically starts the next file with page one.

Alternatively, you can manually type the entire auto include definition using the Manage Dictionary, Insert feature.

## Create Auto Include Definitions Using the Wizard

1. Open the appropriate dictionary.

2. Press **Alt + e, n (Edit/Insert Auto Includes)**. The Insert Auto Include Entry dialog displays.

3. Make the following entries:

### Steno

Insert the steno you write to bring in the include file during translation. You can type either a forward slash (/) or press the Spacebar to separate steno outlines. For example, to search for a two stroke word, such as "end end", you could type -EPBD -- then type / or press the Spacebar to finish with the second stroke, EPBD. When typing steno that starts with a final stroke, place a – (hyphen) before the first letter.

For more information about typing steno outlines in the Steno field, see the [Steno Shortcut Table](#).

### Entry Text

The text portion of the dictionary definition that identifies the include file. Case CATalyst automatically fills in this field with the specified include file name. Select **Browse** to choose the include file you want to associate with the steno identified in the *Steno* field. You cannot type directly into this field.

### Browse

Display the Choose Include File dialog box where you can choose the include file you want to associate with the steno identified in the *Steno* field. Choose the file and then select **Open**. Case CATalyst inserts the name of the file along with the @ symbol in the *Entry Text* field. The @ symbol precedes the entry to identify it as an Auto Include.

If the include file you want is in another user, first select that user and then choose the file name. If the include file is in a case, double click the case name and then choose the file name.

### Bring Layout

Check this box to bring in the associated layout for the file you are including. Case CATalyst adds [Y] to the text portion of the definition to indicate the layout is brought in with the include file. The layout only applies to the Include file and does not affect the rest of the job.

### Keep Page Numbering

Check this box to keep the include file's page numbering. This option is only available when the Bring Layout option is selected. Case CATalyst adds [YK] to the text portion of the definition to indicate the layout is brought in with the include file along with the starting page number.

### Generate All Possible Misstrokes

Check this box to have Case CATalyst generate additional auto include definitions based on all the possible misstrokes of the original steno outline. Case CATalyst generates a definition provided the generated misstroke does not conflict with an existing entry in the Personal Dictionary.

4. Press **Enter (OK)**.
5. When finished creating Auto Includes, press **Esc (Cancel)**.
6. Press **Ctrl + s (File/Save)** to save the dictionary.

## Manually Create Auto Include Definitions

1. Open the appropriate dictionary.
2. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
3. Make the following entries:

### Steno

Insert the steno you write to bring in the include file during translation. Separate multiple strokes with a forward slash.

### Text

Type @ followed by the Include file name. Do not put a space between any characters in the definition. If, however, the file name contains spaces, you must type the name exactly the same, including any spaces.

If you also want to bring in the page layout for the Include file, type [Y] after the *file name*. For example: @includes\title[Y].

If you want to bring the page layout for the include file and the page numbering, type [YK] after the file name. For example: @includes\title[YK]

Use **one** of the following formats depending on where the include file is located. Be sure to add [Y] or [YK] if needed.:

#### @title

The Include file is the current user name.

#### @includes\title

The Include file is in a case in the current user name. In this example, the case name is "includes".

#### @<Kirsten>title

The Include file is in another user name. In this example, the user name is "Kirsten".

#### @<Kirsten>includes\title

The Include file is in a case in another user name. In this example "Kirsten" is the other user and "includes" is the case name.

### Generate All Possible Misstrokes

Check this box to have Case CATalyst generate additional auto include definitions based on all the possible misstrokes of the original steno outline. Case CATalyst generates a definition provided the generated misstroke does not conflict with an existing entry in the Personal Dictionary.

4. Press **Enter (OK)**.
5. When finished creating Auto Includes, press **Ctrl + s (File/Save)** to save the dictionary.

## Insert AccelerWriters

An AccelerWriter is a [macro](#) invoked from the writing machine during realtime writing. For example, you may want to create an AccelerWriter that deletes to the last Question because of a false start or strike that response. When you write the steno outlines assigned to the macro, Case CATalyst performs the actions of the macro. When invoking an AccelerWriter and the cursor focus is in a dialog pane, Case CATalyst automatically sets the cursor focus to the transcript and performs the actions of the macro.

Creating an AccelerWriter is a two step process. In the first step, you create the [macro](#) that contains the commands you want to invoke. You can use an existing macro or create a new one. When creating new macros to be invoked from the steno machine, Stenograph recommends you create the macro while writing realtime to see what actually takes place on the screen. In the second step, you create the dictionary definition to invoke the AccelerWriter. The text portion of an AccelerWriter dictionary entry begins with two ampersands (&&) followed by the macro name. The ampersands designate the entry as an AccelerWriter.

The Insert AccelerWriters feature in Manage Dictionary is a wizard that allows you to quickly create an AccelerWriter definition. Browse to select the macro and Case CATalyst automatically creates the text portion of the definition. Alternatively, you can manually type the entire definition using the Manage Dictionary, [Insert](#) feature. Case CATalyst also provides the option to create the AccelerWriter definition from the realtime file immediately [after creating and saving the](#) macro, eliminating the need to open the dictionary and create it.

Stenograph allows provides pre-made macros and possible dictionary definitions. Select the Help menu, Exceptional Extras and then Using Extras AccelerWriters.

## Create an AccelerWriter Definition using the Wizard

1. Open the appropriate dictionary.
2. Press **Alt + e, w** (**Edit/Insert AccelerWriters**). The Insert AccelerWriter Entry dialog displays.
3. Make the following entries:

### Steno

Insert the steno you write to invoke the AccelerWriter. You can type either a forward slash (/) or press the Spacebar to separate steno outlines. For example, to use a two stroke outline, such as "end end", you could type -EPBD -- then type / or press the Spacebar to finish with the second stroke, EPBD. When typing steno that starts with a final stroke, place a – (hyphen) before the first letter. It is recommended to use a one stroke entry to invoke an Accelerwriter.

### Entry Text

The text portion of the dictionary definition that calls the macro to run when you write the steno entered in the *Steno* field. Case CATalyst automatically fills in this field with the specified macro file name. Select **Browse** to choose the macro you want to associate with the steno identified in the *Steno* field. You cannot type directly into this field.

### Browse

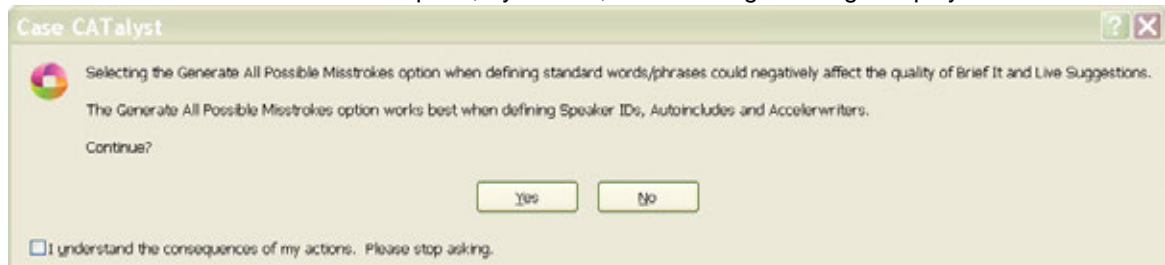

Display the Choose Macro File dialog box where the contents of the Macros case display. Choose the macro to run when you write the steno identified in the *Steno* field and then select **Open**. Case CATalyst inserts the name of the file in the *Entry Text* field. Two ampersands (&&) precede the entry to identify it as an AccelerWriter.

Macros are stored in the Macros case located in the System Files case. You cannot use a macro from another user.

### Generate All Possible Misstrokes

Check this box to generate additional AccelerWriter definitions based on all the possible misstrokes of the original steno outline. Case CATalyst generates a definition provided the generated misstroke does not conflict with an existing entry in the Personal Dictionary.

When inserting or modifying entries in the Personal Dictionary and/or Update Area, if you select the Generate All Possible Misstrokes option, by default, the following message displays:

- Select **Yes** (Alt + y) to generate all possible misstrokes for the current steno outline.
- Select **No** (Alt + n) to return to the previous dialog box with the Generate All Possible Misstrokes option deselected.

To eliminate the General All Possible Misstrokes warning message from displaying, deselect the option in [Dictionary Options](#).

4. Press **Enter (OK)**.

If the steno you have inserted to invoke the macro has one or more entries that start with that same steno (longer match) in the Personal Dictionary, the following message displays:

If the steno you write for a macro has a longer match in the Personal Dictionary, the macro will be delayed until translation determines the next stroke. This will cause a delayed reaction for the macro and in some cases, depending on what the macro does, can cause an unwanted result. The warning is to let you know that you might want to select different steno for your AccelerWriter definition. For example, you want to create a dictionary entry to run a macro while writing realtime. You have already created the macro so you open your Personal Dictionary, select Edit and then select Insert AccelerWriter. You type the steno /E-P and select your RT-Punctuation macro and press Enter. The above message displays. Immediately you know that there is at least one Personal Dictionary entry that starts with /E-P and if you don't change the steno, then the macro will not run until translate knows you are not writing the longer match steno outline.

- Select **Yes** to return to the Insert AccelerWriters dialog box to change the steno outline.
- Select **No** to insert the entry into the current dictionary knowing that the Personal Dictionary contains at least one entry that starts with the same steno outline and that may delay the execution of the macro.

5. When finished creating AccelerWriters, press **Esc (Cancel)**.

6. Press **Ctrl + s (File/Save)** to save the dictionary. If you are writing realtime, you can test the AccelerWriters by returning to the realtime file and writing the steno outline for the selected AccelerWriter.

## Create AccelerWriters Manually

The [Insert AccelerWriters](#) feature in Manage Dictionary is a wizard that allows you to quickly Browse for the macro and automatically create the text portion of the AccelerWriter definition with the appropriate delineating characters. Alternatively, you can manually type the entire definition using the Manage Dictionary, Insert feature.

### Manually Create an AccelerWriter Definition

1. Open the appropriate dictionary.
2. Press **Alt + e, i** (**Edit/Insert**). The Insert Dictionary Entry dialog displays.
3. Make the following entries:

#### Steno

Insert the steno you write to invoke the AccelerWriter. You can type either a forward slash (/) or press the Spacebar to separate steno outlines. For example, to search for a two stroke word, such as "end end", you could type -EPBD -- then type / or press the Spacebar to finish with the second stroke, EPBD. When typing steno that starts with a final stroke, place a – (hyphen) before the first letter. You may have the best results when using one steno outline to invoke an Accelerwriter. For more information about typing steno outlines in the Steno field, see the [Steno Shortcut Table](#).

#### Text

Type two ampersands (&&) to indicate an AccelerWriter and then type the name of the macro.

The text portion of the entry must begin with two ampersands (&&). The name must be the same name as the macro; however, the name is not case sensitive. For example, you created a macro that goes back to the last Question symbol and deletes all the text following the Q. You name the macro: *Delete to last Q*. The dictionary entry can be any the following for the AccelerWriter:

&&delete to last q

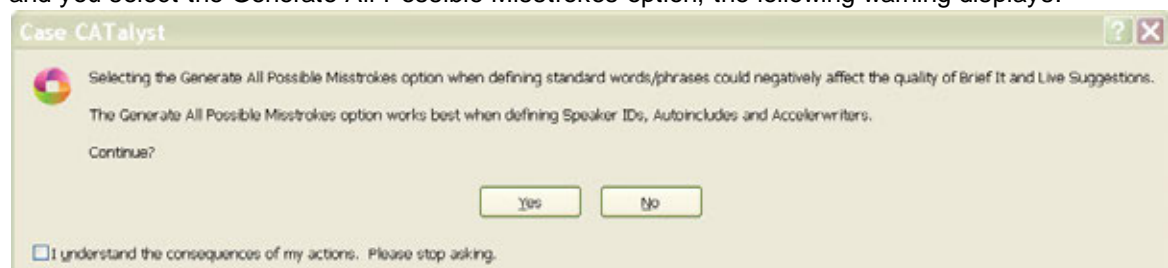

&&DELETE TO LAST Q

&&Delete To Last Q

#### Generate All Possible Misstrokes

Check this box to have Case CATalyst generate additional AccelerWriter definitions based on all the possible misstrokes of the original steno outline. Case CATalyst generates a definition provided the generated misstroke does not conflict with an existing entry in the Personal Dictionary.

If defining to the Personal Dictionary and/or inserting/modifying an entry in the Personal Dictionary and you select the Generate All Possible Misstrokes option, the following warning displays:

- Select **Yes** (Alt + y) to generate all possible misstrokes for the current steno outline.
- Select **No** (Alt + n) to return to the previous dialog box with the Generate All Possible Misstrokes option deselected.

- Select the *I understand the consequences of my actions. Please stop asking.* option to set the warning option to **No**. This is displayed because the [Dictionary Option Warn when inserting/modifying an entry and selecting All Possible Mistrokes](#) option is set to Yes, by default.
4. Press **Enter (OK)**.
  5. When finished creating AccelerWriters, press **Ctrl + s (File/Save)** to save the dictionary.

## Set Cursor Position After Vertical Movement

When using AccelerWriters during realtime, it may be helpful to have the cursor remain in the same horizontal proximity when you move it vertically, up or down, in the file. To employ this movement, you can change a setting in the UserSettings file.

When moving the cursor up or down in the file, the cursor is placed at the beginning of a word or in the middle of the word, depending on the keyboard assignment for the Up and Down Arrow keys.

When the Up Arrow key is assigned to the Move Up command using the default setting, 0, for this option, the cursor moves up to the next line positioned in the same horizontal proximity. For example, you have the following text:

Q. Where was John when you first saw the car in the ditch?

A. On the sidewalk.

Q. And seeing John, did not take your attention away from the car in the ditch?

Your cursor is positioned at the beginning of the word "your" in the third line. When you press the Up Arrow, the cursor position is at the end of the word "sidewalk. When you press the Up Arrow again, the cursor position at the beginning of the word "saw."

In the same example using the alternative setting, 1, pressing the Up Arrow moves the cursor up to the word "sidewalk." When pressed again, the cursor position is on the word, "Where."

This settings does not apply when the Up Arrow key is assigned to the Move Up Word Begin command. You can check the keyboard assignment for the Up and Down Arrow keys in the active [keyboard map](#).

## Change the Vertical Movement of the Cursor

1. Be sure you are in your User name.
2. From Manage Jobs, open the **System Files** case.
3. Double click the **UserSettings.sgxml** file. The Settings Manager dialog box displays.
4. Click in the dialog box and press **Ctrl + f**. The Find dialog box displays.
5. Type **VerticalMotionAffectsCaretXPos** and press **Enter** to move to the *VerticalMotionAffectsCaretXPos* option.
6. Click the **Edit** icon.
7. Type the number, **1**, in the field and click **OK**. To restore the default setting, click **Default**.
8. Press **Alt + s (Save)** to save the setting and close the dialog box.

## Using the Delete Command

The default action for the Delete command when written immediately after an AccelerWriter, is that the Delete command ignores the steno for the AccelerWriter and deletes the stroke written before the AccelerWriter. You can change the default action to have the Delete command written immediately after an AccelerWriter not delete steno.

### Change the Delete Command Action

1. Be sure you are in your User name.
2. From Manage Jobs, open the **System Files** case.
3. Double click the UserSettings.sgxml file. The Settings Manager dialog box displays.
4. Click in the dialog box and press **Ctrl + f**. The Find dialog box displays.
5. Type **Allow-Delete-Past-Macros** and press **Enter** to move to the *Allow-Delete-Past-Macros* option.
6. Click the **Edit** icon.
7. Type the number, **1**, in the field and click **OK** to have the Delete command do nothing when written immediately after an AccelerWriter. To restore the default setting, click **Default**.
8. Press **Alt + s (Save)** to save the setting and close the dialog box.

## Resolve Conflicts

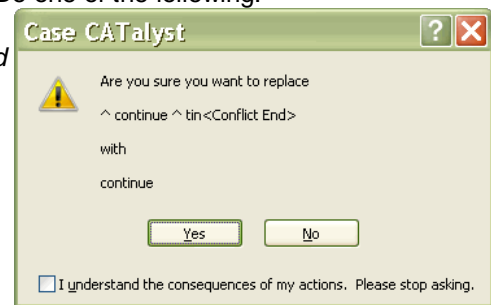

When reviewing and/or modifying a dictionary, you can eliminate a conflict in a dictionary entry by using one of the Resolve Conflict with Choice # - Dict. [Dictionary keyboard map](#) assignments. This feature can be useful if you are working to resolve conflicts and you want to eliminate the conflict in the entry by selecting one of the choices, you are starting with someone else's dictionary instead of building your own or if you have imported an RTF/CRE dictionary from another CAT vendor, and that CAT vendor allows multiple exact steno entries with different text definitions in their dictionary. In that situation, CATalyst automatically creates a conflict when the dictionary is imported. Using the Resolve Conflict With Choice # - Dict. keyboard map assignment you can quickly resolve the conflict entries. You can [filter your dictionary](#) to display only Conflicts.

For example, let's say a dictionary contains the following entry: TEUPB ^continue ^tin. TEUPB is the way you write 'continue' but not the word 'tin'. You position your cursor on the entry and press Ctrl + 1 (default keyboard assignment for Resolve Conflict with Choice 1 - Dict.) to select the first choice of the conflict. Simply position your cursor on the dictionary entry and press the key assignment for the number of the conflict choice you want.

To resolve a conflict in a dictionary entry:

1. Open the dictionary you want to modify.
2. Position your cursor on the dictionary entry that contains a conflict you want to resolve.

3. Press the keyboard assignment for the number of the conflict choice you want.  
The default dictionary keyboard map has the following assignments (unless there was another command already assigned to the following keyboard commands):  
Resolve Conflict with Choice 1 - Dict  
Resolve Conflict with Choice 2 - Dict  
Resolve Conflict with Choice 3 - Dict  
Resolve Conflict with Choice 4 - Dict  
Resolve Conflict with Choice 5 - Dict  
Resolve Conflict with Choice 6 - Dict  
Resolve Conflict with Choice 7 - Dict  
Resolve Conflict with Choice 8 - Dict  
Resolve Conflict with Choice 9 - Dict
4. The "Are you sure you want to replace message displays. Do one of the following:  
If you do not want to see the confirmation message each time you resolve a conflict, you can select the *I understand the consequences of my actions. Please stop asking.* option.
  - Select Yes to select the conflict choice to replace the conflict.
  - Select No to leave the conflict as is.

## Copy/Cut/Paste

The Copy feature copies the selected dictionary entries leaving them in the original dictionary and places a copy on the Windows clipboard. The Cut feature removes selected entries from the original dictionary and places them on the Windows clipboard. The Paste feature inserts copied or cut dictionary entries from the Windows clipboard into another dictionary. There is no limit to the amount times you can paste the entries, however, only the last set of copied or cut dictionary entries remain on the clipboard.

You may want to consider using the [Copy to Dictionary](#) and [Move to Dictionary](#) features to merge dictionary entries from one dictionary to another without opening the destination dictionary.

## Copy, Cut and Paste Dictionary Entries

1. Open the source dictionary which contains the entries you want to copy or move. Press **Alt + f, o, d** (**File/Open/Dictionary**). From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the source dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Use Windows conventions to highlight the dictionary entries for copying or cutting:

### Select an individual entry

Click to highlight the entry.

### Select all the entries in the update area or dictionary

Press **Ctrl + a** to highlight all the entries in the update area or dictionary.

### Select a consecutive group of entries

Click to highlight the first entry of the group. Locate the last entry to select. Press and hold **Shift**, while you click the last entry. All the entries in-between are highlighted.

**Select specific entries**

Press and hold **Ctrl** while you click to highlight the individual entries to add.

4. Press **Ctrl + c (Edit/Copy)** to copy the selected entries or **Ctrl + x (Edit/Cut)** to move the selected entries. If an entry conflicts, a message displays with the entry conflicts and prompts you to replace (Yes) or cancel (No) the Paste.
5. Open the destination dictionary.
6. Press **Ctrl + v (Edit/Paste)** to insert the dictionary entries into the destination dictionary.
7. Press **Ctrl + s (File/Save)** to save the changes to the destination dictionary.
8. In the source dictionary, press **Ctrl + s (File/Save)** to save the changes.

**Copy and Move To Dictionary**

Use the Copy to Dictionary and Move to Dictionary features to select dictionary entries from one dictionary and place them in another without opening the destination dictionary. You can select entries from the source dictionary, such as the job dictionary and add them to several different dictionaries. For example, you want to put certain job dictionary entries into your Personal Dictionary and/or another job dictionary. You open the source dictionary, select the entries and select to either copy or move the selected entries and then select the destination dictionary. As long as you don't select different entries, you can copy the same selected entries to different dictionaries.

The destination dictionary must be closed when copying or moving dictionary entries. The *How to treat entries with duplicate steno when Pasting* option in the [Dictionary Options](#) dialog box controls how to treat conflicting entries when using the Copy and/or Move to Dictionary commands. In other words, if the destination dictionary contains the same steno outline (with a different text definition) as the one entry you are trying to copy or move, the action taken depends on the setting for the *How to treat entries with duplicate steno when Pasting* option.

A quick way to merge the entire contents of one dictionary with another is to use the [Include](#) feature.

**Copy or Move Dictionary Entries**

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the source dictionary, which contains the entries you want to copy or move, and press **Enter**. Verify the dictionary name on the Title Bar.
3. Select entries to copy or move. Do **one** of the following:

**Select all the entries in the dictionary or update area**

Press **Ctrl + a** to highlight all the entries in the update area or dictionary.

**Select a consecutive group of entries**

Click to highlight the first entry of the group. Locate the last entry to select. Press and hold **Shift**, while you click the last entry. All the entries in-between are highlighted.

**Select specific entries**

Press and hold **Ctrl** while you click to highlight the individual entries to add.

4. Do **one** of the following:

**Copy the entries**

Press **Alt + e, d (Edit/Copy to Dictionary)** to keep the entries in the source dictionary and copy them to the destination dictionary.

Or **right click** and select **Copy to Dictionary** to keep the entries in the source dictionary and copy them to the destination dictionary you select from the submenu.

### Cut and remove the entries.

Press **Alt + e, m (Edit/Move to Dictionary)** to remove the entries from the source dictionary and move them to the destination dictionary. Stenograph recommends removing (deleting) the entries if you are working with the Update Area.

Or **right click** and select **Move to Dictionary** and select the destination dictionary from the submenu.

5. Select **one** of the following dictionaries to place the entries. Depending on the dictionary you are copying or moving entries from, all destination dictionaries may not be available.

### Personal Dictionary

#### Update Area

#### Case Dictionary

#### Other Dictionary

When selecting Other Dictionary, the Send To Other Dictionary dialog box displays. Select a dictionary and press **Enter (Open)**.

Depending on the Dictionary Options setting for the *How to treat entries with duplicate steno when Pasting* option, you may be prompted to take action if an entry conflicts.

- Keep Old Text (**Alt + o**) - the definition in the destination dictionary will be retained.
  - Keep New Text (**Alt + n**) - the definition in the source dictionary will overwrite the destination dictionary definition.
  - Create Conflict (**Alt + c**) - a conflict will be created between the source and destination dictionary definitions.
  - Keep Neither (**Alt + e**) - neither definition will be retained and the destination dictionary entry will be deleted.
6. Case CATalyst automatically saves the new entries in the destination dictionary. Press **Ctrl + s, (File/Save)** to save the changes in the open (source) dictionary.

## Send (dictionary entries) to Cat Scratch

You can highlight dictionary entries, right click and send them to the [Cat Scratch](#) pane. To highlight entries, use standard window highlighting commands. To highlight a list of entries in consecutive order, click the first entry and then hold Shift and click the last entry you want to select. To highlight multiple entries but not listed consecutively, click the first entry, hold Ctrl and click each entry you want to select. Right click and then select Sent to Cat Scratch.

Text can be sent to the Text portion of the Cat Scratch pane while editing and using the Send Text to Cat Scratch command. Steno and Text can be sent to the steno and text portion of the Cat Scratch pane via [Brief It](#), [Power Defines](#) and [creating globals](#).

## Search

The Manage Dictionary Search feature allows you to look for a dictionary entry by steno, text, or entry type, such as a conflict, phrase, number of strokes, number, etc. When searching for steno or text, you can limit the search by specifying an exact match, begins with, ends with or contains.

Once a searched entry displays, you can repeat the Search for the same steno/text and search parameters without reentering the information by using Repeat Search Forward (F3) or Repeat Search Backward (Shift +F3).

### Search for a Dictionary Entry

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + f (Edit/Search)**. The Search dialog box displays.
4. Make entries as necessary:

#### Search For

Select the method by which you want to search the dictionary.

##### Steno

Search by steno. In the field, type the steno for which you want to search. You can type either a forward slash (/) or press the Spacebar to separate steno outlines. For example, to search for a two stroke steno outline, such as "end end", you could type EPBD -- then type / or press the Spacebar to finish with the second stroke, EPBD. When typing steno that starts with a final stroke, place a – (hyphen) before the first letter.

##### Partial Stroke

Check this box to search for the specified steno regardless of whether or not it is part of a steno outline. For example, when Partial Stroke is selected, searching for –FPLT finds: -FPLT, FPLTD, FRPBLGTS, FRPBLTS, etc. Searching for –FPLT without the Partial Stroke option selected, displays entries with –FPLT as a separate outline, such as: -FPLT, -FPLT/-FPLT, etc. Case CATalyst searches all steno strokes for the letters indicated in the Steno field regardless of your selection in the Location field.

##### Text

Search by text. In the field, type the text for which you want to search. Include any format symbols or [extended characters](#) as necessary.

##### FS

To add format symbols to your text search, select **FS** and double click the symbol from the list to select it.

You can also use shortcut keys to insert a format symbol. Place the cursor in the Search For field, press **F4** and then press the appropriate letter or symbol.

##### Insert Field

Display the [Insert Field](#) dialog box from which you can select a field to add to a text search.

##### Case Sensitive

Search for the text in the Search For field as it is typed in upper and lower case. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field.

### **Whole Word**

Search only for the whole words that match the text typed in the Search For field.

If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. For example, searching for "of" would result in Search finding "of", "officer", "coffee", "soft", etc.

### **Entry Type**

Search by entry type. Selecting an entry type filters the search so that only entries with the entry type selected display. Click the arrow to display a list of available entry types.

Select **one** Search For type:

#### **Conflict**

The first entry that contains a conflict end format symbol.

#### **Scan stop**

The first entry that contains a scan stop begin or end format symbols.

#### **Numbers**

The first entry that contains numbers.

#### **All Capped**

The first entry that contains all capped text.

#### **Contains capped**

The first entry that contains at least one capital letter.

#### **Phrase**

The first entry that contains two or more words separated by a space.

#### **Contains punctuation**

The first entry that contains punctuation.

#### **Contains format symbol**

The first entry that contains a format symbol.

#### **Used Entries**

The first entry used during translation.

#### **Unused Entries**

The first entry not used during translation. A "0" (zero) displays the Usage count column for an unused entry.

#### **Contains Field(s)**

The first entry that contains a field.

#### **Repeated Stroke Entries**

The first entry that contain repeated steno outlines, such as STPHAO/STPHAO and STPHAO/STPHAO/STKPWHR.

**Auto Includes**

The first entry that begin with @.

**AccelerWriter**

The first entry that begin with &&.

**Number Conversion**

The first entry that contain the {Number Conversion} translate command.

**Number Trigger**

The first entry that contain the {Number Trigger} translate command.

**Numeral Words**

The first entry that contain a word number including hundred, thousand, million, etc.

**Speaker Entries**

The first entry that contain a <Colloquy> format symbol and a colon.

**One Stroke**

All entries that contain only one steno outline.

**Two Strokes**

All entries that contain two steno outlines.

**Three Strokes**

All entries that contain three steno outlines.

**Four Strokes**

All entries that contain four steno outlines.

**Five Strokes**

All entries that contain five steno outlines.

**Six or more steno strokes**

All entries that contain at least six steno outlines.

**2 or more steno strokes**

All entries that contain at least two steno outlines.

**3 or more steno outlines**

The first entry that contain three or more steno outlines.

**Live Suggestions**

Entries created by using a Define With LS1 - LS5 command on a Live Suggestion.

The invisible identification on the entries stay with the entries unless the entries are copied or moved to another dictionary, you export and import a dictionary back into Case CATalyst or you modify an entry or entries with the invisible identification and then modify entry or entries back to what the entry or entries were before modification.

#### **Used Briefs**

Entries created by using a suggested brief in the Brief It pane.

The invisible identification on the entries stay with the entries unless the entries are copied or moved to another dictionary, you export and import a dictionary back into Case CATalyst or you modify an entry or entries with the invisible identification and then modify entry or entries back to what the entry or entries were before modification.

#### **Live Suggestions and Briefs**

Entries created by using a Define With LS1 - LS5 command on a Live Suggestion and entries created by using a suggested brief in the Brief It pane.

The invisible identification on the entries stay with the entries unless the entries are copied or moved to another dictionary, you export and import a dictionary back into Case CATalyst or you modify an entry or entries with the invisible identification and then modify entry or entries back to what the entry or entries were before modification.

#### **Contains <Oops> symbols**

Entries that contain an [Oops](#) format symbol regardless of the category assignment. The Oops format symbol allows for 10 category (0 - 9) assignments. This filter will show all dictionary entries that contain the Oops format symbol.

### **Location**

Select search parameters.

#### **Exact Match**

Search for entries that exactly match the steno or text entered in the Search For field.

#### **Begins With**

Search for entries that begin with the steno or text entered in the Search For field.

#### **Ends With**

Search for entries that end with the steno or text entered in the Search For field.

#### **Contains**

Search for entries that contain, anywhere in the entry, the steno or text entered in the Search For field.

### **Direction**

Select where in the dictionary you want to search for the entries.

#### **Forward**

Search forward, from the cursor position to the end of the dictionary.

#### **Backward**

Search backward, from the cursor position to the beginning of the dictionary.

5. Press **Enter (OK)** to start the search. The Search dialog box closes and the dictionary window displays the entry. If Case CATalyst does not find a match for the selected steno or text search, a message displays.
6. To repeat the same search, press **F3 (Repeat Search Forward)** or **Shift + F3 (Repeat Search Backward)**.

## Search and Replace

The Manage Dictionary Search and Replace feature allows you to search for and replace the text portion of a dictionary entry. For example, let's say you just attended a state convention and attended a training session. During the training, you realized that your suffix definitions should use the Suffix format symbol instead of the Delete Space format symbol. So you want to find all the entries that begin with <Delete Space>, review the entry and either leave the <Delete Space> format symbol for that entry or replace it with the <Suffix> format symbol.

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + r (Edit/Search and Replace)**. The Search and Replace dialog box displays.
4. Make entries as necessary.

### Search For

Type the text for the search, including any format symbols, fields or [extended characters](#). Press **F9** to add extended characters.

### FS

Select **FS** to add [format symbols](#) to your search. Double click the format symbol from the list to select it. You can also type the format symbol shortcut key. Place the cursor in the *Search For* field, press **F4** and then press the appropriate letter or symbol.

### Insert Field

Display the [Insert Field](#) dialog box from which you can select a field to add to the search.

### Case Sensitive

Limit the search based on the upper and lower case letters of text typed in the *Search For* field. If you do not select Case Sensitive, the search replaces all words containing the indicated characters, regardless of the case typed into the field.

### Whole Word

Search only for the whole words that match the text typed in the *Search For* field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. **This is most likely to result in undesirable effects.** For example, replacing "of" would affect "of", "officer", "coffee", "soft", etc.

### Location

#### Exact Match

Search for entries that exactly match the text entered in the *Search For* field.

#### Begins With

Search for entries that begin with the text entered in the *Search For* field.

### Ends With

Search for entries that end with the text entered in the *Search For* field.

### Contains

Search for entries that contain, anywhere in the entry, the text entered in the *Search For* field.

### Direction

Select where in the dictionary you want to search and replace entries.

#### Forward

Search and replace forward, from the cursor position to the end of the dictionary. A confirmation message displays for each possible replacement.

#### Backward

Search and replace backward, from the cursor position to the beginning of the dictionary. A confirmation message displays for each possible replacement.

#### Replace All

Search and replace the entire dictionary without stopping to confirm each replacement. To display a confirmation message, select [Dictionary Options](#), *Warn Before Search and Replace*.

### Replace With

Type the replacement text for the entry in the *Search For* field. Add format symbols, fields or [extended characters](#) if appropriate. Press **F9** to add extended characters.

5. Press **Enter (OK)** to start the search and replace. If no match is found for the search item, a message displays.
6. Press **Ctrl + s (File/Save)** to save the dictionary when finished.
7. Press **Ctrl + F4** to close the dictionary. If another dictionary is open, that dictionary displays. If no other dictionary is open, the Manage Dictionary function closes.

## Repeat Search Forward/Backward

Repeat Search Forward and Repeat Search Backward allow you to search the steno note file applying the current search parameters used with the Search command. You can use these features in Edit, Manage Dictionary, and Manage Notes.

- To repeat the search forward in the file, press **F3 (Edit/Repeat Search Forward)**.
- To repeat the search backward in the file, press **Shift + F3 (Edit/Repeat Search Backward)**.

## Select All

The Select All feature in Manage Dictionary that allows you to highlight all the entries in the dictionary or Wordlist for a subsequent action.

## Manage Dictionary View menu

The Dictionary View menu allows you to [filter your dictionary](#) entries to view only entries that fit a specific criteria, [change the font](#) for the column headings, steno and text and decide what [toolbars](#) you want to see in Manage Dictionary.

## Filter dictionary entries

The Manage Dictionary Filter feature allows you to display only dictionary entries based on a specific criteria such as specific text, specific steno outline(s) or a specific type of dictionary entry. For example, let's say you used Case CATalyst for about 2 years and you want to look at all the dictionary entries that haven't been used for translation. You can filter on Unused Entries. You can review the unused entries and decide to delete them, keep them or move them to another dictionary and continue to translate as usual to see if you notice a difference.

You can also filter a filtered display of the dictionary. There may be times when you filter the display of a dictionary that you want to narrow the display even further. You can now filter within a filtered dictionary. For example, let's say you filter your dictionary for "All Capped" entry type. You select Filter, Entry Type and then All Capped. Some of the results are KRAO\*EU= CIA, KR-FPLT = C, EUFPLT = I, A-FPLT = A, TP-FPLT = F, PW-FPLT = B, AO\*EUFPLT = I, TPWAO\*EU = FBI, etc.

Now, you want to filter the "All Capped" display to only show entries that contain -FPLT so you can see only the entries that are used when fingerspelling. Since you are in a filtered display, you select Filter again. The Filter dialog box is the same except for the addition of a Filter Within Filter button. You select Steno and type -FPLT, select the *Ends With* option and then click the *Filter Within Filter* button (Alt + w). The filtered dictionary display only shows dictionary entries that are defined in all caps and end with the steno -FPLT. In other words, the reporter sees entries such as KR-FPLT = C, EUFPLT = I, A-FPLT = A, TP-FPLT = F, PW-FPLT = B, AO\*EUFPLT = I.

**Filtering a dictionary's view is only a display feature.** Once you select the [Unfilter](#) command, click the Unfilter icon () or close the dictionary, the display returns to the view of the entire dictionary. Filter does not remove entries from the dictionary. To filter the dictionary display, press **Ctrl + y** or select View, Filter. You can also click the Filter () icon. The Filter dialog box displays.

## Filter Entries

1. Press **Alt + f, o, d** (**File/Open/Dictionary**).
2. From the dictionary menu, select the dictionary type. When you choose Case or Job, the Open Existing Document dialog box displays. Select the dictionary and press **Enter**.
3. Press **Ctrl + y** (**View/Filter** or **Alt + v, u**). The Filter dialog box displays.
4. Make entries as necessary:

### Filter On

Select the method by which you want to filter the dictionary.

#### Steno

Filter by steno. In the field, type the steno for which you want to filter. Separate multiple strokes with a forward slash. When starting with a final stroke, place a - (hyphen) before the first letter.

#### Partial Stroke

Check this box to filter on the specified steno regardless of whether or not it is part of a steno outline. For example, when Partial Stroke is selected to filter on -FPLT, CATalyst BCS finds: -FPLT, FPLTD, FRPBLGTS, FRPBLTS, etc. Filtering on -FPLT without the Partial Stroke option selected, displays entries with -FPLT as a separate outline, such as: -FPLT, -FPLT/-FPLT, etc. CATalyst BCS searches all steno strokes for the letters indicated in the Steno field regardless of your selection in the Location field.

#### Text

Filter by text. In the field, type the text on which you want to filter. Use any of the following options to narrow the scope of the filter. To include [extended characters](#), press **F9**.

### **FS (Alt + f)**

To Filter with a format symbol, type the format symbol or display the format symbol list by pressing **FS + f**. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**.

You can insert a format symbol at any point in the text entry. You can also use shortcut keys to insert a format symbol. Place the cursor in the Text field, press **F4** and then press the appropriate letter or symbol.

### **Case Sensitive**

Limit the Filter based on the upper and lower case letters of text typed in the field. If you do not select Case Sensitive, the filter finds all words containing the indicated characters, regardless of the case typed into the Filter On field.

### **Whole Word**

Filter only the whole words that match the text typed in the Filter On field. If you do not select Whole Word, the Filter finds the word both as it stands alone and as part of another word. For example, filtering on the word "of" without selecting Whole Word, would include the words "of", "officer", "coffee", "soft", etc. in the filter.

### **Entry Type**

Filter on an entry type. Click the arrow to display a list of available entry types.

Select **one** Filter type:

#### **Conflict**

All entries that contain a conflict end format symbol.

#### **Scan stop**

All entries that contain scan stop begin or end format symbol.

#### **Numbers**

All entries that contain numbers.

#### **All Capped**

All entries that contain all capped text.

#### **Contains capped**

All entries that contain at least one capital letter.

#### **Phrase**

All entries that contain two or more words separated by a space.

#### **Contains punctuation**

All entries that contain punctuation.

#### **Contains format symbol**

All entries that contain a format symbol.

**Used Entries**

All entries used for translation since loading the dictionary on CATalyst BCS.

**Unused Entries**

All entries that have not been used for translation since loading the dictionary on CATalyst BCS.

**Contains Fields**

All entries that contain fields.

**Repeated Stroke Entries**

All entries that contain repeated steno outlines, such as STPHAO/STPHAO and STPHAO/STPHAO/STKPWHR.

**Auto Includes**

All entries that begin with @.

**AccelerWriter**

All entries that begin with &&.

**Number Conversion**

All entries that contain the {Number Conversion} translate command.

**Number Trigger**

All entries that contain the {Number Trigger} translate command.

**Numeral Words**

All entries that contain a word number including hundred, thousand, million, etc.

**Speaker Entries**

All entries that contain a <Colloquy> format symbol and a colon and all entries defined with the <By-line> format symbol.

**One stroke**

All one stroke entries.

**Two strokes**

All two stroke entries.

**Three strokes**

All three stroke entries.

**Four strokes**

All four stroke entries.

**Five strokes**

All five stroke entries.

**6 or more steno strokes**

All entries that contain six or more steno outlines.

**2 or more steno strokes**

All entries that contain two or more steno outlines.

**3 or more steno outlines**

All entries that contain three or more steno outlines.

**Live Suggestions**

Entries created by using a Define With LS1 - LS5 command on a Live Suggestion. The invisible identification on these entries stay with the entries unless the entries are copied or moved to another dictionary, you export and import a dictionary back into Case CATalyst or you modify an entry or entries with this invisible identification.

**Used Briefs**

Entries created by using a suggested brief in the Brief It pane. The invisible identification on the entries stay with the entries unless the entries are copied or moved to another dictionary, you export and import a dictionary back into Case CATalyst or you modify an entry or entries with the invisible identification .

**Live Suggestions and Briefs**

Entries created by using a Define With LS1 - LS5 command on a Live Suggestion and entries created by using a suggested brief in the Brief It pane. The invisible identification on the entries stay with the entries unless the entries are copied or moved to another dictionary, you export and import a dictionary back into Case CATalyst or you modify an entry or entries with the invisible identification.

**Contains <Oops> symbols**

Entries that contain an [Oops](#) format symbol regardless of the category assignment. The Oops format symbol allows for 10 category (0 - 9) assignments. This filter will show all dictionary entries that contain the Oops format symbol.

**Location**

Select the Filter On parameters.

**Exact Match**

Entries that exactly match the steno or text entered in the Filter On field.

**Begins With**

Entries that begin with the steno or text entered in the Filter On field.

**Ends With**

Entries that end with the steno or text entered in the Filter On field.

**Contains**

Entries that contain, anywhere in the entry, the steno or text entered in the Filter On field.

**Range**

Text entries that fall within the specified range. Enter the beginning text you want to display in the From field. Enter the ending text in the Thru field. All entries between this range display. For example, to Filter all the words that begin with the letter "a", select Text and then select Range. In the From field type **a** and in the Thru field type **az**.

5. Press **Enter (OK)** to filter the dictionary. The Filter dialog box closes and the dictionary window displays the filtered entries. If Show Status Bar is active, the number of entries matching the Filter criteria displays in the lower left corner (X filtered entries of X dictionary entries). When there is no match for the selected steno or text filter, a message displays.

If you insert or modify a dictionary entry that does not match the current Filter criteria, the following message displays:

Press **Enter** to dismiss the message or press **Alt + u** to select the I understand the consequences of my actions. Please stop asking. This option disables the 'doesn't fit filter criteria' message box until the [Dictionary Option](#) *Warn before inserting or modifying an entry in a filtered display* is set to Yes.

6. Do **any** of the following:
  - To return the dictionary display to Full View, press **Alt + v, u (View/Unfilter)** or click the Unfilter (🗑️) icon ).
  - To filter the current filtered entries, press **Ctrl + y** or press **Alt + v, i (View, Filter)**. Follow the instructions in Step 5. Click the **Filter Within Filter** button or press **Alt + w** to filter for entries only in the filtered display.  
**Note:** If you select the Filter button, instead of Filter Within Filter button, you are starting a new filter.
  - To close the dictionary and return the display to all dictionary entries, press **Alt + f, x** or **Ctrl + F4**. You will be prompted if there are unsaved changes. Select whether to save the changes or not.

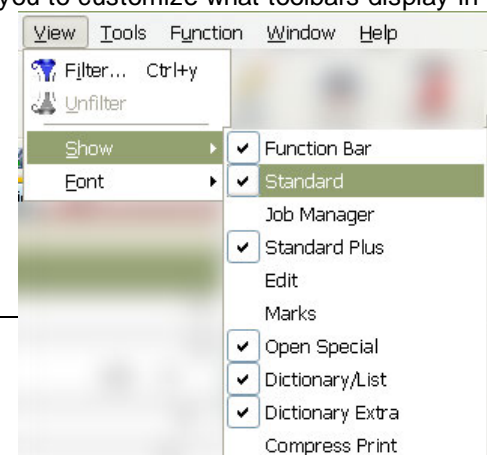

## Unfilter

Once you have [filtered](#) the display of your dictionary, you can return to the full view of your dictionary by pressing **Alt + v, u** or by clicking the Unfilter (🗑️) icon. In addition, if you close your dictionary the next time you open it, all dictionary entries display.

## Show

The Show option displays all the available toolbars and allows you to customize what toolbars display in the

Manage Dictionary feature. To show a specific toolbar, press **Alt + v, s** and confirm there is a check mark in front of the menu item. To hide a specific toolbar, press **Alt + v, s** and remove the check mark in front of the menu item.

## Font

You can change the display font for the dictionary column headers, text portion of the definition, steno portion of the definition and modified date, used date and usage column text information. Press **Alt + v, f** (**View/Font**) to display the Font menu and select an area to change. When the Font dialog box displays, make changes as necessary and press **Enter** (**OK**). Changing the font assignments in one dictionary changes them for all dictionaries in the current user. You can modify the following areas as indicated:

### Column Headers

Affects the font for all the column headings.

### Steno

Affects the font in the Steno column for all dictionary entries.

### Text

Affects the font in the Text column for all dictionary entries.

### Other

Affects the font in the Modified Date, Used Date, and Usage columns.

1. From anywhere in Case CATalyst, press **Alt + f, o, d** (**File/Open/Dictionary**). From the dictionary menu, select Personal, Case, Job, EZ Speakers, Power Define or Update Area, if selected for use. The Open Existing Document dialog box displays.
2. Select the dictionary for which you want to set font attributes and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Alt + v, f** (**View/Font**).
4. From the submenu, select one of the following for which to set the font attributes.
  - **Column Headers** - change the font style for all the column headers.
  - **Steno** - change the font style for the steno in the Steno column.
  - **Text** - change the font style for the text in the Text column.
  - **Other** - change the font style for the text in the Modified Date, Usage Count and Used Date columns.
5. In the Font dialog box, make necessary entries:

### Font

Select a font type.

### Font Style

Select a font style:

- **Regular**—no style attributes
- **Italics**—applies italics to the selected font
- **Bold**—applies bold to the selected font
- **Bold Italic**—applies italics and bold to the selected font.

### Font Size

Select a font size. Size is in points.

### Sample

A sample of how text displays in the job with the selected font settings.

### Script

Select the language in which the characters display. Although a variety of languages are displayed, Western is the only supported language.

6. Press **Enter (OK)** to save the settings.

## Manage Dictionary Tools menu

Case CATalyst Dictionary Tools are features that allow you to select your dictionary options, select a customize dictionary keyboard map, cycle to different dictionary keyboard maps, create EZ speakers (in a case/job dictionary), spell check, create a core list and more. You can even create macros to help you make editing changes to your dictionary more efficient.

Your [Dictionary Options](#) contains settings on where your D-defines go, how to handle duplicate entries when including or pasting entries, what columns, and in what order, display in your dictionary and more.

[Dictionary Builder](#) is also available that allows you to create dictionary entries from a text file using your writing machine or a computer (QWERTY) keyboard. A text file that can be used with Dictionary Builder can be created from another reporter or agency that uses the Create Core List feature in a [transcript](#) or [dictionary](#), a list created by [Case Prep](#) or a list of words in a text file from another source.

## Keyboard Customization

Change Keyboard Maps is a Dictionary feature that allows you to switch the [Keyboard Map](#), permitting you to use different keyboard commands while working in a dictionary. When you open a dictionary, the Dictionary Default keyboard map is active. The name of the active keyboard map displays on the Status bar at the bottom of the screen. You can change the default dictionary keyboard map to have a different keyboard map active when opening the Dictionary function.

To switch keyboard maps while working in the Dictionary function, press **Alt + t, y (Tools/Change Keyboard Map)**. The Keyboard Map submenu displays the keyboard maps available in your user name. From the Keyboard Map menu, select a Keyboard map. The selection displays on the Status bar.

## Cycle Keyboard Maps

The Manage Dictionary Cycle Keyboard Maps feature allows you to switch the active [Keyboard Map](#), permitting you to use different keyboard commands. When you open Manage Dictionary, the Default keyboard map is active. You can modify the [Dictionary Options](#) to change which keyboard map is active when you open Manage Dictionary. The name of the active keyboard map displays on the Status bar at the bottom of the screen.

To change the active keyboard map while working in Manage Dictionary, press **Alt + t, k (Tools/Cycle Keyboard Maps)**. You can continue to press **Alt + t, k** to cycle through all the available keyboard maps in the Dictionary case located in your System Files case. If you have not modified the keyboard map, pressing \ (backslash) also cycles through all the available keyboard maps.

## Create EZ Speakers

Use Create EZ Speakers Entries to quickly identify speaker names for [EZ Speakers](#) definitions in the current job or case dictionary. The EZ Speaker Dictionary is a template that contains steno outlines with text and/or fields, format symbols and [Timers](#) if appropriate. To use EZ Speakers definitions, you must identify the actual speaker names before translation or while writing realtime. Depending on the type of EZ Speakers entry, you may also need to identify the steno outlines. You can specify speaker names from Manage Dictionary, the Translate dialog box, or during realtime translation. Case CATalyst populates the [Speaker List](#) when you use the Create EZ Speakers feature to identify speaker names. A total of 300 speakers can be created via the Create EZ Speakers feature and a total of 310 speakers can display in the [Speaker List pane](#). There are three [different ways in realtime](#) in which you can create EZ Speakers.

If you use [# entries](#) in your EZ Speaker definitions, Case CATalyst generates a speaker definition with the actual speaker name and places it into the job or case (if appropriate) dictionary. If you use [EZ Speaker fields](#), Case CATalyst places the EZ Speaker field in the definition of a job or case dictionary and inserts the speaker name into the job during translation. If the job is in a case, the default selection places the generated speaker definition into the case dictionary, although you can select the job dictionary. If your EZ Speaker definitions include the Timer translate command, the timer command is included with the Speaker text definition.

## Identify EZ Speaker Names

1. Do **one** of the following to display the Create EZ Speakers Entries dialog box:

### Manage Dictionary

- a. From anywhere in Case CATalyst, press **Alt + f, n, d (File/New/Dictionary)**. From the dictionary menu, select **Job**. The create New Document dialog box displays.
- b. Type a name in the File name field and press **Enter (Open)**. Verify the dictionary name on the Title Bar.
- c. Press **Alt + t, z (Tools/Create EZ Speakers Entries)**.

If you use [# entries](#) in your EZ Speaker Dictionary, the names of the speaker display in the dictionary.

If you use EZ Speaker fields in your EZ Speaker Dictionary, the names of the speaker do not display in the dictionary but will be used when the dictionary is used for translation.

### Translate & Edit

- a. Open the Translate & Edit function, press **Alt + u, t**. The Translate dialog box displays.
- b. Select a file to translate or type a new file name for realtime. The file name displays in the File field.
- c. Press **Alt + c (Create EZ Speakers)**.

### Realtime

Press **Alt + t, z (Tools/Create EZ Speakers Entries)**.

or

Write the steno outline defined as **{EZ Speaker Define}** and use your Power Define dictionary definitions to navigate the Create EZ Speakers Entries dialog box.

2. Make entries as necessary:

## Dictionary

### Job Dictionary

Place the generated EZ Speakers definition into the job dictionary. If you use EZ Speaker fields, Case CATalyst places the EZ Speaker field in the definition of a job dictionary and inserts the actual speaker name into the job during translation. If you use # entries, Case CATalyst generates a definition with the actual speaker name and places it into the job dictionary. When using EZ Speaker fields, CATalyst will look for existing field values in the job history. If the job history does not have EZ Speaker field values, CATalyst will look in the case history and automatically fill in the EZ Speaker fields.

This job dictionary is the default unless the job is in a case. This option is available when the job is in a case and you are identifying EZ Speakers from the Translate dialog box or during realtime from the Tools menu. **Select Job dictionary if you do not want the EZ Speaker definitions you create to carry through to all jobs in this case.** For example, let's say you create a Case called August where you are going to put all your jobs you write during the month of August of this year. Since the jobs are not related as far as the same attorneys or subject matter, select Job dictionary and then select the *Always default to Job dictionary* option.

### Case Dictionary

Place the generated EZ Speakers definition into the case dictionary. If you use EZ Speaker fields, Case CATalyst places the EZ Speaker field in the definition of a case dictionary and inserts the actual speaker name into the job during translation. If you use # entries, Case CATalyst generates a definition with the actual speaker name and places it into the case dictionary. When using EZ Speaker fields, CATalyst will look for existing field values in the job history. If the job history does not have EZ Speaker field values, CATalyst will look in the case history and automatically fill in the EZ Speaker fields.

This is the default if the job you are creating is currently in a case. This option is available when the job is in a case and you are identifying EZ Speakers from the Translate dialog box or during realtime from the Tools menu. **Select Case dictionary if all the jobs in the case are related and you want the EZ Speaker definitions to be available for all future jobs in this case.** For example, let's say you have created a case for a specific series of depositions and the same attorneys will be present during all the depositions, then select Case dictionary and the EZ Speakers will be available for all future jobs in this case.

### Always default to Job Dictionary

When you are creating EZ Speaker definitions for a job within a case, you can change the dictionary default to the job dictionary. Select **Job Dictionary** and then check this box. If you select Job Dictionary and do not check this box, Case CATalyst uses the job dictionary for this translation and then defaults back to Case Dictionary the next time you open the Create EZ Speakers dialog box. Select this feature if you use a case but always want your EZ Speaker IDs placed in a job dictionary.

This option is available when the job is in a case and you are identifying EZ Speakers from the Translate dialog box or during realtime from the Tools menu and you select Job Dictionary.

### Currently selected dictionary

Case CATalyst places the EZ Speaker entries into the dictionary displayed.

### Text Token Number

Type the token number, **00 - 99**, for the EZ Speaker entry to which you want to add an actual speaker name. Type only the token number. If you are using # entries in your EZ Speakers

dictionary, do not type the # symbol.

If creating EZ Speakers from your steno machine, write the steno stroke defined as a digit and write the steno outline defined in the Power Define dictionary as [TAB].

### Steno

Do **one** of the following:

- If the token number you type contains a steno outline in the EZ Speakers dictionary, the Steno field displays the steno associated with the token number. You cannot make an entry in the Steno field. Continue to the Text field.
- If the token number you type does not contain a steno outline in the EZ Speaker dictionary, type the appropriate steno. The steno outlines you type in this field replace the ! (exclamation mark) in the EZ Speaker dictionary definition. For example, you write RED/RED for MR. REDFORD. If the EZ Speakers entry contains an !, enter RED/RED.  
You can type either a forward slash (/) or press the Spacebar to separate steno outlines. When typing steno that starts with a final stroke, place a – (hyphen) before the first letter.

If there are two Exclamation marks in the EZ Speakers dictionary entry, type the steno outline once. Using the previous example, type RED.

If creating EZ Speakers from your steno machine, write the steno and then write the steno stroke defined as a digit and write the steno outline defined in the Power Define dictionary as [TAB].

### Text

Type the actual speaker name the way you want it to appear in the transcript. Include any format symbols or [extended characters](#) as necessary. Do not include format symbols or punctuation that are part of the EZ Speakers dictionary entry. For example, for Mr. Redford, type **MR. REDFORD**. The <Colloquy> format symbol before the speaker name, the : (colon), and space following the colon are part of the EZ Speakers dictionary entry.

If creating EZ Speakers from your steno machine, write steno outlines defined as words and/or fingerspelling to write the speaker's name and then write the steno stroke defined as a digit and write the steno outline defined in the Power Define dictionary as [TAB].

### Insert Field

Display the [Insert Field](#) dialog box from which you can select a field to insert into the text portion of the definition.

If you are creating EZ Speakers from your steno machine, you either need to press **Alt + i** on the computer keyboard or click the button with your mouse.

### FS

Display the list of available [format symbols](#). Double click the format symbol you want to use.

You can also use shortcut keys to insert a format symbol. Place the cursor in the New Text field, press **F4** and then press the appropriate letter or symbol.

If you are creating EZ Speakers from your steno machine, write [TAB] to move the cursor focus to an option and then write the steno outline defined in the Power Define dictionary as [SPACE] to select or deselect an option.

### Allcap Text

Check this box to display and save the entry in all upper case letters regardless of the case entered in the Text field.

### Include All Possible Misstrokes

Check this box to have Case CATalyst generate definitions in the job or case dictionary based on all the possible misstrokes for the EZ Speakers entry.

For example, you use the # entry STPHAO = <Colloquy>#01: in your EZ Speakers dictionary. You identify the 01 as MS. ANDERSON. Case CATalyst builds the job dictionary entry: STPHAO = MS ANDERSON:

When you check Include All Possible Misstrokes, Case CATalyst also creates the following job dictionary entries, provided a definition does not already exist in the Personal Dictionary for any of the identified misstrokes:

SPHAO = MS ANDERSON:

STPAO = MS ANDERSON:

STPHO = MS ANDERSON:

If you use the speaker field entry STPHAO =<Colloquy>[!EZ SPEAKER 01] in your EZ Speakers dictionary, Case CATalyst creates the following definitions for MS ANDERSON and places them in the job dictionary. The speaker name, MS ANDERSON is stored with other field information for the job and applies during translation.

<Colloquy>[!EZ SPEAKER 01] = SPHAO

<Colloquy>[!EZ SPEAKER 01] = STPAO

<Colloquy>[!EZ SPEAKER 01] = STPHO

### Entire File

Check this box to have the newly created EZ Speaker apply to the entire job. Uncheck this box to apply the newly created EZ Speaker only to the steno outlines written after the EZ Speaker is defined. By default, this option is checked.

This option is only available during a Case CATalyst Realtime session.

3. Repeat steno, text and token numbers until you define all your speakers.
4. Press **Esc (Close)** when finished.  
If you are creating EZ Speakers from your steno machine, you can write the steno defined in the Power Define dictionary as [ABORT] or write [TAB] until the cursor focus is on the Close button and then write [ENTER].

## Insert and Modify EZ Speakers Dictionary Entries

EZ Speakers dictionary entries use placeholders for speaker names and depending on the type of entry, for steno. The placeholder text can be a token designated with the # sign followed by a number, such as #01 or it can be an EZ Speaker field, such as [!EZ SPEAKER 01]. Using the [Create EZ Speakers](#) feature, you identify the speaker names and steno for each placeholder. Case CATalyst then generates the speaker definitions in either the job or case dictionary. The actual EZ Speakers dictionary is not used during translation.

### Manage EZ Speaker Entries

1. Press **Alt + f, o, d, e (File/Open/Dictionary/EZ Speakers)**. The Open dialog box displays. Select the EZ Speakers dictionary you want to open and press Enter (Open).

2. In the EZ Speakers dictionary, do **any** of the following:

**Insert a new Entry**

Press **Ctrl + i (Edit/Insert)**. The Insert Dictionary Entry dialog box displays with empty Steno and Text fields.

**Modify an Entry**

Use Search (**Ctrl + f**) or cursor movements to find the entry you want to modify and then press **Ctrl + m (Edit/Modify)**. The Modify Dictionary Entry Dialog box displays with the current Steno and Text for the definition.

**Delete an Entry**

Move your cursor to the entry you want to delete and press **Del** or **Delete**. A warning message displays. Select **Yes** to confirm the deletion. No further steps are necessary.

3. Make entries as necessary:

**Steno**

Type new or modify existing steno outlines.

**Standard ID**

Use a Standard ID entry when you write the same steno outline for a speaker identification on every job and then define the steno with the appropriate speaker's name for each job. Type the steno outline you always write to indicate the speaker. For example, you always write EUFPLT/EUFPLT to indicate the first speaker or the Plaintiff's attorney. Type EUFPLT/EUFPLT in the Steno field. You must create a separate definition for each speaker.

**Super ID**

Use a Super ID when you write different steno outlines to identify each speaker for every session. For example, you have Mr. Redford and Ms. Wilson in the session. You write RED/RED to identify Mr. Redford and WEUL/WEUL to identify Ms. Wilson. A Super ID uses the exclamation mark as a placeholder, to represent the variable steno outline entry. Type an ! (exclamation mark) in the Steno field.

**Text**

Type new or modify existing text for the steno outline, including any format symbols. Press **F9** to add [extended characters](#).

**Insert Field**

Display the [Insert Field](#) dialog box from which you can select a field to insert into the text portion of the definition. If the EZ SPEAKER 01, EZ SPEAKER 02, etc. fields do not exist, select **New Field** to create the necessary field.

**FS**

Display the list of available format symbols. Double click the format symbol you want to use in the definition. You can insert a format symbol at any point in the text entry.

You can also use shortcut keys to insert a format symbol. Place the cursor in the New Text field, press **F4** and then press the appropriate letter or symbol.

**Endings**

This option is not applicable when creating EZ Speaker entries.

### Generate All Possible Misstrokes

This option is not usually applicable when inserting or modifying EZ Speaker entries in the EZ Speakers dictionary. This option is available when creating EZ Speakers using the [Create EZ Speakers](#) feature.

4. Press **Enter (OK)**. If an exact entry exists, Case CATalyst prompts you with a message that the entry already exists.
5. Press **Ctrl + s (File/Save)** to save the dictionary when finished.
6. Press **Ctrl + F4** to close the dictionary.

## Using # (token) Entries in EZ Speakers Definitions

Token numbers entries function as placeholders for speaker names in [EZ Speakers](#) dictionary definitions. When EZ Speakers dictionary definitions contain # token numbers and you use the Create EZ Speaker feature, Case CATalyst generates the speaker definition in the job or case dictionary. For example, STPHAO <Colloquy>MR. JONES:

You can use [EZ Speaker fields](#) instead of token numbers entries. When you use the Create EZ Speaker feature with EZ Speaker fields to identify actual speaker names, Case CATalyst automatically places the speaker name in the [Speaker List](#). Using EZ Speaker fields allows the color associated with the speaker name in the Speaker List to be applied during translation. You can add [Timer](#) commands to EZ Speaker definitions that use fields.

There are two types of EZ Speaker entries: Standard ID and Super ID.

### Standard ID

Use a Standard ID when you write the same steno outline for a speaker identification on every job and then define the steno with the appropriate speaker's name for each job.

A Standard ID definition contains text with a token number in the text portion of the entry and steno outlines in the steno portion of the entry. In the following example, #01 is the token:

<Colloquy>#01:Spacebar	STPHAO
<By-line>#01:<Question>	STPHAO/STKPWHR

Before translating, you [specify](#) the name you want to replace the token number. When creating the job dictionary, Case CATalyst replaces #01 with the actual speaker name for all entries containing #01. You can create additional definitions with the steno outlines for misstrokes for the same definition with the same token number. The second speaker name replaces token #02 in the definitions. Case CATalyst replaces the #02 with the actual speaker name for all entries containing the #02.

### Super ID

Use a Super ID when you write different steno outlines to identify each speaker on every job. You can create up to 250 different EZ Speakers.

A Super ID definition contains text with a token number and an ! (Exclamation mark) in the steno portion. When you create more than one type of Super ID, add a unique steno stroke **in addition** to the exclamation mark for each definition. For example:

<Colloquy>#00:Spacebar	!
<By-line>BY#00:<Question>	!/STKPWHR

For example, you have Mr. Redford (RED/RED) and Ms. Wilson (WEUL/WEUL) as the attorneys for the current job. When identifying the EZ Speaker entries before translating, you specify the actual steno, RED/RED, to replace the ! (Exclamation mark). You also specify the actual speaker name, MR. REDFORD, to replace the token number #00. Case CATalyst creates the following job dictionary entries:

<Colloquy>MR. REDFORD: Spacebar	RED/RED
<By-line>BY MR. REDFORD:<Question>Spacebar	RED/RED/STKPWHR

Because the steno outline changes for each dictionary entry, the token number remains the same, #00. You identify additional speaker names by changing the actual steno outline and attorney name. To add the second speaker, you type 00, then WEUL/WEUL to replace the ! (Exclamation mark) and type MS WILSON in the Text field.

A total of 300 individual speaker identifications can be created using the Create EZ Speakers dictionary. One hundred unique speakers can be created using the Standard IDs (01 - 99) and two hundred unique speakers using the Super ID (100 - 299). A total of 310 unique speakers can display in the [Speaker List pane](#) when using the ten Common Speakers feature (300 - 309).

## Using EZ Speaker Fields in EZ Speakers Definitions

EZ Speaker fields contain token numbers which function as placeholders for speaker names in [EZ Speakers](#) dictionary definitions. When EZ Speakers dictionary definitions contain EZ Speaker fields and you use the Create EZ Speaker feature, Case CATalyst generates the speaker definition in the job or case dictionary and inserts the field value, actual speaker name, into the job during translation. For example, the dictionary entry STPHAO <Colloquy>[!EZ SPEAKER 01]: is placed in the job or case dictionary. The name MR JONES displays in Colloquy format in the job. The speaker names are stored with other field information for the job.

You can add [Timer](#) commands to EZ Speaker definitions that use fields. Adding the Start Timer translate command allows you to apply the speaker name and start the Timer with the same steno stroke.

When you use the Create EZ Speaker feature to identify actual speaker names, Case CATalyst automatically places the speaker name in the [Speaker List](#). Using EZ Speaker fields allows the color associated with the speaker name in the Speaker List to be applied during translation.

There are two types of EZ Speakers dictionary entries: Standard ID and Super ID.

### Standard ID

Use a Standard ID entry when you write the same steno outline for a speaker identification on every job and then define the steno with the appropriate speaker's name for each job. For example, you write STPHAO for the first attorney and SKWRAO for the second attorney at every job.

A Standard ID definition contains text with a speaker field and specific steno outlines. In the following example, the [!EZ SPEAKER 01] is the speaker name placeholder:

<Colloquy>[!EZ SPEAKER 01]:Spacebar	STPHAO
<By-line>[!EZ SPEAKER 01]:<Question>	STPHAO/STKPWHR

Before or during translation, you [specify](#) the name you want to replace the EZ Speaker field. When creating the job or case dictionary, Case CATalyst replaces [!EZ SPEAKER 01] with the actual speaker name for all entries containing [!EZ SPEAKER 01]. You can create additional definitions with the steno outlines for misstrokes for the same definition with the same EZ Speaker field. Create as many different speaker entries as necessary by changing the EZ Speaker field number. For example, the second speaker name in the definitions is [!EZ SPEAKER 02]. Case CATalyst replaces the [!EZ SPEAKER 02] with the actual speaker name for all entries containing [!EZ SPEAKER 02].

## Super ID

Use a Super ID when you write different steno outlines to identify each speaker on every job.

A Super ID definition contains the placeholder (!) for the steno and an EZ Speaker field as the placeholder for the speaker name. When using the Create EZ speaker feature, you type different steno for each speaker created. When you create more than one type of Super ID, add a unique steno stroke **in addition** to the exclamation mark for each definition. For example:

<Colloquy>[!EZ SPEAKER 00]:Spacebar	!
<By-line>BY[!EZ SPEAKER 00]:<Question>	!/STKPWHR

For example, you have Mr. Redford (RED/RED) and Ms. Wilson (WEUL/WEUL) as the attorneys for the current job. When use the Create EZ Speakers feature, you specify the actual steno, RED/RED to replace the ! (exclamation mark). You also specify the actual speaker name, MR. REDFORD, to replace [!EZ SPEAKER 00]. Case CATalyst places the following entries in the job or case dictionary. The speaker names are stored with other field information for the job and applied during translation.

<Colloquy>[!EZ SPEAKER 101]:Spacebar	RED/RED
<By-line>[!EZ SPEAKER 101]:<Question>	RED/RED/STKPWHR

Because you change the steno outline for each speaker, the speaker field remains the same, [!EZ SPEAKER 00]. When using the Create EZ Speaker feature, you identify additional speaker names by changing the actual steno outline and attorney name. To add the second speaker, Ms. Wilson, type WEUL/WEUL in the steno field and [!EZ SPEAKER 00] with MS. WILSON in the text field. Case CATalyst places the following entries in the dictionary:

<Colloquy>[!EZ SPEAKER 102]:Spacebar	WEUL/WEUL
<By-line>[!EZ SPEAKER 102]:<Question>	WEUL/WEUL/STKPWHR

The speaker names are stored with other field information for the job. Case CATalyst applies the speaker names during translation.

## Timer Commands in EZ Speaker Field Definitions

If you are required to keep track of time during the proceedings, you can use [Timers](#) with EZ Speaker fields in the EZ Speaker dictionary allowing you to apply the speaker name and start the Timer with the same steno stroke.

### Standard ID

In a Standard ID entry, you have SKWRAO defined as <Colloquy>[!EZ SPEAKER 02]{Start Timer}[2]: When you use the Create EZ Speaker feature, you type MR. PETERSEN in the text field. Because this is a Standard ID, the steno field is grayed out but displays SKWRAO.

The job or case dictionary contains: /SKWRAO <Colloquy>[!EZ SPEAKER 02]:{Start Timer}[2]. The Field values display MR. PETERSEN for [!EZ SPEAKER 02].

If you want the timers to work with the [Auto By Line](#) feature, be sure to have the Start Timer command before the colon or before the ending parenthesis if you use parenthesis instead of a colon. For example:

<By-Line>BY [!EZ SPEAKER 02]{Start Timer}[2]:

<By-Line><Question>(BY [!EZ SPEAKER 02]{Start Timer}[2])

### Super ID

In a Super ID entry, the Start Timer[0] is used. When using the Create EZ Speaker feature and the Super ID entry, the first entry you create, EZ Speaker 101 is automatically generated along with Start Timer [101] command. For example, when using the Create EZ Speaker feature you type: /PHART/PHART in the steno field and MR. MARTIN in the text field. The job or case dictionary contains: /PHART/PHART <Colloquy>[!EZ SPEAKER 101]:{Start Timer}[101]. The Field values display MR. MARTIN for [!EZ SPEAKER 101].

If you want the timers to work with the [Auto By Line](#) feature, be sure to have the Start Timer command before the colon or before the ending parenthesis if you use parenthesis instead of a colon. For example:

<By-Line>BY [!EZ SPEAKER 00]{Start Timer}[0]:

<By-Line><Question>(BY [!EZ SPEAKER 00]{Start Timer}[0])

## Spell Check Dictionary

The Manage Dictionary Spell Check feature checks the spelling of the text portion of entries in an open dictionary and an entry when you are inserting or modifying dictionary entries. Several Spell Check [options](#) allow you to customize Spell Check to your writing style. For example, you can select to automatically check for errors such as punctuation, spacing, hyphenation and identify [wordlists](#) which contain words Case CATalyst should ignore during Spell Check. To use Spell Check when inserting or modifying dictionary entries, you must select the dictionary Spell Check option, Spell Check While Defining. Dictionary Spell Check options apply only to spell checking in Manage Dictionary.

Complete the following steps to [Spell Check](#) the text portion of all the entries in the open dictionary. Some features, specific to spell checking in a transcript, are unavailable while using Spell Check in Manage Dictionary.

### Spell Check Dictionary Entries

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Do one of the following:

#### Spell Check the Dictionary

Press **Shift + F7 (Tools/Spell Check)**. The Spell Check dialog box displays when an entry contains a word or words that Spell Check identifies as misspelled. The Spell Check feature begins checking from the cursor location forward.

#### Spell Check While Inserting/Modifying Dictionary Entries

- a. Verify that the Dictionary Spell Check [option](#), Spell Check While Defining is selected. If the option is not active, you can press Shift + F7 with your cursor in the Text Field to check the word.

- b. Press **Ctrl + i (Edit/Insert)** or **Ctrl + m (Edit/Modify)** to open the Insert/Modify dialog box and make entries. If you misspell the text portion of any entries you add or modify, the Spell Check dialog box displays.
4. The following information displays in the Spell Check dialog box:

**Steno**

The steno associated with the text identified as misspelled.

**Text**

The word identified as misspelled.

**Change To**

Case CATalyst automatically displays an alternative word. You can select a word from the Suggestions list or type a different word in the Change To field and click Suggest. When words display in the Suggestions field, Case CATalyst highlights the closest match to the typed change.

**Suggestions**

Alternative words to the suggestion in the Change To field. Click a word to select it.

5. Use the following actions as necessary:

**Change**

Change the current word to word in the Change To field for this occurrence only. Do **any** of the following:

- Accept the suggestion in the Change To field.
- Select a word from the Suggestions list to display in the Change To field.
- Type a word in the Change To field.

**Ignore**

Leave the word Spell Check suggested as misspelled for this entry. If Spell Check encounters this word again in this session, Spell Check stops.

**Global**

Not available in Manage Dictionary. Use the Manage Dictionary [Search and Replace](#) feature to make a changes to a dictionary entry.

**Ignore All**

Leave the word Spell Check suggested as misspelled or repeated for all occurrences during this session. If you exit the dictionary and run Spell Check again in this dictionary, Spell Check stops on words for which you selected Ignore All.

**Wordlist P, K, J**

Add the word directly to one of the wordlists. Although the Add to Wordlist dialog box does not display, the word is added to the designated wordlist. Select **one** of the following:

**P**

Press **Alt + p** to add the word to your Personal Wordlist.

**K**

Press **Alt + k** to add the word to the case wordlist. This option is not available when spell checking the Personal Dictionary or the current dictionary is not in a case.

### J

Press **Alt + j** to add the word to the job wordlist. This option is not available when spell checking the Personal Dictionary.

### Delete

Delete the repeated word in this dictionary entry.

### Wordlist

Add the word to your Personal, case or job Wordlist. Select an action for the word and select a wordlist. If necessary, the [Add to Wordlist](#) dialog box displays where you can select to automatically ignore the word, correct the word or suggest a specific word.

Only the Personal Wordlist is available when spell checking a Personal Dictionary.

### Definition

Check the definition of the word in the Change To field. The Merriam-Webster Dictionary dialog box displays. When connected to the Internet, in the Merriam-Webster Dictionary dialog box click the Definition Search () icon to connect to the web site specified in the [Definitions Search option](#) where you can view additional definitions and information. Press **Esc** to return to the Spell Check dialog box.

### Suggest

Type a different word in the Change To field and click Suggest to show other suggestions.

### Options

Determine how you want Spell Check to look at words. The Spell Check Options dialog box displays where you can set Dictionary Spell Check [options](#) such as setting the number of suggested words to display or selecting additional Wordlists.

#### 6. Do one of the following:

- When spell checking the dictionary, do one of the following:
  - Spell Check finishes and displays a completion message. Press **Enter (OK)**.
  - Spell Check is still running and you want to stop it. Press **Esc (Cancel)**.
  - Spell Check reaches the end of the file and a message displays indicating that Spell Check has reached the end of the dictionary. Select **Yes** to move to the beginning of the dictionary and continue spell checking the beginning of the job. Select **No** to end Spell Check.

This message displays at the end of the file when you start Spell Check at any point in the job besides the beginning.

- When inserting and modifying dictionary entries, do one of the following:
  - The Insert or Modify Dictionary Entry dialog box displays. Continue inserting or modifying dictionary entries or press **Esc (Cancel)** to close the dialog box.
  - If an existing dictionary entry contains the exact steno outline as the new or modified entry, the Duplicate Entry dialog box displays. Review the steno and text, select an action and then press **Enter (OK)**.

## Create Dictionary Core List

The Core List feature in Manage Dictionary allows you to create a list of unique case or job dictionary entries for the purpose of exchanging the terminology with another reporter or scopist. This is a way to share the case or job dictionary terminology without sharing your steno outlines. Case CATalyst searches the case or job dictionary for entries. An entry appears only once in the Core List, regardless of the number of occurrences in the dictionary.

Case CATalyst names the core list using the file name followed by the text "Dict core list." For example, for the Anderson 012510 job, the core list created in Manage Dictionary is named, Anderson 012510 Dict core list. The Core List is a .txt file and opens in Notepad or WordPad. If you filter the dictionary, Case CATalyst creates a core list of only the filtered entries. You can save and print the file.

### Create a Core List

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select Case or Job. The Open Existing Document dialog box displays.
2. Select the case or job dictionary from which you want to create a core list and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Alt + t, c (Tools/Create Core List)**. Depending on the size of the file, the Core List displays in Notepad or WordPad.
4. Review the entries. You can cut, copy, paste, delete, and print the entries. Refer to your Windows documentation for additional information on using Notepad or WordPad.
5. To save the file, do **one** of the following:

#### Save

Press **Alt + f, s** to save the core list under the current user with the current file name as displayed in the Title bar. The core list is a text file and uses the file extension .txt

#### Save As

Press **Alt + f, a** to save the core list under a different name or in a different folder. The Save As dialog box displays. Make necessary entries.

## Make Wordlist

Make Wordlist is a Manage Dictionary feature that automatically copies all the words in the open dictionary that Spell Check identifies as misspelled, to the wordlist and assigns *Ignore* to them. If no wordlist exists, Case CATalyst automatically creates a job or case wordlist. Make Wordlist only applies to case and job dictionaries.

For example, you may want to use Make Wordlist if you created a job dictionary with the Create EZ Speakers feature which did not Spell Check the speaker names during creation. Spell Check would not recognize the EZ Speakers names. Using Make Wordlist, Case CATalyst copies those names to the job wordlist with *Ignore* assigned to them. When you run Spell Check, Case CATalyst does not stop on the speakers names which are already in the job or case wordlist.

## Macros

A macro is a recorded series of keystrokes, mouse clicks and associated keyboard commands. A filename assigned to the macro allows for playback. Playing back a macro performs the series of recorded commands which reduces the amount of keystrokes required to perform a task or process.

Macros are recordable in Edit and Manage Dictionary. It is possible to begin the recording or playback of a macro in one of the functions and have it continue in the other function. For example, you can begin a macro in Edit and continue the macro within a dictionary. You may want to use a separate naming convention for macros created for Manage Dictionary that identifies them from other macros. For example, "dict - modify entry."

When recording a macro, you can use the mouse and keyboard commands to select menus or icons, however, within a dialog box, only keyboard commands are recorded, such as Alt + a (Cap) in a Global Define dialog box. Mouse clicks within a dialog box are not recognized and are not recorded as part of the macro. Once a dialog box opens, you can Pause recording the macro to select a file name or option using the mouse. When you close the dialog box, by pressing Enter or an Alt key combination, the macro continues to record and you can return to using mouse clicks. When the macro plays back, it pauses once the dialog box is open, allowing you to select the file or option and then continues once you press Enter. For example, you want to record a macro to Include a file and choose a file while using the macro. When the Include dialog box display, click Pause and select a file. File selection is not recorded as part of the macro. After selecting the file, press Enter in the Include dialog box. The macro continues recording once you press Enter.

You can playback a macro by selecting it from a list, pressing a user assigned keyboard command or writing a steno stroke on your writing machine during realtime. To quickly invoke a macro, you can assign it to a [keyboard command](#) or [AccelerWriter](#) dictionary definition. Keyboard command assignments and AccelerWriter definitions can be made immediately after saving the macro or at a later time. Stenograph recommends you set up a realtime session when creating a macro for an AccelerWriter definition to assure the macro works as intended.

Macro files have a .sgmac extension and are stored in a Macros case within the System Files case. You can quickly view the list of existing macros by pressing, **Alt + f, o, m (File/Open/Macros)**. Recorded commands for an existing macro can be viewed or modified using the [Macro Editor](#). You can add and remove functions, text and key combinations allowing you to make changes without re-recording the entire macro. Manage Dictionary functions end with - Dict." when viewing them in the Macro Editor or a Keyboard Maps.

The Macro feature contains a submenu of features that include Record, Playback and Playback Last Macro. You can [create a toolbar](#) from the submenu to float or dock it like any other toolbar.

[Keyboard Map](#) Function: Record Macro

Play Macro

Play Last Macro

## Macro Toolbar

The Macro submenu contains the commands necessary to record and playback macros. You can create a toolbar which contains the three Macro menu commands: Record, Playback Macro and Playback Last Macro. The Macros toolbar can be docked at the top or side of the screen like any other tool or function bar. You can also customize the bar, adding or removing icons.

## Display the Macro Submenu Toolbar

1. Press **Alt + t, m (Tools/Macro)**. The Macro submenu displays.
2. Place the cursor on the dotted line at the top of the submenu.

3. Press and hold the left mouse button. Drag the cursor away from the menu. The submenu displays as a floating toolbar.

4. Place the Macros toolbar anywhere on the screen or position along with other toolbars on the top or side of the screen. Once you create the Macros toolbar, the toolbar displays with a check mark in the Show list (**View/Show**).

5. You can [customize](#) any toolbar if necessary. To close the toolbar, deselect it from the Show list. Once the Macros toolbar closes, it is no longer available in the list. You must drag it from the Macro submenu to redisplay it.

## Create Dictionary Macro

The Macro Record feature allows you to record a series of commands in a dictionary and save them as a [macro](#). Macros are used to save time and effort for results that may take more than one keystroke to perform. For example, if you have some dictionary editing to do that requires the same commands each time, you might want to record a macro to save time and get the same results each time. Once the macro is recorded and named, you can assign a [keyboard command](#) to it so it can be invoked from your computer keyboard. Dictionary keyboard maps are different from an editing keyboard map and are stored in a case named Dictionary in your System Files case.

Recorded commands for an existing macro can be viewed or modified using the [Macro Editor](#). All macros are stored in the Macros case in your System Files folder. If you want to modify a key command in a keyboard map to invoke a dictionary macro, be sure to go to the Dictionary case in your Systems Files folder. The Macro Editor allows you to add and remove functions, text and key combinations without recording the entire macro again.

[Keyboard Map](#) Function: Record Macro

## Create and Assign Macro

1. Open a dictionary.
2. Position your cursor on a dictionary entry.
3. Press **Alt + t, m, r (Tools/Macro/Record)**. The RecordMacro toolbar displays at the top of the screen with Pause and Stop buttons.

4. Record the commands for the macro. Use the mouse and keyboard commands to select menus or icons, however, **in a dialog box, only keyboard commands are recorded**. Mouse clicks within a dialog box are not recognized and are not recorded as part of the macro.

When in a dialog box, click **Pause** on the RecordMacro toolbar to suspend the macro in order to type text, select a format symbol or other action. For example, you are recording a macro to modify the text of several dictionary entries. When the Modify Entry dialog box opens, click **Pause** and type the text. The typed text is not recorded as part of the macro. After you are finished typing the text, press **Enter** in the Include dialog box. The macro continues recording once you press Enter.

5. When finished, click **Stop** on the RecordMacro toolbar. The Save Macro dialog box displays.

If you attempted to record commands that are not recordable functions, the following error message displays: *The actions you took are not recordable. There are no actions that can be saved for a macro.* Press **Enter (OK)** to close the message.

6. In the *File name* field, type a name for the macro. Use the following options as necessary:

**Assign to key in keyboard map (Alt + a)**

Check this box to assign a key combination in your keyboard map to the macro after you save the macro. This allows you to invoke the macro from a keyboard command.

**Define in dictionary to invoke macro from writer (Alt + f)**

Do not select this option. macros cannot be invoked from the writing machine while in a dictionary.

7. Press **Enter (Save)**. One of the following occurs:
  - The Save Macro dialog box closes if no additional options are selected.
  - The Open Keyboard Map dialog box displays if you selected to *Assign to key in keyboard map*. If the option, [Keyboard to open when assigning recorded macros](#), is active, the selected default Keyboard map opens. Make necessary entries to [assign a keyboard command](#) to the macro.
8. Test the macro. Do the following:
  - Playback the macro using the Playback Macro feature. Press **Alt + t, m, p (Tools, Macro, Playback Macro)** or click **Playback Macro** on the Macros toolbar. The Choose Macro dialog box displays. Select the macro just recorded and press **Enter (Open)**.
  - If you assigned the macro to a keyboard command, press the assigned keys.

## Playback Macro

You can Playback a recorded macro using an assigned keyboard command, writing the steno outlines during realtime that are assigned to an AccelerWriter definition, by selecting a playback option from the Macro menu or selecting a macro from the [Macro toolbar](#).

To playback a macro, do one of the following:

### Use Assigned Keyboard Command

If you [assigned](#) a key command to the macro in the active keyboard map, press the assigned key combination to play the specified macro.

### Use AccelerWriter

If you created an [AccelerWriter](#) definition for the macro, stroke the keys on your writing machine to play the specified macro.

### Use Macro Menu Options

### Playback Macro

Press **Alt + t, m, p (Tools/Macro/Playback Macro)**. The Open dialog box displays. Select a macro and press **Alt + o (Open)**. The selected macro plays back.

Macro files have a .sgmac extension and are stored in the Macro case within the System Files case.

### Playback Last Macro

Press **Alt + t, m, L (Tools/Macro/Playback Last Macro)**. The last macro played back using a keystroke plays again. It is recommended to use this command after first using the Playback Macro command.

The last macro remembered is user specific, not job specific.

### Macros Toolbar

In addition to using the keyboard and AccelerWriters to invoke macros, a [Macros toolbar](#) feature is available to invoke macros via the toolbar. You might want to assign seldom used but important macros to the Macros toolbar while invoking common macros with keyboard combinations and using AccelerWriters to invoke those macros during realtime. By default, the Macros toolbar displays in Translate and Edit / Edit. To hide the display of the Macros toolbar, right click on any toolbar and deselect Macros.

[Keyboard Map](#) Function: Play Macro

Play Last Macro

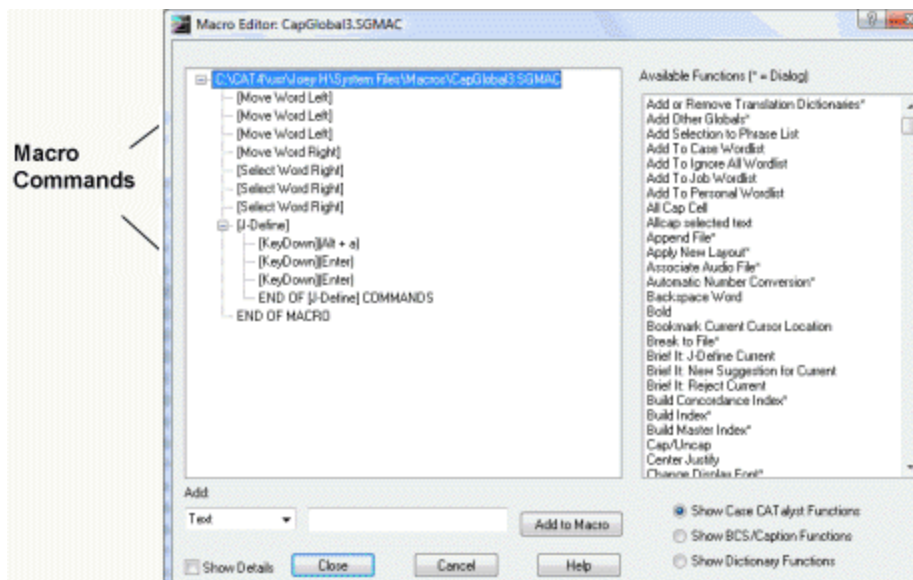

### Editing Macros

You can modify the recorded commands for an existing macro. Using the Macro Editor, add and remove Case CATalyst, CATalyst BCS or Dictionary [functions](#), [text](#) and dialog box [key combinations](#). Macros are stored in the Macros case within the System Files case. Macro files have a .sgmac extension.

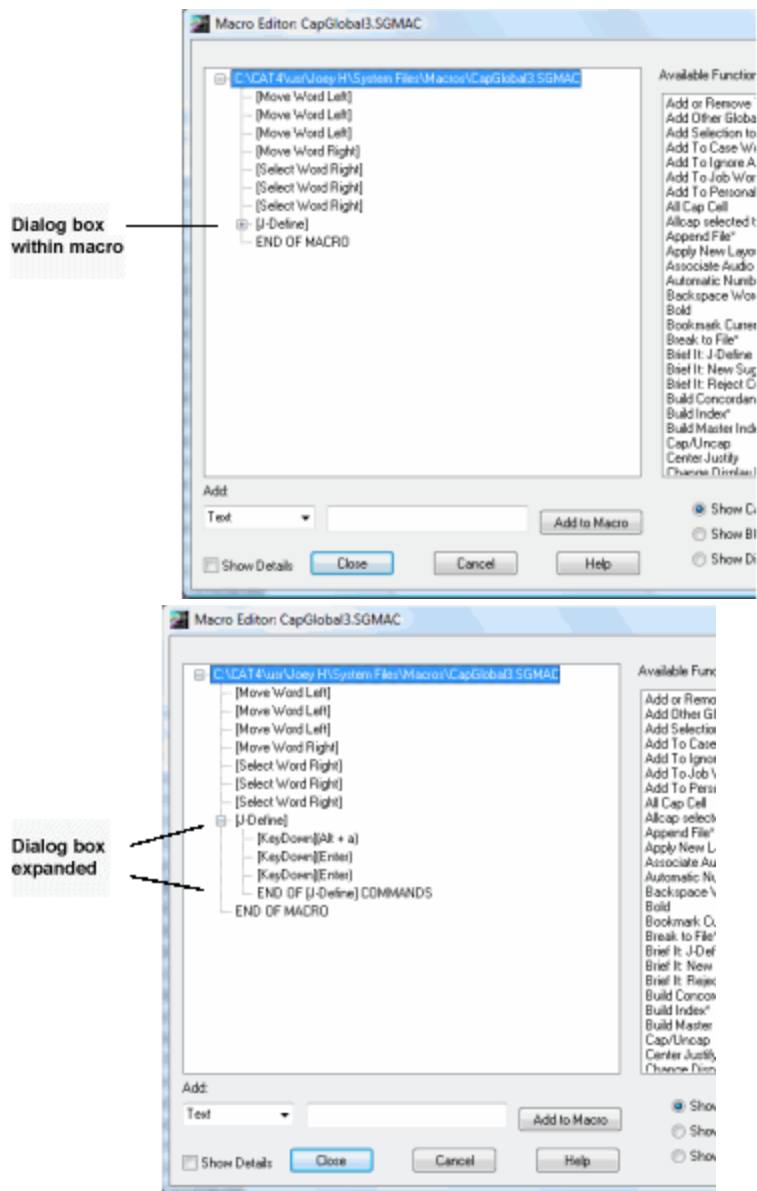

- From anywhere in Case CATalyst or CATalyst BCS, press **Alt + f, o, m (File/Open/Macro)**. The Open Existing Document dialog box displays with the Macros case open. Select the macro and press **Enter (Open)**.
- In Manage Jobs, open the System Files case and then open the Macros case. Double-click a macro to open it.

### Macro Editor

The Macro Editor dialog box opens with the selected macro name in the title bar. The recorded macro commands display in the window.

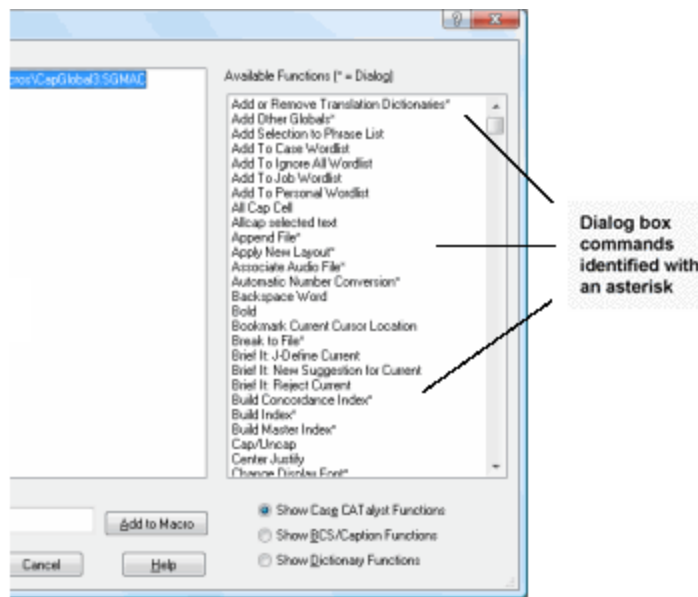

A command that invokes a dialog box within a macro displays with a plus sign. Click the plus sign to display the commands within the dialog box.

### Available Functions

The Available Functions list displays commands for insertion into the macro. Selecting the option *Show Case CATalyst Functions* below the list displays all the valid editing commands available for insertion into the macro. Selecting *Show CATalyst BCS/Caption Functions* displays all the available CATalyst BCS commands. Selecting *Show Dictionary Functions* display all available Manage Dictionary commands.

Functions in the list marked with an asterisk are commands that invoke a dialog box. You cannot insert these commands into a dialog box within the macro.

## Add

### Text

The Add fields allows you to insert text or key combination into the macro. Selecting *Text* from the drop down list allows you to type the text in the field which you want to add to the macro. Once the text is typed, the *Add to Macro* option inserts the text into the macro following the highlighted line.

### Key Combination

Selecting *Key combination* from the drop down list, allows you to enter a key combination into the field by pressing the appropriate keys on the keyboard. Key combinations can only be added to a dialog box that is part of the macro. The *Add to Macro* option inserts the key combination into the macro following the highlighted line.

## Remove

To remove the function, text or key combination from the macro, highlight the line and press **Delete**.

**Show Details**

Display the key stroke details of the macro (KeyUp/KeyDown). This option is typically used to troubleshoot the macro.

**Close/Save/Done**

The option that displays depends on the editing state of the macro:

**Close**

Displays when you open the macro and allows you to close the Macro Editor dialog box without making any changes.

**Save**

Displays after you make changes to the macro allowing you to save them.

**Done**

Displays after saving the macro allowing you close the Macro Editor dialog box.

**Cancel**

Close the Macro Editor dialog box without applying any changes since the last save.

**Add Functions to an Existing Macro**

1. Do one of the following:
  - From anywhere in Case CATalyst or CATalyst BCS, press **Alt + f, o, m (File/Open/Macro)**. The Open Existing Document dialog box displays with the Macros case open. Select the macro and press **Enter (Open)**.
  - In Manage Jobs, open the System Files case and then open the Macros case. Double-click a macro to open it.
2. In the Macro Editor dialog box, select one of the following to determine the type of functions to display in the Available Functions window:

**Show Case CATalyst Functions**

Display Case CATalyst or CATalyst BCS transcript editing functions.

**Show BCS/Caption Functions**

Display CATalyst BCS and captioning functions.

**Show Dictionary Functions**

Display Manage Dictionary functions.

3. Highlight the line in the macro that precedes the position where you want to insert the command and double click the desired function. The command inserts after the highlighted item. You cannot insert a function at the end of the macro.

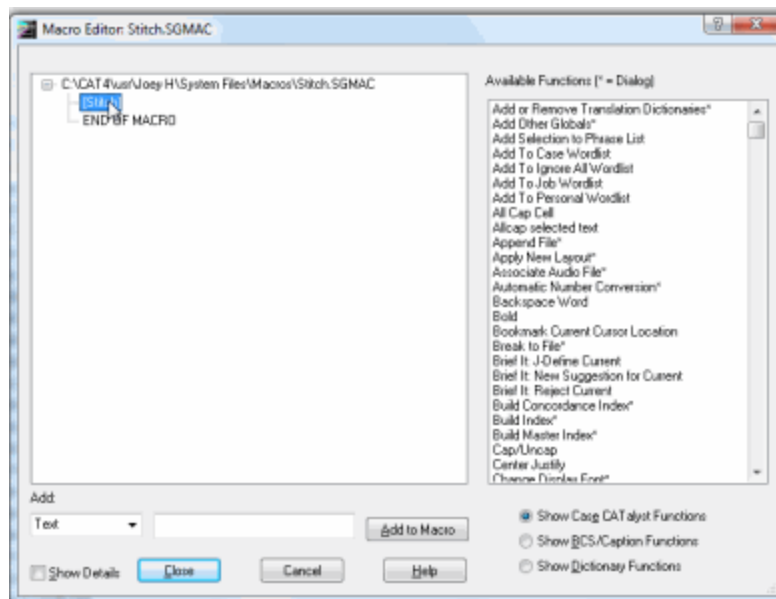

To insert more than one function, it is necessary to highlight the position where you want to insert the command each time. The message, *Please select an item in the macro. The item will be inserted after the selection.* indicates the position for inserting the line is deselected. Highlight the line in the macro that precedes the position where you want to insert another function.

Functions in the list marked with an asterisk are commands that invoke a dialog box. You cannot insert a function marked with an asterisk into an active dialog box. If you attempt to insert a function

into an active dialog box, The following message displays; *A function cannot be inserted at this point in the macro, because a dialog is active. Functions can only be inserted when no dialog is active in the macro.* To add commands containing a key combination use the [Add](#) field.

### Example

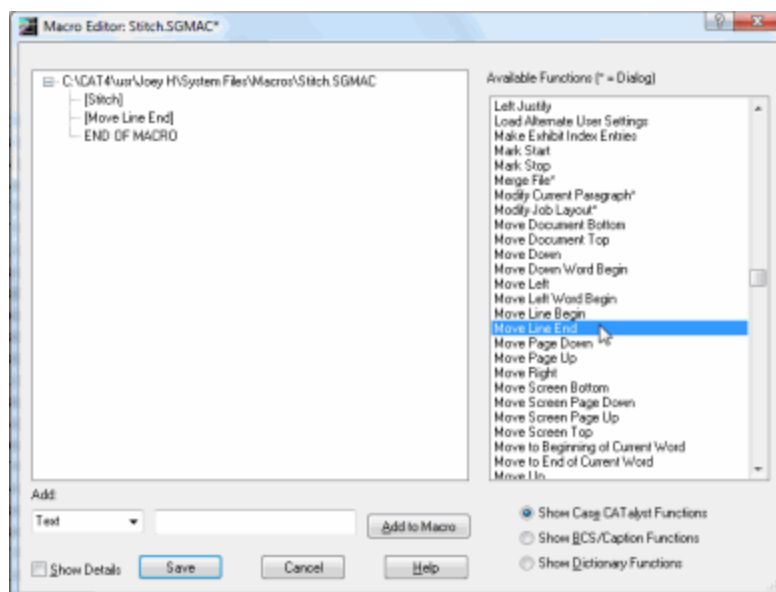

In the following Stitch macro, you want to add the command, Move Line End, to move the cursor to the end of the line. You highlight the last command line of the macro.

4. In the Available Functions field, double-click the command you want to insert. Functions followed by an asterisk invoke a dialog box. The position you highlight is remembered even though the highlight does not appear once you click in the Available Functions window.

### Example

Continuing with the Stitch macro, The Move Line End command inserts after the [Stitch] line.

5. If necessary, add other functions, [text](#) or [key combinations](#). To remove a command, highlight the line and press **Delete**.
6. Press **Enter (Save)**. A confirmation message may display, depending on your save options. The Macro Editor dialog box remains open.
7. Select **Done** to close the Macro Editor dialog box.

## Add Key Combinations to an Existing Macro

Key combinations can only be added to a dialog box that is part of the macro. Dialog boxes display with a plus sign if the view of the dialog box commands is collapsed or a minus sign if the view is expanded with the commands displayed in an indented list.

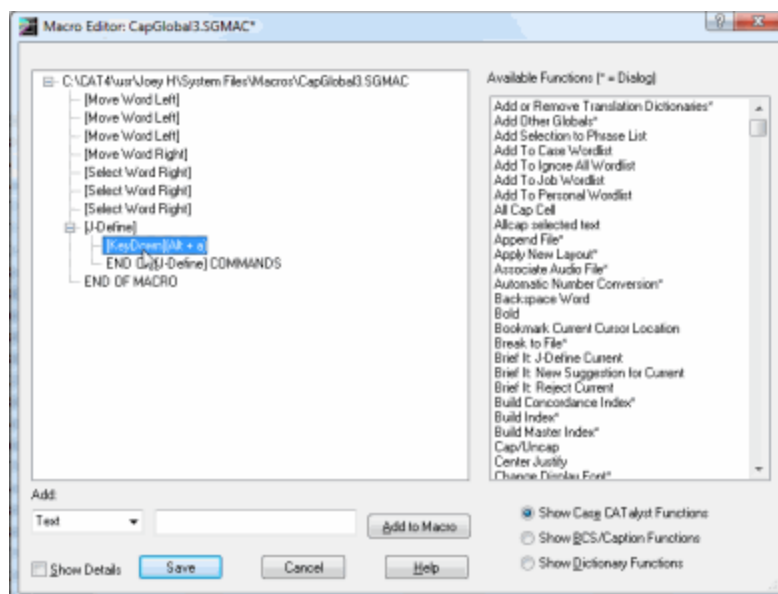

## Add Commands

1. Do one of the following:
  - From anywhere in Case CATalyst or CATalyst BCS, press **Alt + f, o, m (File/Open/Macro)**. The Open Existing Dialog Document dialog box displays with the Macros case open. Select the macro and press **Enter (Open)**.
  - In Manage Jobs, open the System Files case and then open the Macros case. Double-click a macro to open it.
2. In the Macro Editor dialog box, highlight the line within a dialog box that precedes the position where you want to insert the key combination. The command inserts after the highlighted item.

Dialog boxes display with a plus sign if the view of the dialog box commands is collapsed or a minus sign if the view is expanded. If there are no commands in the dialog box, highlight the dialog box name.

### Example

In the following CapGlobal3 macro, you want to add Enter to the end of the J Define, so the dialog box closes at the end of the macro. You highlight the last command line in the J Define dialog box.

3. In the Add field:

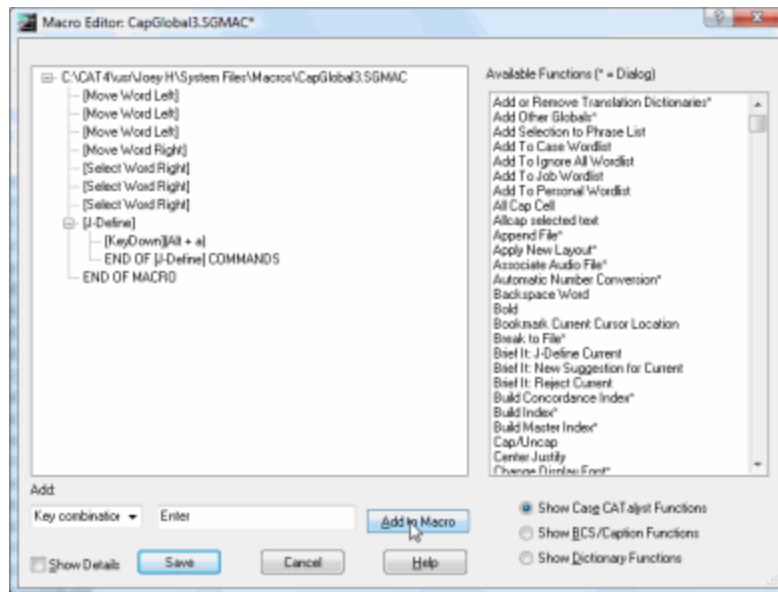

- Select **Key combination** from the drop down list. The position you highlight is remembered even though the highlight does not appear once you click in the Add field.
- Place the cursor in the command field to the right and press the key combination you want to add. The key combination displays in the field.
- Select **Add to Macro**. The key combination inserts after the line you highlighted.

If you did not highlight a line within a dialog, the following message displays; *In order to insert keystrokes onto a dialog in the macro, some part of the dialog needs to be selected.* Select a line within a dialog and select **Add to Macro**.

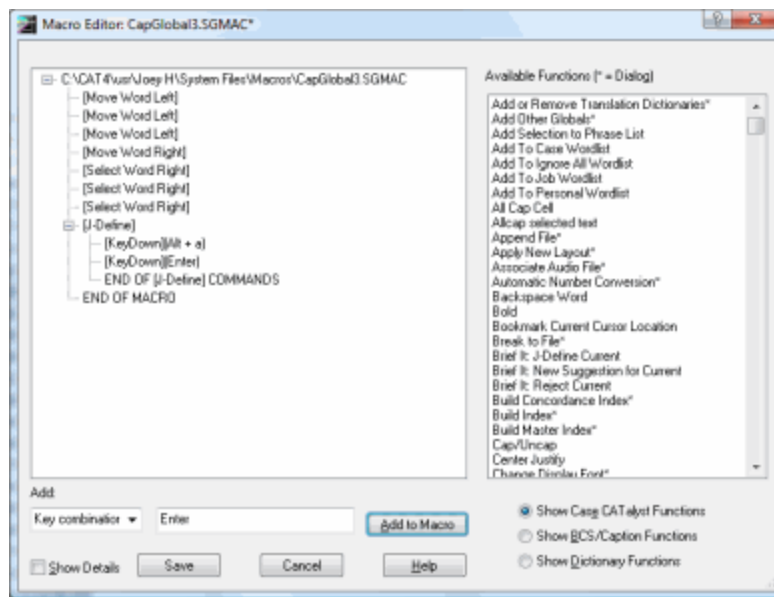

### Example

Continuing with the CapGlobal3 macro, you select **Key combination** from the drop down list.

With your cursor in the command field, you press **Enter** and then select **Add to Macro**.

The Enter command inserts after the line you highlighted, [KeyDown](Alt + a).

4. If necessary, add other key combinations, [text](#) or [functions](#). To remove a command, highlight the line and press **Delete**.
5. Press **Enter (Save)**. A confirmation message may display, depending on your save options. The Macro Editor dialog box remains open.
6. Select **Done** to close the Macro Editor dialog box.

### Add Text to an Existing Macro

1. Do one of the following:
  - From anywhere in Case CATalyst or CATalyst BCS, press **Alt + f, o, m (File/Open/Macro)**. The Open Existing Document dialog box displays with the Macros case open. Select the macro and press **Enter (Open)**.
  - In Manage Jobs, open the System Files case and then open the Macros case. Double-click a macro to open it.

2. In the Macro Editor dialog box, highlight the line within a dialog box that precedes the position where you want to insert the text. The text inserts after the highlighted item. You can insert text anywhere in the macro. You cannot insert text at the end of the macro.

Dialog boxes display with a plus sign if the view of the dialog box commands is collapsed or a minus sign if the view is expanded with the commands displayed in an indented list.

3. In the Add field:
  - a. Select **Text** from the drop down list. Text is the default. The position you highlight is remembered even though the highlight does not appear once you click in the Add Field.
  - b. Place the cursor in the command field to the right and type the text you want to add.
  - c. Select **Add to Macro**. The text inserts after the line you highlighted.
4. If necessary, add other text, [key combinations](#) or [functions](#). To remove a command, highlight the line and press **Delete**.

5. Press **Enter (Save)**. A confirmation message may display, depending on your save options. The Macro Editor dialog box remains open.
6. Select **Done** to close the Macro Editor dialog box.

## Dictionary Builder

The Dictionary Builder feature is a Manage Dictionary feature that allows you to build dictionary entries using a writing machine or your computer (QWERTY) keyboard. Dictionary Builder displays a word or phrase from an ASCII (.txt) wordlist or a dictionary builder list created by Case Prep. You can define one or more steno outlines for each word or phrase. The ASCII file must have a .txt extension and each word or phrase in the wordlist must occur on a separate line. A Speak Word command/button is available so as you are building your dictionary with a Case Prep wordlist or a downloaded wordlist, you can hear the word's pronunciation and write what you hear. In addition to the Speak Word command/button, there is an Auto-Speak option that will automatically pronounce each word/phrase as you move through the list.

Case CATalyst uses the [Dictionary Options](#) settings when encountering a conflict with steno that already exists in the same dictionary. If you are building a case or job dictionary and you enter steno that already exists in your Personal Dictionary, a *Personal Dictionary contains this steno* message displays in the Dictionary Builder dialog box. There is a *Replace spaces following titles* option located in Dictionary Options that will automatically replace a space following a title (i.e. Mr., Mrs., Dr., etc.) with a <Sticky Space> format symbol. For example, the text in the Word: field displays Dr. Kay. With the *Replace spaces following titles* option set to Yes, the space following Dr. is removed and replaced with a <Sticky Space> format symbol. Dr.<Sticky Space>Kay.

A Dictionary Builder case is located in the System Files case and is the default location for the lists of words created by [Case Prep](#). You can store lists of words in the Dictionary Builder case or use the Browse button to select your list from another location.

## Create Dictionary Entries Using the Dictionary Builder:

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**.
2. From the dictionary menu, select the type of dictionary. When you choose Case or Job, the Open Existing Document dialog box displays. Select the dictionary or type a new dictionary name and press **Enter**.
3. Press **Alt + t, b (Tools, Dictionary Builder)**. The Dictionary Builder Setup dialog box displays.
4. Make entries as necessary:

### Writer

- Stenograph Writer Serial/Bluetooth  
This option includes Stenograph's Luminex, Diamante, Wave, élan Mira, élan Cybra, Stentura Fusion, Stentura Protégé, Stentura LX, Stentura, 200/400 SRT and SmartWriter. Bluetooth is a wireless serial connection and may not be available for all writers listed.
- Stenograph Writer USB  
This option includes Stenograph's Luminex, Diamante, Wave, élan Mira, élan Cybra, Stentura Fusion and Stentura Protégé.
- Stenograph Writer WiFi  
This option includes Stenograph's Luminex, Diamante and élan Mira A3.
- StenoRam III, III+, Ultra  
This option includes Xscribe's StenoRam III, III+ and Ultra with a serial connection.

- **FlashWriter**  
This includes ProCAT's Flash steno machine and any other steno writer that uses the Flash serial connection protocol.
- **Baron TX**  
This includes Baron Transcriptor X (TX) steno machine and any other steno writer that uses the BOLT serial connection protocol.
- **Keyboard input (no writer)** allows you to use your computer (QWERTY) keyboard to input steno and does not require a connected writer.

**Comm Port**

If you are connected to your writing machine via USB, no entry is required in this field. If you are not connecting your writer via USB, select the correct COM port to which your writing machine is attached to the computer. If you selected Keyboard input (no writer) option in the Writer field, this option is grayed out.

**Wordlist**

Do one of the following:

**Start with a new wordlist**

Select **Browse** to display the Open Dictionary Builder wordlist dialog box. Select a wordlist and press **Enter (Open)**.

**Start at the beginning of a file**

Select this option to start at the beginning of the wordlist last used.

**Continue where I left off**

Select this option to continue with a wordlist you already started, beginning at the point where you previously stopped.

5. Press **Enter. (OK)**.
6. Write a stroke on your writing machine to establish a connection. If you selected Keyboard input (no writer), no action is needed.
7. The Dictionary Builder dialog box displays. The word for which you are defining displays in the *Word* field. If there is an entry in your Personal Dictionary with the same steno outline, the *Personal Dictionary contains this steno* message displays. You can enter a different steno outline or if this dictionary has a [higher priority](#) than your Personal Dictionary when translating, this entry will take priority. Do **any** of the following:
  - a. From your writing machine, stroke the steno outline for the word/phrase displayed. This option is only available if you selected a writer connection in the Setup dialog box. If you want to hear the word/phrase the default steno outline for the Speak Word command is **SPAO\*EBG**. You can customize the steno outlines used to invoke commands by clicking the Modify Steno Command button.
  - b. From your computer keyboard, type the steno outline for the word/phrase displayed. This option is only available if you selected Keyboard input (no writer) in the Setup dialog box. If you want to hear the word or phrase, press **Alt + k** which will speak the word/phrase only on demand and **Alt + u** will toggle the state of the Auto-Speak Word feature. When the Auto-Speak Word option is selected, each time you move to a new word/phrase the word/phrase will automatically be spoken.
  - c. Press **Alt + c** to toggle the capitalization of the word or phrase in the Word field.

- d. Press **Alt + g** (if active) to define additional steno outlines with a suffix.  
The Endings button is active when Case CATalyst analyzes the word and steno outline to determine if one or more suffixes (" -G", " -S" or " -D" steno) could be added to the word. Edit's [Plural Endings](#) Option setting also applies to the Endings feature. The Plural Endings option allows you to set the final S, final Z or both as keys you write to indicate a plural. You can choose any of the suggested definitions to add to your dictionary. For example, you have 'represent' in the Word field and REPT in the Steno field. The following suggested entries may display when you select Endings: REPTD = represented and REPTS = represents. The word "representing" is not suggested because the final "g" comes before the final "t" in the original steno outline.
- e. You can press **Alt + w** to move your cursor to the Word: field and edit the text word or phrase if needed. For example, the word or phrase in the Word field is misspelled. Once you correct the spelling, you use the New Outline command to keep the modified word or phrase in the Word field to create additional steno outlines.

If you were modifying the entry in the Word field to add a <Sticky Space> format symbol following a title, there is a *Replace spaces following titles* option located in Dictionary Options. When this option is set to Yes and you are using Dictionary Builder, CATalyst will automatically replace a space following a title (i.e. Dr., Mr., Mrs., etc.) with a <Sticky Space> format symbol. For example, the text in the Word: field displays Dr. Kay. With the *Replace spaces following titles* option set to Yes, the space following Dr. is removed and replaced with a <Sticky Space> format symbol. Dr.<Sticky Space>Kay.

The default setting for the *Replaces spaces following titles* option is No. If you want CATalyst to replace spaces following titles with the <Sticky Space> format symbol, change the option to Yes. Dictionary Options can be accessed while in a dictionary by pressing **Alt + t, o, t** (Tools, Options, Dictionary Options) or from Manage Jobs by pressing **Alt + t, o, d, o** (Tools, Options, Dictionary Options, Options).

If there is an entry in your Personal Dictionary with the same steno outline, the *Personal Dictionary contains this steno* message displays. You can enter a different steno outline or if this dictionary has a [higher priority](#) than your Personal Dictionary when translating, this entry will take priority.

8. Use the following commands as necessary. Click the option or stroke the steno outline associated with the command. The associated steno for each command can be changed using the Modify Steno Commands option.

### **Next Word**

Displays the next word in wordlist.

### **Previous Word**

Displays the previous word in the wordlist.

### **New Outline**

Allows you to stroke another steno outline for the same word.

### **Delete**

Delete the previous stroke.

### **Modify Steno Commands**

Display the Dictionary Builder Steno Command dialog box where you can change steno for any of the five Dictionary Builder commands. When finished making changes, press **Enter (OK)**. This button is not available if Keyboard input (no writer) was selected in the Setup dialog box.

9. When finished, select **Done**. The Dictionary Builder dialog box closes.

## Brief My Dictionary

Most users love [Brief It](#) and how it helps them write shorter and faster. Brief It is a great productivity tool. But you most likely still have multi-stroke words you are writing over and over again. How can you find them and get briefs for them without waiting for Brief It? For example, let's say that you want to see the top ten multi-stroke words/phrases that you have used in the last six months and then get one stroke briefs for them. You simply open your Personal Dictionary, open the Brief My dictionary dialog box, select a few options and press Enter. CATalyst does the work for you. You will be presented with a list of words/phrases that meet the selected criteria and a list of brief suggestions.

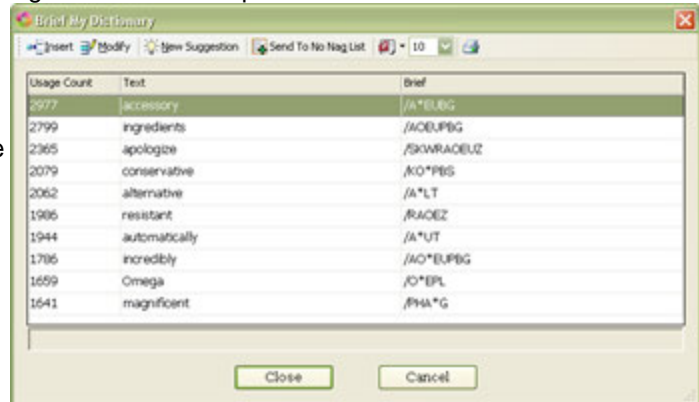

### To Use Brief My Dictionary:

1. Open your Personal Dictionary.
2. Select Tools, Brief My Dictionary (**Alt + t, f**). The Brief My Dictionary dialog box displays.
3. In the *Find entries with* section, select one of the following:
  - a) 2 or more strokes will display the most recently used multi-stroke steno outlines starting with two stroke entries.
  - b) 3 or more strokes will display the most recently used multi-stroke steno outlines starting with three stroke entries. Two stroke entries will not be analyzed or displayed.
4. In the *That do not have matching text with a* section, select one of the following:
  - a) Shorter outline means CATalyst will only analyze and display dictionary entries that do not have another identical entry in the same dictionary (and also looking at the Personal dictionary) defined with less strokes.
  - b) Single stroke outline means CATalyst will only analyze and display dictionary entries that do not have another identical entry in the same dictionary (and also looking at the Personal dictionary) defined with a single/one stroke.
5. In the *Used most frequently in the past* section, type the number of months to limit the search.
6. In the *Show* section, type the number of most recently used multi-stroke entries you would like to see at this time.
7. Press Enter or click **OK** to continue.

8. The results display in a three column dialog box with several possible actions:

- Usage Count column displays the number of times the multi-stroke entry has been used.
- Text column shows the word/phrase that meets the criteria specified.
- Brief column displays a suggested brief.

9. Do **any** of the following:

- a) Insert ( ) - adds the highlighted text and brief entry in the current dictionary. (**Alt + I** or **Ctrl + I**).

**Note:** the entry or entries are added to the dictionary when you click Close which also closes the dialog box.

- b) Modify ( ) - positions the cursor in the Brief column and makes it editable so you can create your own brief (**Alt + m** or **Ctrl + m**).

**Note:** the modified entry or entries are added to the dictionary when you click **Close** which also closes the dialog box.

- c) New Suggestion ( ) - removes the current brief and suggests a different brief for the highlighted entry. (**Alt + n** or **Ctrl + n**).

If Brief My Dictionary cannot suggest a brief for the selected word/phrase the following dialog box displays prompting if you want to remove the word/phrase from the list. Click **Yes** to remove the word/phrase or **No** to keep the word/phrase in the list.

- d) Send To No Nag List ( ) - sends the word/phrase in the Text field to the No Nag List and both Brief My Dictionary and Brief It will no longer offer suggestions (or "nag" you) for briefs for that text.

(**Alt + d** or **Ctrl + d**).

- e) To adjust the font style and size, use the font/size icon 14 .

- f) To print ( ) the list of words/phrases and the suggested briefs, click the Print icon in the dialog box.

10. If you have inserted an entry or multiple entries, press **Enter** or click Close to **add them to your dictionary**. If you select Cancel, no changes have been saved.

**Things to know:**

- If you select to insert some of the suggestions into your dictionary, **you must click Close** (or press Enter) in order for the entries to be added to your dictionary.
- If you highlight a few entries and select Insert and then review the rest of the entries and click Cancel, no entries have been added to your dictionary.
- If you select the 2 or more strokes options and a two stroke word/phrase is found, Brief My Dictionary will try to find and display a one stroke suggestion. If you select New Suggestion, a two stroke suggestion may display if no one-stroke brief can be found.
- When analyzing a dictionary, Brief My Dictionary will analyze the current dictionary you are in and compare it to your Personal Dictionary (and Update Area if you use one) to look for matching text.

**Options**

The Options menu allows you to preview and change the color theme of Case CATalyst, spell check options when spell checking your dictionary, options on how duplicate entries are handled when pasting and including, and more.

**Themes...**

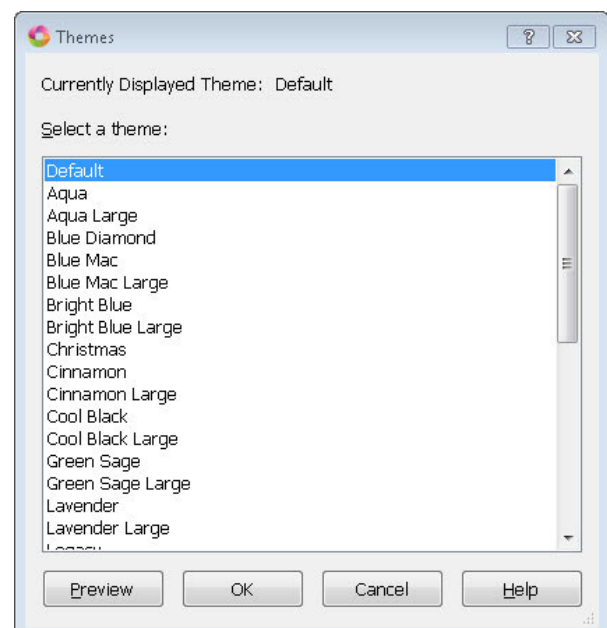

Themes affect the display of the toolbar background color, open file tab colors, dialog pane margins and the format of the open file tabs. There are a variety of pre-made themes available. You can preview a theme by selecting a theme and then clicking the Preview button (Alt + p). The current theme name is displayed at the top of the dialog box.

To Access Themes...

- in Manage Jobs, Translate and Edit and Manage Dictionary, press **Alt + t, o, h** (**Tools/Options/Themes...**).
- anywhere in CATalyst, click the All Options icon () on the toolbar.

**To select a theme:**

1. From Manage Jobs or Translate and Edit, press **Alt + t, o, h** (Tools/Options/Themes...).
2. In the Themes dialog box, highlight a theme and do any of the following:
  - a. To preview the theme, press **Alt + p** (Preview).
  - b. To apply the current theme and close the Theme dialog box, press **Enter** (OK).
  - c. To close the theme box and keep your current theme, click **Cancel**.

## Dictionary Spell Check Options

Dictionary Spell Check Options determine Spell Check parameters applied when spell checking dictionary entries. You can select automatic Spell Check features, choose Wordlists, set the number of Suggestions and choose the language type. For example, you can add a job wordlist, choose the WinterTree Medical Wordlist, activate the option to have Spell Check ignore all capped words and single characters, display notification when Spell Check completes in a text field and set the number of suggested words to display at 10.

Spell Check uses a default wordlist along with any provided wordlists you select. Spell Check will also use the Personal Wordlist and case and/or job wordlist when spell checking. If, in the rare case, there is a word you feel is misspelled in the default wordlists, you can put the word in your [Personal Wordlist](#) with the exclude attribute.

Use [Transcript Spell Check options](#) to set Spell Check parameters for spell checking during Edit. Transcript Spell Check options are set independently from Dictionary Spell Check options.

The priority of the wordlists are as follows: Ignore All (which is in memory only), Job, Case, Personal, Exclude List (if selected), optional "other" wordlists, main language wordlists provided by Wintertree, Wintertree medical (if selected), Stedman's medical (if selected), Wintertree legal (if selected) and Black's legal (if selected).

Access Dictionary Spell Check Options:

- from Manage Jobs, press **Alt + t, o, d, s** (**Tools/Options/Dictionary/Dictionary Spell Check**).
- from Manage Dictionary, press **Alt + t, o, d** (**Tools/Options/Dictionary Spell Check**).

## Dictionary Spell Check Options

To make a change, click an option. Depending on the field, check or uncheck the box or select a choice from the drop down list. When finished with all your changes, select **OK**.

### Language

Select which language set to use when running Spell Check. Selecting a language set for Spell Check affects the language set for the WinterTree Medical and Legal [Wordlists](#). Black's Law and Stedman's Medical wordlists are only available in English.

- **American English**
- **British English**
- **French** — When using French, Spell Check considers words beginning with a letter followed by an apostrophe, such as "c'est" to be misspelled and suggests a space following the apostrophe, "c' est." Change the [Advanced Spell Check](#) option, *Spell Check contractions as separate words* to prevent Spell Check from stopping on these words.
- **Italian** — When using Italian, Spell Check considers words beginning with a letter followed by an apostrophe to be misspelled and suggests a space following the apostrophe. Change the [Advanced Spell Check](#) option, *Spell Check contractions as separate words* to prevent Spell Check from stopping on these words.
- **Spanish**
- **Brazilian Portuguese**

### Options

Check the features you want active when Spell Check runs.

**Autocorrect**

Automatically correct a word with the specified alternative contained in an applied [wordlist](#). For example, Spell Check recognizes "teh" as misspelled and automatically replaces it with "the" because the entry in the applied wordlist is: "teh" Autocorrect "the".

**Ignore Allcapped Words**

Do not stop on words or abbreviations that are all capitalized and not recognized by Spell Check.

**Ignore Mixed Case**

Do not stop on mixed case words that have more than one initial capped letter and are not recognized by Spell Check. For example, Spell Check does not stop on "CATalyst ", "McNeal", or "OZpc."

**Ignore Mixed Digits**

Do not stop on combinations of digits and numbers not recognized by Spell Check. For example, Spell Check does not stop on 12F, t3sting, or 500th.

**Report Repeated Words**

Stop on repeated words unless the words have been added to your Personal, Case or Job wordlist.

**Strip Possessives**

Spell check only the root word.

**Suggest Split Words**

Offer two separate words as a Suggestion for a single word that can legitimately be two words. For example, Spell Check stops on "someperson" and offers the Suggestion "some person".

**Ignore Single Characters**

Do not stop on individual characters. For example, do not have Spell Check stop on the X in "X marks the spot".

**Add Changes to Wordlist**

Add the highlighted word and its replacement to the Job wordlist as a Suggest, when using the Change option. For example, Spell Check stops on the word "someperson". You select "some person" from the Suggestions list. In the wordlist, the following entry occurs: "someperson" Suggest "some person". Spell Check continues to stop on every occurrence of the word in the dictionary.

**Deselect All**

Deselect all options. You may want to use this feature when creating a macro to select a specific Spell Check option. To run a macro for a specific Spell Check option you would first need to deselect all the other options. By using Deselect All, you can deselect all the options at once and then select the specific one you want to use.

**Additional Wordlists**

Use the **Add** button to display the Open dialog box where you can locate and include other [wordlists](#) to apply during Spell Check. Once added to the list, you must check the box next to each wordlist you want to apply during Spell Check. Uncheck the box to inactivate the wordlist but keep it in the list for later use. Use **Remove** to delete the wordlist from the list. You can Add it again if necessary.

Wordlists are applied during Spell Check in a [priority](#) order. Additional wordlists are applied before all other wordlists except the Ignore All Wordlist which is a temporary wordlist that is not viewable. Wordlists contained in the Additional Wordlists field are applied in the order they occur. Use the **Move Up** and **Move Down** buttons to reorder the list.

### **Match Common Word Processors**

The Match Common Word Processors option uses an exclude list that contains all common words from the Wintertree American wordlist or Wintertree British wordlist that some commonly used spell checkers (i.e. word processor software) report as being misspelled. Although there are words in the Wintertree American wordlist or Wintertree British wordlist that commonly used spell checkers mark as misspelled, many of those same words may be recognized spellings in other spell checkers. By checking this option, you are setting CATalyst's spellchecker to stop on these words even though the built-in wordlist says these words are correct.

When you select the Match Common Word Processors option, the listed legal and medical wordlists are automatically deselected (to give you the most desired results). Deselecting the Match Common Word Processors option does not automatically reselect all the wordlists listed below. You will need to select each wordlist you want to use. All commonly used spell checkers may not have medical and legal terminology as a part of their wordlists. If all the medical and legal wordlist are deselected, you most likely will need to add some medical and legal words to your Personal Wordlist (with the Ignore attribute) so Spell Check doesn't stop on them. For example, if you select the Match Common Word Processors option and deselect the medical and legal words, you may have to add "Voir" (Voir Dire) to your Personal Wordlist so Spell Check doesn't stop on it. There may be medical words you will need to add also. If you select this option and continue to select all medical and legal wordlists, you may still find some words that commonly used spell checkers would consider misspelled. You can select all, some or none of the wordlists, it is your decision.

*This option is grayed out if American English or British English is not selected in the Language field.*

### **Use Wintertree Medical Wordlist**

Use the Wintertree Medical Wordlist.

### **Use Stedman's Medical Wordlist**

Use the Stedman's Medical Wordlist.

### **Use Wintertree Legal Wordlist**

Use the Wintertree Legal Wordlist.

### **Use Black's Legal Wordlist**

Use the Black's Legal Wordlist.

### **Display Red Squiggle Under Misspelled Words**

This option does not apply to dictionary Spell Check.

### **Spell Check While Defining**

Invoke Spell Check when inserting and modifying entries.

### **Scan While Spell Check**

This option does not apply to dictionary Spell Check.

### **Scan Options**

This option does not apply to dictionary Spell Check.

**Notify me when spellcheck completes in a text field**

When the Spell Check while Defining option is Off and you spell check a field using Spell Check (Shift + F7), the No Spelling Errors dialog box displays.

**Maximum Number of Suggestions**

Enter a number between 10 and 100 to determine the maximum number of alternative words that display in the Suggestions field. The recommended setting is 10. This is the default.

**Dictionary Options**

Dictionary Options allows you to customize whether your D-defines go directly to your Personal Dictionary or to the Update Area, what happens to conflicting entries when combining dictionaries, decide what warning messages you see and more. Settings in Dictionary Options affect all dictionaries in the user folder.

Access Dictionary Options:

- At Manage Jobs, press **Alt + t, o, d, o** (Tools, Options, Dictionary, Options).
- At Manage Jobs, press **Alt + t** and then select All Options. Navigate to the Dictionary section and select Options.
- In Manage Dictionary, press **Alt + t, o, t** (Tools, Options, Dictionary, Options).
- At Manage Dictionary, press **Alt + t** and then select **All Options**. Navigate to the Dictionary section and select **Options**.
- Click the All Options icon (  ) on the toolbar and then navigate to the Dictionary section and select **Options**.

**Dictionary Options**

Select your choice from the drop-down list on the right side of the option. When finished, to save and close the Dictionary Options dialog box, select **OK**.

**D-Defines go to the Update Area Yes/No**

When making D-defines (entries defined to the Personal Dictionary), entries are placed in the Personal Dictionary and the newest entry is always used during translation. When you open your Personal Dictionary, based on your Dictionary Options (see below) you may be prompted to take action on any conflicting (entries with identical steno outline(s) and different text definition) entries. To have your D-defines go directly to the Personal Dictionary, select **No**. By default, D-defines made while editing go to the Personal Dictionary.

When D-defines go to the Update Area, the entries go to a holding dictionary that allows you to review, revise, delete entries before moving them to your Personal Dictionary. If you work with a scopist that creates dictionary definitions or you edit on multiple computers, you may want to select the D-Defines go to Update Area option. The scopist can send the Update Area along with the edited file or you can backup and restore the Update Area on your main computer. You can then review the entries and add the ones you want to your Personal Dictionary. To have your D-defines go to the Update Area, select **Yes**.

**How to treat entries with duplicate steno from D-defines Stop for Decision / Keep New Text / Keep Old Text / Create Conflict**

When the *D-Defines go to the Update Area* option is set to No, select one of the options as the default action when D-defines conflict with entries in your Personal Dictionary. When a D-define is made while writing realtime or editing that is different than the existing Personal Dictionary entry, the entry goes into your Personal Dictionary and is automatically used until you open your dictionary. Once you open your dictionary, depending on your dictionary options, either the action that you selected is performed or you need to decide how to resolve the conflict. Select from the following options: Stop for Decision which allows you to select the action for each conflicting entry, or automatically have one of the following actions performed: Keep New Text, Keep Old Text or Create Conflict. If undecided, select Stop for Decision.

If *D-defines go to the Update Area* is set to Yes, this option is not available.

### Stop for Decision

Displays the Duplicate Entry dialog box for each conflicting steno outline along with the text definitions. Review the steno. and text and then select an action: **Keep New Text**, **Keep Old Text**, **Create Conflict** or **Keep Neither**. Keep Neither removes the original dictionary entry from the destination dictionary and does not include the new dictionary entry.

Selecting an action applies only to the duplicate entry displayed. If you want to apply the same action to all duplicate entries, check the box, *Apply this choice to the rest of the duplicate entries for this include*. When finished selecting your action, choose **OK**.

If you choose Cancel, Case CATalyst prompts you with a Yes/No option to confirm the cancellation. Selecting Yes cancels any action taken with the Include and closes the Duplicate Entry dialog box. Selecting No displays the Duplicate Entry dialog box.

### Keep New Text

Keep the text definition from the newest D-define and remove the old entry.

### Keep Old Text

Keep the text definition from the current Personal Dictionary entry and disregard the newest dictionary entry.

### Create Conflict

Keep both the original and new text to create a conflict in the entry.

## How to treat entries with duplicate steno when Including Stop for Decision / Keep New Text / Keep Old Text / Create Conflict

When using Manage Dictionary's Include feature to combine dictionaries, you need to decide how you want Case CATalyst to handle the included entries if some entries conflict (entries with identical steno outline(s) and different text definition) with entries in the destination dictionary. Select **one** of the following:

### Stop for Decision

Displays the Duplicate Entry dialog box for each conflicting steno outline along with the text definitions. Review the steno. and text and then select an action: **Keep New Text**, **Keep Old Text**, **Create Conflict** or **Keep Neither**. Keep Neither removes the original dictionary entry from the destination dictionary and does not include the new dictionary entry.

Selecting an action applies only to the duplicate entry displayed. If you want to apply the same action to all duplicate entries, check the box, *Apply this choice to the rest of the duplicate entries for this include*. When finished selecting your action, choose **OK**.

If you choose Cancel, Case CATalyst prompts you with a Yes/No option to confirm the cancellation. Selecting Yes cancels any action taken with the Include and closes the Duplicate Entry dialog box. Selecting No displays the Duplicate Entry dialog box.

### **Keep New Text**

Keep the text definition from the source and remove the old entry from the destination dictionary.

### **Keep Old Text**

Keep the text definition from the destination dictionary entry and disregard the source dictionary entry.

### **Create Conflict**

Keep both the original and new text to create a conflict in the entry.

## **What to do with source dictionary after Include   Stop for Decision / Delete Source Dictionary / Leave Source Dictionary**

The Source dictionary is the dictionary you select to bring entries into the current (destination) dictionary. You open the destination dictionary, select Include and then select the dictionary (source) you want to include into the currently opened dictionary. The default action is to Stop for Decision.

Depending on your dictionary options, if the *Warn before voiding undo ability when using Include* option (see below) is active, you will be prompted that if you continue you will not be able to undo changes that were done before the include. If you need to "undo changes" you can exit the dictionary without saving it. By default, this prompt is active.

Select **one** of the following:

### **Stop For Decision**

Displays the following message prompting you for a decision after including the entries: "Do you want to delete the source dictionary?" Select **Yes** to delete the source dictionary or **No** to retain the source dictionary after including. Stop For Decision is the default.

### **Delete Source Dictionary**

Automatically delete the source dictionary after including the entries in the destination dictionary.

### **Leave Source Dictionary**

Automatically retain the source dictionary after including the entries in the destination dictionary.

## **How to treat entries with duplicate steno when Pasting   Stop for Decision / Keep New Text / Keep Old Text / Create Conflict**

When using the cut, copy and paste commands in the Manage Dictionary function, you need to decide how you want Case CATalyst to handle the pasted entries if some entries conflict (entries with identical steno outline(s) and different text definition) with entries in the destination dictionary. Select **one** of the following:

### **Stop for Decision**

Displays the Duplicate Entry dialog box for each conflicting steno outline along with the text definitions. Review the text and select an action **Keep New Text**, **Keep Old Text**, **Create Conflict** or **Keep Neither**. When finished selecting your action, choose **OK**. No action occurs if you choose Cancel. Stop for Decision is the default. Keep Neither is an action available when you use Stop for Decision. Keep Neither removes the original dictionary entry from the destination dictionary and does not paste the new dictionary entry.

### **Keep New Text**

Keep the copied/cut text definition and remove the old entry from the destination dictionary.

### **Keep Old Text**

Retain the destination dictionary entry and disregard the copied/cut entry.

### **Create Conflict**

Keep both the original and new text to create a conflict in the entry.

### **Break steno outlines based on key order Yes/No**

Case CATalyst allows you to type text characters in the Steno field of a dialog box to generate steno characters. For example, you type JAIMS and Case CATalyst generates SKWRAEUPLS.

Select **Yes** to have Case CATalyst automatically add a / (forward slash) between steno strokes based on steno key order. For example, you type PATRIK. The result is /PAT/REUBG. You do not need to type the / . Select **No** to manually insert the slash between steno strokes to indicate multiple strokes.

### **Swap steno entered out of key order Yes/No**

Select **Yes** to have Case CATalyst automatically corrects typed steno in the Steno field of a dialog box. For example, you type READ. The steno order corrects to /RAED; TOAD corrects to TAOD.

Select **No** to not have Case CATalyst automatically correct incorrectly ordered steno keys. Case CATalyst does not generate the correct steno character or may generate the steno character as a "final" character instead of the intended "initial" character. Case CATalyst inserts / to separate strokes when it is clear a second stroke is written.

This field is only available if you select No in the *Break steno outlines based on key order* field.

### **Default Keyboard map**

Select the active [keyboard map](#) when using Manage Dictionary. Click the down arrow to display the list of available dictionaries. All dictionary keyboard maps located in the Dictionary case within your System Files case, are available for selection from the list. The Default keyboard map will be used until it is changed to another keyboard map. Only dictionary commands can be used in the dictionary keyboard map.

### **Warn before deleting entries**

Check this box to display a confirmation message when deleting dictionary entries. Each time you delete an entry, the message prompts you with a Yes/No option to continue the deletion. This is the default.

Uncheck this box to disable the confirmation message when deleting entries. You can also deselect this message by checking the option, *I understand the consequences of my actions. Please stop asking.* in the message box.

### **Warn before Search and Replace Yes/No**

Search and Replace allows you to search for and replace the text portion of a dictionary entry. You can search and replace all entries forward, backward or all matching entries at one time.

Check this box to display a confirmation message when selecting the Replace All option. The message prompts you with a Yes/No choice option to continue the replace without stopping for a decision. This is the default.

Uncheck this box to disable the confirmation message when replacing. You can also deselect this message by checking the option, *I understand the consequences of my actions. Please stop asking.* in the message box. The confirmation message displays only when you select Replace All. It does not display when you select Forward or Backward. Forward and Backward stop on every occurrence.

#### **Warn before voiding undo ability when using Include    Yes/No**

The Include feature allows you to include the entire contents of another dictionary into the displayed dictionary. You cannot Undo the Include unless you exit the dictionary without saving. All unsaved changes made prior to the Include are lost.

Check this box to display a warning message when including a dictionary. The message prompts you with a Yes/No choice option to continue the Include. This is the default.

Uncheck this box to disable the warning message when you Include a dictionary. You can also deselect this message by checking the option, *I understand the consequences of my actions. Please stop asking.* in the message box.

#### **Warn when inserting or modifying an entry in a filtered display    Yes/No**

When you display dictionary entries in a filtered view, and then modify a filtered entry so that it no longer meets the filter criteria, the modified entry no longer displays in the filtered view.

Check this box to display a warning message when the modified entry does not meet the filter criteria. The message prompts you that the entry will not be displayed and press Enter to continue.

Uncheck this box to disable the warning message when modifying an entry in filtered view. You can also deselect this message by checking the option, *I understand the consequences of my actions. Please stop asking.* in the message box.

#### **Warn when overwriting EZ Speakers Entries    Yes/No**

Check this box to display a confirmation message when you create a duplicate speaker identification with an existing token number in the Create EZ Speaker Entries feature. The message prompts you with a Yes/No choice option to overwrite the existing entry.

Uncheck this box to disable the confirmation message when identifying speaker names. You can also deselect this message by checking the option, *I understand the consequences of my actions. Please stop asking.* in the message box.

#### **Warn twice before exiting without saving changes    Yes/No**

If you have unsaved changes and you select to exit the dictionary, select Yes to have an Are you sure message display. Select No, if you do not want the extra warning dialog box. The default setting is Yes.

#### **Confirm Conflict Resolution    Yes/No**

If a dictionary entry is a conflict and you eliminate the conflict by using one of the Resolve Conflict with Choice # - Dict commands, a confirmation message displays prompting you to confirm you want to replace the conflict (conflict displays) with the conflict choice (the conflict choice displays). To disable the confirmation message from displaying when you resolve a conflict, set this option to No. To change the setting, double click the Confirm Conflict Resolution option to toggle between Yes and No. The default setting is Yes.

**Print Steno in Crowded Format Yes/No**

Check this box to print the dictionary entries in crowded line format and reduce the number of pages needed to print the dictionary entries. Crowded line format prints the steno outlines using a forward slash to separate the strokes. The steno for the entry prints on the same line. For example, let's say you have a dictionary definition for "cap on" it would print as the following when this option is set to Yes: /KA\*P /O\*PB.

Uncheck this box to print the dictionary entries to print steno outlines in steno paper tape format. For example:

```
K A * P
O* PB
```

**Display steno in "paper tape" format Yes/No**

Select **Yes**, the default, to display the steno outlines for dictionary entries in paper tape format. Paper format displays steno outlines for a dictionary entry in a vertical display as it appears written on paper tape. For example, you have the dictionary entry "arrhythmia" which contains multiple steno outlines for the dictionary entry.

```
arrhythmia      A R
                 R EU PBLG
                 PH AO E
                 K W RA
```

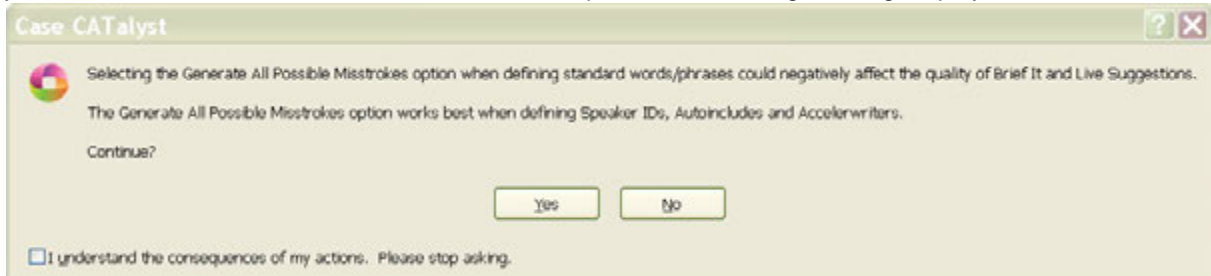

Select **No** to display the steno outlines in crowded format. This setting also affects the display of printed dictionary entries. Crowded format reduces the amount of space it takes to display the dictionary entry. In crowded steno format, multiple steno outlines for entries are separated by a slash on one or more lines. The same entry displays as:

```
arrhythmia      AR/REUPBLG/PHAOE/KWRA
```

**Warn when inserting/modifying an entry and selecting All Possible Misstrokes Yes/No**

This option will display a warning message when inserting or modifying dictionary entries in your Personal Dictionary or Update Area (if used) when you have selected the Generate All Possible misstrokes option in the Insert/Modify dialog box. The Generate All Possible Misstrokes option can be a good option when creating additional definitions for speaker identifications, realtime commands, format symbols, Auto Includes, AccelerWriters and punctuation. The option can also be helpful for case-specific or job-specific terminology (names, briefs). However, for average words and phrases, especially when a dictionary is not mature enough, using the Generate All Possible Misstrokes option is much more likely to generate defines that will either never be used in translation; mistranslates that need to be re-defined or it will prevent Brief It from working as well as it could/should. This option is set to Yes as the default action. Change the option to No if you do not want to see this warning when inserting/modifying entries in the Personal Dictionary and Update Area.

If defining to the Personal Dictionary and/or inserting/modifying an entry in the Personal Dictionary and you select the Generate All Possible Misstrokes option, the following warning displays:

- Selecting **Yes** (Alt + y) will generate all possible misstrokes for the current steno outline.
- Selecting **No** (Alt + n) will return to the Insert or Modify dialog box with the Generate All Possible Misstrokes option deselected.
- Select the *I understand the consequences of my actions. Please stop asking.* option to set the warning option to **No**.

### Column Display Order:

Customize the order in which you want the columns to display on the Manage Dictionary screen. Click in the Column Display Order: option and then click the Browse (...) button to display the Confirm Column Order dialog box. In the Choose column order section, highlight a column name and then use the arrow icons (↑ ↓) to position the order of the columns. When finished, click **OK** to save the changes.

To customize which columns display, double click the column name to toggle between Visible and Not Visible. The Text and Steno columns are inactive as those two columns will always display in a dictionary.

### Replace spaces following titles Yes/No

When this option is set to Yes and you are in the Dictionary Builder feature, a space following a title (i.e. Mr., Mrs., Dr., etc.) will automatically be replaced with a <Sticky Space> format symbol. For example, the text in the Word: field displays Dr. Kay. The space following Dr. is removed and replaced with a <Sticky Space> format symbol, Dr.<Sticky Space>Kay. Default setting is No.

### Ask to insert entry after search doesn't find a match

Select "Yes" (default) to have Case CATalyst ask if you'd like the Insert dialog to open when a text or steno match is not found by Search. the text or steno searched for will automatically appear in the Insert dialog. Selecting "No" will result in Search notifying you that a match was not found without asking if you'd like to open Insert.

### Dictionary Verify Options:

The [Dictionary Verify](#) feature, checks your dictionary for potential issues. In the Dictionary Verify reporter, you may see invalid modification date or invalid used date. There is nothing wrong with the dictionary entry, it is just the date information for specific entries is not correct. You can select to correct the issue by selecting the appropriate option listed below.

### Fix Invalid Modification Date

Double click the Fix Invalid Modification Date option to toggle between Yes and No. If set to Yes, Dictionary Verify will reset the dictionary entry date to today's date based on your computer's date.

### Fix Invalid Used Date

Double click the Fix Invalid Used Date option to toggle between Yes and No. If set to Yes, the *How to fix used date:* option is active.

### How to fix used date:

To select an option to fix the used date, click the down arrow. Select one of the following:

#### Set entry as unused

Reset the Usage Count flag to reflect the dictionary entry has never been used.

#### Set to Modification Date

Reset the Used date to match the modification date.

#### Set to today's date

Reset the Used date to today's date based on your computer's date.

## Application/Computer Options

Application/Computer Options allow you to set certain defaults for Case CATalyst. Access Application/Computer Options in Manage Jobs press **Alt + t, o, a** or Edit press **Alt + t, o, /** (**Tools/Options/Application Computer Options**).

## Application/Computer Options

To make a change, click an option. Select a choice from the drop down list. When finished with your changes, select **OK**. The *Restore Default Settings* option returns all the Advanced Edit Options to their original Case CATalyst default selection.

### Start-up Settings

#### Start-up Size

Start-up size determines the size and location of the Case CATalyst window when Case CATalyst opens. This setting affects all users on this computer. By default, Case CATalyst is set to open maximized.

#### Last Known Size

Case CATalyst opens with the last customized size and position of the Case CATalyst window. It is necessary to manually resize and position the window. Do not use Windows Aero to resize the window.

It may be necessary to change the Windows settings for the Case CATalyst shortcut icon in order for the *Last Known Size* option to function properly. Some versions of Case CATalyst install with this setting set to *Maximized*. The shortcut setting must be set to *Normal window*. To modify the Case CATalyst shortcut setting, right click the Case CATalyst icon and select **Properties**. On the Shortcut tab, in the *Run* field, select **Normal window**.

#### Maximized

The Case CATalyst window opens to the size of your screen.

#### Full Screen

The Case CATalyst window opens with only the Menu bar and Full Screen toolbar displayed. The Function Bar and all other toolbars are not shown.

**Renew expiring e-Key license**

Your e-Key, keyless access, requires reauthorization every 90 days. By default, reauthorization is set to automatically renew. Optionally, you can choose to manually reauthorize via renewal notification. This setting affects the current Case CATalyst application.

**Without Asking**

By default, this option is active to automatically reauthorize e-Key, keyless access, when the renewal date falls within 29 days. e-Key requires reauthorization every 90 days. When reauthorization successfully completes, a message displays indicating successful reauthorization. Close the message box by pressing **Enter**. The 90 days of reauthorization is added to the amount of authorized days currently remaining. Automatic reauthorization requires an Internet connection.

A reauthorization reminder message displays if automatic reauthorization is unavailable. For example, this may happen if you do not have Internet access at the time of automatic reauthorization.

**At User Direction Only**

Display a reauthorization reminder message that requires you to [manually respond](#) to renew keyless access. Internet access is necessary to respond to the notification message for reauthorization. If you do not have an Internet connection, follow the instructions in *e-Key Activation* for [No Internet Access](#).

**Check for Updates****Check for Updates Enabled**

The Check for Updates Help menu item or the Check for Updates button in the [About Case CATalyst](#) dialog box allows all users in this application to check for Case CATalyst updates. Select **Yes** to have the Check for Updates menu item and the Check for Updates button in the About Case CATalyst dialog box active and to receive update reminder messages when you haven't checked for updates for three months. There are some situations where Network Administrators or Instructors, for example, control the Case CATalyst version being used and do not want individuals updating. Select **No** to disable automatic update check reminders and gray out the Check for Updates menu item and button in the About Case CATalyst dialog box. The default is Yes.

**Track Changes****Editor ID**

Designate a name to associate with changes and comments made to a transcript with the [Track Changes](#) feature. When this option is left blank, the current user name is used as the Editor ID. The entry in this field applies to all files for all users on the system. The default is blank. To fill in the Editor ID field, click in the blank field to the right of the option and type the name.

**Always Track Changes in Edit**

The Always Track Changes in Edit option, when set to Yes, automatically sets the Track Changes option to be active when editing. If you are writing realtime and making editing changes in the file, realtime is active and track changes is not active. Once you stop translation (Ctrl + \ or File, Stop Translation) with this option set to Yes, the Track Changes feature is automatically active. This option may be ideal for a scopist who wants to track their changes in every file. If you manually turn Track Changes off in the file, it will remain off until you turn it back on or until you open the file in Edit again. The Always Track Changes in Edit option setting affects all Case CATalyst users on the current computer.

**Edit**

### **Fast Save**

Save settings works with the widest range of hardware configurations and in most situations, the selection for this option should remain Yes. Yes is the default. In a rare situation, Stenograph Technical Support may recommend changing the option to No. The selection in this field works in conjunction with Auto Save and Auto Recover and has no effect on manual saves made with Ctrl + s (File/Save) or File/Save As.

### **Touch Screen Settings**

#### **Touch Screen Sensitivity**

Use the Touch Screen Sensitivity setting to adjust the touchscreen sensitivity in Case CATalyst. This setting may need to be adjusted for each touchscreen. Select a setting between 0 and 8. 4 is the default setting.

- If tapping on the touchscreen, used to move the cursor to that screen location - is not functioning or is resulting in scrolling, select a higher number for this setting.
- If swiping on the touchscreen - used to scroll the screen - is resulting in the cursor position moving like you tapped the touchscreen, select a lower number for this setting.

## Import & Export

You can convert files produced on different CAT systems into Case CATalyst files using the Import function. You can also convert a Stentura dictionary (must be on the original export diskettes) to a Case CATalyst dictionary. Import options allow you to set general and specific import parameters.

When importing files from different CAT systems, you may need to apply a CATalyst layout to reformat the file. There may be paragraph information in the imported file that will prevent an applied layout to properly format the file. If this is the case, once the file is imported, it may be necessary to [remove all paragraph deltas](#) and then apply a CATalyst format.

The Export function allows you to convert Case CATalyst dictionaries into a format for use with the Luminex, Diamante, élan Mira or Stentura Fusion. You can also convert files (steno, text, dictionaries) to use with other CAT systems by exporting them to RTF/CRE. Files can also be exported for use with litigation software, websites or other CAT systems. Depending on the file type selected for export, export options allow you to set export parameters.

### Import

You can import the following files into Case CATalyst:

- [ASCII](#) text files.
- [Case CATalyst 3.x](#) steno note, dictionary, page layout, text files including index templates and text files with audio.
- [Cheetah RTF/CRE dictionary](#).
- [Premier Power](#) dictionary, transcript, and steno note.
- [RTF/CRE](#) dictionary, text, and note files.
- [Stentura](#) dictionary, including JDEFINES. JOB.
- [Eclipse](#) dictionary, text and note files.

Access the Import function:

- On the Function Bar, click Import .
- Press **Alt + u, i**.
- From the Menu Bar, select **Function/Import**.

### Export

Case CATalyst can export files in the following formats:

- [ASCII](#) text.
- [RTF/CRE](#) dictionary, text and steno notes.
- [HTML](#) text.
- [Luminex, Diamante, élan Mira, Stentura Fusion dictionaries](#).
- [Stentura dictionary](#).
- [PTE](#)
- [CaseViewNet](#)

- [TextMap](#)
- [PTX](#)

Fields are an editing feature available in Case CATalyst version 5.x and higher. Case CATalyst version 4.x does not support fields. When sharing files from Case CATalyst version 5.x or higher with a user running Case CATalyst 4.x, you must first [convert](#) the fields to text. Converting fields to text does not apply to other export formats. It is only necessary when you want to edit Case CATalyst version 5.x and higher files in Case CATalyst version 4.x.

Access the Export function:

- On the Function Bar, click Export  the Export dialog box displays.
- On the Function Bar, click Create ASCII  the Export dialog box displays.
- Press **Alt + u, x** the Export dialog box displays.
- From the Menu Bar, select Function/Export the Export dialog box displays.

## About ASCII Files

ASCII is an acronym for American Standard Code for Information Interchange. ASCII format is a copy of the transcript in a "generic" format without bold, underline, italics, subscript, and superscript text attributes. This generic format allows other software programs to read the file. Depending on the system using the ASCII, there is no guarantee that the ASCII file will look or print exactly the same on each system.

Use ASCII when you want to move a file from one system to another and have it print the same way on both systems. It is common to create ASCII files for clients to use with their litigation support programs.

Page numbers changed with Set Page/Question Number feature display in the exported ASCII file. The section breaks are not recognized. If you want to split the file, you must split it outside of Case CATalyst.

Tabs in the exported file convert to spaces. This allows the ASCII file to work correctly with condensing programs.

Use the Case CATalyst Create ASCII or Export function, to [save files in ASCII format](#). You can create the ASCII file on an external storage device such as a CD, thumb drive or on a hard drive. Case CATalyst creates the following types of ASCII formats: Page Image, Compress, DiscoveryZX, CaseView II, Summation, and Amicus.

When writing realtime, you can send the realtime data in ASCII/ANSII format to another location by selecting the appropriate options in the Translate Options, [Output to ASCII/ANSII](#) tab.

You can also use the universal [RTF/CRE](#) format to exchanges files, which retains much of the file formatting.

## About RTF/CRE Files

RTF is an acronym for Rich Text Format. CRE is an acronym for Court Reporter Extension. RTF/CRE is universal file formats that retain much of the original file formatting and text attributes. RTF/CRE files allow you to exchange jobs between different CAT systems. You can exchange steno notes, job dictionaries, and text files. This makes it easier, for example, for a scopist and reporter working on different CAT systems to exchange files. The quality of the formatting for an RTF/CRE import depends on the quality of the export from the original CAT system.

An exported RTF/CRE file has an .RTF file extension regardless of the original file type. Since all RTF/CRE files export with an .RTF extension, the file name must be unique so one file does not overwrite multiple file types when exporting the text, notes and job dictionary for the same file. For example, you are exporting the Anderson job dictionary and transcript file. Each file exports with the .RTF extension so the job dictionary and transcript file name must be different. You can develop your own naming convention, such as AndersonDict.RTF and AndersonText.RTF or you can let Case CATalyst suggest a name. If you select the Keep the Case CATalyst job name option when you export, Case CATalyst creates a name: Anderson\_D.RTF for the job dictionary file and Anderson\_T.RTF for the transcript file. If you export a note file, Case CATalyst adds "\_N" to the file name.

When working with a Case CATalyst 3.x user, you must export a Case CATalyst 4.x or higher file to RTF/CRE format so that the Case CATalyst 3.x user can access the files. When you export RTF/CRE files for use in Case CATalyst 3.x, it is important to note that the paragraph styles in Case CATalyst 4.x or higher control the margins for each type of paragraph format. There are no secondary margin format symbols. When you import the RTF/CRE file into Case CATalyst 3.x, all margins in the Edit file are brought to the left. To view the file as it actually appears in Case CATalyst, you can global the secondary margin format symbols into the Case CATalyst 3.x file. For example, you could create E-defines that global the secondary margin On for Colloquy and Off for Q and A.

Use the Case CATalyst Import function, to [copy RTF/CRE files](#) onto your system. Use the Case CATalyst Export function, to [save files in RTF/CRE](#) format.

You can also create files in the universal [ASCII](#) format; however, ASCII files only contain text and no underlying steno.

## Import

You can import the following files into Case CATalyst:

- [ASCII](#) text files.
- [Case CATalyst 3.x](#) steno note, dictionary, page layout, text files including index templates and text files with audio.
- [Cheetah RTF/CRE dictionary](#).
- [Premier Power](#) dictionary, transcript, and steno note.
- [RTF/CRE](#) dictionary, text, and note files.
- [Stentura](#) dictionary, including JDEFINES. JOB.

## Import ASCII Files

1. From anywhere in Case CATalyst, press **Alt + u, i (Functions/Import)**. The Import dialog box displays.

2. Make the following entries:

### Import Source

Select **ASCII**.

### Import From

Locate the folder where the ASCII files are stored. The files display in the window below.

### File of Type

ASCII files can have different extensions depending on the software which created the ASCII or the extension chosen at the time of creation. Select the file extension for the ASCII files you want to display in the window:

- ASCII Files (.txt)
- ASCII Files (.asc)
- ASCII Files (\*.v\*)
- ASCII Files (\*.txt; \*.asc; \*.v\*)
- All Files (\*.\*)

3. Click **Options** to display the Import Options dialog box.
4. Click the **ASCII Options** tab. Verify or change the following ASCII Import Options. If necessary, also set options on the [General](#) Import Options tab. When finished with import options, click **OK**.

### Default Source Folder

When you select to import ASCII files, Case CATalyst automatically looks for source files in this folder.

### Browse

Display the Browse For Folder where you can choose a default folder for storing the imported file. To create a new folder location, click the **Make New Folder** button. When finished, click **OK**.

5. Click a file to select it for Import. For multiple files, hold **Ctrl** and click the files.
6. Press **Enter (OK)**. The message, "Import Complete", displays when Import is successful.

When importing multiple files, the Save As dialog box displays for you to save each file. If the option, "Keep same filename as original system" is checked, and the filename does not currently exist, Case CATalyst names the files and completes the import. The Save As dialog box does not display.

7. Review the imported files.

## Import CATalyst 3.0 Files

Case CATalyst allows you to import Case CATalyst 3.0 note, dictionary, page layouts, text files including index templates and text files with audio. Case CATalyst 3.0 files retain their case information when imported regardless of the Import settings.

When importing Case CATalyst 3.0 text files with audio, Case CATalyst 4.x and higher retains the audio synchronization. You can use Case CATalyst audio features with the imported file, however Case CATalyst does not correct synchronization issues that existed previously in the 3.0 file. For example, if there was extensive drift in the 3.0 file importing the file into Case CATalyst version 6 does not correct the drift. Stenograph recommends correcting the drift in 3.0 before backing up the file and importing it into 6.x. To use the Audio options, you must have AudioSync capabilities.

## Import Case CATalyst 3.0 Note, Dictionary, Page Layout and Text Files

1. Press **Alt + u, i (Functions/Import)**. The Import dialog box displays.
2. Make the following entries:

### Import Source

Select **Case CATalyst 3.0**.

### Import From

If Case CATalyst 3.0 resides on the same system as Case CATalyst, the Case CATalyst 3.0 default user name displays. If the Case CATalyst 3.0 files are in a different Folder, locate the folder. Files display in the window below.

### File of Type

Select the type of files to display in the window. Although .wav files do not display in this field, Case CATalyst automatically imports a .wav file associated with a text file.

- All Case CATalyst 3.0 files
  - Only Case CATalyst 3.0 Transcript files (.ngl)
  - Only Case CATalyst 3.0 Dictionary files (.dct)
  - the Personal Dictionary lists as: perdict\$.dct
  - the Update Area lists as: update\$.dct
  - the EZ Speakers dictionary lists as: templt\$.dct
  - Only Case CATalyst 3.0 Steno files (.stn)
  - Only Case CATalyst 3.0 Page Layout file (.pgl)
3. Click **Options** and then select the Case CATalyst 3.0 Options tab to verify or change [Case CATalyst 3.0 Import Options](#). If necessary, also set options on the [General](#) Import Options tab. When finished with import options, click **OK**.
  4. Click a file to select it for import. If the files are in a case, double click the case and then select the files. For multiple files, do either of the following:
    - Press and hold **Ctrl** while you click the individual entries you want to add.
    - Click to highlight the first entry of the group. Locate the last entry. Press and hold **Shift**, while you click the last entry. All the entries in-between are highlighted.
  5. Press **Enter (OK)**. The Save As dialog box displays.
  6. Depending on your Import options, Case CATalyst suggests a name based on the original file name. Save the suggested name or type a name in the File name field. Verify the folder or select a new one.
  7. Press **Enter (Save)**. The message, "Import Complete", displays when the Import is successful. When you import multiple files, the Save As dialog box displays for you to save each file.

## Import Cheetah RTF/CRE Dictionary

1. From anywhere in Case CATalyst, press **Alt + u, i (Functions/Import)**. The Import dialog box displays.
2. Make the following entries:

**Import Source**

Select **RTF/CRE**.

**Import From**

Locate the folder where the RTF/CRE files are stored. The files display in the window below.

**File of Type**

Select **RTF/CRE Dictionary Files**.

4. Click the Cheetah dictionary to select it for Import. For multiple files, hold Ctrl and click the files.
5. Press **Enter (OK)**. If you import an RTF/CRE dictionary created by Cheetah TurboCat, the following message displays. Select TurboCat.

**The dictionary *dictionaryname.rtf* was exported by TurboCAT.**

**Please select whether this was from TurboCAT or by CAPtivor™.**

**Use my selection for all other dictionaries I'm importing right now.**

**TurboCAT**

**CAPtivor**

This message only displays when importing a RTF/CRE dictionary created by TurboCAT. It does NOT display when importing a RTF/CRE dictionary created by Cheetah SmartCat.

6. The message, "Import Complete", displays when Import is successful.

## **Import Premier Power Files**

Case CATalyst can import Premier Power Files that are backed up to diskette or reside on the hard drive. You can only import a single disk backup. If you have a multiple disk backup, Case CATalyst only restores the first disk. For best results, Stenograph suggests you optimize the file in Premier Power before importing.

## **Import Premier Power Dictionaries, Text Files and Note Files**

1. From anywhere in Case CATalyst, press **Alt + u, i (Functions/Import)**. The Import dialog box displays.
2. Make the following entries:

**Import Source**

Select **Premier Power**.

**Import From**

Locate the folder where the Premier Power files are stored. Case CATalyst defaults to looking on the hard drive for a Power\User\ folder. If a Power\User folder is not found, Case CATalyst defaults to the current user folder location. The files display in the window below.

**File of Type**

Select the type of files to display in the window. Choose to display:

- All Premier Power Files
- Premier Power Transcript Files (\*.ngl)

- Premier Power Dictionary Files (\*.dct; \*.job)
  - Premier Power Notes Files (\*.hms; \*.stn)
3. Click **Options** to display the Import Options dialog box.
  4. Select the **Premier Power** tab and make necessary entries. When finished click **Apply**. If necessary, also set options on the [General](#) Import Options tab. When finished with import options, click **OK**.

### Default Source Folder

When you select to import Premier Power files, Case CATalyst automatically looks for source files in this folder.

### Browse

Display the Browse For Folder where you can choose a default folder for storing the imported file. To create a new folder location, click the **Make New Folder** button. When finished, click **OK**.

5. Click a file to select it for Import. For multiple files, hold **Ctrl** and click the files.  
If the files you want to import are from a Premier Power backup, a Premier Power case displays. Double click the Premier Power case to view the files contained in the backup.

6. Press **Enter (OK)**. The message, "Import Complete", displays when Import is successful.

When you import multiple files, the Save As dialog box displays for you to save each file. If you checked the option, "Keep same filename as original system", and the filename does not currently exist, Case CATalyst names the files and completes the import. The Save As dialog box does not display.

7. Review the imported files.

## Import RTF/CRE Files

1. From anywhere in Case CATalyst, press **Alt + u, i (Functions/Import)**. The Import dialog box displays.
2. Make the following entries:

### Import Source

Select **RTF/CRE**.

### Import From

Locate the where the RTF/CRE files are located. The files display in the window below.

### File of Type

Select the type of files to display in the window. Choose to display:

- All RTF/CRE files
- RTF/CRE Transcript Files
- RTF/CRE Dictionary Files
- RTF/CRE Notes Files
- All Files (\*.\*)

3. Click **Options** and then select the **RTF/CRE Options** tab to verify or change [RTF/CRE Import Options](#). If necessary, also set options on the [General](#) Import Options tab. When finished with import options, click **OK**.
4. Click a file to select it for Import. For multiple files, hold **Ctrl** and click the files.
5. Press **Enter (OK)**. The message, "Import Complete", displays when Import is successful.

When you import multiple files, the Save As dialog box displays for you to save each file. If you checked the option, "Keep same filename as original system", and the filename does not currently exist, Case CATalyst names the files and completes the import. The Save As dialog box does not display.

If you import a dictionary with conflict resolution AI data, Case CATalyst prompts you to import the data into the SecondChoice Conflict Database. Conflict Resolution AI data is typically found in Eclipse RTF/CRE exported dictionaries.

6. Review the imported files.

## Import Stentura Dictionary

1. Press **Alt + u, i (Functions/Import)**. The Import dialog box displays.
2. Make the following entries:

### Import Source

Select **Stentura Dictionary**.

### Import From

Locate the disk drive from which you are going to read the Stentura dictionary. The default is the A:\ drive. Change the drive if necessary.

### JDEFINES.JOB file

Check this box to import the job dictionary, if applicable. You must have saved job defines to the job dictionary, JDEFINES.JOB, on the Stentura.

3. Click **Options** and then select the **Stentura Dictionary Options** tab to verify or change [Stentura Dictionary Import Options](#). If necessary, also set options on the [General](#) Import Options tab. When finished with import options, click **OK**.
4. Press **Enter (OK)**. A message displays instructing you to insert the diskette into the disk drive.
5. Insert the diskette and press **Enter (OK)**. The following message displays:

**Do you want to convert Stentura dictionary PERDICT\$.DCT?**

6. Select one of the following:

### All

Convert all the dictionaries on the diskettes.

### Yes

Convert the Personal Dictionary (PERDICT\$.DCT).

### No

Convert other dictionaries on the diskette.

## Import Eclipse Files

Using Case CATalyst's Import feature, you can select to import version 4 or higher Eclipse text (.ecl), steno (.not) and dictionary (.dix) file types. This capability might be helpful for customers who have recently transitioned from Eclipse to Case CATalyst. For example, let's say you have an old Eclipse transcript that you need to access or print. You can simply import the transcript into Case CATalyst instead of converting the transcript to RTF/CRE format and then importing it. Or let's say, you are an official and you now need to transcribe a steno file for a proceeding that was taken months ago while you were using Eclipse. Simply import the steno file and any job dictionaries that might be useful, translate and edit it.

This capability might also be useful for a firm that uses Case CATalyst where there are a few Eclipse files that need to be produced in the firm's format. As with all file imports, we strongly recommend you review the files after they have been imported.

Although you can import previous Eclipse files for case preparation, you can now use native Eclipse files (along with other file types) with [Case Prep](#) for preparation for an ongoing trial or depositions. Case Prep makes it easy and quick to find words that are not defined or are defined in your dictionaries by comparing previous transcripts. In addition to finding words that are defined or not defined in your dictionaries, Case Prep also suggests briefs, creates a dictionary builder file, Heads-up list and much more. You will be totally prepared for the job and your translation will look great! Case Prep is available from the Manage Jobs Tools menu.

### To import an Eclipse file:

1. From anywhere in Case CATalyst, press **Alt + u, i** (Functions, Import). The Import dialog box displays.
  2. In the Import Source section, press **Alt + e** (Eclipse).
  3. Press **Alt + b** (Browse) to navigate to the location of the Eclipse files and select it.
  4. The available Eclipse files display in the area below the path. **Select** the file or files you want to import and click **OK** (Enter). The files import with the original name unless they conflict with an existing file with the same name. If so, you will be prompted to rename the imported file.
- As with all file imports, we strongly recommend you review the files after they have been imported.

## Export

Case CATalyst can export files in the following formats:

- [ASCII](#) – Text
- [RTF/CRE](#) – Dictionary, Text and Steno Notes
- [HTML](#) – Text
- [TextMap](#) - LexisNexis CaseMap compatible document
- [PTF](#) - LiveNote compatible document
- [CaseViewNet](#)
- [PTX](#) - RealLegal compatible document
- [Luminex, Diamante, élan Mira, Stentura Fusion Dictionaries via USB](#)
- [Luminex and Diamante Dictionaries via WiFi](#)
- [Stentura Dictionary](#)

Fields are an editing feature available in Case CATalyst version 5.x and higher. Case CATalyst version 4.x does not support fields. When sharing files from Case CATalyst version 5.x or higher with a user running Case CATalyst 4.x, you must first [convert](#) the fields to text. Converting fields to text does not apply to other export formats. It is only necessary when you want to edit Case CATalyst version 5.x and higher files in Case CATalyst version 4.x.

### Export Dictionary via USB

Export Case CATalyst dictionaries to the Luminex, Diamante, élan Mira or Stentura Fusion writer via USB cable connected to the computer.

1. Be sure your Luminex, Diamante, élan Mira or Stentura Fusion is On. Insert the USB cable into the back of the writer and into your computer. Make sure no files are open on your writer.
2. Do one of the following:
  - From anywhere in Case CATalyst, press **Alt + u, x (Functions/Export)**. The Export dialog box displays. Click the **Stenograph Writer** tab.
  - Click the Export to Writer  icon. The **Stenograph Writer** tab displays. To initially access the icon, you must [add](#) the icon to the Function Bar.
3. On the Stenograph Writer tab, make necessary selections:

#### Export Files

Select the job dictionaries to export. By default, the Personal Dictionary is selected. You cannot deselect the Personal Dictionary.

You can use Power Define commands from a Case CATalyst Power Define dictionary loaded onto the Luminex or Diamante to create J-Defines. When you load your Case CATalyst Power Define dictionary onto your Luminex or Diamante, the Luminex or Diamante Spell Mode feature is disabled and the Power Define dictionary takes the highest priority over other dictionaries in the Luminex and Diamante J-Define feature. If you export your Power Define dictionary, review the Luminex or Diamante Spell Mode format commands and make sure there are entries in their Power Define dictionary before exporting.

#### Export With

Select **USB (All)**. You must have the USB driver installed on your computer. For information on loading the USB driver, see the appropriate user guide for your writing machine.

#### Export Spell Check Wordlist

Check this box to export the Case CATalyst Spellcheck wordlist. The Case CATalyst Spellcheck wordlist is CATalyst's internal wordlist and not personal, case or job wordlists. The Spellcheck wordlist is used by the Suffix feature on the Luminex, Diamante, élan Mira and Stentura Fusion Suffix to append and spell check root words with suffixes. Using the Suffix feature provides for easier readback on the writing machine screen.

You must be using the Diamante, élan Mira V3.00 or above or the Stentura Fusion V3.00 or above to use this feature.

#### Export Prefixsuffixrules.ini File

Check this box to export the Case CATalyst [Prefixsuffixrules.ini](#) file. The Prefixsuffixrules.ini file is used to enhance the Suffix feature on the Luminex, Diamante, élan Mira and Stentura Fusion. Using the Suffix feature provides for easier readback on the writing machine screen. When the Prefixsuffixrules.ini File option is grayed out, there is no Prefixsuffixrules.ini file in your System Files case. A Prefixsuffixrules.ini file is not necessary to use the Suffix feature.

You must be using the Diamante, élan Mira V3.00 or above or the Stentura Fusion V3.00 or above to use this feature.

### Show Export Complete message box

Check this box to display the message, *Export Complete*, when Case CATalyst completes the export. Uncheck the box to prevent the display of the *Export Complete* message. The selection for this option applies to all the tabs in the Export dialog box.

4. Press **Alt + e (Export)**. The writing machine beeps and briefly displays a progress bar along with a series of messages as the dictionaries load. When the writing machine finishes loading the dictionaries, it reboots.
5. Depending on your Case CATalyst setting, the export message, *Export Complete*, may display.

## Export Dictionary Via WiFi

Case CATalyst version 12.5 or higher and a Luminex or a WiFi enabled Diamante version 1.13 or higher allows export of Case CATalyst dictionaries to the Luminex or Diamante via WiFi.

1. Ensure your Luminex or Diamante and computer are turned On and fully booted. Make sure no files are open on your writer.
2. Ensure the Luminex or Diamante WiFi option is On and you are connected to the same network as the Case CATalyst computer.
3. In Case CATalyst, open the Export function and select the **Stenograph Writer** tab. Do **one** of the following:
  - From anywhere in Case CATalyst, press **Alt + u, x (Functions/Export)**. The Export dialog box displays. Click the **Stenograph Writer** tab.
  - Click the Export to Writer  icon. The Stenograph Writer tab displays. To initially access the icon, you must [add](#) the icon to the Function Bar.
4. Make necessary entries:

### Export Files

Select the job dictionaries to export. By default, the Personal Dictionary is selected to ensure you have the most recent version on your Luminex or Diamante. You cannot deselect the Personal Dictionary.

You can load a Case CATalyst Power Define dictionary onto the Luminex or Diamante and use Power Define commands to create J-Defines. When you load your Case CATalyst Power Define dictionary onto your Luminex or Diamante, the Luminex/Diamante Spell Mode feature is disabled and the Power Define dictionary takes the highest priority over other dictionaries in the Diamante J-Define feature. If you export your Power Define dictionary, review the Luminex/Diamante Spell Mode format commands and make sure there are entries in their Power Define dictionary before exporting. See your Luminex or Diamante User Guide for all Spell Mode characters.

### Export With

Select **WiFi**. Ensure the Luminex or Diamante WiFi option is On and you are connected to the same network as the Case CATalyst computer. See your Luminex User Guide or Diamante WiFi guide for more information.

### Export Spell Check Wordlist

Check this box to export the Case CATalyst Spellcheck wordlist. The Case CATalyst Spellcheck wordlist is CATalyst's internal wordlist and not personal, case or job wordlists. The Spellcheck wordlist is used by the Suffix feature on the Luminex, Diamante, élan Mira and Stentura Fusion Suffix to append and spell check root words with suffixes. Using the Suffix feature provides for easier readback on the writing machine screen.

You must be using the Luminex, Diamante, élan Mira V3.00 or above or the Stentura Fusion V3.00 or above to use this feature.

### Export Prefixsuffixrules.ini File

Check this box to export the Case CATalyst [Prefixsuffixrules.ini](#) file. The Prefixsuffixrules.ini file is used to enhance the Suffix feature on the Luminex, Diamante, élan Mira and Stentura Fusion. Using the Suffix feature provides for easier readback on the writing machine screen. When the Prefixsuffixrules.ini File option is grayed out, there is no Prefixsuffixrules.ini file in your System Files case. A Prefixsuffixrules.ini file is not necessary to use the Suffix feature.

You must be using the Luminex, Diamante, élan Mira V3.00 or above or the Stentura Fusion V3.00 or above to use this feature.

### Show Export Complete message box

Check this box to display the message, *Export Complete*, when Case CATalyst completes the export. Uncheck the box to prevent the display of the *Export Complete* message. The selection for this option applies to all the tabs in the Export dialog box.

5. Press **Alt + e (Export)**. The Luminex or Diamante beeps and briefly displays a progress bar along with a series of messages as the dictionaries load. When the writing machine finishes loading the dictionaries, it reboots.
6. When the Luminex or Diamante finishes loading the dictionaries, it reboots, displaying the Opening menu. A verifying dictionary message may display. Depending on your Case CATalyst setting, the message, Export Complete, may display. Export Complete, may display.

## Export Dictionary via Disk

Export Case CATalyst dictionaries to the élan Mira or Stentura Fusion writer via diskette or Data SD card.

1. Do one of the following:

- From anywhere in Case CATalyst, press **Alt + u, x (Functions/Export)**. The Export dialog box displays. Click the **Stenograph Writer** tab.
- Click the Export to Writer  icon. The **Stenograph Writer** tab displays. To initially access the icon, you must [add](#) the icon to the Function Bar.

2. Do one of the following:

### Data SD Card

Insert a Data SD card with enough available space for dictionaries you are exporting into a USB Flash Drive reader. Insert the reader into an available USB port on your computer. If you have an SD slot built into your computer, you do not need to use the USB Flash Drive reader.

### Diskette

Insert a blank formatted diskette into the computer diskette drive.

3. Make necessary entries:

### Export Files

Select the job dictionaries for exporting to the élan Mira or Stentura Fusion. By default, the Personal Dictionary is selected. You cannot deselect the Personal Dictionary.

You can load a Case CATalyst Power Define dictionary onto the Luminex or Diamante and use Power Define commands to create J-Defines. When you load your Case CATalyst Power Define dictionary onto your Diamante, the Diamante Spell Mode feature is disabled and the Power Define dictionary takes the highest priority over other dictionaries in the Diamante J-Define feature. If you export your Power Define dictionary, review the Luminex or Diamante Spell Mode format commands and make sure there are entries in their Power Define dictionary before exporting.

### Export With

Select **Drive (élan/Fusion)** and then select the appropriate drive letter for the floppy diskette (original Mira) or Data SD card on your computer.

### Export Spell Check Wordlist

Check this box to export the Case CATalyst Spellcheck wordlist to enhance the élan Mira/Stentura Fusion Suffix feature. The élan Mira/Stentura Fusion Suffix feature uses the Spellcheck wordlist to append and spell check root words with suffixes. The élan Mira/Stentura Fusion Suffix feature provides for easier readback on the writing machine screen when using suffixes. You must have élan Mira/Stentura Fusion V3.00 or above to use this feature.

### Export Prefixsuffixrules.ini File

Check this box to export the Case CATalyst [Prefixsuffixrules.ini](#) file to enhance the élan Mira/Stentura Fusion Suffix feature. When the Prefixsuffixrules.ini File option is grayed out, there is no Prefixsuffixrules.ini file in your System Files case. A Prefixsuffixrules.ini file is not necessary to use the Suffix Handling feature.

The élan Mira/Stentura Fusion Suffix feature uses the Prefixsuffixrules.ini file to append and spell check root words with suffixes. The élan Mira/Stentura Fusion Suffix feature provides for easier readback on the writing machine screen when using suffixes. You must have élan Mira/Stentura Fusion V3.00 or above to use this feature.

### Show Export Complete message box

Check the box to display the message, *Export Complete*, when Case CATalyst completes the export. Uncheck the box to prevent the display of the *Export Complete* message. The selection for this option applies to all the tabs in the Export dialog box.

4. Select **Export**. Case CATalyst displays the message: *Please insert disk number 1 into drive x:\ and press OK*
5. Press **Enter (OK)**. Case CATalyst displays the message: *Transferring Dictionaries to Disk*.

If using diskettes, Case CATalyst prompts you to insert the next diskette if necessary.

6. Do one of the following:

**Data SD Card**

Using the Windows Safely Remove Hardware utility, remove the USB Flash Drive reader from the computer.

**Diskette**

Remove the diskette from the diskette drive.

7. Load the dictionaries into the élan Mira or Stentura Fusion writer. Do one of the following:

**Data SD Card**

- a. Turn your élan Mira or Stentura Protégé Off.
- b. Insert the Data SD card containing the dictionaries into the élan Mira or Stentura Fusion Data SD slot.
- c. Turn the élan Mira or Stentura Fusion **On**. The writing machine automatically loads the dictionaries from the Data SD card. A progress bar displays along with a series of messages as the dictionaries load.
- d. When prompted, remove the Data SD card and press **OK**. The élan Mira reboots and is ready to use.

**Diskette**

- a. Turn your élan Mira Off.
- b. Insert the first diskette into the diskette drive of the élan Mira and turn the writer On. The élan Mira begins to load the dictionary, prompting you to load additional diskettes if necessary.
- c. When the élan Mira finishes loading the dictionary, press **OK** when prompted.
- d. The élan Mira reboots and is ready to use.

## Export Stentura Dictionary

Exporting to Stentura dictionary includes exporting to the Stentura 8000 or 8000LX. To export to a Stentura Fusion dictionary, see the [Export Dictionary via USB](#) topic.

1. From anywhere in Case CATalyst, press **Alt + u, x (Functions/Export)**. The Export dialog box displays.
2. Click the **Stentura** tab. Make entries as necessary:

**Export Files**

Select the Stentura job dictionaries you want to export. To select your Personal Dictionary, check the Export Personal Dictionary box.

**Export to drive**

Select the drive to which you want to export the Stentura dictionaries. The default drive is A:\

**Export Personal Dictionary**

By default, the Personal Dictionary is selected. You cannot deselect the Personal Dictionary.

If this is the first time, in the current user name, you are selecting to export a Stentura dictionary; Case CATalyst automatically selects the Personal Dictionary.

**Stentura Memory Size**

The Stentura writer comes standard with 2 megabytes of memory. The default for this field is 2MB. If you have a 4 megabyte Stentura, select **4MB**.

All Stentura LX steno machines with serial numbers after 8045119 have 4 megabytes of memory. If you are unsure of the size of your Stentura writer memory, check your invoice for the 4 megabyte option.

Memory size options:

**2MB**

**4MB**

**Show Export Complete message box**

Check the box to display the message, *Export Complete*, when Case CATalyst completes the export. Uncheck the box to prevent the display of the *Export Complete* message. The selection for this option applies to all the tabs in the Export dialog box.

3. Press **Alt + e (Export)**. If you select a floppy disk drive, Case CATalyst prompts you to insert a disk. Insert a diskette into the drive and press **Enter (OK)**. Case CATalyst prompts you to insert the next diskette if additional disks are necessary to Export the selected Stentura dictionaries. Be sure to label the diskettes.

**Export to PTF**

A PTF tab is available in the Export dialog box allowing you to export a transcript directly to a PTF file. A PTF file can be opened in LiveNote™ software products. If a concordance index exists in the original transcript, the PTF export will ignore the concordance index and will not be a part of the PTF file.

**Export File to PTF Format**

1. From anywhere in Case CATalyst, press **Alt + u, x (Functions/Export)**. The Export dialog box displays.
2. Click the **PTF** tab and then click **Options...** Make entries as necessary:
3. Click **OK** to save your settings and continue. At the PTF export tab, you can export the entire document or range of pages.

**Range**

The range of pages for which you want to create the ASCII. Select **one**:

**Entire Document**

Export all the pages in the file. Whether the transcript has sections or not, the entire file will be exported to one PTF file.

**Selected Pages**

There may be times when you only want to provide your clients with specific pages of the PTF file because of confidential or redacted information. You can type the page numbers in the field for the pages you want to provide to your clients. To export selected pages, separate the page numbers with a comma with no space following the comma. For example, to export page 5 and page 25, type: 5,25

To export a series of pages, type the beginning page number, followed by a hyphen, and then followed by the ending page number. For example, to export page 5 through 10, type: 5-10.

To export a combination of individual and consecutive pages, type the individual page number separated by a comma, and then beginning page numbers for the consecutive pages, followed by a hyphen, and then the ending page number and all separated by commas with no spaces following the comma. For example, to include page 5, pages 15 through 20, and page 29, type the following: 5,5-20,29.

If the file has sections and you want to print a specific page from a section, type the section number, a colon and then the page number. For example, if you wanted to print page 3 from section 7, type: 7:3.

If you want to export a specific page or pages from multiple sections, type the section, colon and then page number followed by a comma and then section, colon and then page number. For example, let's say you want to export page 4 from section 2 and page 7 from section 4, type 2:4, 4:7.

### Section

If the file has multiple sections and you want to export a specific section, select the section to export from the drop-down list.

### Show Export Complete message box

Check the box to display the message, *Export Complete*, when Case CATalyst completes the export. Uncheck the box to prevent the display of the *Export Complete* message. The selection for this option applies to all the tabs in the Export dialog box.

4. To change the export location or other output options, click **Options**
5. Press **Enter (Save)** to export the file. When finished exporting files, Case CATalyst displays the message, *Export Complete*.

## Export to PTF Options

### Output

#### Default Location

The default drive and folder location where you are creating the PTF file. Your selection in this field displays under *Output to:* on the Export PTF tab. From the drop down list, choose a location:

- Same folder as selected file.
- another folder location. Use **Browse** to add alternate locations to the list.

#### Extension

The transcript exports with a PTF extension. The field is grayed out and cannot be changed.

#### Keep CATalyst Job Name

Check this box to keep the original Case CATalyst file name when you export the file.

#### If original filename already exists, automatically suggest a new name

Check this box to have Case CATalyst automatically suggest a new file name to the exported file if it detects that the file name already exists on the destination location. For example, if you are importing the Smith file and the Smith file already exists, Case CATalyst suggests Smith 1.

## Formatting

Only two options are available in the PTF export. All other options are grayed out and unavailable.

### Cap All

Check this box if you want the text in the ASCII file to appear in all capital letters.

### Include Timestamps

If the original file contains timestamps, you can include timestamps in the PTF file. Select **one** of the following to determine how timestamps display:

- Clock (Actual time)
- Elapsed (Starting at 0:00)

## Export to ASCII

Export to ASCII allows you to create a generic version of the transcript. In other words, it allows the transcript to be opened in litigation products, Notepad, Microsoft Word or other text editors. There are several different [ASCII format options](#) available such as Page Image, Compressed , CaseView, Summation, Amicus and raw ASCII. If you provide different ASCII formats for different clients, you can select the ASCII options and save them to an ASCII saved settings file. You can have as many saved ASCII settings files as needed. When you need to create an ASCII, load the settings file, select the transcript and create the ASCII -- as simple as that.

Using the Range feature, you can export the entire file, sections or specific pages to an ASCII format.

When exporting to ASCII, Case CATalyst analyzes the layout of the selected file to determine the left most paragraph margin. Case CATalyst considers all paragraph styles in the layout to determine if a left margin value less than the line number value exists. This includes all paragraph styles in the layout that are not used in the transcript.

Export to ASCII is available via the Functions menu, at Manage Jobs by right clicking a transcript and selecting Export to ASCII and is also available in [Finish 'em](#).

## Export File to ASCII Format

1. From anywhere in Case CATalyst, press **Alt + u, x (Functions/Export)**. The Export dialog box displays.
2. Click the **ASCII** tab. Make entries as necessary:

### Export Files

Select the files you want to export by checking the box next to each file name. To export all the files in a case, check the box next to the case.

### Key Selected Options

The currently selected export options for the ASCII file.

#### Type

The type of ASCII you are creating. The last type of ASCII file created displays. For more information on ASCII types, see [ASCII format options](#).

#### Output to

The drive and folder location where you are creating the ASCII file.

### **Additional copy to**

This field displays if you select to create an additional copy of the ASCII file.

### **Load Settings**

Load a different set of options for exporting the file. The Saved ASCII Settings dialog box displays where you can select a file to use. Choose the file and press **Enter (Open)** to load the settings. The name for the currently loaded settings file displays to the right of the Load and Save Settings buttons.

### **Save Settings**

Save the current ASCII Export settings. The Save ASCII Settings dialog box displays. In the File name field, type a name to identify this group of settings and press **Enter (Save)**. Case CATalyst saves the file in the Saved ASCII Settings case located in the System Files case.

### **Always Remember Last Used Setting**

Check this box to always export with the last settings used.

### **Options**

Change [ASCII Export Options](#). In the ASCII Export Options dialog box, make necessary entries and then press **Enter (OK)** to accept the changes and return to the Export ASCII tab.

### **Range**

The range of pages for which you want to create the ASCII. Select **one**:

#### **Entire Document**

Export all the pages in the file. Whether the transcript has sections or not, the entire file will be exported to one ASCII file.

#### **Selected Pages**

There may be times when you only want to provide your clients with specific pages of the ASCII file because of confidential or redacted information. You can type the page numbers in the field for the pages you want to provide to your clients. To export selected pages, separate the page numbers with a comma with no space following the comma. For example, to export page 5 and page 25, type: 5,25

To export a series of pages, type the beginning page number, followed by a hyphen, and then followed by the ending page number. For example, to export page 5 through 10, type: 5-10.

To export a combination of individual and consecutive pages, type the individual page number separated by a comma, and then beginning page numbers for the consecutive pages, followed by a hyphen, and then the ending page number and all separated by commas with no spaces following the comma. For example, to include page 5, pages 15 through 20, and page 29, type the following: 5,5-20,29.

If the file has sections and you want to print a specific page from a section, type the section number, a colon and then the page number. For example, if you wanted to print page 3 from section 7, type: 7:3.

If you want to export a specific page or pages from multiple sections, type the section, colon and then page number followed by a comma and then section, colon and then page number. For example, let's say you want to export page 4 from section 2 and page 7 from section 4, type 2:4, 4:7.

### Section

If the file has multiple sections and you want to export a specific section, select the section to export from the drop-down list.

#### Show Export Complete message box

Check the box to display the message, *Export Complete*, when Case CATalyst completes the export. Uncheck the box to prevent the display of the *Export Complete* message. The selection for this option applies to all the tabs in the Export dialog box.

3. Press **Enter (Export)**. If the destination location contains an ASCII file with the same name as the ASCII file you are creating, the Save As dialog box displays. Depending on your Export options, Case CATalyst suggests a name based on the original file name. Save the suggested name or type a name in the File name field and press **Enter (Save)**.

If you select a floppy disk drive, Case CATalyst prompts you to insert a disk. Insert a diskette into the drive and press **Enter (OK)**. If you selected v1 for the ASCII extension, Case CATalyst prompts you to insert the next diskette if additional disks are necessary to Export the selected file.

4. Press **Enter (Save)** to export the file.

If you select a floppy disk drive:

- Case CATalyst prompts you to insert a disk. Insert a diskette into the drive and press **Enter (OK)**. If you selected v1 for the ASCII extension, Case CATalyst prompts you to insert the next diskette if additional disks are necessary. If additional diskettes are necessary, Case CATalyst displays which pages are on each diskette. Be sure to label the diskettes.
  - Case CATalyst creates the ASCII file and then displays the following message, *Would you like to save this ASCII to another diskette?* To make another copy of the diskette, select **Yes**. To complete the export, select **No**. If you select multiple files for export, Case CATalyst displays this prompt for each file. You can disable this message by modifying a setting in the UserSettings.sgxml file.
5. When finished exporting files, Case CATalyst displays the message, *Export Complete*, if the option is selected.

### Set Lines Per Page for ASCII Output

Case CATalyst has a default setting of 34 double spaced lines in an ASCII file. When more than 34 double spaced lines exist, Case CATalyst considers the entire ASCII single spaced. In rare occurrences, a transcript may exceed 34 double space lines. You can change the default setting to have Case CATalyst recognize a larger number of double spaced lines when creating an ASCII.

### Change the Number of Lines per Page ASCII Output

1. Be sure you are in your User name.
2. From Manage Jobs, open the **System Files** case.
3. Double click the **UserSettings.sgxml** file. The Settings Manager dialog box displays.
4. Click in the dialog box and press **Ctrl + f**. The Find dialog box displays.
5. Type **AsciiMaxDSLinesPerPage** and press **Enter** to move to the *AsciiMaxDSLinesPerPage* option.
6. Click the **Edit** icon.
7. Type the desired number of transcript double spaced lines per page in the field and click **OK**. To restore the default setting, click **Default**.

8. Press **Alt + s (Save)** to save the setting and close the dialog box.

## Export to HTML

You can export text files in HTML format:

1. From anywhere in Case CATalyst, press **Alt + u, x (Functions/Export)**. The Export dialog box displays.
2. Click the **HTML** tab. Make entries as necessary:

### Export Files

Select the files you want to export by checking the box next to each file name. To export all the files in a case, check the box next to the case. The entire HTML file will be exported.

### Key Selected Options

The currently selected export options for the HTML file.

#### Type

Page Image is the only type of HTML you can create.

#### Output to

The drive and folder location where you are creating the HTML file.

#### Options

Change HTML export options. The HTML Export Options dialog box displays. Make entries as necessary. When finished, press **Enter (OK)** to accept the option values and return to the Export HTML tab.

### Show Export Complete message box

Check the box to display the message, *Export Complete*, when Case CATalyst completes the export. Uncheck the box to prevent the display of the *Export Complete* message. The selection for this option applies to all the tabs in the Export dialog box.

3. Press **Enter (Export)**. If the destination location contains an HTML file with the same name as the HTML file you are creating, the Save As dialog box displays. Depending on your Export options, Case CATalyst suggests a name based on the original file name. Save the suggested name or type a name in the File name field and press **Enter (Save)**.

If you select a floppy disk drive, Case CATalyst prompts you to insert a disk. Insert a diskette into the drive and press **Enter (OK)**. Case CATalyst prompts you if additional disks are necessary.

4. When finished exporting files, Case CATalyst displays the message, *Export Complete*.

## Export to HTML Options

### Output

#### Default Location

The default drive and folder location where you are saving the HTML file. Use Browse to select a different location. This selection displays under Key Selected Options on the Export HTML tab.

#### Keep CATalyst Job Name

Check this box to keep the original Case CATalyst file name when you export the file. Uncheck this box to have Case CATalyst prompt you for a name when exporting.

**If original filename already exists, automatically suggest a new name**

Check this box to have Case CATalyst automatically suggest a new file name for the exported file if it detects that the file name already exists on the destination location. For example, if you are exporting the Smith file and the Smith file already exists, Case CATalyst suggests Smith 1.

**Formatting**

**Include Page Numbers**

Check this box to include page numbers in the HTML file.

**Column**

This option is unavailable.

**Include Paragraph Numbers**

Check this box to include the paragraph numbers in the HTML file.

**Renumber Paragraphs**

Check this box to renumber the paragraphs in the HTML file. You must also make an entry in the First Paragraph Number field.

**Cap All**

Check this box if display the text in the HTML file in all capital letters.

**Form Feeds: Beginning of Job**

This option is unavailable.

**Form Feeds: Beginning of Job**

This option is unavailable.

**Form Feeds: Beginning of Job**

This option is unavailable.

**Include Line Numbers**

Include line numbers in the HTML file.

**Include Headers and Footers**

Include the headers and footers from the job in the HTML file.

**Include Timestamps**

If the original file contains timestamps, you can include timestamps in the HTML file. Select **one** of the following to determine how timestamps display:

- **Clock** (Actual time)
- **Elapsed** (Starting at 0:00)

## Export to RTF/CRE

RTF is an acronym for Rich Text Format. CRE is an acronym for Court Reporter Extension. RTF/CRE is universal file formats that retain much of the original file formatting and text attributes. RTF/CRE files allow you to exchange jobs between different CAT systems and possibly dictionaries in writing machines. You can exchange steno notes, job dictionaries, and text files by using the [Export to RTF/CRE feature](#). **Using the Export function, you can export note, text and dictionary files to RTF/CRE format. You can also export these files from within their respective Case CATalyst function using the Export to RTF/CRE feature. Export note files from Manage Notes, dictionary files from Manage Dictionary and text files from Edit.**

When exporting files to RTF/CRE, the default extension for the files is .rtf. When exporting files to RTF/CRE from Manage Jobs, Case CATalyst automatically names the RTF/CRE versions of the file with an added letter to distinguish the file type. In other words, let's say you are exporting the steno notes, dictionary and text file of the Petersen file. By default, Case CATalyst names the RTF/CRE files as follows: Petersen\_S.rtf (steno file), Petersen\_D.rtf (dictionary) and Petersen\_T.rtf (text file). When exporting a file from its respective Case CATalyst function, by default the RTF/CRE version becomes a subfile of the file name. For example, let's say you are exporting the Jones dictionary from within Manage Dictionary. When you export the dictionary, you will see an Jones.rtf subfile.

When exporting a file to RTF/CRE format, Case CATalyst includes any steno that was marked as deleted in the job, information for field names and captioning related format symbols if applicable.

Tables, by default, do not export to RTF/CRE. You can change the setting in [RTF/CRE Export Options](#). Exported tables may require minor adjustments to cell margins and line breaks.

Italic and Bold font styles contained in a paragraph style are retained in the exported. RTF/CRE file.

## Export File to RTF/CRE Format

1. From anywhere in Case CATalyst, press **Alt + u, x (Functions/Export)**. The Export dialog box displays.
2. Click the **RTF/CRE** tab. Make entries as necessary:

### Export Files

Select the files you want to export by checking the box next to each file name. To export all the files in a case, check the box next to the case.

### File of Type

Select the type of files you want to display in the Export Files field. Click the down arrow to display a list of file types. Choose **one**:

- **All Files**
- **Transcript Files (.sgngl)**
- **Dictionary Files (.sgdct)**
- **Note Files (.sgstn)**

### Options

Change the RTF/CRE Export Options. In the RTF/CRE Export Options dialog box make necessary entries and then press **Enter (OK)** to accept the changes and return to the RTF/CRE Export tab.

### Show Export Complete message box

Check the box to display the message, *Export Complete*, when Case CATalyst completes the export. Uncheck the box to prevent the display of the *Export Complete* message. The selection for this option applies to all the tabs in the Export dialog box.

3. Press **Enter (Export)**. The Save As dialog box displays. Depending on your import options, Case CATalyst suggests a name based on the original file name. Save the suggested name or type a name in the File name field and press **Enter (Save)**.

If you select a floppy disk drive, Case CATalyst prompts you to insert a disk. Insert a diskette into the drive and press **Enter (OK)**. Case CATalyst prompts you to insert the next diskette if additional disks are necessary. Be sure to label the diskettes.

4. Press **Enter (Save)** to export the file. To cancel the export, select **Cancel**. If you selected multiple files to save and want cancel the save for all of them, check the **Cancel All Remaining Saves** option.

## Export from within a Case CATalyst function

1. In Edit, Manage Notes or Manage Dictionary, press **Alt + f, e (File/Export to RTF/CRE)**. The Save As dialog displays.
2. If necessary, select a different folder in which to save the file. You may, for example, want to save the file to a flash/thumb drive located on a different drive. For example, the flash/thumb drive might be assigned to the E:\ drive.
3. The current file name displays in the File name field. If you use the current filename, Case CATalyst exports the file with the .rtf extension. For example, a text file in Case CATalyst is collins.sgngl. When exported from within the Edit function, the file name becomes collins.rtf. If the filename already exists in the folder to which you are exporting, Case CATalyst prompts you to replace the existing file.

If you want to use a different name, type the new name in the File name field.

4. Press **Enter (Save)**.

## Export to CaseViewNet

If you have an active [CaseViewNet](#) license, you will see an CaseViewNet export tab. If you select to export a transcript to CaseViewNet, the transcript is converted to a CaseViewNet format. The exported transcript has a .sgcwn file extension and can be opened in CaseViewNet. If you do not have an active CaseViewNet license, the CaseViewNet tab does not display on the Export dialog box.

Export to CaseViewNet is available via the Export dialog box and at Manage Jobs by right clicking a transcript and selecting Export to CaseViewNet. The CaseViewNet option will not display in the Export dialog box or at Manage Jobs' right click menu if there is not an active CaseViewNet license.

## Export File to CaseViewNet

1. From anywhere in Case CATalyst, press **Alt + u, x (Functions/Export)**. The Export dialog box displays.
2. Click the **CaseViewNet** tab.
3. In the *Export Files* field, select the transcripts to export.
4. The *Output to* field identifies the export location. To change the export location or other output options, click **Options**. The CaseViewNet Export Options dialog box displays.

### Show Export Complete message box

Check the box to display the message, *Export Complete*, when Case CATalyst completes the export. Uncheck the box to prevent the display of the *Export Complete* message. The selection for this option applies to all the tabs in the Export dialog box.

5. Make necessary entries. When finished press **Enter (OK)** to close the dialog box.

### Default Location

The drive and folder location for the exported file. The default uses the same folder as the current file. Use **Browse** to select another location. Once you use the selected location, it is available from the drop down list.

### Keep Case CATalyst Job Name

Select this option to keep the original Case CATalyst file name when you export the file. For example, you export the Collins file. The CaseViewNet file exports as Collins.sgcvn.

### If original filename already exists, automatically suggest a new name

Select this option to have Case CATalyst automatically suggest a new file name for the exported file if it detects that the file name already exists in the destination location.

### Range

The range of pages for which you want to create the ASCII. Select **one**:

#### Entire Document

Export all the pages in the file. Whether the transcript has sections or not, the entire file will be exported to one CaseViewNet file.

#### Selected Pages

There may be times when you only want to provide your clients with specific pages of the CaseViewNet file because of confidential or redacted information. You can type the page numbers in the field for the pages you want to provide to your clients. To export selected pages, separate the page numbers with a comma with no space following the comma. For example, to export page 5 and page 25, type: 5,25

To export a series of pages, type the beginning page number, followed by a hyphen, and then followed by the ending page number. For example, to export page 5 through 10, type: 5-10.

To export a combination of individual and consecutive pages, type the individual page number separated by a comma, and then beginning page numbers for the consecutive pages, followed by a hyphen, and then the ending page number and all separated by commas with no spaces following the comma. For example, to include page 5, pages 15 through 20, and page 29, type the following: 5,5-20,29.

If the file has sections and you want to print a specific page from a section, type the section number, a colon and then the page number. For example, if you wanted to print page 3 from section 7, type: 7:3.

If you want to export a specific page or pages from multiple sections, type the section, colon and then page number followed by a comma and then section, colon and then page number. For example, let's say you want to export page 4 from section 2 and page 7 from section 4, type 2:4, 4:7.

#### Section

If the file has multiple sections and you want to export a specific section, select the section to export from the drop-down list.

6. Press **Enter (Export)**.

## Export to TextMap

Using the Export function, you can export a transcript with or without attachments, in LexisNexis® TextMap® Evidence format (.xmef). You can e-mail the file to your client and they can open it using the LexisNexis TextMap Reader. The exhibits are hyperlinked and an all word index is available in TextMap Reader. The [LexisNexis TextMap Reader](#) is a free download. If a concordance index exists in the original transcript, the TextMap export will ignore the CATalyst concordance index and it will not be a part of the PTF file.

The Export to TextMap allows you to export a transcript with or without attachments and open it in LexisNexis TextMap Exhibit Linker software. The LexisNexis TextMap Exhibit Linker software automatically creates hyperlinks for each exhibit reference. You or your scopist can also create exhibit aliases that provide for additional exhibit hyperlinks. [LexisNexis TextMap Exhibit Linker](#) may be available free to court reporting professionals.

When inserting an Attachment Point format symbol in the Case CATalyst transcript, it is important to place it inside Index On and Index Off format symbols or as close to the Exhibit number as possible. This allows Case CATalyst to easily locate the attachment containing your exhibit. If Case CATalyst cannot locate the attachment between the format symbols, it selects the word adjacent to the attachment point as the link for the attachment in the exported file. If the same file is attached to multiple places in the transcript, only one copy appears in the exported file.

## Export File to TextMap

1. From anywhere in Case CATalyst, press **Alt + u, x (Functions/Export)**. The Export dialog box displays.
2. Click the **TextMap** tab.
3. In the **Export Files** field, select the transcripts to export.
4. The **Output to** field identifies the export location. Click **Options** to change the export location or other output options.
5. The **Range** field allows you to select the range of pages for which you want to export to Textmap. Select **one**:

### Entire Document

Export all the pages in the file. Whether the transcript has sections or not, the entire file will be exported to one TextMap file.

### Selected Pages

There may be times when you only want to provide your clients with specific pages of the TextMap file because of confidential or redacted information. You can type the page numbers in the field for the pages you want to provide to your clients. To export selected pages, separate the page numbers with a comma with no space following the comma. For example, to export page 5 and page 25, type: 5,25

To export a series of pages, type the beginning page number, followed by a hyphen, and then followed by the ending page number. For example, to export page 5 through 10, type: 5-10.

To export a combination of individual and consecutive pages, type the individual page number separated by a comma, and then beginning page numbers for the consecutive pages, followed by a hyphen, and then the ending page number and all separated by commas with no spaces

following the comma. For example, to include page 5, pages 15 through 20, and page 29, type the following: 5,5-20,29.

If the file has sections and you want to print a specific page from a section, type the section number, a colon and then the page number. For example, if you wanted to print page 3 from section 7, type: 7:3.

If you want to export a specific page or pages from multiple sections, type the section, colon and then page number followed by a comma and then section, colon and then page number. For example, let's say you want to export page 4 from section 2 and page 7 from section 4, type 2:4, 4:7.

### Section

If the file has multiple sections and you want to export a specific section, select the section to export from the drop-down list.

### Show Export Complete message box

Check the box to display the message, *Export Complete*, when Case CATalyst completes the export. Uncheck the box to prevent the display of the *Export Complete* message. The selection for this option applies to all the tabs in the Export dialog box.

6. Press **Enter (Export)**. A wait cursor displays while the export processes.
7. An Export Complete message displays when the export finishes, if appropriate. Press **Enter (OK)** to close the dialog box.

## Export to TextMap Options

### Output

#### Default Location

The drive and folder location for the exported file. The default uses the same folder as the current file. Use **Browse** to select another location. Once you use the selected location, it is available from the drop down list.

#### Extension

A TextMap file uses the .xmef extension. You cannot edit this field.

#### Keep Case CATalyst Job Name

Select this option to keep the original Case CATalyst file name when you export the file. For example, you export the Collins file. The TextMap file exports as Collins.xmef.

#### If original filename already exists, automatically suggest a new name

Select this option to have Case CATalyst automatically suggest a new file name for the exported file if it detects that the file name already exists in the destination location. For example, if you are exporting the Smith file and the Smith file already exists, Case CATalyst suggests Smith 1.

### Formatting

#### Cap All

Check this box if display the exported text in all capital letters.

### Include Timestamps

If the original file contains timestamps, you can include timestamps in the exported file. Select **one** of the following to determine how timestamps display:

- **Clock** (Actual time)
- **Elapsed** (Starting at 0:00)

## Export to PTX

Exporting a transcript to PTX format may allow your client to open the file using RealLegal E-Transcript Viewer™ and/or RealLegal E-Transcript Bundle Viewer™. In CATalyst, you can set up themes for different clients, which includes Company Info, Print Headers and Splash Screen information. If you use Case CATalyst fields in the transcript, those field values will be used as suggestions in the Job Info/Properties dialog box in RealLegal's viewers. If the CATalyst transcript layout includes timestamps, you can select to export the timestamps also. There are [PTX fields](#) that can be used in the themes to automatically fill in Header/Footer information along with the Splash Screen information. Themes are saved in the Ptx Themes case in the System Files case.

Export to PTX is available via the Export (**Alt + u, x**) dialog box and at Manage Jobs, by right clicking a transcript and selecting Export to PTX.

**Important:** The PTX Job Info/Properties dialog box has security lockout options. If you select to use any of the lockout features and the client attempts to perform one of the lockout functions, the client may be prompted for a Unlock code. Case CATalyst **does not** provide a unlock code. You can either create another PTX without that feature locked out or not allow the client to perform the function(s).

1. From anywhere in Case CATalyst, press **Alt + u, x (Functions/Export)**. The Export dialog box displays.
2. Click the **PTX** tab. Make entries as necessary.

### Export Files

Select the files you want to export by checking the box next to each file name. To export all the files in a case, check the box next to the case.

### Key Selected Options

The currently selected export options for the PTX file.

#### Type

PTX is the only available format.

#### Output to

The drive and folder location where you are creating the PTX file.

#### Additional copy to

This field displays if you select to create an additional copy of the PTX file.

#### Theme:

Themes refer to how you set up a document for export, the company information you include in a transcript and the appearance of a transcript, e.g., headers, footers, and the cover page..

3. Click **Options** to change the theme. (For more information on **PTX Options**, see below.)

In the PTX Export Options dialog box, select the theme you want to use and make any other changes as necessary and then press **Enter (OK)** to accept the changes and return to the Export PTX tab.

If you select to Export without setting up a theme, the following message displays:

Press **Enter** to continue without setting up a theme or click No, click Options and then select New Theme. For more information on PTX Options, see below. See [PTX fields](#) for more information about using PTX fields and Case CATalyst fields.

## Range

The range of pages for which you want to create the PTX. Select **one**:

### Entire Document

Export all the pages in the file. Whether the transcript has sections or not, the entire file will be exported to one PTX file.

### Selected Pages

There may be times when you only want to provide your clients with specific pages of the PTX file because of confidential or redacted information. You can type the page numbers in the field for the pages you want to provide to your clients. To export selected pages, separate the page numbers with a comma with no space following the comma. For example, to export page 5 and page 25, type: 5,25

To export a series of pages, type the beginning page number, followed by a hyphen, and then followed by the ending page number. For example, to export page 5 through 10, type: 5-10.

To export a combination of individual and consecutive pages, type the individual page number separated by a comma, and then beginning page numbers for the consecutive pages, followed by a hyphen, and then the ending page number and all separated by commas with no spaces following the comma. For example, to include page 5, pages 15 through 20, and page 29, type the following: 5,5-20,29.

If the file has sections and you want to print a specific page from a section, type the section number, a colon and then the page number. For example, if you wanted to print page 3 from section 7, type: 7:3.

If you want to export a specific page or pages from multiple sections, type the section, colon and then page number followed by a comma and then section, colon and then page number. For example, let's say you want to export page 4 from section 2 and page 7 from section 4, type 2:4, 4:7.

### Section

If the file has multiple sections and you want to export a specific section, select the section to export from the drop-down list.

### Show Export Complete message box

Check the box to display the message, *Export Complete*, when Case CATalyst completes the export. Uncheck the box to prevent the display of the *Export Complete* message. The selection for this option applies to all the tabs in the Export dialog box.

4. Press **Enter (Export)**.  
If the destination location contains a PTX file with the same name as the PTX file you are creating, the Save As dialog box displays. Depending on your Export options, Case CATalyst suggests a name based on the original file name. Save the suggested name or type a name in the File name field and press **Enter (Save)**.
5. PTX Job Info dialog box displays. You can select the appropriate options and/or fill in any of the following text field you want. Do any of the following:

#### Job Name

Type the name of the file or use the current name displayed in the field.

#### Transcript Type

Select the Transcript Type. Deposition, Expert Witness, Courtroom proceeding and Other are available.

#### Misc

Select either of the miscellaneous options of Draft or Show Splash Screen. If selected, the information designated in the splash screen tab of the selected theme display when a client opens the PTX.

#### Security lockouts

Select any of the available functions to prevent the client from performing the action. Print Full Size, Print Condensed, Print Word Index, Clipboard copy and Save As features are available for lockout.

**Important:** If you select to use any of the lockout features and the client attempts to perform one of the lockout functions, the client may be prompted for a Unlock code. Case CATalyst **does not** provide a unlock code. You can either create another PTX without that feature locked out or not allow the client to perform the function.

#### Field Values

Using fields in a transcript that exactly match the PTX <> fields will allow CATalyst field value to be used as a suggestion during the PTX export of the file. For example, if you use the PTX <WITNESS> field and you have a {!WITNESS} field in the transcript, the value of the CATalyst field will be suggested in the Witness field. NOTE: If you have an [!INTERVIEWER] in CATalyst, Export to PTX will use that value. If the <INTERVIEWER> field is empty, PTX will use the value of the [!ATTORNEY] field.

Click **OK** to continue with the Export.

6. Press **Enter (Save)** to export the file.

## PTX Export Options

### Output

### Default Location

The default drive and folder location where you are creating the PTX file. Your selection in this field displays under *Key Selected Options* on the Export PTX tab. From the drop down list, choose a location:

- Same folder as selected file.
- another folder location. Use **Browse** to add alternate locations to the list.

### Additional Copy

Check this box to create an additional copy of the PTX export file. You may want to create a copy on your hard drive for archiving purposes. From the drop down list, choose a destination location:

- Same folder as selected file
- another folder location. Use **Browse** to add alternate locations to the list.

### Extension

The transcript exports with a PTX extension. The field is grayed out and cannot be changed.

### Keep CATalyst Job Name

Check this box to keep the original Case CATalyst file name when you export the file.

### If original filename already exists, automatically suggest a new name

Check this box to have Case CATalyst automatically suggest a new file name to the exported file if it detects that the file name already exists on the destination location. For example, if you are importing the Smith file and the Smith file already exists, Case CATalyst suggests Smith 1.

## Formatting

### Default Theme

You can create different themes for different clients or requirements. Once you save and name the theme, it will be listed in the drop-down list. To select a theme, click the down arrow and select the theme.

### Edit Theme...

Allows you to make changes to the default information sent with the PTX file or make changes to the currently displayed theme. There are three tabs to a theme:

- Company Info (input your name or firm name along with contact information) displays if the user attempts to perform a function that is locked out and Firm Name field value displays when you select Properties in the viewing software.
- Print Headers (customize the PTX's header and footer information with fields and/or static text). The headers and footers display on the full size transcript and/or condensed version.
- Splash Screen Text (customize an optional splash screen with fields or static text). The Splash Screen displays (if information is in the Splash Screen tab when the file was exported) when the file is opened in the viewer. The user will need to click I Accept to continue.

On each tab, there are places where you can use "fields" to fill in variables. For example, you may use <COMPANY> and/or <COMPANYPHONE> to display the information contained in the Company and Phone fields. Some values for these fields will be filled in once you select a file to export. See [PTX fields](#) to see the date fields that can be used in the Print Header and Splash Screen tab of a theme.

**New Theme...**

Allows you to set up different themes for different clients. Select New Theme, type a name and select an existing theme to which you want the new theme based. Once a new theme is created, you can customize the theme using Edit theme.

**Cap All**

Check this box if you want the text in the PTX file to appear in all capital letters.

**Include Timestamps**

Clock

Elapsed

Check the Include Timestamps box and then either Clock or Elapsed option to have the PTX exported transcript include timestamps. The CATalyst transcript layout must have timestamps selected. Once the transcript is opened in either the RealLegal E-Transcript Viewer™ and/or RealLegal E-Transcript Bundle Viewer™, the timestamp setting in the PTX viewer will need to be selected to display timestamps and positioning of the timestamps.

**PTX fields**

There are a variety of fields available for use in PTX themes and the job info dialog box. Any field in a CATalyst transcript that exactly matches the <> fields for PTX files will be suggested during the PTX export of the file. For example, a CATalyst formatted [!WITNESS] field matches a formatted PTX <WITNESS> field. NOTE: If you have an [!INTERVIEWER] in CATalyst, Export to PTX will use that value. If the <INTERVIEWER> field is empty, PTX will use the value of the [!ATTORNEY] field. The following PTX fields can be used within themes:

<TITLE> (Job Name)  
<VOLUME>  
<CASENUM>  
<CASENAME>  
<WITNESS>  
<INTERVIEWER> (Attorney)  
<REPORTER>  
<COMPANY>  
<COMPANYEMAIL>  
<COMPANYFAX>  
<COMPANYPHONE>  
<COMPANYHOMEPAGE>  
<COMPANYSCHEDULEPAGE>  
<JOBNUM>  
<PLAINTIFF>  
<DEFENDANT>

The following Date fields can be used on the Print Headers tab of the PTX theme. These date fields **do not** need to be in the Case CATalyst transcript. If the field is on the Print Headers tab, the date field will automatically fill in based on the date of the job.

<b>DATE FIELD</b>	<b>JOB DATE RESULT</b>
<DATETEXT>	October 28, 2009
<DATE>	10/28/2009
<DATECAPTEXT>	OCTOBER 28, 2009
<NUMERICSLASH>	10/28/2009
<NUMERICDASH>	10-28-2009

Current System Date:

<b>DATE FIELD</b>	<b>CURRENT DATE RESULT</b>
<TODAY>	12-18-2012
<TODAYTEXT>	December 18, 2012

The following Date fields can be used on the Splash Screen tab of the PTX theme. These date fields do not need to be in the Case CATalyst transcript. If the field is on the Splash Screen tab, the date field will automatically fill in based on the date of the job.

<b>DATE FIELD</b>	<b>CURRENT DATE RESULT</b>
<DATECAPLONGTEXT>	WEDNESDAY, OCTOBER 28, 2009
<DATELONGTEXT>	Wednesday, October 28, 2009

## Lists & Tables

Several lists and tables provide integrated functionality of various Case CATalyst features. Keyboard Maps, for example, allow customization of key combinations used to invoke commands. In the default Keyboard Map, pressing the right arrow moves the cursor one space at a time. Pressing the letter "d" invokes the command to create a Personal Dictionary definition. The Personal Globals table is another example. The Personal Globals table allows you to build a list that automatically corrects typed words while editing.

### Case CATalyst Lists & Tables

- [EZ Text Table](#)
- [Keyboard Maps](#)
- [Phonetic Table](#)
- [Steno Shortcut Table](#)
- [NumberConversion.ini File](#)
- [User Definitions Table](#)
- [Personal Globals](#)
- [Format Symbols Options Table](#)
- [Personal Briefs](#)
- [No Nag List](#)
- [Common Words](#)
- [Settings Manager](#)
- [Homophones](#)
- [Global Table](#)
- [Mistran Minder](#)
- [Case Prep Exclude List](#)
- [Fill-In-Field List](#)
- [Prefixsuffixrules File](#)

## File - New - List/Table

The File, New, List/Table feature allows you to open blank table or list. When you select File, New, List/Table, the submenu lists the following lists or tables you can create: EZ Text, Keyboard Map, Phonetic Table or Steno Shortcut Table. If one or more of the items are grayed out, it means that table or list of that type already exists and only one table or list of that type can exist in a user name. For example, if in the current user's System File case there is a Phonetic Table, the Phonetic Table choice will be grayed out. If you select Keyboard Map, the Create New Document dialog box displays with the Files of type field set to Keyboard Table (\*.sgkbd). A user can have multiple Keyboard Maps.

### To create a new list/table file:

1. Press **Alt + f, n, i** (File, New, List/Table).

2. Do one of the following:
  - a) [EZ Text Table](#) - this option is only available if there is no EZ Text Table in the current user's System Files case. If the option is available, CATalyst opens a blank EZ Text Table and when changes are saved, it is automatically stored in the System Files case. Go to Step 4.
  - b) [Keyboard Map](#) - this option is always available. The Create New Document dialog box displays with the Files of type field set to Keyboard Table (\*.sgkbd). Go to Step 3.
  - c) [Phonetic Table](#) - this option is only available if there is no Phonetic Table in the current user's System Files case. If the option is available, CATalyst opens a default Phonetic Table and when changes are saved, it is automatically stored in the System Files case. Go to Step 4.
  - d) [Steno Shortcut Table](#) - this option is available if there is no Steno Shortcut Table located in the current user's System Files case. If the option is available, CATalyst opens default Steno Shortcut Table and when changes are saved, it is automatically stored in the System Files case. Go to Step 4.
3. In the Create New Document dialog box, type the name of the keyboard map and press **Enter** (Open). A keyboard map displays. You can assign, modify or delete assignments.
4. When finished, save and close the table/list.

## EZ Text Table

The EZ Text table allows you to create up to 20 strings of text which you can insert into the transcript while editing. Each text line can contain up to approximately 900 characters including conflicts, scan stops, format symbols, etc. EZ Text lines are stored in the EZ Text table located in the Systems Files case.

Access the EZ Text table:

- in Manage Jobs. Press **Alt + f, o, i, e** (**File/Open/List/Table/EZ Text Table**).
- in Edit. Press **Alt + t, y, e** (**Tools/Keyboard Customization/EZ Text Table**).
- in Edit you can create and modify EZ Text Table entries and insert text directly into the transcript from the [EZ Text pane](#). To open the EZ Text dialog pane, press **Alt v, e, e** (**View/Panes/EZ Text**).

## EZ Text Table Features

Make necessary entries. When finished, press **Alt + s** (**File/Save**) to save changes.

### Number

Identifies the number associated with the EZ Text line listed in the Text field. The first ten lines are numbered #1 through #10 and the next ten lines are numbers Shift + 1-10.

### Text

The current text for the EZ Text entry, if any, displays in this field.

### Modify an Entry

Highlight an EZ Text line and press **Ctrl + m** (**Edit/Modify**). The EZ Text Assignment dialog box displays with the current text from the highlighted EZ Text line. Make necessary entries and press **Enter** (OK):

### Text

Type new or modify existing text. Each text line can contain up to approximately 900 characters including conflicts, scan stops, format symbols and [extended characters](#). The maximum number of EZ Text lines is 20.

### Insert Auto Include

Display the EZ Text Auto Include dialog box. Select an Include file to associate with the selected EZ Text key. Do the following:

1. Select Browse to display the Choose Include File dialog box.
2. Navigate to the location of the file you want to insert.
3. Select a file and press Enter (Open). The file name displays in the Entry Text field. The "@" symbol, @, at the beginning of the entry designates the file as an Include file and must precede the file name.
4. Check Bring Layout to retain the layout for the selected Include file.
5. Press Enter (OK) to return to the EZ Text Assignment dialog box.

### Insert Field

Display the [Insert Field](#) dialog box from which you can select a field to insert into the definition. For example, you may have entries for dropped examinations and want to use the EZ Speaker fields. You create the entry: <Centered Paragraph>DIRECT EXAMINATION<By Line>BY[!EZ SPEAKER 1]:<Question>

### FS (Alt + f)

Display the list of available format symbols. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol you want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry.

You can insert a format symbol at any point in the text entry. To have the format symbol list always display, check the Always Show Format Symbols box. You can also use shortcut keys to insert a format symbol.

### Delete an Entry

Highlight the EZ Text line and press **Delete**. Choose **Yes** at the confirmation prompt.

### Print the EZ Text Table

Press **Ctrl + p (File/Print)** to display the [Print](#) dialog box from which you can print the EZ Text table.

## Resize Table Columns

Do **one** of the following to resize the column widths in the EZ text Table:

- Place the cursor on the line dividing the column headings and hold the mouse button down. The cursor becomes a double headed arrow. Move the line left or right to the desired position. Release the button.
- Complete the steps:

1. Press **Alt + v, r (View/Resize Columns)**. The Resize Columns dialog box displays.
2. In the top field, select the column, **Number** or **Text**, to resize.
3. In the bottom field, type a pixel number or use the arrow buttons to increase or decrease the pixel size.
4. Press **Alt + a (Apply)** to apply and view the changes.
5. Press **Enter (OK)** when finished.

## Change EZ Text Table Font

The font type and size for the body and heading text in the EZ Text Table are customizable. The font type and size applies equally to the body and heading text.

### Modify the Font:

1. Press **Alt + f, o, i, u (File, Open, List/Table, EZ Text)**.
2. When the EZ Text table displays, do either of the following:
  - If the Dictionary/List Toolbar (  ) is displaying, go to Step 3.
  - If the Dictionary/List Toolbar is not displaying, right click a toolbar and select Dictionary/List Toolbar.
3. Do any of the following:
  - Click the Font style icon (  ) to change the font type.
  - Click the Font size icon (  ) to change the font size.
4. Closing the EZ Text Table saves the font change information. If you have made other changes, you will be prompted to save your changes.

## Mistran Minder List

The MistranMinderList (User, Case or Job) contains your unique mistranslates (words or phrases). For example, sometimes you misstroke the word *gently* and you get *generally* or you misstroke the word *except* and you get *exempt*. These words can be added to a Mistran Minder list (User, Case or Job) and when you run Mistran Minder, all occurrences in the file will be listed in the Search Results pane for you to review. Open a transcript and select Tools, Mistran Minder. The Mistran Minder results display in the Search Results pane. With your cursor in the Search Results pane, you can use your up and down arrows to move through the results along with scrolling in the transcript text or you can use the scroll bar to move to a specific entry, double click the entry and move immediately to the location in the transcript. Once you have reviewed the results, you can close the Search Results dialog pane.

Some users add their common mistran minder entries to their Homophone list. Using the [Cycle Homophones](#) feature, they can quickly switch to the correct word/phrase they desired. Using the examples from above, since "generally" and "gentle" are two common misstrokes this the user, both words are in the user's Mistran Minder list and are also in the Homophone list as homophones of each other. So, when reviewing the Mistran Minder results, if the user comes across an occurrence of the word "gently" in the transcript when it should have been "generally," the user invokes the Cycle Homophones command and quickly changes "gently" to "generally" without retyping anything.

Once you have added words to the Mistran Minder List, you can review and/or edit it by selecting File, Open, List/Table, MistranMinder and then select User, Case or Job. When selecting Case or Job, you will then need to select the appropriate Case or Job name.

The Mistran Minder list (User, Case or Job) can contain words and/or phrases. The Mistran Minder list will recognize entries with punctuation, such as:

; is that correct  
said "  
, 2014  
[ATC]

Punctuation symbols not allowed in the Mistran Minder list are: { } | ^

If you want to review or search for a particular category of items, such as dates, you might want to use the [Search](#) (Ctrl + f) command, select Regular Expression (Alt + r), List Results (Alt + L) and then select Dates from the Regular Expression list.

To Create a Mistran Minder List:

## Create/Add entries to the Mistran Minder List

[Mistran Minder](#) analyzes your transcript and displays a list of any words/phrases found in the Mistran Minder List (User, Case or Job) that are also found in your transcript. For example, sometimes you intend to write the word *gently* and you get *generally* or *exempt* and you get *except*. These words can be added to a Mistran Minder List. Then while editing, you run the Mistran Minder command so you can quickly find and fix (if needed) all occurrences of your personal mistranslates. The [MistranMinderList](#) applies to every job unless you create a case or job Mistran Minder list. There may be times you'd like to add unique mistranslates that are only occurring in a particular job or case. For example, let's say you are working on a job that you created a case for and you have taken 10 depositions already. There are a lot of case specific initials and acronyms in the jobs so there is the potential of some misstrokes. You can add the misstroked initials or acronyms to a Case Mistran Minder List rather than adding them to your System Files MistranMinderList which applies to all jobs. When you run Mistran Minder, the entries in the case Mistran Minder List only apply to the files in the case and it will continue to also look at your user specific Mistran Minder List as well. If you don't use cases but want to have specific words/phrases for a job, you can also send words to a Job Mistran Minder List.

To create a Mistran Minder list that applies to all jobs, you can position your cursor in front of a word or highlight multiple words, right click, press **m** and select **User**. You can also open your User MistranMinderList located in your System Files case and type the word or words on a line and type any additional mistranslated words or phrases each on their own line, save and close the file. The Mistran Minder List that applies to all jobs is located in your System Files case named *MistranMinderList*.

If you create a case and add words/phrases to the case Mistran Minder List, the list will be named *MistranMinderList* and stored in the actual case. The case Mistran Minder List applies to all files in the case.

If you create a job and add a word/phrase to the job Mistran Minder list, it will be named the *name of the job underscore MistranMinderList*. For example, if the name of the job is Carlson\_Dave-6-16-18 and you add words/phrases to the job Mistran Minder list, the job Mistran Minder list is named: Carlson\_Dave-6-16-18\_MistranMinderList. The job Mistran Minder list applies only to the job of the same name. In your transcript, you simply select Tools and then Mistran Minder. CATalyst quickly displays words/phrases found in the transcript that match your MistranMinderList.

**To add a word/phrase to a Mistran Minder list:**

1. While editing, position your cursor immediately before a word or highlight a phrase and do any of the following:
  - a) Press **Alt + e, m** (Edit, Send to Mistran Minder) or click the Edit menu, then Send to Mistran minder and do **one** of the following:
    - Press **u** to send the word/phrase to the User Mistran Minder List.
    - Press **c** to send the word/phrase to the Case Mistran Minder List.
    - Press **j** to send the word/phrase to the Job Mistran Minder List.
  - b) If you have assigned a key combination for Send to Mistran Minder List, Send to Case Mistran Minder or Send to Job Mistran Minder, press the appropriate key combination for the action you want.
  - c) Right click, press **m** (Send to Mistran Minder List) and then do **one** of the following:
    - Press **u** to send the word/phrase to the User Mistran Minder List.
    - Press **c** to send the word/phrase to the Case Mistran Minder List.
    - Press **j** to send the word/phrase to the Job Mistran Minder List.
2. When appropriate, select press **Alt + t, i** (Tools, Mistran Minder) to check the transcript. Results display in the Search Results dialog pane.
3. Once you have reviewed the results, you can close the Search Results dialog pane.

Note: If your User MistranMinder List doesn't exist and you select Tools, Mistran Minder you will be prompted to create one.

You simply open your Mistran Minder List and type "gently" (without the quotes) on a line and type "exempt" (without the quotes) on a line. Type any additional mistran words or phrases each on their own line, save and close the file. You can include punctuation along with words in the Mistran Minder List. For example, let's say you like to double check occurrences of the word *said* followed by a quote (said ') and the word says followed by a quote (says "). You could put both words in your Mistran Minder list on separate lines. Entries can contain punctuation such as:

```
; is that correct  
said "  
, 2014  
[ATC]
```

Punctuation symbols not allowed in the Mistran Minder list are: { } | ^

## Fill-In-Field List

The Fill-In-Field List.csv file stores the field values for [Fill in Field](#) list group types. Field List Group fields are related fields designed for Appearance pages. Default fields for a field list group include, SPEAKER1, FIRM1, ATTORNEY1, ADDRESS-A1, ADDRESS-B1, CITY1, STATE1, ZIP1.

Case CATalyst creates the Fill-In-Field List file when you create your user. The column headings in the Fill-In-Field List represent the associated fields in a [Field List Group](#). When you enter a value (attorney or firm name, address, etc.) for a field in Edit using [Fill In Field](#), Scan and Fill-In-Fields and the New List Entry in the Insert Field dialog box the entry is automatically added to the Fill-In-Fields List. An [Import vCard](#) feature is also available to let you directly import attorney vCard files into the Fill In Field List. You can also populate the list by copying files from another Fill-in-Field List, such as another reporter. You copy all the fields and data from another Fill-In-Field List using the [Include](#) command or add individual entries using the copy and past commands. You can open the list and directly manage the entries, adding, renaming and deleting [fields](#) and [data](#). The Fill-in-Field List is available for all jobs/transcripts.

Creating a [Case Fill-In-Field List](#) allows you to limit the Fill-In-Field List to the case specific client information. You can include exported information from a court reporting management software program, such as Analyzer, where firm and attorney appearance information is already available. For example, you are just beginning the first of ten depositions involving a train wreck. You create a Case named WRECK 10-10 and then create a Case Fill-In-Field List within the WRECK 10-10 case. Your firm uses Analyzer, so you export the appearance information to Case CATalyst save the files as a Case Fill-In-Field List. If another reporter takes a deposition for the same case, you can share your Case Fill-In-Field List.

The Fill-In-Field List is accessible to other users on the same computer or network environment by [changing](#) certain Field Options settings. For example, you may want to use another Fill-In-Field List location when working in a network environment when all users share a Fill-In-Fields List.

The Fill-In-Field List is a .csv (comma separated value) file type which is a common file format. You may want to check with your state bar association for an available list.

You can combine Fill-in-Field lists using the [Include](#) feature on the Fill-in-Field File menu. No duplicate entries will be added. For example, you edit on your office computer and your home computer. You may have added entries to both Fill-in-Field Lists but not the same entries if you did not backup and restore the Fill-in-Field list before editing on either computer. If you have two different versions of the Fill-in-Field List, you could include your office computer's Fill-in-Field List with your home computer's list to make one complete list and then back it up and restore it on your office computer.

## Change Fill-In-Field List Fonts

The font type and size for the body and heading text in Fill-In-Fields are customizable. The font type and size applies equally to the body and heading text.

### Modify the Font:

1. Press **Alt + f, o, i, u** (**File, Open, Fill In Field List, Fill In Field List or Case Fill In Field List**).
2. Do either of the following:
  - If the Dictionary/List Toolbar (  ) is displaying, go to Step 3.
  - If the Dictionary/List Toolbar is not displaying, right click a toolbar and select Dictionary/List Toolbar.
3. Do any of the following:
  - Click the Font style icon (  ) to change the font type.
  - Click the Font size icon (  ) to change the font size.
4. Closing the Fill In Field List saves the font change information. If you have made other changes, you will be prompted to save your changes.

## Create a Case Fill-In-Field List

When a Fill-In-Field List\_Case file exists in a Case, the Scan and Fill in Fields feature uses the case information in place of the System Files Fill-In-Fields List. Case CATalyst only recognizes a Case Fill-In-Field List with the filename, *Fill-In-Field List\_Case*, located in the specific case in which you are using it. A Fill-In-Field List\_Case file located in the root of your user name is not recognized as a valid Fill-In-Field List.

### Create a Case Fill-In-Field List

1. In Manage Jobs, open the Case in which you want to create the list.
2. Press **Alt + f, n, f, c** (**File/New/Fill-In-Field List/Case Fill-In-Field List**). The Create New Document dialog box displays.
3. The required default name, *Fill-In-Field List\_Case*, displays in the File name field.
4. Press **Enter** (**Open**). Case CATalyst creates the Case list using the current column format from your Fill-In-Fields List.
5. Do any of the following:
  - Open your Fill-In-Field List, choose entries and select **Copy**. In the Fill-In-Field\_Case, select **Paste** to add the copied entries.
  - Create new [entries](#) and add [columns](#).
  - Use the [Import vCard](#) feature to import attorney vCard information directly into the Case Fill-In-Field List
6. Press **Ctrl + s** (**File/Save**) to save the changes and close the Fill-In-Field List\_Case.
7. To save an Analyzer attorney information file:

### Create a Case Fill-In-Field List with Analyzer Information

If you or your court reporting firm uses Analyzer, save the exported attorney information file to the appropriate Case in Case CATalyst using the name, Fill-in-Fields List\_Case.

## Include Fill-in-Field List Entries

You can Include one Fill-in-Field List into another Fill-in-Field List. All the data from the selected Fill-in-Field List is added to the current Fill-in-Field List. Case CATalyst checks for duplicate entries and does not include an entry if the data and headers of the entry match. To add individual entries to the Fill-in-Field List, use the Copy and Paste commands. An asterisk displays on the Fill-In-Field List tab when Case CATalyst adds the entries and the file changes.

### Include a Fill-in-Field List to another Fill-in-Fields List

1. Do one of the following:
  - Press **Alt + f, o, f** (**File/Open/Fill In Field List**) to open the Fill-In-Field List.
  - Press **Alt + f, o, c** (**File/Open/Case Fill In Field List**) to open a Fill-In-Field List\_Case List. In the Open Existing Document dialog box, select the file and press **Enter** (**Open**).
2. Press **F9** (**File/Include**). The Include dialog box displays.
3. Make necessary entries:

**Look In**

Choose the user name from which you want to select the include file. The default is the current user. You can also the Browse button to navigate to another location for the Fill-in-Field List you want to select. For example, perhaps you copied the Fill-in-Field List to a flash/thumb drive or to your desktop.

**File Window**

Displays a list of the files. By default, the Fill-in-Field List is located in the System Files case. A Fill-In-Field List\_Case is located in the associated Case. Highlight the Fill-in-Field List you want to include. Fill-In-Field List files contain the .csv extension. The file name displays in the File name field.

**File name**

The name of the selected file to Include.

**Files of type**

Displays the type of file to Include. The default subfile type is .csv.

**Browse**

Select a different folder or location.

4. Press **Enter (Open)**. An asterisk displays on the Fill-In-Field List tab when Case CATalyst adds the entries and the file changes.
5. Press **Ctrl + s (File/Save)** to save the list.

## Manage Fill-In-Field List Columns

Column headings in the Fill-In-Field List represent the associated fields in a [Field List Group](#). Field List Group fields are related fields. You can add new columns, modify existing column names, hide columns, delete unnecessary columns, select the display and order of columns and change the sort order of columns in the Fill In Field list. To manage Fill-In-Field List entry data, see [Manage Field List Group Data](#).

Creating a new column automatically adds a field of the same name to each Field List Group which is available in the [Insert Field](#) dialog box. For example, you want to add the web address for each attorney on your Appearance page. In your Fill-In-Field List, you create a column named, "Web Address." Case CATalyst creates the column in the Fill-In-Field List and automatically adds the *Web Address* field to each Field List Group. You insert the Web Address field on your Appearance page using the Insert Field feature.

To access a Fill-In-Field List, do one of the following.

- Press **Alt + f, o, f (File/Open/Fill In Field List)** to open the Fill-In-Field List in your System Files case.
- Press **Alt + f, o, c (File/Open/Case Fill In Field List)** to open a Fill-In-Field List\_Case List. In the Open Existing Document dialog box, select the file and press **Enter (Open)**.

When you are finished making changes, save the Fill-In-Fields list by pressing **Alt + s (File/Save)** to retain the changes.

## Select Columns to Display

### Show/Hide Columns

To show or hide columns, right click a column heading and select **Columns**. The list of columns displays in order that they appear on the screen. A check mark indicates the column is visible in the Fill-in-Fields list. When unchecked, the column is hidden from view. Click a column name to select or deselect it.

Changing the column display in the Fill-In-Field List affects the fields that display for the Field List Groups in the Insert Field and Fill In Fields dialog boxes. If you do not use all the fields that are available for a field group list, you may want to hide those columns. Field associated with the hidden column show at the end of the Field List Group entries in the Insert Field dialog box and are considered User Defined fields instead of Field List Group entries.

### Hidden Columns

To display a list of hidden columns, right click a column heading and select **Hidden Column List**. The Column Chooser dialog box displays the list of hidden columns. To add a hidden column to the screen, click and hold the left mouse button on the selected name and drag it to the desired location on the column heading bar and release the button. The width of the column may need adjusting after adding it to the screen.

### Restore Default Columns

To restore the column display to the original Case CATalyst default values, right click a column heading and select **Restore Default Columns**. Restoring the default columns displays all the default columns and display order. It does not delete any user created columns.

## Insert/Rename/Delete Columns

### Insert a Column

Insert a user defined column. Right click a column heading and select **Insert Column**. In the Insert Column dialog box, type a name for the column and press **Enter (OK)**. A field with the same name is automatically added to the Field List Groups once you save the Fill-In-Field List. Newly created fields do not affect a Case Fill-in-Field List.

### Rename a Column

To change a column name, position the cursor on the column heading for the name change. Right click and select **Rename Column**. In the Rename Column dialog box, type the new name and press **Enter (OK)**. Rename a column in the Fill-In-Fields list also renames the field in the Field List Group.

If a column contains an existing value and the column name changes, the values in the original columns are retained in the renamed column. A field matching the new column name displays in the [Field List Group](#). The original field matching the original column name is retained in the Field List Group along with any filled in value. No changes occur in the transcript for any filled in values for the original column name. For example, the current job has the PHONE NUMBER field as part of the Field List Groups with filled in values. You change the PHONE NUMBER column name to be CELL which automatically adds the CELL field to the Field List Group. The CELL field replaces the PHONE NUMBER field in the Field List Group. No values display for the CELL field. Values for the PHONE NUMBER fields inserted into the transcript remain unchanged.

### Delete a Column

Remove the selected column and all the field data from the Fill-In-Field List. Right click a column heading and select Delete. Deleting a column from the Fill-In-Field List also deletes the field from the Field List Group. If you re-insert the column that contained data, Case CATalyst displays a message that the column previously existed and prompts you to restore the data.

## Change the Sort Order

You can sort the Fill-In-Field List to help locate specific entries. To change the column on which Case CATalyst sorts the field information, click the desired column heading. Case CATalyst identifies the column used for sorting with a triangle to the right of the column heading. Click the column heading until the triangle points up for ascending order (a-z; 0-9) or down for descending order (z-a; 9-0). For example, you want to sort the entries by FIRM in ascending order. Click the FIRM column heading until the triangle points up.

## Change the Display Order of Columns

To change the display order, click the desired column heading and hold the left mouse button. Drag the heading to a new location on the column heading bar and release the button. For example, you can reposition the Phone Number column to follow the Attorney column.

Changing the column order changes the order of information in the Insert Entry and Modify Entry dialog boxes; and changes the order of information the Insert Field and Fill In Fields dialog boxes in Edit.

## Adjust Column Widths

Do either of the following to manage column widths:

- Place the cursor on the line dividing the column headings and hold the mouse button down. Move the line left or right to the desired position. Release the button.
- Place the cursor on the column heading. Use the right click menu and select **Best Fit** to automatically size the column based on the longest entry on a single line.

## Manage Fill-In-Field List Values

Manage your Field List Groups entries by adding, renaming and deleting data in the Fill-In-Field List. You can also copy entries from another Fill-In-Field List using the [Include](#) or Copy and Paste commands.

Adding [new columns](#) to the Fill-In-Field List adds new fields to the [Field List Groups](#) in the Edit Insert Field dialog box. Each column heading reflects a field in the Field List Group. To manage Fill-In-Field List columns, see [Manage Fill-In-Field List Columns](#).

To access a Fill-In-Field List, do one of the following.

- Press **Alt + f, o, f (File/Open/Fill In Field List)** to open the Fill-In-Field List.
- Press **Alt + f, o, c (File/Open/Case Fill In Field List)** to open a Fill-In-Field List\_Case List. In the Open Existing Document dialog box, select the file and press **Enter (Open)**.

When you are finished making changes, save the Fill-In-Fields list by pressing **Alt + s (File/Save)** to retain the changes.

## Insert/Modify Fill-In-Field List Entries

1. Do one of the following:
  - Right click in the list and select **Insert**. The Insert Entry dialog box displays.
  - Right click an entry and select **Modify**. The Modify Entry dialog box displays.
  - Right click a specific cell in the entry and select **Modify Cell** to quickly modify a single cell. Type your change.
2. Use the following options as necessary:

### ATTORNEY SORT

The Attorney Sort field does not display in an Edit, Field List Group entry.

Attorney Sort automatically displays a saved, filled in name listed in the Attorney column with the last name followed by first name. This sort order allows you to quickly locate an attorney by last name when filling in the Appearance information during Edit. The Attorney Sort field ignores certain suffixes, such as Jr., Sr. and Esq. when sorting by last name.

You can modify the text in the Attorney Sort field. For example, you have an attorney **John Van Den Tillar** listed in the Attorney field. Case CATalyst, by default, displays the name in the Attorney Sort field as **Tillar, John Van Den**. Modify the text in the Attorney Sort field to reflect the correct sorting order, **Van Den Tillar, John**.

If the Field option, [Sort attorney names using Attorney Sort column](#) is set to Yes, Case CATalyst displays names in the [Fill In Field](#) dialog box using the format of the Attorney Sort field. Case CATalyst inserts the name into the transcript as it appears in the Attorney field.

### FS

Add a format symbol to a field. For example, you may want to bold the firm name or add a new line to an address. When you select FS, the [Format Symbol](#) list displays. Double click the desired format symbol.

### Save as New

Make changes to an existing entry, such as the attorney and speaker name, and retain all the other information as a new entry. For example, you have several entries for the Jennifer C Davenport firm. A new attorney starts working for the firm at the same location. Modify an existing Jennifer C. Davenport entry, change the attorney and speaker name information and then select Save as New to create a new entry in the Fill-In-Field List.

This option is only available when modifying an entry.

3. Click **(OK)**.

## Delete Fill-In-Field List Entries

1. Use [Search](#) (Ctrl + f) or [Filter](#) (Ctrl + y) to locate the desired entries.
2. Do **one** of the following to select entries for deletion:

### Select one entry at a time

Highlight the entry for selection.

### Select specific entries

Press and hold **Ctrl** while you click the individual entries to highlight.

**Select a consecutive group of entries**

Click to highlight the first entry of the group. Locate the last entry. Press and hold **Shift**, while you click the last entry. All the entries in-between are highlighted for selection.

**Select all the entries**

Press **Ctrl + a**. All the entries are highlighted for selection.

3. Press **Delete** or click the Delete  icon to delete the selected entries. You can undo the delete by pressing **Ctrl + z (Undo)**.
4. A confirmation message displays. Choose **Yes** to delete the selected entries. Choose **No** to prevent any entries from deletion.
5. Press **Ctrl + s (File/Save)** to save the Fill-In-Field List file.

**Share the Fill-in-Field List**

The Fill-in-Field list is accessible to other users on the same computer or network environment by changing certain Field Options settings. For example, you may want to use another Fill-In-Field List location in a network environment when all users share a Fill-In-Fields List.

You can also combine Fill-in-Fields using the [Include](#) feature on the Fill-in-Fields File menu.

**Share the Fill-in-Field List**

1. Be sure you are in your User name.
2. From Manage Jobs, press **Alt + t, o, e, f (Tools/Options/Edit/Field)**. The Field Options dialog box displays.
3. Locate the option, *Fill-In-Field in current user*, and select **No**. The *Fill-In-Field List path* field becomes available.
4. In the *Fill-In-Field List path* field, click the **Browse** button to navigate to the location of the Fill-In-Fields List you want to use. Fill-In Field lists have a .csv extension. The path displays in the field.
5. Press **Alt + s (Save)** to save the settings and close the Field Options dialog box. The setting is remembered until you change it.

**Search and Filter Fill-In-Field List**

Search allows you to locate a word or words in the [Fill-In-Fields List](#). You can search forward or backward for a whole word, part of a word, or multiple words. Once a searched entry displays, you can repeat Search for the same text and search parameters by using Repeat Search Forward or Repeat Search Backward. Search and Replace allows you to search for and replace text for a field entry.

Filter displays only the entries in the Fill-In-Field List that contain the specified criteria. Entries filtered out are not removed from the file. All the entries redisplay when you select Unfilter or the next time you open the Fill-In-Fields List. A filtered display is searchable.

To access a Fill-In-Field List, do one of the following.

- Press **Alt + f, o, f (File/Open/Fill In Field List)** to open the Fill-In-Field List.
- Press **Alt + f, o, c (File/Open/Case Fill In Field List)** to open a Fill-In-Field List\_Case List. In the Open Existing Document dialog box, select the file and press **Enter (Open)**.

When you finish making changes, save the Fill-In-Fields list by pressing **Alt + s (File/Save)**.

## Search

1. Press **Ctrl + f (Edit/Search)**. The Search dialog box displays.
2. Make necessary entries:

### Search For

Type the text you want to find.

#### FS

To add format symbols to your search, select **FS** and double click the symbol from the list to select it.

You can also use shortcut keys to insert a format symbol. Place the cursor in the Search For field, press **F4** and then press the appropriate letter or symbol.

#### Insert Field

Field are generally not used in the Fill-In-Field List. To add a field to the search, click **Insert Field** to select a field from the [Insert Field](#) dialog box.

### Entry Type

An Entry Type in generally not used to search the Fill-In-Field List. Selecting an entry type filters the search so that only entries with the entry type selected display. Select an entry type from the drop down list.

### Case Sensitive

Check this box to limit the search based on the upper and lower case letters of text typed in the *Search For* field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field.

### Whole Word

Search only for the words that match the text typed in the Search For field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word.

### Location

Select search parameters.

#### Exact Match

Search for entries that exactly match the text entered in the Search For field.

#### Begins With

Search for entries that begin with the text entered in the Search For field.

#### Ends With

Search for entries that end with the text entered in the Search For field.

#### Contains

Search for entries that contain, anywhere in the entry, the text entered in the Search For field.

**Direction**

Select **one**:

**Forward**

Search forward, from the cursor position to the end of the file.

**Backward**

Search backward, from the cursor position to the beginning of the file.

3. Press **Enter (OK)** to start the search. If no match is found for the search item, a message displays.
4. To repeat the same search, press **F3 (Edit/Repeat Search Forward)** or **Shift + F3 (Edit/Repeat Search Backward)**.

**Search and Replace**

1. Press **Ctrl + r (Edit/Search and Replace)**. The Search and Replace dialog box displays.
2. Make necessary entries:

**Search For**

Type the text you want to find.

**FS**

To add format symbols to your search, select **FS** and double click the symbol from the list to select it.

You can also use shortcut keys to insert a format symbol. Place the cursor in the Search For field, press **F4** and then press the appropriate letter or symbol.

**Insert Field**

Field are generally not used in the Fill-In-Field List. To add a field to the search, click **Insert Field** to select a field from the [Insert Field](#) dialog box.

**Case Sensitive**

Limit the search based on the upper and lower case letters of text typed in the Search For field. If you do not select Case Sensitive, the search replaces all words containing the indicated characters, regardless of the case typed into the field.

**Whole Word**

Search only for the words that match the text typed in the Search For field. If you do not select Whole Word, the search finds the word both as is stands alone and as part of another word.

**Location**

Select search parameters.

**Exact Match**

Search for entries that exactly match the text entered in the Search For field.

**Begins With**

Search for entries that begin with the text entered in the Search For field.

#### **Ends With**

Search for entries that end with the text entered in the Search For field.

#### **Contains**

Search for entries that contain, anywhere in the entry, the text entered in the Search For field.

#### **Direction**

Select **one**:

##### **Forward**

Search and replace forward, from the cursor position to the end of the file. A confirmation message displays for each possible replacement.

##### **Backward**

Search and replace backward, from the cursor position to the beginning of the file. A confirmation message displays for each possible replacement.

#### **Replace With**

Type the replacement text for the entry in the Search For field.

##### **FS**

To add format symbols to the replacement text, select **FS** and double click the symbol from the list to select it.

You can also use shortcut keys to insert a format symbol. Place the cursor in the Replacement With field, press **F4** and then press the appropriate letter or symbol.

##### **Insert Field**

Field are generally not used in the Fill-In-Field List. To add a field to the text, click **Insert Field** to select a field from the [Insert Field](#) dialog box.

4. Press **Enter (OK)** to start the search and replace. If no match is found, a message displays.
5. Press **Ctrl + s (File/Save)** to save the file.

## **Filter Entries**

1. Press **Ctrl + y (View/Filter)**. The Filter dialog box displays.
2. Make necessary entries:

##### **Filter**

Select a field from the drop down list. In the blank box to the right of the field, type the text on which you want to filter. Case CATalyst displays only the entries that contain the text entered. If you leave the box blank, then Case CATalyst filters on the blank, displaying entries that have no entry in the field selected for filtering.

##### **FS**

To add format symbols to filter text, select **FS** and double click the symbol from the list to select it.

You can also use shortcut keys to insert a format symbol. Place the cursor in the field, press **F4** and then press the appropriate letter or symbol.

### Insert Field

Fields are generally not used in the Fill-In-Field List. To add a field to the filter, click **Insert Field** select a field from the [Insert Field](#) dialog box.

### Entry Type

Filter the selected field by entry type. Selecting an entry type displays only entries with the selected entry type. Choose an entry type from the drop down list.

### Case Sensitive

Limit the filter based on entries containing the upper and lower case letters of text typed in the field. If you do not select Case Sensitive, the filter displays all entries containing the indicated characters, regardless of the case typed into the field.

### Whole Word

Filter only on words that match the text typed in the field. If you do not select Whole Word, the filter displays entries with words as they stand alone and as part of another word.

### Location

Select filter parameters:

#### Exact Match

Filter on entries that exactly match the text entered in the field.

#### Begins With

Filter on entries that begin with the text entered in the field.

#### Ends With

Filter on entries that end with the text entered in the field.

#### Contains

Filter on entries that contain, anywhere in the entry, the text entered in the field.

3. Press **Enter (OK)**. Case CATalyst displays the filtered entries. If you search within a filtered display, the search is limited to the filtered entries. If your search cannot locate the entry, unfilter the display or filter by different criteria.
4. Press **Alt + v, u (View/Unfilter)** to redisplay the entire Fill-In-Field List. If you close the Fill-In-Field List in a filtered display, all entries display when you open the list.

## Import vCard Fill-in-Field List

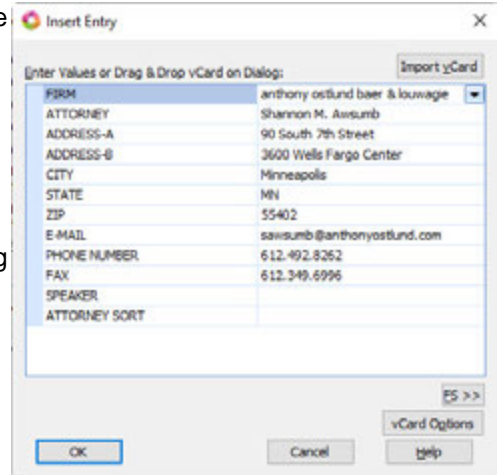

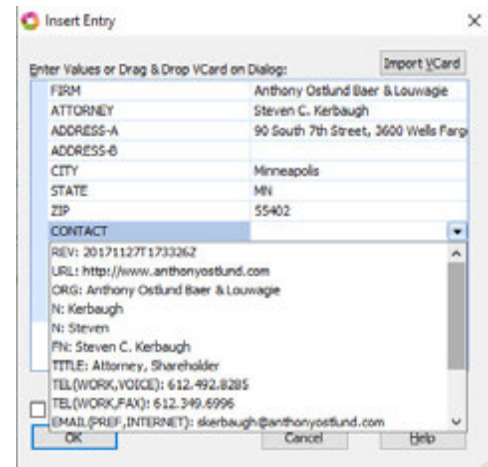

You can import vCard files, also known as VCF (Virtual Contact File), when creating/modifying an entry in a Fill in Field List or when creating a New List Entry in the Fill In Field dialog during edit. The ability to import vCard files speeds up the process of creating Fill In Field List entries. If you have access to an attorney's vCard you can import the information directly to a Fill-In-Field List or Case Fill-in-Field List instead of typing it in manually.

To import a vCard file, you must first have a vCard file. Attorneys may provide a vCard file download link in their Email signature and/or may provide a vCard file download link on their Firm's website. vCard files typically have a ".vcf" extension.

### Importing a vCard in a Fill in Field List:

You can import a vCard into the Fill in Field List and/or a Case Fill in Field List:

1. Select **File, Open, Fill in Field List**
    - a. To open the Fill In Field List, select **Fill In Field List**. (*Alt+f,o,f, f*)
    - b. To open a Case Fill in Field List, select **Case Fill in Field List** (*Alt+f,o,f,c*), and then use the Open Existing Document dialog to select the Case Fill in Field List you'd like to open.
  2. To insert a new attorney group in the Fill in Field list, select **Edit, Insert** (*Ctrl+i*).
  3. When the Insert Entry dialog appears, do one of the following:
    - a. Drag and drop a "filename.vcf" file on to the Insert Entry dialog. A plus sign icon '+' will appear at your mouse pointer location on the Insert Entry dialog to let you know when you can release the mouse button to drop in the vCard.
    - b. Use the Import vCard button to browse for and use a vCard file.
      - i. Click the **Import vCard** button.
      - ii. The Import vCard File dialog will default to the Downloads folder on your system. Browse to the location of the "filename.vcf" file you'd like to import, then either double click the file or highlight and click **Open**.
  4. Case CATalyst will use the vCard file information to populate the attorney group fields. To specify a specific text capitalization for any of the field headings, use the [vCard Options](#) button. Although Case CATalyst is able to match many different possible values from vCard files with the Fill in Field List headings, Case CATalyst may not be able to match all vCard information. For example, if you have renamed your E-MAIL heading to be CONTACT, Case CATalyst may not be able to populate the CONTACT fields with the email information from the vCard file. Do one of the following to populate the missing information:
    - a. Select the heading you'd like to modify and then click the down arrow  that appears on the right. The information contained within the vCard will show. Select the information that matches the information for the heading you are trying to populate. Case CATalyst will remember this selection and try to use that vCard information to populate the heading in the future.
    - b. You may also choose to manually type in the information. You may need to type the information if the vCard does not contain the information.
- **Note:** The ATTORNEY SORT field will not be populated by the vCard. Case CATalyst will create the ATTORNEY SORT on its own.

- Click **OK**, to add the entry to the Fill in Field List.

### Using a vCard to modify an existing entry:

There may be times you want to use a vCard file to modify an existing entry. For example, when an attorney changes their address and email contact information and provides you with an updated vCard. The process for modifying an existing entry is very similar to inserting a new entry with the following exceptions:

- Select **File, Open, Fill in Field List**
    - To open the Fill In Field List, select **Fill In Field List**. (*Alt+f,o,f, f*)
    - To open a Case Fill in Field List, select **Case Fill in Field List** (*Alt+f,o,f,c*), and then use the Open Existing Document dialog to select the Case Fill in Field List you'd like to open.
  - To modify an existing entry, double click on the entry or highlight the entry and then select **Edit, Modify** (*Ctrl+m*).
  - The Modify Entry dialog will appear. The remaining steps for using a vCard file are the same as when inserting a new entry.
- **Note:** If the vCard changes the attorney name of the entry you are modifying, for example, the attorney changed their last name, Case CATalyst will not automatically change the ATTORNEY SORT information for that entry. To have Case CATalyst recreate the proper ATTORNEY SORT, manually delete the ATTORNEY SORT text before clicking OK.

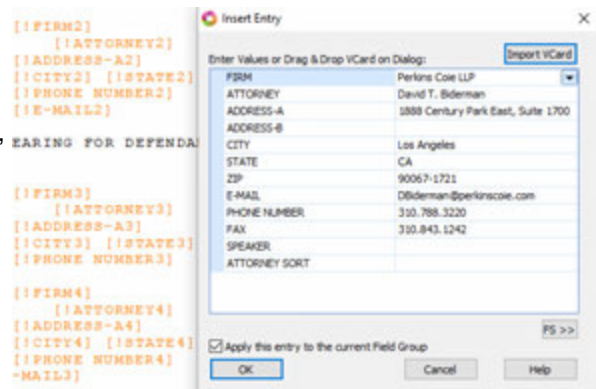

### Using a vCard to fill in fields during edit:

Importing a vCard can be done when you are filling in attorney fields while editing a transcript. For example, let's say you downloaded a vCard and you'd like to use it to fill in the ATTORNEY2 field group on your appearance page.

- Double click on the ATTORNEY field, or use *Scan and Fill in Fields* (*Ctrl+Shift+s*) to open the Fill in Field dialog.
  - Click the **New List Entry** button.
  - Inside of the Insert Entry dialog, you may drag and drop the vCard or use the Import vCard button to import the vCard.
  - Click **OK** to use the imported vCard information to fill in the attorney group fields.
- **Note:** While there is a standard that governs the data and format of a vCard, experience has shown the standard is not always followed. As a result, your experience with some vCard files will be better than with others. Case CATalyst does its best to correctly import vCard information. When Case CATalyst cannot match vCard information to a heading in the Fill in Field List, you may use the down arrow to look at the vCard data and make a selection. Case CATalyst will then match that vCard data with the Fill in Field heading for future vCard imports.

### vCard Options

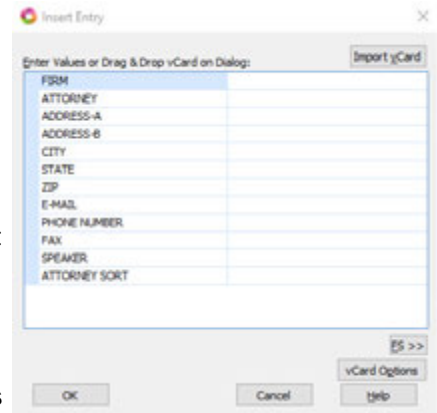

vCard Options allows you to specify the Speaker Prefix (titles) for the Speaker field and set your capitalization preferences for each Field Name heading when using [Import vCard](#).

## Using vCard Options

To access the vCard Options dialog do the following:

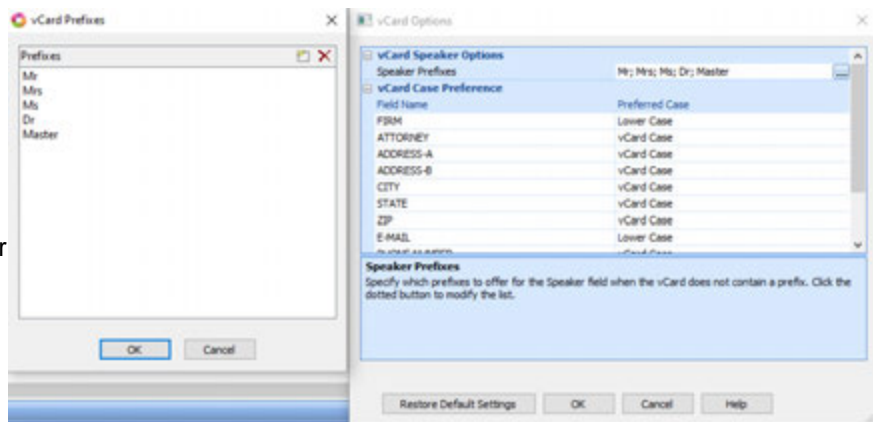

1. Select **File, Open, Fill in Field List**
  - a. To open the Fill In Field List, select **Fill In Field List**. (*Alt+f,o,f, f*)
  - b. To open a Case Fill in Field List, select **Case Fill in Field List** (*Alt+f,o,f,c*), and then use the Open Existing Document dialog to select the Case Fill in Field List you'd like to open.
2. To insert a new attorney group in the Fill in Field list, select **Edit, Insert** (*Ctrl+i*).
3. When the Insert Entry dialog appears, click the **vCard Options** button.

### vCard Speaker Options

The vCard Speaker Options section of the vCard Options dialog lets you specify the Speaker Prefixes (titles) for the speaker field when the vCard does not contain a prefix. The Prefixes you specify will appear as SPEAKER Field choices in the drop-down list for the [Import vCard](#) feature. For example, you may decide that you no longer want to be presented with the default title of "Master" when you use the drop down arrow to fill in the Speaker field when using the Import vCard feature. You can modify the Speaker Prefixes to remove any of the defaults or to add your own. Do the following to modify the default Speaker Prefixes:

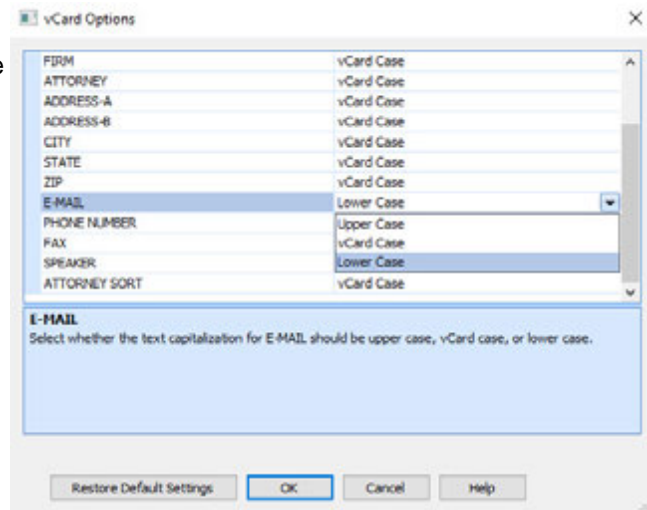

1. Click on the Speaker Prefix line under the vCard Speaker Options section of the vCard Options dialog.
2. Click the dotted button  to the right of the Speaker Prefixes text field to open the vCard Prefixes dialog.
  - a. To add a prefix, click the **new entry** button (*INSERT*).
    - i. Type the prefix text you'd like to add in the field that appears below the existing prefixes.
    - ii. Click OK to accept the changes.
  - b. To delete an existing prefix, highlight the prefix you'd like to delete and then click the **delete** button  (*DEL*).
    - i. Click OK to accept the changes.

### vCard Case Preferences

The vCard Case Preferences section of the vCard Options dialog lets you specify the text capitalization individually for each Field Name when using the Import vCard feature. You can select Upper Case, vCard Case (imported text will match the capitalization from the vCard) , or Lower Case. For example, you may want to have the E-MAIL field text import as lower case regardless of the capitalization of the text in the vCard. Do the following to choose the vCard Case Preference for each Field Name:

1. Click on the Field Name line you'd like to specify a preference for under the vCard Case Preference section of the vCard Options dialog.
2. Click the down arrow ▼ to the right of the Field Name text field to open the drop down selection dialog.
3. Click the Upper Case, vCard Case, or Lower Case option you'd like to use for the Field Name.

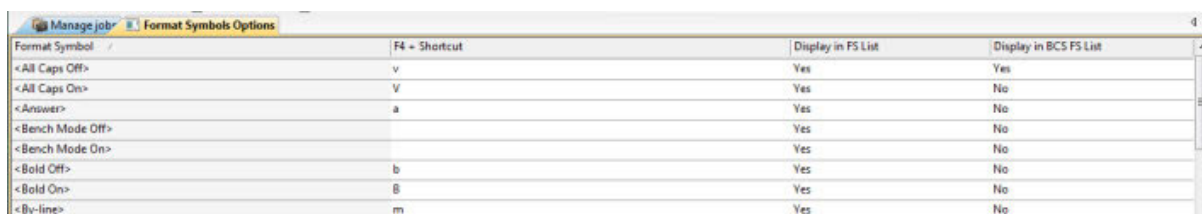

## Format Symbols Options Table

The Format Symbols Options table contains Case CATalyst [translate commands](#), Case CATalyst [format symbols](#) and [CATalyst BCS format symbols](#) along with the default shortcut key assignments. Shortcut keys allow you to insert a format symbol or translate command by invoking a key combination of F4 plus the key associated with the command. For example the default "F4 t" inserts a Tab or the default "F4 X" inserts a {Suffix} translate command in a definition. Not all format symbols and translate commands have a default shortcut key assignment. You can modify the default assignments to suit your writing style. For example, you seldom use the default "F4 m" to insert a By Line format symbol but often insert a Parenthetical format symbol. You modify the By Line format symbol shortcut key to upper case "M" and the Parenthetical format symbol shortcut key to lower case m. As a result, "F4 M" inserts a By Line and "F4 m" inserts a Parenthetical format.

You can [customize](#) the display of format symbols in the Format Symbols list and [modify](#) the shortcut key assignments by making changes in the Format Symbols Options table. This may be helpful if you are a captioner using CATalyst BCS and you want to assign shortcut keys to the commonly used <Caption:> format symbols. The Display in BCS FS List column only displays if your e-Key license includes the optional Broadcast Captioning Suite option.

The Format Symbol Options table is sortable by column in ascending or descending order. To sort, click on a column heading. The arrow in the column heading indicates when the sort in the selected column is in ascending or descending order. You can also [search](#), print the entire table and [print a reference sheet](#).

To open the Format Symbols Options table, press **Alt + f, o, i, o** (**File/Open/List/Table/Format Symbols Options**).

Format Symbol	F4 - Shortcut	Display in FS List	Display in BCS FS List
<All Caps Off>	v	Yes	Yes
<All Caps On>	V	Yes	No
<Answer>	a	Yes	No
<Bench Mode Off>		Yes	No
<Bench Mode On>		Yes	No
<Bold Off>	b	Yes	No
<Bold On>	B	Yes	No
<By-line>	m	Yes	No

## Modify Format Symbol Options Table Entries

The Format Symbols Options table contains Case CATalyst and CATalyst BCS translate commands and format symbols with default shortcut key assignments. The Display in BCS FS List column only displays if your e-Key license includes the optional Broadcast Captioning Suite. You can customize the shortcut assignments to meet your needs.

### Modify Entries

1. From anywhere in Case CATalyst, press **Alt + f, o, i, o** (**File/Open/List/Table/Format Symbols Options**). The Format Symbols Options table displays.
2. Highlight the entry you want to modify and press **Ctrl + m** (**Edit/Modify**). You can use the [Search](#) feature to quickly locate an entry in the table.
3. In the Modify dialog box, make necessary entries:

#### F4 Shortcut

When a shortcut key assignment exists for the selected format symbol or translate command, it displays in the field. To change or assign a shortcut key assignment, click the down arrow and select a character from the list. If you select a shortcut key that is already assigned to another format symbol, Case CATalyst prompts you to reassign the key. Select Yes or No at the prompt.

To remove an assignment, select the "blank" option at the top of the drop down list.

#### Reset to Default Value

Click this button to reset the selected format symbol shortcut key assignment to the default value. If the default is a capital letter, Case CATalyst restores it as a capital letter. The value in the table changes once you click OK.

#### Display this format symbol when showing the Format Symbols list

Check this box to display the selected format symbol in the Case CATalyst Insert Format Symbol dialog box. Yes displays in the *Display in FS List* column when this option is active. This option affects the display of the format symbol in the list only. The shortcut key assignment works regardless of the display status.

#### Display this format symbol when showing the Format Symbols list in BCS

Check this box to display the selected format symbol in the CATalyst BCS Insert Format Symbol dialog box. CATalyst BCS is optional captioning software. Yes displays in the Format Symbol Options, *Display in BCS FS List* column when this option is active. This option affects the display of the format symbol in the list only. The shortcut key assignment works regardless of the display status.

When the *Hide Caption-specific format symbols* option in [Advanced Edit Options](#) is set to Yes, it overrides the individual settings made for captioning format symbols in the Format Symbols Options table.

4. Press **Enter (OK)** to apply the changes and close the dialog box.
5. Press **Ctrl + s (File/Save)** to save the changes to the Format Symbols Options table. Changes are active in the Insert Format Symbol dialog box once you save the changes.

## Change Format Symbols Options Table Fonts

The font type and size for the body and heading text in the Format Symbol Options table are customizable. The font type and size applies equally to the body and heading text.

### Modify the Font:

1. Press **Alt + f, o, i, u (File, Open, List/Table, Format Symbols Options)**.
2. Do either of the following:
  - If the Dictionary/List Toolbar (  ) is displaying, go to Step 3.
  - If the Dictionary/List Toolbar is not displaying, right click a toolbar and select Dictionary/List Toolbar.
3. Do any of the following:
  - Click the Font style icon (  ) to change the font type.
  - Click the Font size icon (  ) to change the font size.
4. Closing the Format Symbols Options table saves the font change information. If you have made other changes, you will be prompted to save your changes.

## Search Format Symbol Options Table

Search allows you to locate a format symbol or translate command in the Format Symbol Options table. You can search forward or backward for a whole word, part of a word, or multiple words. Once a searched entry displays, you can repeat the search for the same text and search parameters by using Repeat Search Forward or Repeat Search Backward.

### Search

1. From Manage Jobs, press **Alt + f, o, i, o (File/Open/List/Table/Format Symbols Option)**. The Format Symbols Options displays.
2. Press **Ctrl + f (Edit/Search)**. The Search dialog box displays.
3. Select the method by which you want to search the Personal Globals table.

#### Specific Text

Search by specific text. In the *Search* field, type the text you want to find.

#### Entry Type

Check this box

Check this box to customize the search by entry type. Case CATalyst searches all the columns for entries that contain the selected entry type. Click the down arrow to select an entry type from the list:

#### Numbers

The first entry that contains numbers.

**All Capped**

The first entry that contains all capped text.

**Contains capped**

The first entry that contains at least one capital letter.

**Phrase**

The first entry that contains two or more words separated by a space.

**Contains punctuation**

The first entry that contains punctuation.

**Numerical Words**

The first entry that contain a word number including hundred, thousand, million, etc.

4. Use the remaining fields as necessary:

**Case Sensitive**

Check this box to limit the search based on the upper and lower case letters of text typed in the *Search* field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field. This option is unavailable when searching by *Entry Type*.

**Whole Word**

Search only for the words that match the text typed in the *Search* field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. This option is unavailable when searching by *Entry Type*.

**Location**

Select search parameters. This option is unavailable when searching by *Entry Type*.

**Exact Match**

Search for entries that exactly match the text entered in the *Search* field.

**Begins With**

Search for entries that begin with the text entered in the *Search* field.

**Ends With**

Search for entries that end with the text entered in the *Search* field.

**Contains**

Search for entries that contain, anywhere in the entry, the text entered in the *Search* field.

**Direction**

Select **one**:

**Forward**

Search forward, from the cursor position to the end of the file.

### Backward

Search backward, from the cursor position to the beginning of the file.

5. Press **Enter (OK)** to start the search. If no match is found for the search item, a message displays.
6. To repeat the same search, press **F3 (Edit/Repeat Search Forward)** or **Shift + F3 (Edit/Repeat Search Backward)**.

## Print Format Symbol Reference Sheet

The format symbols and shortcut keys in the Format Symbol Options table are printable as a reference sheet. You can print the reference sheet in format symbol or shortcut key sort order.

### Print a Reference Sheet

1. From anywhere in Case CATalyst, press **Alt + f, o, i, o (File/Open/List/Table/Format Symbols Options)**. The Format Symbols Options table displays.
2. Select File/Print Reference Sheet and choose a sort order from the submenu.

## Global Table

A Global Table contains definitions created using D-Define, K-Define, J-Define, E-Define and Other Dictionary Define commands in the job. Each job has its own Global Table. When you make the first [global definition](#) for the job, Case CATalyst creates a Global Table, if one does not already exist. [Global Table Options](#) determine how certain global features are handled and allows you to customize Global Table display settings.

You can [manage the globals](#) in the Global Table for the job. Apply, undo, modify, delete and print globals. Other features allow you add globals from other Global Tables and to copy and paste globals from one Global Table to another.

Global Tables are available for use in translation. Global Tables are available for use in translation. Translating with a Global Table allows you to use previously created [E-Defines](#) in the selected Global Table along with any defines in the selected dictionaries. To use Global Tables in translation, in the Translate dialog box, select the [Show Global Tables](#) option to display global files for selection.

Access the Global Table:

- in Edit. Press **Ctrl + y (Global/Global Table)**.
- in Manage Jobs. Press **Alt + f, o, i, t (File, Open, List/Table, Global Table)**. In the Open Existing Document dialog box, select a Global Table and press **Enter (Open)**.

Modifying a Global Table entry from Manage Jobs does not change the globalled text already applied to the job. To apply changes to text, it is necessary to modify the globals from within Edit. Additionally, Undo Global is only available from within Edit.

[Keyboard Map](#) Functions: Global Table

## Understanding the Global Table

The following information displays in a Global Table. The most recent global displays at the top. Use the [Search](#) and [Filter](#) features to locate a specific entry or entries with specific criteria.

You can sort globals in the table by clicking a column heading. Continue to click the column heading until the triangle points up for ascending order or down for descending order. By default, the cursor moves to the top row in the sort order. To have the cursor remain at the current line location change the [Retain position after sort](#) Global Table option.

### Number

The number of the global. When you create globals, Case CATalyst sequentially assigns a number to each global. The Global Table opens with the entries listed in descending global number order, the most recent global first in the list.

### Type

The type of global define: D-Define, K-Define, J-Define, E-Define or a Personal Global. If you made an Other global, it will be listed as a J-define type of global.

### Steno

The steno portion of the global.

### Case Sensitive

Y or N displays in this column when the entry is an [E-Define](#) or a Personal Global. Y indicates you made the global case sensitive so that it replaces only text with the upper and lower case letters as they display in the definition.

### Old Text

The text, steno and format symbols, if applicable, the global replaces.

### New Text

The replacement text for the global.

### Selective

The global was marked as [Selective](#) when the steno or text was defined. If you use the [Add Other Globals](#) command to apply the global, Case CATalyst no longer considers the global Selective. A Selective global used during realtime does not apply to new realtime text.

The Global Table option, [Exclude Selective Global](#) determines if a selective global should be included when copying and pasting.

## Global Table Options

Global Options determine how certain global features are handled and allow you to customize Global Table display settings. You can access Global Table Options from the Global Table. Press **Alt + t, o** (**Tools/Options**).

You can also [manage the globals](#) in the Global Table such as delete, modify, undo, etc.

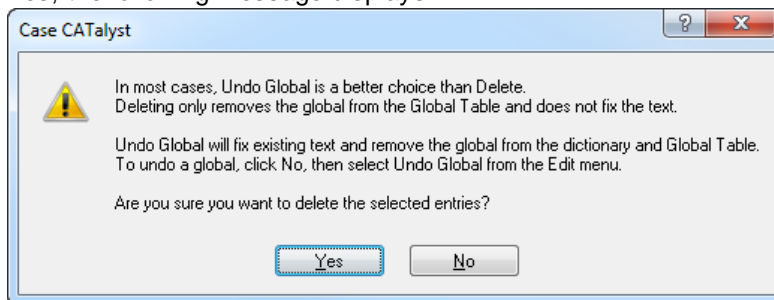

## Global Table Options

To make a change, click an option. Depending on the field, select a choice from the drop down box, type an entry or use the Browse button. When finished with all your changes, select **OK**. The *Restore Default Settings* option returns all the Global Table Options to their original Case CATalyst default selection.

### Warn before deleting entries

Check this box to display a confirmation message when you delete global table entries. Deleting a global removes it from the global table and does not fix or change existing text. In most cases, users want to reverse a global to change the transcript text back to what it was (steno/text) before making the global and remove the definition from the designated dictionary. To do that, use the [Undo Global](#) command which is available when opening the Global Table while in a Transcript or you can locate the global in the transcript and select Undo Global from the Global menu.

If you opened the Global Table while in a transcript and select to delete a global and this option is set to Yes, the following message displays:

The Delete global confirmation message differs depending on whether you are deleting globals in a Global Table that was opened at Manage Jobs or a global table that opened within a transcript. When opening a Global Table from Manage Jobs and selecting to delete a global, a Yes No confirmation message displays.

Uncheck this option to disable the confirmation message when you delete entries

### Exclude Selective Global

Check this box to exclude [selective](#) globals from being added or pasted when using the [Add Other Globals](#) command or when copying and pasting globals from one table to another.

Uncheck this box to have selective globals available when using the Add Other Globals... feature.

### Global Table Heading font

The current font selection for the column headings displays in the field. Click the **Browse** button to display the Font dialog box. Select the font and click **OK**. Font style attributes do not apply.

Global Table fonts apply to the Add Globals dialog box when you use the Add Other Globals feature.

### Global Table Steno font

The current font selection for the steno portion of the entries displays in the field. Click the **Browse** button to display the Font dialog box. Select the font and click **OK**. Font style attributes do not apply.

When selecting font types for steno display, it is best to select a Fixed Space Font. Case CATalyst, by default, has three fixed spaced fonts: Andale Mono, Arial Monospaced and Letter Gothic MT plus the Windows Courier New. If you select a proportional font, steno characters may not line up based on their placement on the steno keyboard.

Global Table fonts apply to the Add Globals dialog box when you use the Add Other Globals feature.

### Global Table Text font

The current font selection for the text that displays in the Old Text and New Text fields. Click the **Browse** button to display the Font dialog box. Select the font and click **OK**. Font style attributes do not apply.

Global Table fonts apply to the Add Globals dialog box when you use the Add Other Globals feature.

#### **Global Table Other font**

The current font selection for Global Table text under the Number, Type, Case Sensitive and Selective headings displays in the field. Click the **Browse** button to display the Font dialog box. Select the font and click **OK**. Font style attributes do not apply.

#### **Retain position after sort**

Select **No** to have the cursor move to the top row in the Global Table after clicking a column heading to change the sort order. This is the default.

Select **Yes** to maintain the cursor position at the current line location after click a column heading to change the sort order.

#### **Add Other Globals go to dictionaries**

Select **Yes** to have the *Add Other Globals* feature add all D-Defines, K-Defines and J-Defines to the Global Table and their respective dictionaries. This is the default setting.

Select **No** to have the *Add Other Globals* feature add all D-Defines, K-Defines and J-Defines only to the Global Table.

### **Manage Global Table Entries**

You can apply, undo, add, modify and delete globals in your Global Table. The Global Table is accessible from Edit and from Manage Jobs. Modifying a Global Table entry from Manage Jobs, however, does not change globals already applied to the open job. To affect globals, it is necessary to modify the globals from within Edit (open the transcript and then open the Global Table). Additionally, it is only possible to Undo a global from within Edit. If you are scopist, you may be using the [Xtra Global Table](#) feature which you can also manage from the System Files case.

Use the [Search](#) feature to quickly locate an entry. The [Filter](#) feature allows you to display Global Table entries in a specified category or with specific criteria.

Access the Global Table:

- in Edit. Press **Ctrl + y (Global/Global Table)**. When modifying a global in Edit, the modified text applies to matching global of the existing global throughout the entire file.
- in Manage Jobs. Press **Alt + f, o, i, t (File, Open, List/Table, Global Table)**. In the Open Existing Document dialog box, select a Global Table and press **Enter (Open)**. When modifying a global at Manage Jobs, the modified text is changed in the Global Table and has no effect on the text in the job. If you open the job and then open the Global Table, the text of the global will be modified but it does not apply to the job.

### **Add Other Globals to the Global Table**

The [Add Other Globals](#) feature allows you to copy global definitions from another job to your current job and place the globals into the global table of the current job.

### **Apply Globals Backwards in the Global Table**

When making a global definition, by default, the global only applies forward in the file unless you select the Entire File option. The global does not apply to previous transcript. The Global Table feature, Apply Backwards, allows you to choose globals and apply them backward in the job. The global remains active for new text, such as realtime.

Use [Apply All Global Backward](#) to quickly apply all globals in the transcript backward in the job. A global marked as "[selective](#)" does not automatically apply backward when using this feature.

### Apply Globals Backward

1. Do one of the following:
  - Highlight the entry for selection.
  - Press and hold **Ctrl** while you click the multiple entries to highlight.
  - Click to highlight the first entry of the group. Locate the last entry you want to select. Press and hold **Shift**, while you click the last entry. Case CATalyst highlight all the entries in-between.
  - Press **Ctrl + a** to highlight all the entries.
2. Press Alt + e, a (Apply Backward) to apply the globals backward in the job.

## Copy and Paste Globals

To copy and paste globals from one Global Table to another:

1. Open Global Table from which you want to copy. Do one of the following:

#### Select one entry

Highlight a single entry.

#### Select specific entries

Press and hold **Ctrl** while you click multiple entries to highlight for selection.

#### Select a consecutive group of entries

Click to highlight the first entry of the group. Press and hold **Shift**, while you click the last entry. Case CATalyst highlights all the entries in-between for selection.

#### Select all the entries

Press **Ctrl + a** to highlight all the entries for selection.

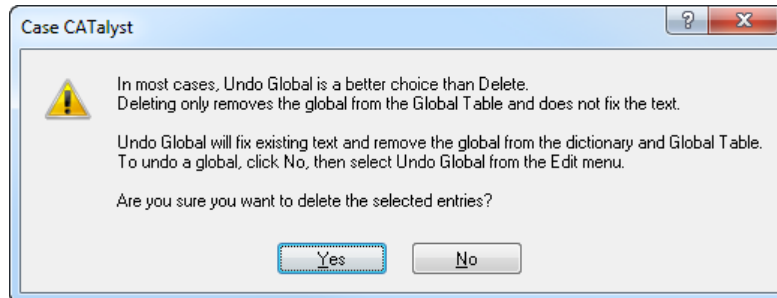

2. Right click and select **Copy** and close the Global Table.
3. Open the Global Table in which you want to Paste the entries.
4. Right click and select **Paste**.

## Delete Globals

You can remove globals from the Global Table using the Delete command which removes the globals from the Global Table but does not fix or change existing text. Deleting a global prevents it from applying to new, incoming text. ***If you opened the Global Table while in a transcript, in most cases, users want to reverse the action of a global so it changes the transcript text back to what it was (steno/text) before making the global in all instances in the transcript where the global was applied and remove the entry from the designated dictionary.***

When deleting a global from a Global Table opened from Manage Jobs, an *Are you sure you want to delete?* message displays.

When deleting a global from a Global Table while in a transcript, a warning message displays explaining that deleting a global will not change or fix the existing text.

To reverse the global action, use the [Undo Global](#) command. Undo Global does not affect text modified after the global applied.

To remove globals from the global table:

1. Highlight the entries to delete. Do **one** of the following:

### Select one entry

Highlight a single entry.

### Select specific entries

Press and hold **Ctrl** while you click multiple entries to highlight for selection.

### Select a consecutive group of entries

Click to highlight the first entry of the group. Press and hold **Shift**, while you click the last entry. Case CATalyst highlights all the entries in-between for selection.

### Select all the entries

Press **Ctrl + a** to highlight all the entries for selection.

2. Press **Delete** to remove the global from the global table. A confirmation message displays if you have the [Warn before deleting entries](#) option selected. Select **Yes** to continue the deletion.

## Modify Global Text

To modify the text in the New Text field of an entry:

1. Highlight the entry and press **Ctrl + m (Edit/Modify)**
2. Case CATalyst positions the cursor in the *New Text* field at the end of the current text. Make necessary changes. To insert a format symbol, press **F4, F4** to display the Format Symbol list. Double click an entry to select it.
3. Press **Enter** to complete the modification.
4. At the modify confirmation prompt, press **Enter** confirm the change.

In edit, the modified global applies throughout the entire file to the matching steno/text of the existing global.

In realtime, the modified global applies only to the existing globals. Once the file is saved, the modified global text is saved in the destination dictionary if appropriate.

At Manage Jobs, the modified global text is changed in the Global Table and has no affect on the text in the file.

## Print Globals

To print global entries for the open job in Edit:

1. From the Global Table, press **Ctrl + p (File/Print)**. The Print dialog box displays.
2. Select the printer and press **Enter (OK)**.

## Send Globals to Cat Scratch

Send global entries to the User, Case or Job Cat Scratch Dialog Pane, depending on the selected user scope of the Cat Scratch pane.

1. In the Global Table, highlight the entries to send. Do **one** of the following:

### Select one entry

Highlight a single entry.

### Select specific entries

Press and hold **Ctrl** while you click multiple entries to highlight for selection.

### Select a consecutive group of entries

Click to highlight the first entry of the group. Press and hold **Shift**, while you click the last entry. Case CATalyst highlights all the entries in-between for selection.

### Select all the entries

Press **Ctrl + a** to highlight all the entries for selection.

2. Select **Edit/Send to Case Cat Scratch**.

## Undo Globals

While editing a job, you can undo globals using one of three different commands without opening the Global Table:

- [Undo Last Global](#) reverses the last global action.
- [Undo Global](#) reverses the global from the job. Undo is also available in the Global Table. You can undo a global at anytime.
- [Undo Global Once](#) reverses the global action for a single word.

## Search Global Table

Search allows you to locate a entry in the Global Table you want to view or modify. You can search forward or backward for steno or text, including whole word, part of a word, or multiple words. Once a searched entry displays, you can repeat Search for the same text and search parameters by using *Repeat Search*.

Use the [Filter](#) feature to display Global Table entries in a specified category or with specific criteria.

Access the Global Table:

- in Edit. Press **Ctrl + y (Global/Global Table)**.
- in Manage Jobs. Press **Alt + f, o, i, t (File, Open, List/Table, Global Table)**. In the Open Existing Document dialog box, select a Global Table and press **Enter (Open)**.

Modifying a Global Table entry from Manage Jobs does not change the globalled text already applied to the job. To apply changes to text, it is necessary to modify the globals from within Edit.

Additionally, Undo Global, and other undo global features, are only available from within Edit.

## Search Global Table

1. From the Global Table, press **Ctrl + f (Edit/Search)**. The Search dialog box displays.
2. Make entries as necessary:

### Search For

Select the method by which you want to search the Global Table.

#### Steno

Search by steno. Type the search steno in the field. Separate multiple strokes with a forward slash. When starting with a final stroke, place a – (hyphen) before the first letter.

#### Partial Stroke

Check this box to search for the specified steno regardless of whether or not it is part of a steno outline. For example, searching for –FPLT finds: -FPLT, FPLTD, FRPBLGTS, FRPBLTS, etc. Without the *Partial Stroke* option, searching –FPLT displays entries with –FPLT as a separate outline, such as: -FPLT, -FPLT/-FPLT, etc. This option only displays when you search for Steno.

#### Text

Search by text. Type the search text in the field. The search considers both *Old Text* and *New Text*.

#### FS

Add format symbols to a text search. Select **FS** and double click the format symbol from the list to select it; or use shortcut keys. To use a shortcut key, place the cursor in the *Search For* field, press **F4** and then the appropriate letter or symbol.

#### Case Sensitive

Limit the search based on the upper and lower case letters of text typed in the *Search For* field. Without this option, the search considers all words containing the indicated characters, regardless of the case typed into the field. This option only displays when you search for Text.

3. Press **Enter (OK)** to start the search. The Search dialog box closes and the Global Table window displays the entry. If Case CATalyst does not find a match for the selected steno or text search, a message displays.
4. To repeat the same search, press **F3 (Edit/Repeat Search)**.

## Filter Global Table

Filter displays only the entries in the Global Table that contain the specified criteria. Entries filtered out are not removed from the file. All the entries redisplay when you select Unfilter or the next time you open the Global Table.

Use the [Search](#) feature to quickly locate an entry you want to view or modify.

Access the Global Table:

- in Edit. Press **Ctrl + y (Global/Global Table)**.
- in Manage Jobs. Press **Alt + f, o, i, t (File, Open, List/Table, Global Table)**. In the Open Existing Document dialog box, select a Global Table and press **Enter (Open)**.

Modifying a Global Table entry from Manage Jobs does not change the globalled text already applied to the job. To apply changes to text, it is necessary to modify the globals from within Edit. Additionally, Undo Global, and other undo global features, are available from within Edit.

## Filter Global Table

1. From the Global Table, press **Alt + v, f (View/Filter)**. The Filter dialog box displays.
2. Make entries as necessary:

### Filter

Click the down arrow to display the filter criteria. Select one of the following:

#### Number

Filter the display by the assigned entry number. Type the entry number in the field.

#### Steno

Filter the display by steno. Type the steno in the field. Separate multiple strokes with a forward slash. When starting with a final stroke, place a – (hyphen) before the first letter.

#### Partial Stroke

Check this box to filter on entries that contain a portion of the steno outlined typed. For example, you filter on –FPLT. The filter includes: -FPLT, FPLTD, FRPBLGTS, FRPBLTS, etc. Filtering on –FPLT without the *Partial Stroke* option, displays entries with –FPLT as a separate outline, such as: -FPLT, -FPLT/-FPLT, etc.

#### Case Sensitive

Filter the display based on the E-Define Case Sensitive attribute. A global created with the Case Sensitive attribute replaces only text with upper and lower case letters as they display in the definition. Select **Y** to filter on entries with the Case Sensitive attribute. Select **N** to filter on entries without it.

#### Type

Filter the display by global define type. Select a define type from the drop down list.

#### Old Text

Filter the display based on text in the *Old Text* field. Type the text in the field.

Add format symbols and fields to the filter as necessary. Select **FS** and double click the format symbol from the list to select it; or use shortcut keys. To use a shortcut key, place the cursor in the field, press **F4** and then the appropriate letter or symbol. To add a field, click [Insert Field](#) and select a field. Press **F9** to add [extended characters](#).

### **New Text**

Filter the display based on text in the New *Text* field. Type the text in the field.

Add format symbols and fields to the filter as necessary. Select **FS** and double click the format symbol from the list to select it; or use shortcut keys. To use a shortcut key, place the cursor in the field, press **F4** and then the appropriate letter or symbol. To add a field, click [Insert Field](#) and select a field. Press **F9** to add [extended characters](#).

### **Selective**

Filter the display based on the Selective attribute. A global created with the Selective attribute moves to each occurrence affected by the global change, allowing you to choose to apply the change, skip the occurrence or apply the change to all occurrences. Select **Y** to filter on entries with the Selective attribute. Select **N** to filter on entries without it.

### **Entry Type**

Filter the display by entry type, such as conflict or Auto Include. Select an entry type from the drop down list. This field is available when *Old Text* or *New Text* is selected in the *Filter* field.

#### **Entry Types**

##### **Conflict**

The first entry that contains a conflict end format symbol.

##### **Scan stop**

The first entry that contains a scan stop begin or end format symbols.

##### **Numbers**

The first entry that contains numbers.

##### **All Capped**

The first entry that contains all capped text.

##### **Contains capped**

The first entry that contains at least one capital letter.

##### **Phrase**

The first entry that contains two or more words separated by a space.

##### **Contains punctuation**

The first entry that contains punctuation.

##### **Contains format symbol**

The first entry that contains a format symbol.

##### **Contains Field(s)**

The first entry that contains a field.

**Auto Includes**

The first entry that begin with @.

**AccelerWriter**

The first entry that begin with &&.

**Number Conversion**

The first entry that contain the {Number Conversion} translate command.

**Number Trigger**

The first entry that contain the {Number Trigger} translate command.

**Numerical Words**

The first entry that contain a word number including hundred, thousand, million, etc.

**Speaker Entries**

The first entry that contain a <Colloquy> format symbol and a colon.

**Case Sensitive**

Filter on entries based on the upper and lower case letters of text typed in the field. Without this option, the filter considers all words containing the indicated characters, regardless of the case typed into the field. This field is available when *Old Text* or *New Text* is selected in the *Filter* field.

**Whole Word**

Filter only on entries that match the filter text typed in the field. If you do not select *Whole Word*, the filter locates the text as it stands alone and as part of another word. This field is available when *Old Text* or *New Text* is selected in the *Filter* field.

**Location**

Select filter parameters.

**Exact Match**

Filter on entries that exactly match the text entered in the *Filter* field.

**Begins With**

Filter on entries that begin with the text entered in the *Filter* field.

**Ends With**

Filter on entries that end with the text entered in the *Filter* field.

**Contains**

Filter on entries that contain, anywhere in the entry, the text entered in the *Filter* field.

3. Press **Enter (OK)**. If no entries are found for the filter item, a message displays.

## Keyboard Maps

A Case CATalyst Keyboard Map (.sgkbd) contains entries which determine the action that occurs, in Edit or Manage Dictionary, as a result of pressing a key or combination of keys on the keyboard, often called "shortcut keys." For example, when the Default keyboard map is active in Edit, pressing the right arrow moves the cursor to the right one word at a time; Ctrl + right arrow moves the cursor to the right one character at a time; pressing Shift + F7 invokes Spell Check.

Edit and Manage Dictionary have independent customizable keyboard maps. You can create new keyboard maps and modify existing ones by [modifying](#) the keyboard map entries. Keyboard functions available for assignment differ in Edit and Manage Dictionary. Certain keys and key combinations are unavailable for assignment to a keyboard function because they are used by Case CATalyst. For example, the F4 key, used to insert format symbols and F10 key, used to place the cursor focus on the menu bar, are not available. Certain key combinations for the following keys are also unavailable: F1, F6, Esc, and Tab. These keys are available to use in the following key combination assignments: F1 + Ctrl, F1 + Shift and F1 + Ctrl+ Shift; F6 + Shift, Esc + Shift and Tab + Shift. In addition to assigning a keyboard function, you can create and assign a [macro](#) to a keyboard command. Only one keyboard function or macro can be assigned to a key or key combination.

Edit opens, by default, with the Edit [Default](#) keyboard map active. You can create and use multiple keyboard maps but only one is active at a time. By default, Keyboard maps for Edit are stored in the System Files case. Keyboard map options, located in [Advanced Edit Options](#), allow you to specify the active keyboard map in Edit, select any keyboard map from any user on the system and specify a keyboard map to use when recording keyboard commands to invoke macros. The Default keyboard map as well as customized maps for Edit are located in the System Files case. The Default keyboard map is not initially visible. It becomes visible in the System Files case once you open and save it with the name, **Default**. Other keyboard maps can reside in any other location on the computer.

The Personal Command Summary Card feature is available from the View menu when in a keyboard map and also available from the Help menu in any function where you may select any keyboard map. The Personal Command Summary Card always displays the current keyboard map assignments. In other words, if you make changes to your keyboard map at a later date, you simply select Personal Command Summary Card to see the latest version of your keyboard map.

If your e-Key license includes the BCS option, in addition to Basic, Intermediate and Advanced command summary card versions, the BCS Basic and BCS Advanced versions are available.

Manage Dictionary opens, by default, with the Manage Dictionary [Default](#) keyboard map active. Keyboard maps for Manage Dictionary must be stored in the Dictionary case located in the System Files case. The Dictionary case is created once you open and save a keyboard map while in a dictionary. Opening the Dictionary keyboard map for the first time and saving it automatically creates the Default keyboard map in the Dictionary Case. To change the opening active keyboard map in Manage Dictionary, change the setting in [Dictionary Options](#).

The name of the active keyboard map displays on the Status bar at the bottom the screen. Click the name to display a list of available keyboards. You can easily switch the active keyboard map by selecting another keyboard from the list. The [Cycle Keyboard Map](#), also allows you to easily switch the active keyboard map.

The Insert key does not have a command assigned to it. The Insert key normally is assigned to toggle between Insert and Overstrike. If you want the Insert key to toggle between Insert and Overstrike, assign the Insert Overstrike Toggle command to the Insert key.

Also note that Ctrl + Shift + 0 (zero) is reserved for Windows and if assigned to a function or macro in a CATalyst keyboard, nothing will happen when trying to use it.

## Keyboard Map Information

### Key

The key or key combination available for assignment.

### Function

The action that occurs when the associated key or key combination is pressed.

### Macro Filename

The macro location and name assigned to the Play Macro function and associated key.

## Change Keyboard Map Fonts

The font style and size for the body and heading text in the Keyboard Maps are customizable. The font style and size applies equally to the body and heading text.

### Modify the Font:

1. Press **Alt + f, o, i, u (File, Open, List/Table, Keyboard Maps)**. In the Open Existing Document dialog box, select a Keyboard Map.
2. When the keyboard map displays, do either of the following:
  - If the Dictionary/List Toolbar (  ) is displaying, go to Step 3.
  - If the Dictionary/List Toolbar is not displaying, right click a toolbar and select Dictionary/List Toolbar.
3. Do any of the following:
  - Click the Font style icon (  ) to change the font style.
  - Click the Font size icon (  ) to change the font size.
4. Closing the Keyboard Map saves the font change information. If you have made other changes, you will be prompted to save your changes.

## Create & Modify Keyboard Maps

Create new or customize an existing [keyboard maps](#) in Edit and Manage Dictionary to better fit your writing and editing style. You may want to create or modify keyboard map entries to perform keyboard functions not currently assigned to a key or key combination, modify a keyboard assignment to a key combination that is easier to remember or to invoke a [macro](#).

### Keyboard Maps in Edit

Refer to [Edit Keyboard Map Functions](#) for a list of default available keyboard functions available for assignment, including, Upper ANSI and extended ASCII characters available for assignment in any keyboard map. The list identifies the default keyboard assignments for Edit. By default, Keyboard maps for Edit are stored in the System Files case.

### Keyboard Maps in Manage Dictionary

The Dictionary Default keyboard map is accessible to view and modify after you open it for the first time and save it. The Dictionary case, that stores Dictionary keyboard maps, is created the first time you save the Dictionary Default keyboard map. To access the Dictionary Default keyboard map for the first time and create the Dictionary Case, open a dictionary. Double click **Default** on the Status bar at the bottom of the screen. After the keyboard map opens, close it. When prompted to save the file, select **Yes** to automatically save the keyboard map with the filename, "Default." Keyboard maps for Manage Dictionary must be stored in the Dictionary case located in the System Files case.

Refer to [Dictionary Keyboard Map Functions](#) for a list of default Dictionary keyboard functions available for assignment.

The Insert key does not have a command assigned to it. The Insert key normally is assigned to toggle between Insert and Overstrike. If you want the Insert key to toggle between Insert and Overstrike, assign the Insert Overstrike Toggle command to the Insert key.

You may notice that some keys have the capability for four assignments. You can assign an action to the key itself, the key plus Shift, the key plus Ctrl and the key plus Ctrl + Shift. In other cases, you may only be able to assign an action to the key and possibly the key plus shift. Windows reserves some key combinations that are not to be reassigned.

## Manage Keyboard Maps

1. Open the desired keyboard map type:

### Edit Keyboard Maps

#### Open an Active Keyboard Map

Double click the keyboard name in the Status bar at the bottom of the Edit screen.

#### Open Existing Keyboard Map

Press **Alt + f, o, i, k** (**File/Open/List-Table/Keyboard Map**). The Open Existing Document dialog box displays. Select an existing keyboard map and press **Enter** (**Open**).

To open the Edit default keyboard map, type the name **Default** in the *File name* field. Once initially accessed, it is available for selection in the Manage Jobs, Systems Files case.

#### Create New Keyboard Map

Press **Alt + f, n, i, k** (**File/New/List-Table/Keyboard Map**). The Create New Document dialog box displays. Type a name in the *File name* field and press **Enter** (**Open**).

## Dictionary Keyboard Maps

#### Open the Active Keyboard Map

Double click the keyboard name in the Status bar at the bottom of the Dictionary screen.

#### Open Existing Keyboard Map

Press **Alt + f, o, i, k** (**File/Open/List-Table/Keyboard Map**). The Open Existing Document dialog box displays. Double click the Dictionary case, located in the System Files case. Type an existing name in the File name field and press **Enter** (**Open**).

To access the Dictionary Default keyboard map, it is necessary to initially open and save the Dictionary Default keyboard map from an open dictionary. Open a dictionary and double click **Default** on the Status bar at the bottom of the screen. Save the keyboard map as "Default" or rename it.

### Create New Keyboard Map

Press **Alt + f, n, i, k (File/New/List-Table/Keyboard Map)**. The Create New Document dialog box displays. Double click the Dictionary case, located in the System Files case. Type a name in the File name field and press **Enter (Open)**.

New Dictionary keyboard maps display with default keyboard command assignments. Dictionary keyboard maps must be stored in the Dictionary case located in the System Files case. If the Dictionary case is not available, create it by opening a dictionary and double clicking **Default** on the Status bar at the bottom of the screen. When the Default keyboard map opens, save or rename it. The Dictionary case is created when you save the keyboard map.

2. Do one of the following:

- Press **Ctrl + i (Edit/Insert)** to add a new key assignment.
- Double click the key or key combination to modify.
- Highlight the key or key combination to modify and press **Enter** or **Ctrl + m (Alt + Edit/Modify)**.

3. The Assign Key to Function dialog box displays. Make necessary entries:

### Currently Assigned to

The keyboard function presently assigned to the key or key combination identified in the Key field.

### Key

The Key field contains a list of keyboard keys. The options below the Key field indicate if the key is used alone or in conjunction with Ctrl, Shift, or Ctrl and Shift. The selected radio button designates the active key combination. You can assign a different keyboard function to each of the key combinations. For example, in the Default keyboard map, n alone displays the letter "n". **Ctrl + n** displays the View Vertical Notes feature. **Shift + n** displays a capital letter "N".

Select a key for assignment from the drop down list and then click the radio button next to one of the following: Key Only, Ctrl + Key, Shift + Key, Ctrl + Shift + Key. The keyboard function presently assigned for the selected key combination displays in the Currently Assigned to field. If no keyboard function is assigned, the field is blank.

When you assign a single key to invoke a command, consider assigning Shift plus the same key to the same command. This helps to prevent the possibility of invoking the capped version of a keyboard command when the Caps Lock is on.

### Restore Default Assignment

Restore the default keyboard function assignment for the identified in the Key field. This only restores the default assignment for the current key.

### Filter by Category

Click a category to display only the keyboard functions for the selected category in the Functions list. For example, you want to locate Move to next red squiggle, which is a Spell Check keyboard function. Select the Category, Spell Check to display a list of only the available Spell Check keyboard functions. Select All to display all the keyboard map functions available for assignment.

## Functions

To change the keyboard function for the key in the Key field, highlight the desired keyboard function from the list. Recorded Macros display alphabetically at the end of end of the list in the MACROS section.

When you assign a key combination immediately after creating the macro, the newly created macro displays highlighted in the MACROS section.

## Search

Display the Find dialog box to search for a specific keyboard function.

### Find Search Functions List

1. Type a keyboard function name or portion of a name in the *Search for* field. To limit the search to a particular category, first select the category in the Filter by Category field and then select Search.
2. Select the direction to search.
3. Press **Enter** (OK). To repeat the search, press **F3** to search forward or **Shift + F3** to search backward. If you limited the search by category for the desired keyboard function and it does not display in the list, the incorrect category was selected. For example, you select to filter by Punctuation for Move Word Left. This keyboard function is a Cursor action so Search does not locate it in the Punctuation category.

## Use Windows Default

Use the Windows default keyboard assignment if your Windows Regional Language setting is set to a language other than English. For example, if French is selected as your Windows Regional and Language and the key assignment in the Keyboard Map is set to Windows default, the keyboard action follows the Windows default French language keyboard.

4. Press **Enter** (Assign). The entry displays in the Keyboard Map list.

If you modify an entry with an existing assignment, a message prompts you to continue. Choose **Yes** to replace the existing assignment with the new keyboard function. Choose **No** to retain the existing assignment.

5. Press **Ctrl + s** (File/Save) to save the change to the keyboard map.
6. Press **Ctrl + F4**, to close the keyboard map when finished.

## Delete Keyboard Map Assignment

1. Open the keyboard map which contains the key assignment you want to delete. Do either of the following:
  - Press **Alt + f, o, i, k** (File/Open/List/Table/Keyboard Map). The Open Existing Document dialog box displays. If you are opening a Dictionary keyboard map, double click the Dictionary Case. Type the keyboard map name in the *File name* field and press **Enter** (Open). The selected keyboard map displays.
  - Open the active keyboard map from Edit for an Edit keyboard map or Manage Dictionary for a Manage Dictionary keyboard map. Double click the keyboard name in the Status bar at the bottom of the Edit screen. The keyboard map displays.
2. Highlight the assignment you want to delete and press **Delete** (Edit/Delete). The following message displays: "Are you sure you want to delete this assignment?" Press **Yes** to delete the entry.

3. Press **Ctrl + s (File/Save)** to save the change to the keyboard map.
4. Press **Ctrl + F4**, to close the keyboard map. If you opened the active keyboard map from Edit, the Edit screen displays. If you opened the active keyboard map from Manage Dictionary, the dictionary displays.

## Filter Keyboard Map Entries

The Filter feature allows you to limit the display of the keyboard map entries to specific keys, keyboard function or macro filename. You can further customize the filtered display using additional criteria. Filter does not remove entries from the keyboard map. All entries display when you apply the Unfilter feature. A filtered display is [searchable](#).

## Filter Keyboard Functions

1. Press **Ctrl + y (View/Filter)**. The Filter dialog box displays.
2. Make necessary entries:

### Filter

#### Key

Filter on a specific key. Type the key in the field. To filter on a specific type of key, check the option, **Entry Type**, and select a type from the drop down list.

#### Macro Filename

Filter on a specific macro. Type all or part of the macro name in the field.

#### Function

Filter on a specific keyboard function. Type all or part of the keyboard function name in the field. To filter on a specific keyboard function category, check the option, **Entry Type**, and select a type from the drop down list.

#### Entry Type

Filter on keys or keyboard functions by entry type. Select an entry type from the drop down list. This option is available when filtering by *Key* or by *Function*.

#### Case Sensitive

Filter on keyboard functions identified in the field, as it is typed in upper and lower case. If you do not select Case Sensitive, the filter includes all words containing the indicated characters, regardless of the case typed into the field.

#### Whole Word

Filter only on whole words that match the text typed in the *Search* field. When Whole Word is not selected, the search finds the word both as it stands alone and as part of another word.

### Location

Select the filter parameter:

#### Exact Match

Filter on keyboard functions that match the text in the field exactly as it is entered.

#### Begins With

Filter on keyboard functions that begin with the text entered in the field.

**Ends With**

Filter on keyboard functions that end with the text entered in the field.

**Contains**

Filter on keyboard functions that contain, anywhere in the entry, the text entered in the field.

3. Press **Enter (OK)**. The Filter dialog box closes and the screen displays the filtered entries. If no entry matches the filter criteria, a message displays.

If you search within a filtered display, the search is limited to the filtered entries. If your search cannot locate the entry, unfilter the display or filter by different criteria.

4. Press **Alt + v, u (View/Unfilter)** to redisplay all the entries. If you close the Keyboard Map in a filtered display, all entries display when you open it.

## Personal Command Summary Cards

The Personal Command Summary Card feature displays your selected keyboard map assignments in a basic, intermediate or advanced command card version. For example, let's say that you have made many changes to the Default keyboard map. You can create a Command Summary Card (reference sheet) based on your own keyboard map assignments. You open your keyboard map, select View, then Personal Command Summary Card. Select the command summary version you want to view. The keyboard command summary card opens in your default browser. You can view the command summary card on the screen and/or select to Print Preview in your browser and then print it (landscape format is best).

The Personal Command Summary Card feature is available from the View menu when in a keyboard map and also available from the Help menu in any function where you may select any keyboard map. The Personal Command Summary Card always displays the current keyboard map assignments. In other words, if you make changes to your keyboard map at a later date, you simply select Personal Command Summary Card to see the latest version of your keyboard map.

If your e-Key license includes the BCS option, in addition to Basic, Intermediate and Advanced command summary card versions, the BCS Basic and BCS Advanced versions are available.

1. To view or print a personalized command summary card, do one of the following:
  - Open your keyboard map, select View and then Personal Command Summary Card.
  - From anywhere in Case CATalyst, select Help, Personal Command Summary Card.
2. Select Basic, Intermediate or Advanced.

If you selected Personal Command Summary Card from the help menu and you are not in a keyboard map, the Choose Keyboard Table dialog box displays. Select any keyboard map.
3. Your Personal Command Summary Card displays in your Internet browser.
  - You can display your Personal Command Summary Card while editing.
  - You can print your Personal Command Summary Card by selecting the Print Preview feature in your browser, confirm Landscape orientation and then click Print.
  - You can save your Personal Command Summary Card to an html file type which will always open in your default internet browser or a specific browser when using the Windows' Open With feature.
4. To close the Personal Command Summary Card display, press Ctrl + F4 or click the X in the upper right hand corner.

## Keyboard Map Functions - Dictionary

You can create a new keyboard map or [modify](#) the entries of an existing Manage Dictionary keyboard map to change the functionality of the keyboard commands while managing dictionary entries. The following table lists all the keyboard functions available for assignment in a Manage Dictionary keyboard map.

Case CATalyst contains a Manage Dictionary Default keyboard map with default keyboard command assignments. The Dictionary Default keyboard map is accessible to view and modify after you open it for the first time and save it. The Dictionary case is created the first time you save the Dictionary Default keyboard map. To access the Dictionary Default keyboard map for the first time and create the Dictionary Case, open a dictionary. Double click **Default** on the Status bar at the bottom of the screen. After the keyboard map opens, close it. When prompted to save the file, select **Yes** to automatically save the keyboard map with the filename, "Default." Keyboard maps for Manage Dictionary must be stored in the Dictionary case located in the System Files case. A keyboard map has the .sgkbd extension.

The Ctrl + Shift + 0 (zero) key combination is reserved for Windows and if assigned to a function or macro in a CATalyst keyboard, nothing will happen when trying to use it.

You may notice that some keys have the capability for four assignments. You can assign an action to the key itself, the key plus Shift, the key plus Ctrl and the key plus Ctrl + Shift. In other cases, you may only be able to assign an action to the key and possibly the key plus shift. Windows reserves some key combinations that are not to be reassigned.

## Available Dictionary Keyboard Assignments

Function	Default Keyboard Command	Action
Change Column Header Font - Dict.	F12	Display the Font dialog box to change the font style for the column headings.
Change Other Font - Dict.		Display the Font dialog box to change the font style for the text in the Modified Date, Usage Count and Used Date columns.
Change Steno Font - Dict.		Display the Font dialog box to change the font style for the steno in the Steno column.
Change Text Font - Dict.		Display the Font dialog box to change the font style for the text in the Text column.
Close File - Dict.		Close the current file and display a Save Changes dialog box if there are unsaved changes to the file.

<b>Function</b>	<b>Default Keyboard Command</b>	<b>Action</b>
Copy - Dict.	c + Ctrl Insert + Ctrl	Copy the selected entries from the current dictionary and place them on the clipboard.
Copy to Case Dictionary - Dict.		Copy the selected dictionary entries and paste into a selected Case Dictionary without opening the dictionary.
Copy to Other Dictionary - Dict.		Copy the selected dictionary entries and paste into a selected dictionary without opening the dictionary.
Copy to Personal Dictionary - Dict.		Copy the selected dictionary entries and paste into your Personal Dictionary without opening the dictionary.
Copy to Update Area - Dict.		Copy the selected dictionary entries and paste into Update Area without opening the Update Area.
Create Core List - Dict.		Create a list of unique case or job dictionary entries.
Create EZ Speakers Entries - Dict.		Display the Create EZ Speakers dialog box to identify names for EZ Speaker definitions in a job or case dictionary.
Cut - Dict.	x + Ctrl Delete + Ctrl Delete + Shift	Remove the selected dictionary entries from current dictionary and place them on the clipboard.
Cycle Keyboard Maps - Dict.	\	Change the current Keyboard Map to the next available Keyboard Map.
Delete Entry - Dict.	Delete	Delete the highlighted entries.
Dictionary Builder - Dict.		Display the Dictionary Builder Setup dialog box.

Function	Default Keyboard Command	Action
Dictionary Options - Dict.		Display the Dictionary Options dialog box.
Dictionary Spellcheck Options - Dict.		Display the Dictionary Spell Check Options dialog box.
Document End - Dict.	End + Ctrl	Move the cursor to the end of the file.
Document Home - Dict.	Home + Ctrl	Move the cursor to the beginning of the file.
Export to Stenograph Writer		Opens the Export to Stenograph Writer dialog box with the current dictionary selected.
Export to RTF-CRE - Dict.		Display the Save As dialog box with File Type set to RTF.
Filter - Dict.	y + Ctrl	Display the Filter dialog box.
Include Dictionary - Dict.	F9	Display the Include dialog box.
Insert AccelerWriters - Dict.		Display the Insert AccelerWriter Entry dialog box.
Insert Auto Includes - Dict.		Display the Auto Include Entry dialog box.
Insert Entry - Dict.	Insert i + Ctrl	Display the Insert Dictionary Entry dialog box.
Line Down - Dict.	Down	Move the cursor and highlight the next dictionary entry.
Line End - Dict.	End	Move the cursor to the end of the field when a dialog box is open
Line Home - Dict.	Home	Move the cursor to the beginning of the field when a dialog box is open.

Function	Default Keyboard Command	Action
Line Up - Dict.	Up	Move the cursor and highlight the previous dictionary entry.
Make Wordlist - Dict.		Automatically copy all the words in the current dictionary, that Spell Check thinks are misspelled, to the wordlist and assign <i>Ignore</i> to them.
Modify Entry - Dict.	Enter Enter + Shift m + Ctrl	Display the Modify Dictionary Entry dialog box.
Move to Case Dictionary - Dict.		Remove the selected dictionary entries from the current dictionary and place them into a selected Case Dictionary without opening the dictionary.
Move to Other Dictionary - Dict.		Remove the selected dictionary entries from the current dictionary and place them into another dictionary without opening the dictionary.
Move to Personal Dictionary - Dict.		Remove the selected dictionary entries from the current dictionary and place them into your Personal Dictionary without opening the dictionary.
Move to Update Area - Dict.		Remove the selected dictionary entries from the current dictionary and place them into the Update Area without opening the Update Area.
New Caption File		Display the Create New File dialog box with the default file type set to "Caption Files (*.sgcap)."
New Case Dictionary		Display the Create New File dialog box with the default file type set to "Dictionary Files (*.sgdct)."

Function	Default Keyboard Command	Action
New Case Fill In Field List		
New Case Wordlist		Display the Create New File dialog box with the default file type set to "Wordlist Files (*.tlx)."
New EZ Speakers		Open a new EZ Speakers dictionary if one does not exist or open an existing EZ Speakers dictionary.
New EZ Text Table		Open a blank EZ Text table if one does not exist or open the existing EZ Text table.
New File	n + Ctrl	Display the Create New File dialog box with the default file type set to "Transcript Files (*.sgnfl)."
New Fill In Field List		Open a blank Fill-In-Field List if one does not exist or open the existing Fill-In-Field List.
New Job Dictionary		Open the Create New File dialog box with the default file type set to "Dictionary Files (*.sgdct)."
New Job Wordlist		Display the Create New File dialog box with the default file type set to "Wordlist Files (*.tlx)."
New Keyboard Map		Display the Create New File dialog box with the default file type set to "keyboard Table (*.sgkbd)."
New Layout		Display the Create New File dialog box with the default file type set to "Layout Files (*.sgpgl)."
New Notes File		Display the Create New File dialog box with the default file type set to "Notes Files (*.sgstn)."

<b>Function</b>	<b>Default Keyboard Command</b>	<b>Action</b>
New Personal Dictionary		Open a blank Personal Dictionary if one does not exist or open the existing Personal Dictionary.
New Personal Wordlist		Open a blank Personal Wordlist if one does not exist or open the existing Personal Wordlist.
New Phonetic Table		Open a blank Phonetic Table if one does not exist or open the existing Phonetic Table.
New Power Define		Open a blank Power Define Dictionary if one does not exist or open the existing Power Define Dictionary.
New Read Notes		Display the Read Setup dialog box to read steno notes, unless the Read option to not display the Read Setup dialog box is active.
New Steno Shortcut Table		Open a blank Steno Shortcut Table if one does not exist or open the existing Steno Shortcut Table.
New Text File		Display the Create New File dialog box with the default file type set to Transcript Files (*.sgngl)."
Open BCS Number Conversion File		Display the BCS Number Conversion file.
Open Caption File		Display the Open Existing Document dialog box with the file type set to "Caption Files (*.sgdct)."
Open Case Dictionary	k + Ctrl	Display the Open Existing Document dialog box with the file type set to "Dictionary Files (*.sgdct).

Function	Default Keyboard Command	Action
Open Case Wordlist		Display the Open Existing Document dialog box with the file type set to "Wordlist Files (*.tlx)."
Open Case Fill In Field List		
Open EZ Speakers	e + EZ Speakers	Display the Open Existing dialog box with the default file type set to "EZ Speakers Dictionaries."
Open EZ Text Table		Display the Open Existing dialog box with the default file type set to EZ Text Files (*.sgezt)."
Open EZKeys File		Display the Open Existing dialog box with the default file type set to "EZKeys (*.ezk)."
Open File	o + Ctrl	Display the Open Existing Document dialog box with the default file type set to "Transcript Files (*.sgngl)."
Open Fill In Field List		Open the existing Fill-In-Field List for the current user or create a new one if no Fill-In-Field List exists.
Open Job Dictionary	o + j	Display the Open Existing Document dialog box with the default file type set to "Dictionary Files (*.sgngl)."
Open Job Voice Dictionary		Display the Open Existing Document dialog box with the default file type set to "Voice Command Files (*.sgvcd)."
Open Job Wordlist		Display the Open Existing Document dialog box with the default file type set to "Wordlist Files (*.tlx)."

<b>Function</b>	<b>Default Keyboard Command</b>	<b>Action</b>
Open Keyboard Map		Display the Open Existing Document dialog box with the default file type set to "Keyboard Table (*.sgkbd)."
Open Layout		Display the Open Existing Document dialog box with the default file type set to "Layout Files (*.sgpgl)."
Open Macro		Display the Open Existing Document dialog box with the default file type set to "Macro Files (*.sgmac)."
Open Mistran Minder List		Display the MistranMinderList in your System Files case.
Open Notes File		Display the Open Existing Document dialog box with the default file type set to Notes.
Open Number Conversion File		Open the Number Conversion file stored in the System Files case.
Open Personal Dictionary	d + Ctrl	Open the Personal Dictionary for the current user or create a new one if no Personal Dictionary exists.
Open Personal Voice Dictionary		Open the Personal Voice Dictionary for the current user or create a blank one if no Personal Voice Dictionary exists.
Open Personal Wordlist		Open the Personal Wordlist for the current user or create a blank one if no Personal Wordlist exists.
Open Phonetic Table		Open the Phonetic Table for the current user or create a blank one if no Phonetic Table exists.
Open Power Define	w + Ctrl	Open the Power Define Dictionary for the current user or create a blank one if no Power Define Dictionary exists.

Function	Default Keyboard Command	Action

Search and Replace - Dict.	r + Ctrl	Display the Search and Replace dialog box to search for and replace the specified text and replace it with new text either selectively or for all the occurrences in the dictionary.
Select All - Dict.	a + Ctrl	Highlight all the entries in the dictionary.
Select Document End - Dict.	End + Ctrl + Shift	Highlight the entries from the current location to the end of the dictionary.
Select Document Home - Dict.	Home + Ctrl	Highlight the entries from the current location to the beginning of the dictionary.
Select Line Down - Dict.	Down + Shift	Highlight the entry from the current location forward in the dictionary, one entry at a time.
Select Line Up - Dict.	Up + Shift	Highlight the entry from the current location backward in the dictionary, one entry at a time.
Select Page Down - Dict.	Page Down + Shift Page Down + Ctrl	Highlight entries from the current location forward in the dictionary one screen at a time.
Select Page Up - Dict.	Page Up + Shift Page Up + Ctrl	Highlight entries from the current location backward in the dictionary one screen at a time.

Function	Default Keyboard Command	Action
Send To Cat Scratch Pane - Dict.		Send the current dictionary entry or highlighted entries to the steno & text section of the Cat Scratch pane.
Spellcheck - Dict.	F7 F7 + Ctrl F7 + Shift	Spell check the text portion of the dictionary entries.
Undo	z + Ctrl	Reverse the most recent consecutive changes or actions in the current dictionary.
Unfilter		Removes the currently applied filter and displays the entire dictionary.
Windows Default		Apply the current Windows Default setting to the key combination based on the selected Windows language set.

## Keyboard Map Functions - Edit

You can create a new keyboard map or [modify](#) the entries of an existing Edit keyboard map to change the functionality of the keyboard commands, also known as shortcut keys, during an editing session. The following table lists all the functions available for assignment in a Case CATalyst Edit keyboard map. It includes available keyboard, Upper ANSI and extended ASCII characters.

Case CATalyst contains an Edit Default keyboard map with default keyboard command assignments. Keyboard assignments for functions listed in the Functions list are indicated in the following table. The words "Windows Default" appear where the default assignment is affected by the selected Windows Language setting. For example, default Windows keyboard commands appropriate for the English language are only active when the English language setting is selected in Windows Region and Language options. When French is selected the keyboard commands appropriate for French are active.

The Case CATalyst Edit Default keyboard map is not initially visible in your Systems Files case. To open the Default keyboard map for the first time, press **Alt + f, o, i, k** (**File/Open/List/Table/Keyboard Map**). In the Open Existing Document dialog box, type **Default** in the File name field and press **Enter** (**Open**). Once opened, the Default keyboard map becomes visible for selection in your System Files case. A keyboard map has the .sgkbd extension and must be stored in the System File case.

## Available Edit Keyboard Functions

Function		Default Keyboard Command	Action
	[none]		Remove the key assignment with nothing assigned to a key combination.
'	Apostrophe	'	Type an apostrophe.
'	Smart Single Quote		You can cycle the single quote between applying it to the current word, the previous punctuation or before the previous punctuation. Simply press the same key to cycle through the punctuation positions.

^ Circumflex/Caret	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
_ Underscore	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
` Grave accent or backtick	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
{ Left curly bracket	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
Pipe/More/Vertical line	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
} Right curly bracket	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
~ Tilde	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
+ Plus/addition sign	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
< Less than sign	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
= Equals sign	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
> Greater than sign	Windows Default	Type the character assigned to the currently selected Windows keyboard map.

Function	Default Keyboard Command	Action
0	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
1	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
2	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
3	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
4	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
5	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
6	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
7	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
8	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
9	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
a	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
A	Windows Default	Type the character assigned to the currently selected Windows keyboard map.

Function	Default Keyboard Command	Action
Add Last Brief To No Nag		Send the last brief in the Brief It pane to the No Nag List located in the System Files case.
Add or Remove Translation Dictionaries	a + Ctrl	Display the Add or Remove Translation Dictionaries dialog box during realtime.
Add Other Globals		Display the Add Other Globals dialog box.
Add Selection to Phrase List		Add the highlighted phrase to the Concordance Index Phrase list.
Add To Case Wordlist		Add the word to the Case Wordlist for use with Spell Check.
Add To Ignore All Wordlist		Add the word to the Ignore All Wordlist for use with Spell Check.
Add To Job Wordlist		Add the word to the Job Wordlist for use with Spell Check.
Add To Personal Wordlist		Add the word to the Personal Wordlist for use with Spell Check.
All Cap Cell		Capitalize all text in the table cell.
Allcap selected text		Change the selected text to all capital letters.
Append File		Display the Append dialog box for selection of a text file to add to the end of the current file.
Apply All Globals Backward		Applies all globals in the Global Table backward in the file.

Function	Default Keyboard Command	Action
Apply New Layout		Display the Select Layout to Apply dialog box to apply a new layout to the current file.
Apply Personal Globals		Apply Personal Globals table entries to the current transcript.
Associate Audio File		Display the Choose Audio File dialog box to associate an audio file to the current file.
Autolink Exhibits		Inserts the Attachment Point format symbol in the transcript and displays the Open dialog box for selecting an external document for attaching an exhibit. Once the document is attached, the Autolink Exhibits dialog box displays showing all the locations where the exhibit will be attached.
Autolink Exhibits Options		Display the Autolink Exhibits Options dialog box where you can set up exhibit aliases for autolinking.
Automatic Number Conversion		Apply an automatic number conversion rule based on the Number Conversion file entries.
b	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
B	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
Backspace Word	Backspace + Ctrl	Delete the previous word.
Bold		Surround the highlighted text with the Bold On and Bold off format symbols.
Bookmark Current Cursor Location	b + Ctrl + Shift	Place an invisible bookmark in the file. Use the Go To Bookmarked Cursor command to find the bookmarked location.

Function	Default Keyboard Command	Action

Function	Default Keyboard Command	Action
Insert Subscript Off		Insert the Subscript Off format symbol to disable the Subscript On format symbol.
Insert Subscript On		Insert the Subscript On format symbol to enable the subscript formatting of text following the format symbol.
Insert Superscript Off		Insert the Superscript Off format symbol to disable the Superscript On format symbol.
Insert Superscript On		Insert the Superscript On format symbol to enable the superscript formatting of text following the format symbol.
Insert Tab	Tab	Insert the Tab format symbol.
Insert Table Columns		Display the Insert Columns dialog box when the cursor is in a table.
Insert Table Dialog		Display the Insert Table dialog box.
Insert Table Rows		Display the Insert Table Rows dialog box when the cursor is in a table.
Insert Uncap Next		Insert the Uncap Next format symbol to remove the initial capitalization of the following word.
Insert Underline Off		Insert the Underline Off format symbol to disable the Underline On format symbol.
Insert Underline On		Insert the Underline On format symbol to enable the underlining of text following the format symbol.
Insert User-Defined Paragraph		Display the Set User Defined dialog box.

Function	Default Keyboard Command	Action
Insert Volume Description		Display the Index Volume Description dialog box to type a description for the Master Index reference.
Internet Search		Place the highlighted word or phrase in the Search field of the selected search engine site when connected to the Internet.
Interrupted Q/A/C	q + Ctrl	Place a dash (--) at the end of the current Question, Answer or Colloquy paragraph style and place a dash (--) at the beginning of the next matching paragraph style.
Italic		Surround the highlighted text with Italics On and Italics Off format symbols.
j	Windows Default	Type the character assigned to the currently selected Windows keyboard.
J	Windows Default	Type the character assigned to the currently selected Windows keyboard.
J-Define	j + Ctrl	Display the Global – J-Define dialog box.
Join current paragraph to previous		Join the current paragraph where your cursor is positioned to the previous paragraph and remove the current paragraph's format symbol (if appropriate).
Join Tables		Puts two tables together regardless if they are the same number of rows or columns as long as there is no text between the two tables.
k	Windows Default	Type the character assigned to the currently selected Windows keyboard.
K	Windows Default	Type the character assigned to the currently selected Windows keyboard.

Function	Default Keyboard Command	Action
K-Define	k + Ctrl	Display the Global – K-Define dialog box.
I	Windows Default	Type the character assigned to the currently selected Windows keyboard.
L	Windows Default	Type the character assigned to the currently selected Windows keyboard.
Layout Settings Report		Display the Print dialog box to print the current layout information.
Left Justify		Align text with the left margin.
Load Alternate User Settings		Display the Open dialog box with the "Alternate User Setting (*.ini)" file type selected.
m	Default	Type the character assigned to the currently selected Windows keyboard.
M	Windows Default	Type the character assigned to the currently selected Windows keyboard.
Make Exhibit Index Entries		Display the Make Exhibit Index Entries dialog box.
Manual Link		Create a manual attachment point link to an external document (exhibit).
Mark Start		Invoke the Mark Start command to highlight the following text by moving the cursor, using Search or using the Go To command.
Mark Stop		Invoke the Mark Stop command to stop highlighting text.

Function	Default Keyboard Command	Action
Merge File	m + Ctrl	Display the Merge dialog box to remove the contents of one file and place the contents in the current file.
Mistran Minder		Invoke the Mistran Minder feature. <a href="#">Mistran Minder</a> searches the entire document for words/phrases in the Mistran Minder List and displays the results in the Search Results pane.
Modify Current Paragraph		Display the Layout dialog pane for the current paragraph style.
Modify Job Layout		Displays the Layout dialog pane for the current applied layout.
Move Document Bottom	End + Ctrl	Move the cursor to the end of the file.
Move Document Top	Home + Ctrl	Move the cursor to the beginning of the file.
Move Down	Down Arrow	Move the cursor down one line.
Move Down Word Begin		Move the cursor down one line and position the cursor at the beginning of the closest word.
Move Left	Left Arrow + Ctrl	Move the cursor to the left one character at a time.
Move Left Word Begin		Moves the cursor to the beginning of the word that is left of the cursor.
Move Line Begin	Home	Move the cursor to the beginning of the current line.
Move Line End	End	Move the cursor to the end of the current line.

Function	Default Keyboard Command	Action
Move Page Down	Page Down + Ctrl	Move the cursor to the first line of the next page.
Move Page Up	Page Up + Ctrl	Move the cursor to the first line of the previous page.
Move Right	Right Arrow + Ctrl	Move the cursor to the right one character at a time.
Move Screen Bottom	Down + Ctrl	Move the cursor to third line from the bottom of the screen.
Move Screen Page Down	Down Arrow + Ctrl; Page Down	Move the cursor down in the file approximately a screen page.
Move Screen Page Up	Up Arrow + Ctrl; Page Up	Move the cursor up in the file approximately a screen page.
Move Screen Top	Up + Ctrl	Move the cursor to the first line displayed at the top of the screen.
Move to Beginning of Current Word		Move the cursor to the beginning of the current word.
Move to End of Current Word		Move the cursor to the end of the current word.
Move to the next red squiggle		Move the cursor to the next word that displays a red squiggle underneath.
Move to the previous red squiggle		Move the cursor to the previous word that displays a red squiggle underneath.
Move Up	Up Arrow	Move the cursor up to the previous line.

Function	Default Keyboard Command	Action
Move Up Word Begin		Move the cursor up to the previous line and position the cursor at the beginning of the closest word.
Move Word End		Move the cursor to the end of each word to the right.
Move Word Left	Left Arrow	Move the cursor to the end of each word to the left.
Move Word Right	Right Arrow	Move the cursor to the beginning of each word to the right.
Multi-File Append		Append multiple Work Units or selected files into the current open transcript.
n	Windows Default	Type the character assigned to the currently selected Windows keyboard.
N	Windows Default	Type the character assigned to the currently selected Windows keyboard.
New Caption File		Display the Create New File dialog box with the default file type set to "Caption Files (*.sgcap)."
New Case Dictionary		Display the Create New File dialog box with the default file type set to "Dictionary Files (*.sgdct)."
New Case Fill In Field List		Create a Case Fill In Field List for the current case.
New Case Wordlist		Display the Create New File dialog box with the default file type set to "Wordlist Files (*.tlx)."

Function	Default Keyboard Command	Action
New EZ Speakers		Open a new EZ Speakers dictionary if one does not exist or open an existing EZ Speakers dictionary.
New EZ Text Table		Open a blank EZ Text table if one does not exist or open the existing EZ Text table.
New File		Display the Create New File dialog box with the default file type set to "Transcript Files (*.sgnfl)."
New Fill In Field List		Open a blank Fill-In-Field List if one does not exist or open the existing Fill-In-Field List.
New Job Dictionary		Open the Create New File dialog box with the default file type set to "Dictionary Files (*.sgdct)."
New Job Wordlist		Display the Create New File dialog box with the default file type set to "Wordlist Files (*.tlx)."
New Keyboard Map		Display the Create New File dialog box with the default file type set to "keyboard Table (*.sgkbd)."
New Layout		Display the Create New File dialog box with the default file type set to "Layout Files (*.sgpgl)."
New Notes File		Display the Create New File dialog box with the default file type set to "Notes Files (*.sgstn)."
New Personal Dictionary		Open a blank Personal Dictionary if one does not exist or open the existing Personal Dictionary.

Function	Default Keyboard Command	Action
New Personal Wordlist		Open a blank Personal Wordlist if one does not exist or open the existing Personal Wordlist.
New Phonetic Table		Open a blank Phonetic Table if one does not exist or open the existing Phonetic Table.
New Power Define		Open a blank Power Define Dictionary if one does not exist or open the existing Power Define Dictionary.
New Read Notes		Display the Read Setup dialog box to read steno notes, unless the option to not display the Read Setup dialog box is active.
New Steno Shortcut Table		Open a blank Steno Shortcut Table if one does not exist or open the existing Steno Shortcut Table.
New Text File		Display the Create New File dialog box with the default file type set to Transcript Files (*.sgnfl)."
Next Header		Move the cursor to the next occurrence of a header or footer.
Next Search	F3	Repeat the current search pattern forward in the file.
Next Search Results		Move the cursor forward in the file for the last searched text.
Normal View		Change the transcript view setting to Normal View.
Number Conversion	u + Ctrl	Display the Number Conversion dialog box when the cursor is immediately before numbers or highlighted (marked) text.

Function	Default Keyboard Command	Action
o	Windows Default	Type the character assigned to the currently selected Windows keyboard.
O	Windows Default	Type character assigned to the currently selected Windows keyboard.
Open All Options Dialog		Opens the All Options dialog box which contains the majority of Case CATalyst options.
Open BCS Number Conversion File		Display the BCS Number Conversion file.
Open Caption File		Display the Open Existing Document dialog box with the file type set to "Caption Files (*.sgdct)."
Open Case Dictionary		Display the Open Existing Document dialog box with the file type set to "Dictionary Files (*.sgdct)."
Open Case Fill In Field List		Open the Case Fill In Field List for the current file. If the current file is not in a case, this action does nothing.
Open Case Wordlist		Display the Open Existing Document dialog box with the file type set to "Wordlist Files (*.tlx)."
Open Current Case Dictionary		Open the Case dictionary for the current file. If the current file is not in a case, this action does nothing.
Open Current Job Dictionary		Open the job dictionary of the same name as the current transcript.
Open EZ Speakers		Display the Open dialog box with the default file type set to "EZ Speakers Dictionaries."

Function	Default Keyboard Command	Action
Open EZ Text Table		Display the Open dialog box with the default file type set to EZ Text Files (*.sgezt)."
Open EZKeys		Open the last EZKeys file used.
Open EZKeys File		Display the Open dialog box with the default file type set to "EZKeys (*.ezk)."
Open File	o + Ctrl	Display the Open Existing Document dialog box with the default file type set to "Transcript Files (*.sgngl)."
Open Fill In Field List		Open the existing Fill-In-Field List for the current user or create a new one if no Fill-In-Field List exists.
Open Job Dictionary		Display the Open Existing Document dialog box with the default file type set to "Dictionary Files (*.sgngl)."
Open Job Voice Dictionary		Display the Open Existing Document dialog box with the default file type set to "Voice Command Files (*.sgvcd)."
Open Job Wordlist		Display the Open Existing Document dialog box with the default file type set to "Wordlist Files (*.tlx)."
Open Keyboard Map		Display the Open Existing Document dialog box with the default file type set to "Keyboard Table (*.sgkbd)."
Open Layout		Display the Open Existing Document dialog box with the default file type set to "Layout Files (*.sgpgl)."
Open Macro		Display the Open Existing Document dialog box with the default file type set to "Macro Files (*.sgmac)."

Function	Default Keyboard Command	Action
Open Mistran Minder List		Open the Mistran Minder List for the current user that is located in the System Files case.
Open Notes File		Display the Open Existing Document dialog box with the default file type set to Notes.
Open Number Conversion File		Open the Number Conversion file.
Open Personal Dictionary		Open the Personal Dictionary for the current user or create a new one if no Personal Dictionary exists.
Open Personal Globals File		Open the Personal Globals file for the current user.
Open Personal Voice Dictionary		Open the Personal Voice Dictionary for the current user or create a new one if no Personal Voice Dictionary exists.
Open Personal Wordlist		Open the Personal Wordlist for the current user or create a new one if no Personal Wordlist exists.
Open Phonetic Table		Open the Phonetic Table for the current user or create a new one if no Phonetic Table exists.
Open Power Define		Open the Power Define Dictionary for the current user or create a new one if no Power Define Dictionary exists.
Open Steno Shortcut Table		Open the Steno Shortcut Table for the current user or create a new one if no Steno Shortcut Table exists.
Open System Files Case		Display the Open Existing Document dialog box with the default file type set to "All."

Function	Default Keyboard Command	Action
Open Text File		Display the Open Existing Document dialog box with the default file type set to "Transcript Files (*.sgnfl)."
Open Update Area		Open the Update Area for the current user or create a new one if no Update Area exists.
Open User Definition Table		Opens the <a href="#">User Definition Table</a> where you can add definitions for user specific words.
Orphan Control		Display the Set Number of Lines dialog box.
Other Dictionary Define	o + Ctrl + Shift	Display the Global – Other Dictionary dialog box.
p	Windows Default	Type the character assigned to the currently selected Windows keyboard.
P	Windows Default	Type the character assigned to the currently selected Windows keyboard.
Page Number Change		Display the Page Number Change dialog box to change the starting page number or paragraph number.
Page View		Change the transcript view settings to Page View.
Paste	v + Ctrl	Paste the text most recent copied or cut into the transcript at the current cursor location.
Paste Item 1 from Clipboard		Paste the text from Clipboard Item 1 into the transcript at the current cursor location.
Paste Item 10 from Clipboard		Paste the text from Clipboard Item 10 into the transcript at the current cursor location.

Function	Default Keyboard Command	Action
Paste Item 2 from Clipboard		Paste the text from Clipboard Item 2 into the transcript at the current cursor location.
Paste Item 3 from Clipboard		Paste the text from Clipboard Item 3 into the transcript at the current cursor location.
Paste Item 4 from Clipboard		Paste the text from Clipboard Item 4 into the transcript at the current cursor location.
Paste Item 5 from Clipboard		Paste the text from Clipboard Item 5 into the transcript at the current cursor location.
Paste Item 6 from Clipboard		Paste the text from Clipboard Item 6 into the transcript at the current cursor location.
Paste Item 7 from Clipboard		Paste the text from Clipboard Item 7 into the transcript at the current cursor location.
Paste Item 8 from Clipboard		Paste the text from Clipboard Item 8 into the transcript at the current cursor location.
Paste Item 9 from Clipboard		Paste the text from Clipboard Item 9 into the transcript at the current cursor location.
Paste Table Rows		Display the Paste Table Rows dialog box to paste the most recent copied or cut table row within the same table before or after the row in which the cursor is positioned.
Pause Audio		Pause the recording of audio during realtime.
Play Audio	F9 + Shift	Play the audio associated with the cursor location.
Play Last Macro		Invoke the last played macro.

Function	Default Keyboard Command	Action
Play Macro		Display the Choose Macro dialog box in the Keyboard Map file to select a macro to assign to the current key combination.
Plural Word Endings Option		Display the Plural Word Ending Options dialog box to designate how to use the final S, Z or both when writing plural endings in steno.
Previous Header		Move the cursor to the previous header in the transcript.
Previous Search Results		Move the cursor backward in the file to the last searched text.
Print Current Page	p + Ctrl + Shift	Send the current page to the printer with the most recently used print options.
Print File	p + Ctrl	Displays the Print dialog box.
Print Preview		Change the display to print preview option.
q	Windows Default	Type the character assigned to the currently selected Windows keyboard.
Q	Windows Default	Type the character assigned to the currently selected Windows keyboard.
Query Realtime Translations	q + Ctrl + Shift	Display the Lookup dialog box with the dictionary name and definition for the current steno outlines.
Quick Suggest		The <a href="#">Quick Suggest</a> dialog box displays when the cursor is positioned on an untranslate, Drag/Drop or Suffix Drag translation or word(s).

Function	Default Keyboard Command	Action
Quick Tran		Start translation quickly and without typing a name with "Writer" as the steno source and the most recently used translation settings including dictionaries.
QuickFix Prefix		Display the QuickFix dialog box to select a prefix.
QuickFix Suffix		Display the QuickFix dialog box to select a suffix.
QuickFix Your View		Display the QuickFix Your View dialog box to reset the view to Page view and dock all panes.
r	Windows Default	Type the character assigned to the currently selected Windows keyboard.
R	Windows Default	Type the character assigned to the currently selected Windows keyboard.
Record Macro		Display the RecordMacro toolbar to record all subsequent keyboard commands and mouse clicks until Stop is selected.
Redact Selection		Surround the selected text with Redaction On and Redaction Off format symbols.
Redo	z + Ctrl + Shift	Restore the most recent consecutive changes or actions in the current file.
Remove All Paragraph Deltas		Display the confirmation dialog box to remove all paragraph deltas which indicate changes in paragraph formatting that are different from the applied layout.
Remove Link		Remove the current attachment point link to an external document (exhibit).

Function	Default Keyboard Command	Action
Remove Suffix		Removes the <a href="#">shortest suffix</a> from the current word.
Replace	r + Ctrl	Display the Replace dialog box to replace the text for this single occurrence.
Replace with Live Suggestion 1		Replace the current untranslate and possibly surrounding steno/text with the first Live Suggestion displays in the Brief It pane.
Replace with Live Suggestion 2		Replace the current untranslate and possibly surrounding steno/text with the second Live Suggestion displays in the Brief It pane.
Replace with Live Suggestion 3		Replace the current untranslate and possibly surrounding steno/text with the third Live Suggestion displays in the Brief It pane.
Replace with Live Suggestion 4		Replace the current untranslate and possibly surrounding steno/text with the fourth Live Suggestion displays in the Brief It pane.
Replace with Live Suggestion 5		Replace the current untranslate and possibly surrounding steno/text with the fifth Live Suggestion displays in the Brief It pane.
Request Live Suggestion		CATalyst will display a word/phrase based on the highlighted (selected) words/steno.
Reset the View		Reset the view to Case CATalyst default view settings of Page view and the display of the Vertical Notes pane.
Resolve All Chosen Conflicts		Confirm the selected conflict for all EZ Choice and AutoChoice conflicts.

Function	Default Keyboard Command	Action
Restore Steno	F2 + Shift; F2 + Ctrl	Revert the translated text to the original steno outline.
Resume Audio		Resume the recording of audio during realtime.
Resume Spellcheck	F7 + Ctrl + Shift	Resume spell check when the cursor focus is not in the Spell Check dialog box.
Reveal Codes	r + Ctrl + Shift	Toggle the display of the Reveal Codes dialog pane.
Right Justify		Align the text to the right margin.
s	Windows Default	Type the character assigned to the currently selected Windows keyboard.
S	Windows Default	Type the character assigned to the currently selected Windows keyboard.
Save Alternate User Settings		Display the Save As dialog box with the default "Alternate User Settings" to save certain edit settings, such as display colors and font, to a file.
Save File	s + Ctrl	Save the file.
Save File As		Display the Save As dialog box to save the text file as another name.
Save Selected Text As		Display the Save Copy As dialog box to type a file name and save the selected (highlighted) text to a file.
Scan and Fill in Next Field		Scan to the first empty field and display the appropriate fill in field dialog box to make a selection. Scan to the next empty field after selecting.

Function	Default Keyboard Command	Action
Scan Backward	F8 + Shift	Scan backward through the file using the current Scan For options.
Scan Backward for Attachment Points		Scan backward in the file for the previous attachment point format symbol.
Scan Backward for Bench		Scan backward in the file for the previous Bench Mode On format symbol.
Scan Backward for Changes		Scan backward in the file for the previous tracked change.
Scan Backward for Conflicts		Scan backward in the file for the previous conflict.
Scan Backward for Drag/Drop		Scan backward in the file for the previous Drag/Drop Begin format symbol.
Scan Backward for Fields		Scan backward in the file for previous empty fields.
Scan Backward for Hidden Text		Scan backward in the file for previous Hidden Text.
Scan Backward for Index Placeholders		Scan backward in the file for the previous index placeholder format symbol.
Scan Backward for Indexed Items		Scan backward in the file for the previous index format symbol.
Scan Backward for Oops		Scan backward in the file for the previous Oops format symbol.
Scan Backward for Prefix/Suffix		Scan backward in the file for the previous Prefix or Suffix Begin format symbol.

Function	Default Keyboard Command	Action
Scan for Attachment Points		Scan forward in the file for the next attachment point format symbol.
Scan for Bench		Scan forward in the file for the next Bench Mode On format symbol.
Scan for Changes		Scan forward in the file for the next tracked change.
Scan for Conflicts		Scan forward in the file for the next conflict.
Scan for Drag/Drop		Scan forward in the file for the next Drag/Drop Begin format symbol.
Scan for Fields		Scan forward in the file for the next empty field.
Scan for Hidden Text		Scan forward in the file for the next Hidden Text.
Scan for Index Placeholders		Scan forward in the file for the next Index Placeholder format symbol.
Scan for Indexed Items		Scan forward in the file for the next indexing format symbol.
Scan for Oops		Scan forward in the file for the next Oops format symbol.
Scan for Options		Scan forward through the file using the current Scan For options.
Scan for Prefix/Suffix		Scan forward in the file for the next Prefix or Suffix Begin format symbol.

Function	Default Keyboard Command	Action
Scan for Scan Stops		Scan forward in the file for the next Scan Stop Begin format symbol.
Scan for Suffix Drag		Scan forward in the file for the next Suffix Drag Begin format symbol.
Scan for Untranslates		Scan forward in the file for the next untranslate.
Scan Forward	F8	Using the current Scan For option selections, scans forward through the file.
Scroll Text Backwards	a + Ctrl + Shift	Automatically move the cursor backward line to line at the designated time interval.
Scroll Text Decrease Speed		Decrease the speed at which the cursor automatically moves from line to line when using the Scroll Text feature.
Scroll Text Forward	a + Ctrl	Automatically move the cursor forward line to line at the designated time interval.
Scroll Text Increase Speed		Increase the speed at which the cursor automatically moves from line to line when using the Scroll Text feature.
Scroll Text Speed		Display the Scroll Text Speed dialog to adjust the speed of the Scroll Text feature.
Scroll Text With Audio	F9 + Ctrl + Shift	Automatically move the cursor line to line and play the associated audio, if available, at the designated time increment.
Search	f + Ctrl	Display the Search dialog box to search for text, steno or timestamps.

Function	Default Keyboard Command	Action
Search and Replace		Display the Search and Replace dialog box to search for and replace the specified text and replace it with new text either selectively or for all the occurrences in the transcript.
Search Next Hidden Text		Search forward in the transcript for the next Hidden Text entry and display the Hidden Text dialog box.
Search Next Layout Change		Search forward in the transcript for the next layout change and display the Layout Change dialog box when found.
Search Next Missing By Line		Search for the next occurrence of a missing By Line.
Search Next Paragraph		Move the cursor to the beginning of the next paragraph style.
Search Next Punctuation		Move the cursor forward in the transcript to the next punctuation mark.
Search Next Q/A/C		Move the cursor forward in the transcript to the next Question, Answer or Colloquy paragraph style.
Search Next Sentence Ending Punct.		Move the cursor forward in the transcript to the next sentence ending punctuation: period, interrog, dash and exclamation mark.
Search Previous Sentence Ending Punct.		Move the cursor backward in the transcript to the previous sentence ending punctuation: period, interrog, dash and exclamation mark.
Search Previous	F3 + Shift	Search backward in the file for the last searched text, steno or timestamps.

Function	Default Keyboard Command	Action
Search Previous Hidden Text		Search backward in the transcript for the next Hidden Text entry and display the Hidden Text dialog box.
Search Previous Layout Change		Search backward in the transcript for the next layout change and display the Layout Change dialog box when found.
Search Previous Paragraph		Move the cursor to the beginning of the previous paragraph style.
Search Previous Punctuation		Move the cursor backward in the transcript to the previous punctuation mark.
Search Previous Q/A/C		Move the cursor backward in the transcript to the previous Question, Answer or Colloquy paragraph style.
Seating Chart: Hide All Speakers		Hide the display of all Seating Chart speakers.
Seating Chart: Hide MiniViewer		Hide the Speaker List MiniViewer.
Seating Chart: Show All Speakers		Display all Seating Chart speakers. If auto hide is active, the Seating Chart speakers hide after the number of second specified.
Seating Chart: Show MiniViewer		Display the Speaker List MiniViewer.
Seating Chart: Toggle AutoHide Feature		Toggle the auto hide setting for Seating Chart speakers between auto hide and always displayed.
Select Document Bottom	End + Ctrl + Shift	Highlight (mark) text from the cursor location forward to the end of the transcript.

Function	Default Keyboard Command	Action
Select Document Top	Home + Ctrl + Shift	Highlight (mark) text from the cursor location backward to the beginning of the transcript.
Select Down	Down Arrow + Shift	Highlight (mark) text line by line from the cursor location forward through the transcript.
Select Down Word Begin		Highlight (mark) text line by line from the cursor location forward through the transcript with the cursor positioned before a word.
Select Left	Left Arrow + Ctrl + Shift	Highlight (mark) the character to the left of the cursor location.
Select Line End	End + Shift	Highlight (mark) text from the cursor location to the end of the line.
Select Line Home	Home + Shift	Highlight (mark) text from the cursor location to the beginning of the line.
Select Macro to Play		Display the Choose Macro dialog box to select a macro to play.
Select Page Down	Page Down + Ctrl + Shift	Highlight (mark) text from the cursor location forward to the end of the current page.
Select Page Up	Page Up + Ctrl + Shift	Highlight (mark) text from the cursor location backward to the beginning of the current page.
Select Right	Right Arrow + Ctrl + Shift	Highlight (mark) the character to the right of the cursor location.
Select Screen Bottom	Down Arrow + Ctrl + Shift	Highlight (mark) text from the cursor location forward to the bottom of the screen.
Select Screen Page Down	Page Down + Shift	Highlight (mark) lines from the cursor location forward that represent a screen page.

Function	Default Keyboard Command	Action
Select Screen Page Up	Page Up + Shift	Highlight (mark) lines from the cursor location backward that represent a screen page.
Select Screen Top	Up Arrow + Ctrl + Shift	Highlight (mark) text from the cursor location backward to the top of the screen.
Select Up	Up Arrow + Shift	Highlight (mark) from the cursor location backward to the beginning of the line and backward to the previous line.
Select Up Word Begin		Highlight (mark) from the cursor location backward to the beginning of the line and backward to the previous line.
Select Whole Transcript		Highlight (mark) the text in the entire transcript.
Select Word Left	] + Ctrl; Left Arrow + Shift	Highlight (mark) one word at a time to the left of the cursor.
Select Word Right	[ + Ctrl; Right Arrow + Shift	Highlight (mark) one word at a time to the right of the cursor.
Selected Fields to Text in Selection		Converts only currently selected (marked) fields to text.
Selected Fields to Text in this Document		Converts all matching currently selected (marked) fields to text throughout the entire document.
Selected Fields to Text in this Section		Converts all matching currently selected (marked) fields to text in the current section.
Selected Fields to Text on this Page		Converts all matching currently selected (marked) fields to text on the current page.

Function	Default Keyboard Command	Action
Send Last Brief To Cat Scratch		Send the last brief in the Brief It pane to the steno & text section of the Cat Scratch pane.
Send to Mistran Minder List		Send the word or highlighted phrase to the Mistran Minder List in the System Files case.
Send to Case Mistran Minder List		Send the word or highlighted phrase to the Case Mistran Minder List. The job must be in a case.
Send to Job Mistran Minder List		Send the word or highlighted phrase to the Job Mistran Minder List.
Send Selected Brief To Cat Scratch		Send the selected brief in the Brief It pane to the steno & text section of the Cat Scratch pane.
Send Steno & Text To Cat Scratch Pane		Send the highlighted text and underlying steno in the transcript to the steno & text section of the Cat Scratch pane.
Send To Cat Scratch Pane		Send the highlighted text to the text section of the Cat Scratch pane.
Set Active Window		Display the Set Active Window dialog box to select the dialog pane for the cursor focus.
Set Audio Delay		Display the Set Audio Delay dialog box to adjust the synchronization between the cursor location in the job and the playback of the audio file.
Set Cursor Context		Display the Set Cursor Context dialog box to select a resting cursor position for arrowing or scrolling through the file.

Function	Default Keyboard Command	Action
Set Cursor Size		Display the Set Cursor Size dialog box to change the size of the cursor on the screen.
Set Focus To Edit		Place the cursor focus in the transcript.
Set Job End Time Field		Fills in the Job End Time field value with the current time when inserted into the job.
Set Job Start Time Field		Fills in the Job Start Time field value with the current time when inserted into the job.
Set Normal Audio Speed		Reset the audio playback speed to the default setting when the Audio Playback Speed dialog box is displayed.
Set Words Per Folio		Display the Set Words per Folio dialog box to set the number of pages in a folio.
Show Timestamp Dialog		Display the Show Timestamps dialog box to determine the display of timestamps in either clock or elapsed time.
Smart Colon	; + Shift	Attach a colon (:) to the end of the previous word, add two spaces and cap the next word.
Smart Comma	,	Attach a comma (,) to the end of the previous word and add a space.
Smart Exclamation	1 + Shift	Attach an exclamation mark (!) to the end of the previous word, add two spaces, and cap the next word.
Smart Period	.	Attach a period (.) to the end of the previous word, add two spaces, and cap the next word.

Function	Default Keyboard Command	Action
Smart Question	/ + Shift	Attach a question mark (?) to the end of the previous word, add two spaces, and cap the next word.
Smart Remove Punctuation		Remove the punctuation at the end of the previous word, remove a space, and uncap the next word. Applies to colon, period, exclamation mark, question mark, and semi-colon.
Smart Semicolon	;	Attach a semi-colon (;) to the end of the previous word and add a space.
Space	Space; Space + Shift	Insert a space into the transcript.
Spellcheck	F7 + Shift	Begin spellchecking the file based on the selected wordlists and spell check options.
Spelling Lookup	F7 + Ctrl	Display the Spelling Lookup dialog box with the selected word in the Text field.
Split Compound Word		Invoke the Split Compound Word command to separate a compound word into two words.
Split Compound Word - Exclude		Sends the split words to the Compound Wordlist with the exclude attribute.
Split Compound Word - Set Preferred		Sends the split words to the Compound Wordlist with the suggest attribute.
Split Table		Split one table into two.
Stitch	- + Ctrl	Cycle through the stitch options for the selected words.
Stop Audio	F9 + Ctrl	Stop the playback of the associated audio.

Function	Default Keyboard Command	Action
Stop Translation	\ + Ctrl	Stop realtime translation and stop the connection from the writing machine.
Suggest a Brief		Brief It suggests a conflict-free brief for the highlighted or typed text.
Surround With Comma		Insert a comma before and after the selected words.
Surround With Dash	= + Ctrl	Insert a dash before and after the selected words.
Surround With Double Quote		Insert a double quote before and after the selected words.
Surround With Parentheses		Insert an open parenthesis before and a closed parenthesis after the selected words.
Surround With Single Quote		Insert a single quote before and after the selected words.
Swap Table Rows		Exchange the position of the row with cursor focus with the row below.
t	Windows Default	Type the character assigned to the currently selected Windows keyboard.
T	Windows Default	Type the character assigned to the currently selected Windows keyboard.
Table Cell Properties		When the cursor is in a table cell, display the Cell Properties dialog box to specify a character.
Table Column Properties		Display the Column Properties dialog box to set leader dots in a table column.

Function	Default Keyboard Command	Action
Table Properties...		Display the Table Properties dialog box to set table properties.
Table Row Properties		When the cursor is in a table row, display the Row Properties dialog box to specify a character for a particular table row.
Text List Brief it		Run Brief It on a text file to generate briefs.
Text To Dict Define		Create a dictionary definition by typing steno for the selected text.
Timer Information		Display the Timer Options dialog box to assign names to Timers and group Timers.
Toggle All Punctuation	, + Ctrl	Cycle through a series of punctuation symbols for the first punctuation occurrence on the same transcript line as the cursor: period, question mark, comma, colon, semicolon, exclamation mark, dashes and no punctuation.
Toggle Apply E-Define To Typed Text		Toggle the state of the Advanced Global option, Apply E-define to Typed Text.
Toggle Clipboard Lock 1		Toggle clipboard item 1 between a locked, preventing cut or copied text from being overwritten, and unlocked state.
Toggle Clipboard Lock 10		Toggle clipboard item 10 between a locked, preventing cut or copied text from being overwritten, and unlocked state.
Toggle Clipboard Lock 2		Toggle clipboard item 2 between a locked, preventing cut or copied text from being overwritten, and unlocked state.

Function	Default Keyboard Command	Action
Toggle Clipboard Lock 3		Toggle clipboard item 3 between a locked, preventing cut or copied text from being overwritten, and unlocked state.
Toggle Clipboard Lock 4		Toggle clipboard item 4 between a locked, preventing cut or copied text from being overwritten, and unlocked state.
Toggle Clipboard Lock 5		Toggle clipboard item 5 between a locked, preventing cut or copied text from being overwritten, and unlocked state.

## Modify Keyboard Map Columns

You can resize the column widths and reorder the columns in the keyboard map.

### Resize a Column

Place the cursor on the line dividing the column headings and hold the left mouse button down. The cursor becomes a double headed arrow. Move the line left or right to the desired position and release the button.

### Reorder Columns

Place the cursor on a column heading and hold the left mouse button down. Move the cursor to a new location. Red arrows indicate the new position. Release the mouse button.

## Search Keyboard Map

The Search feature in a keyboard map allows you to locate keyboard functions by text or entry type, such as Cursor movement, Global or Edit. You can limit the search by specifying an exact, initial, or ending character match. Once a search result displays, repeat the Search with the same search parameters without reentering the information by using Repeat Search Forward (F3) or Repeat Search Backward (Shift +F3). You can use the [Filter](#) feature to limit the display of the keyboard map to a specific key, macro or keyboard function. A filtered display is searchable.

## Search for Keyboard Functions

1. From within a keyboard map, press **Ctrl + f (Edit/Search)**. The Search dialog box displays.
2. Make necessary entries:

### Search

#### Text

Type the text for the keyboard command or function on which you are searching.

### Entry Type

Search by entry type. Select an entry type from the drop down list to search entries categorized by the selected entry type.

### Case Sensitive

Search for the text in the *Search* field as it is typed in upper and lower case. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field. Depending on your search criteria, this option may not be available.

### Whole Word

Search only for whole words that match the text typed in the *Search* field. When Whole Word is not selected, the search finds the word both as it stands alone and as part of another word. Depending on your search criteria, this option may not be available.

### Location

Select the search parameter. Depending on your search criteria, this option may not be available.

#### Exact Match

Search for entries that match the text, exactly as it is entered, in the *Search* field.

#### Begins With

Search for entries that begin with the text entered in the *Search* field.

#### Ends With

Search for entries that end with the text entered in the *Search* field.

#### Contains

Search for entries that contain, anywhere in the entry, the text entered in the *Search* field.

### Direction

Select the direction of the search:

#### Forward

Search forward, from the cursor position to the end of the keyboard map.

#### Backward

Search backward, from the cursor position to the beginning of the keyboard map.

3. Press **Enter (OK)** to search the keyboard functions. The Search dialog box closes and the Search highlights the first entry that meets the search criteria. If no entry matches the search criteria, a message displays. To repeat the search using the same criteria, press **F3** to search forward or **Shift + F3** to search backward.

If you search for a keyboard function within a filtered display, the search is limited to the filtered keyboard functions. If your search cannot locate the desired keyboard function, try [unfiltering](#) the display or filter by different criteria.

## Set Keyboard Map Options

1. From the Keyboard Map table, press **Alt + t, o (Tools/Options)**. The Options dialog box displays.
2. Make an entry as necessary:

**Warn before restoring default key assignment.**

Check this box to display a warning message when you restore a default key assignment in the Assign Key to Function dialog box.

Uncheck this box to disable the warning message. You can also turn this warning off from the confirmation dialog box by checking the option: *I understand the consequences of my actions. Please stop asking.*

3. Press **Enter (OK)**.

**EZKeys Transition to Keyboard Maps**

EZKeys, the Spacebar plus one other key function, provided the ability to record a series of keystrokes and play them back. The Spacebar plus key macro concept was originally designed for CAT systems prior to the introduction of the Windows operating system. While CAT systems designed for Windows attempted to continue with the concept, the internal functionality of the Spacebar in Windows resulted in this type of macro concept almost unusable in current Windows operating systems.

Today, Keyboard Maps and Macros provide greater efficiency, reliability and 100% compatibility on all Windows based operating systems. Stenograph highly recommends transitioning from EZKeys to Keyboard Maps and Macros to take optimal advantage of your Case CATalyst system.

**Transition From EZKeys to Keyboard Maps and Macros****Step 1: Set the Keyboard Map**

Set the CAT4 kbd keyboard map as the default keyboard map. The CAT4 kbd keyboard map may contain several of the shortcuts you are accustomed to using allowing you to press the same key but without the Spacebar.

1. In Manage Jobs, press **Alt + t, o, e, a (Tools, Options, Edit, Advanced Edit)**. The Advanced Edit Options dialog box displays.
2. Under *Keyboard Map Options*, click **Default Keyboard Map**.
3. Click the down arrow and select **CAT4 kbd** from the list.
4. Press **Enter (OK)**.

**Step 2: Print EZKeys**

1. Determine the EZKeys you use regularly. You may be using EZKeys shortcuts for so long that the key pressed for a particular command is performed automatically. To print a list of your EZKeys:
2. From the Case CATalyst Function menu, select **EZKeys**. The EZKeys toolbar displays.

3. On the EZKeys Toolbar, click the **Edit** icon. The EZKeys dialog box displays.
4. Click the Open  icon. In the Open dialog box, navigate to desired EZKeys file (.ezk) and press **Enter (Open)**.

5. Click the Print  icon.
6. Close EZKeys. In the EZKeys dialog box, click the **Close** button.
7. On the EZKeys toolbar, click the **Close** icon.
8. Open a job in Edit and try each EZKeys on the printout to confirm the ones you regularly use.

### Step 3: Identify Similar Keyboard Map Commands

Determine which keyboard commands in the Case CATalyst CAT4 kbd keyboard map perform the same actions as your EZKeys shortcuts.

1. Open a job in Edit.
2. Test each of the EZKeys, one at a time by pressing the key without the Spacebar, to determine if an action similar to your EZKeys occurs. For example, you have an EZKeys, Spacebar + i, to move the cursor up one line. Press i without the Spacebar. The default command assigned to i in the CAT4 kbd keyboard map moves the cursor up one line. In another example, you have an EZKeys, Spacebar + f, to Search, press f without the Spacebar. The default command assigned to f initiates a search.

Create a list of keys that produce an action different than you expect. For example, you use the EZKeys, Spacebar + n, to open Vertical Notes, however, when you press "n," the default keyboard command moves the cursor down a page.

### Step 4: Assign preferred commands to keys

1. From the open job in Edit, double click **Kbd map: CAT4 kbd** on the Status Bar the bottom of the Edit screen. The CAT4 kbd keyboard map displays.
2. Scroll until you locate the first key on your list that did not perform the command desired.
3. With the key highlighted, press **Enter (Ctrl+m)**. The Assign Key to Function dialog box displays. Use the fields as necessary to make changes.

 Assign Key to Function Fields

#### Currently Assigned to

The keyboard function presently assigned to the key or key combination identified in the Key field.

#### Key

The Key field contains a list of keyboard keys. The options below the Key field indicate if the key is used alone or in conjunction with Ctrl, Shift, or Ctrl and Shift. The selected radio button designates the active key combination. You can assign a different keyboard function to each of the key combinations. For example, in the Default keyboard map, n alone displays the letter "n". **Ctrl + n** displays the View Vertical Notes feature. **Shift + n** displays a capital letter "N".

Select a key for assignment from the drop down list and then click the radio button next to one of the following: Key Only, Ctrl + Key, Shift + Key, Ctrl + Shift + Key. The keyboard function presently assigned for the selected key combination displays in the Currently Assigned to field. If no keyboard function is assigned, the field is blank.

When you assign a single key to invoke a command, consider assigning Shift plus the same key to the same command. This helps to prevent the possibility of invoking the capped version of a keyboard command when the Caps Lock is on.

**Restore Default Assignment**

Restore the default keyboard function assignment for the identified in the Key field. This only restores the default assignment for the current key.

**Filter by Category**

Click a category to display only the keyboard functions for the selected category in the Functions list. For example, you want to locate Move to next red squiggle, which is a Spell Check keyboard function. Select the Category, Spell Check to display a list of only the available Spell Check keyboard functions. Select All to display all the keyboard map functions available for assignment.

**Functions**

To change the keyboard function for the key in the Key field, highlight the desired keyboard function from the list. Recorded Macros display alphabetically at the end of end of the list in the MACROS section.

When you assign a key combination immediately after creating the macro, the newly created macro displays highlighted in the MACROS section.

**Search**

Display the Find dialog box to search for a specific keyboard function.

**Find Search Functions List**

1. Type a keyboard function name or portion of a name in the *Search for* field. To limit the search to a particular category, first select the category in the Filter by Category field and then select Search.
2. Select the direction to search.
3. Press **Enter (OK)**. To repeat the search, press **F3** to search forward or **Shift + F3** to search backward. If you limited the search by category for the desired keyboard function and it does not display in the list, the incorrect category was selected. For example, you select to filter by Punctuation for Move Word Left. This keyboard function is a Cursor action so Search does not locate it in the Punctuation category.

**Use Windows Default**

Use the Windows default keyboard assignment if your Windows Regional Language setting is set to a language other than English. For example, if French is selected as your Windows Regional and Language and the key assignment in the Keyboard Map is set to Windows default, the keyboard action follows the Windows default French language keyboard.

4. Press **Ctrl + s (File/Save)** to save the changes.
5. Click the tab for the open job in Edit and try the new key assignments.

**Step 5: Record and assign macros**

You may have some EZKeys that perform multiple commands. For example, you might have, Spacebar + x, to save and close the file in Edit. To create a keyboard assignment for multiple commands, it is necessary to create a [macro](#), a recorded series of keystrokes. Recording a macro is similar to recording an EZKey. Once you record the keystrokes, you name to the macro and then assign the macro to the desired keyboard command.

## NumberConversion.ini File

The NumberConversion.ini file contains formatting rules based on "keyword" word and number combinations that are used by the [Automatic Number Conversion](#) feature to convert numbers and words into specific formats. There is one NumberConversion.ini file per user when translating and editing. It is located in the System Files case. If you also use CATalyst BCS for captioning sessions, the captioning numberconversion.ini file is located in the Captioning case within the System Files case. If you need number conversion formats specifically to a case, you can create a [Case Numberconversion file](#).

Depending on the keyword, there may be multiple rules available depending on how you want the numbers converted. When you select a keyword, select a rule, then the comment section displays information as to how the number will convert. For example, each of the months of the year are keywords and there are four rule options available. Let's say the witness says, "I participated in a protest march one day during that week." You most likely would not want "march one" to change to March 1st in a situation like that so you would apply the {Match\_Case} rule to the month of March and probably May. A number conversion will only occur when CATalyst encounters numbers following "March" and "May" and not when "may" and "march" are followed by numbers.

### Example

The keyword "dollars" is associated with the number conversion rule for {MONEY}. This rule looks to the left of the keyword and inserts the dollar symbol when preceded by numbers and removes the word "dollars." When Automatic Number Conversion is active and you write "50 dollars," the result is "\$50."

### Example

The keyword "avenue" is associated with the number conversion rule for {ADDRESS}. This rule looks to the left of the keyword and caps up to two words when preceded by numbers. When Automatic Number Conversion is active and you write "1234 red pine avenue," the result is "1234 Red Pine Avenue."

### Example

The keywords "a.m." and "p.m." are associated with the number conversion rule for {TIME}. This rule dictates that a 3 or 4 digit number appears with a colon before the last two digits. When Automatic Number Conversion is active and you write eleven forty-five a.m., the rule for a.m. applies after translation, resulting in 11:45 a.m. If you write "315 a.m.," it converts to "3:15 a.m."

To open the NumberConversion.ini file, do one of the following:

- Press **Alt + f, o, i, n (File, Open, List/Table, Number Conversion)**.
- On the Case CATalyst Translate Options Input tab, click **numberconversion...** you will be prompted with the following message: *To view this file, the Translate dialog box needs to close. Apply changes and continue?* The default is set to Yes. If you press **Enter** or click Yes, any changes will be saved and the Translate dialog box will automatically close and the numberconversion file will open. If you click **No**, the message box closes and the Translate Input dialog box displays.

[Keyboard Map](#) Function: Open Number Conversion

## NumberConversion.ini File Overview

When you open the NumberConversion.ini file, the contents display in three columns: Keyword, Rule and Comment. The Keyword column indicates the keyword that you write; the rule column indicates the type of automatic number conversion instruction; and the Comment column briefly describes the function of the rule. You can sort the entries in ascending or descending order by clicking the desired column heading.

Keyword	Rule	Comment
a.m.	(TIME){1-12}	time before noon
abv	(STANDARD)	alcohol by volume eg 1% abv
abw	(STANDARD)	alcohol by weight eg 1% abw
acoustic ohm	(STANDARD)	measure of sound resistance
acoustic ohms	(STANDARD){PLURAL}	(plural) measure of sound resistance
acre	(STANDARD)	measure of real estate

Depending on your number writing style or theory, you may want to [modify](#) the NumberConversion.ini file to maximize the benefits of the Automatic Number Conversion feature. The NumberConversion.ini file comes with a default set of keyword entries. You can add, delete or modify entries to customize the file.

Keywords have a maximum length of 63 characters. If you create an entry for an existing keyword a message displays. When a duplicate keyword entry exists that can convert a number two different ways, the number conversion applies the last entry in the list. For example, you have the word "highway" listed as a keyword for {ADDRESS} rule. You also have the word "highway" listed as a keyword for {DIGITAFTER}{CAPWITHNUM} rule. You write "1234 rough old highway". The words "rough" and "old" are not capped because this uses the first format in the list. If you write "highway 66", highway is initial capped because it is the last entry. The result is Highway 66.

## Modify NumberConversion.ini File

The NumberConversion.ini file is located in your System Files case and contains keywords and rules when writing numbers and text that should be formatted a specific way. For example, let's say you have Automatic Number Conversion feature selected and you write "3 hundred thousand fifty two dollars." Automatic Number Conversion would convert that to "\$300,052".

Add, modify or remove entries from the NumberConversion.ini file.

You can also [change the font type and/or font size](#) to make the numberconversion file more readable.

## Add or Modify an Entry

- To open the NumberConversion.ini file, do one of the following:
  - Press **Alt + f, o, i, n** (**File, Open, List/Table, Number Conversion**).
  - On the Case CATalyst Translate Options Input tab, click **numberconversion...** *To view this file, the Translate dialog box needs to close. Apply changes and continue?* The default is set to Yes. If you press **Enter** or click Yes, any changes will be saved and the Translate Input dialog box will automatically close and the numberconversion file will open.
- The NumberConversion.ini contains three columns. The Keyword column lists the keyword for the automatic number conversion. This word has a maximum length of 63 characters. The Rule column

is the instruction for the keyword. The Comment column is a brief description of what is going to be the result of this entry.

Keyword	Rule	Comment
s.m.	(TIME)(1-12)	time before noon
abv	(STANDARD)	alcohol by volume eg 1% abv
abw	(STANDARD)	alcohol by weight eg 1% abw
acoustic ohm	(STANDARD)	measure of sound resistance
acoustic ohms	(STANDARD)(PLURAL)	(plural) measure of sound resistance
acre	(STANDARD)	measure of real estate

3. Do one of the following:

- Add Entry — Press **Ctrl + i (Edit/Insert)**. The Insert Entry dialog box displays.
- Modify Entry — Highlight the entry to modify and press **Ctrl + m (Edit/Modify)**. The Modify Entry dialog box displays.

4. Make entries as necessary:

### 5. **Keyword**

Type the word you want to associate to the rule. If you create a duplicate keyword entry, a message displays indicating a duplicate entry.

### **Rule**

Highlight the rule to associate with the keyword. Available options applicable to the rule display in the Options field.

### **Options**

Options applicable to the Rule selected display in this field. Highlight an option to select it.

### **Money Symbol**

This field displays when you select the {MONEY} rule. Depending on the Options selected, the following fields are available. Select one:

- Dollars [\$] — Select this option to include a dollar sign in the money conversion.
- Cents [¢] — Select this option to include a cents sign in the money conversion.
- Other — Select this option to include a customized symbol in the money conversion. Type a money symbol in the field. If you select the {MONEY}{MONEYSUFFIX} rule, then up to three characters that appear between the brackets in Other will display after the number with a space in between. For example, you select {MONEYSUFFIX} and Other and USD in the brackets. When you write "fifty dollars," automatic number conversion converts it to 50 USD.

### **Description**

A sample and brief description of how the selected rule with the selected option is applied.

### **Personal Comments**

Entry in this field is optional. Type any comments you want to note about your entry.

6. Press **Enter (OK)**.

7. Press **Ctrl + s (File/Save)** to save the file.

8. Press **Alt + f, x (File/Exit)** to exit the NumberConversion.ini file.

## **Remove an Entry**

1. To open the NumberConversion.ini file, do one of the following:
  - Press **Alt f, o, i, n** (**File/Open/List Table/Number Conversion**).
  - On the Case CATalyst Translate Options Input tab, click **numberconversion...** *To view this file, the Translate dialog box needs to close. Apply changes and continue?* The default is set to Yes. If you press **Enter** or click Yes, any changes will be saved and the Translate Input dialog box will automatically close and the numberconversion file will open.
2. Do one of the following:
  - To disable the number conversion keyword but leave it in the Numberconversion file in case you change your mind, highlight the entry and press **Ctrl + m**. The Modify Entry dialog box displays. In the Keyword field, type two forward slashes (**//**) in front of the keyword. For example, if the keyword is "drive," it will now look like **//drive.** (without the quotes.) This allows the entry to remain in the numberconversion file but is not active.
  - Highlight the entry you want to remove from the file and press **Delete** or click the Delete  icon.
3. Press **Enter** (**OK**).
4. Press **Ctrl + s** (**File/Save**) to save the file.
5. Press **Alt + f, x** (**File/Exit**) to exit the NumberConversion.ini file.

## Change NumberConversion.ini Fonts

The font type and size for the body and heading text in the NumberConversion.ini file are customizable. The font type and size applies equally to the body and heading text.

### Modify the Font:

1. Press **Alt + f, o, i, u** (**File, Open, List/Table, NumberConversion**). The NumberConversion (.ini) table displays.
2. Do either of the following:
  - If the Dictionary/List Toolbar (  ) is displaying, go to Step 3.
  - If the Dictionary/List Toolbar is not displaying, right click a toolbar and select Dictionary/List Toolbar.
3. Do any of the following:
  - Click the Font style icon (  ) to change the font style.
  - Click the Font size icon (  ) to change the font size.
4. Closing the NumberConversion file saves the font change information. If you have made other changes, you will be prompted to save your changes.

## Filter NumberConversion.ini File

The Filter feature allows you to limit the display of the NumberConversion.ini entries to specific Keyword, Rule or Comment. You can further customize the filtered display using additional criteria. Filter does not remove entries from the NumberConversion.ini file. All entries display when you apply the Unfilter feature. A filtered display is [searchable](#).

## Filter NumberConversion.ini Entries

1. Press **Ctrl + y (View/Filter)**. The Filter dialog box displays.
2. Make necessary entries:

### Filter

#### Keyword

Filter on a specific word or words in the *Keyword* field. Type the text in the field. To filter on a specific type of *Key word*, check the option, **Entry Type**, and select a type from the drop down list.

#### Rule

Filter on a specific rule. Type the text.

#### Comment

Filter on specific text in the *Comment* field. Type the text. To filter on a specific type of Comment, check the option, **Entry Type**, and select a type from the drop down list.

#### Entry Type

Filter on text by entry type. Select an entry type from the drop down list. This option is available when filtering by *Keyword* or by *Comment*.

#### Case Sensitive

Filter on the text identified in the field, as it is typed in upper and lower case. If you do not select Case Sensitive, the filter includes all words containing the indicated characters, regardless of the case typed into the field.

#### Whole Word

Filter only on whole words that match the text typed in the field. When Whole Word is not selected, the search finds the word both as it stands alone and as part of another word.

### Location

Select the filter parameter:

#### Exact Match

Filter on text that matches the text in the field exactly as it is entered.

#### Begins With

Filter on text that begins with the text entered in the field.

#### Ends With

Filter on text that ends with the text entered in the field.

#### Contains

Filter on text that contains, anywhere in the entry, the text entered in the field.

3. Press **Enter (OK)**. The Filter dialog box closes and the screen displays the filtered entries. If no entry matches the filter criteria, a message displays.

If you search within a filtered display, the search is limited to the filtered entries. If your search cannot locate the desired entry, unfilter the display or filter by different criteria.

4. Press **Alt + v, u (View/Unfilter)** to redisplay all the entries. If you close the NumberConversion.ini file in a filtered display, all entries display when you open the file.

## Search NumberConversion.ini File

Search allows you to locate a word or words in the NumberConversion.ini File. You can locate information in the Keyword, Rule and Alternate Suggestions columns, searching forward or backward for a whole word, part of a word or a phrase. Once a searched entry displays, press F3 to search for the next occurrence or Shift + F3 to search backward for a previous occurrence.

### Search

1. To open the NumberConversion.ini file, do one of the following:
  - Press **Alt f, o, i, n (File/Open/List Table/Number Conversion)**.
  - On the Case CATalyst Translate Options Input tab, click **numberconversion**. A message prompts you to close the Translate dialog box in order to open the NumberConversion.ini file.
2. Press **Ctrl + f (Edit/Search)**. The Search dialog box displays.
3. Make necessary entries:
4. **Search**

Type the text you want to locate in the field. Use the remaining options, as necessary.

#### Entry Type

Check this box to limit the search to include one of the following criteria. From the drop down list in the Search field, select one of the following criteria:

- Numbers — The first entry that contains numbers.
- All Capped — The first entry that contains all capped text.
- Contains capped — The first entry that contains at least one capital letter.
- Phrase — The first entry that contains two or more words separated by a space.
- Contains punctuation — The first entry that contains punctuation.
- Numeral Words — The first entry that contains number words.

#### Case Sensitive

Check this box to limit the search based on the upper and lower case letters of text typed in the Search field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field. This field is unavailable when you select to search by Entry Type.

#### Whole Word

Search only for the words that match the text typed in the Search field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. This field is unavailable when you select to search by Entry Type.

#### Location

Limit the search to include one of the following criteria. These fields are unavailable when you select to search by Entry Type.

### **Exact Match**

Search for entries that exactly match the text entered in the Search field.

### **Begins With**

Search for entries that begin with the text entered in the Search field.

### **Ends With**

Search for entries that end with the text entered in the Search field.

### **Contains**

Search for entries that contain, anywhere in the entry, the text entered in the Search field.

### **Direction**

Select one of the following:

#### **Forward**

Search forward from the cursor position to the end of the table.

#### **Backward**

Search backward from the cursor position to the beginning of the table.

5. Press **Enter (OK)** to start the search. If no match is found for the search item, a message displays.
6. To repeat the same search, press **F3 (Edit/Repeat Search Forward)** or **Shift + F3 (Edit/Repeat Search Backward)**.

## **Search and Replace NumberConversion.ini Entries**

Search and Replace allows you to search for and replace words in the Keyword or Comments column of a NumberConversion.ini entry. You can search forward or backward. Once a searched entry displays, you can repeat Search for the same text and search parameters by using Repeat Search Forward or Repeat Search Backward.

### **Search and Replace**

1. To open the NumberConversion.ini file, do one of the following:
  - Press **Alt f, o, i, n (File/Open/List Table/Number Conversion)**.
  - On the Case CATalyst Translate Options Input tab, click **numberconversion**. A message prompts you to close the Translate dialog box in order to open the NumberConversion.ini file. Be sure you are in your User name.
2. Press **Alt + e, e (Edit/Search and Replace)**. The Search and Replace dialog box displays.
3. Make necessary entries:

#### **Search**

Type the text you want to locate in the field. Use the remaining options, as necessary.

#### **Case Sensitive**

Check this box to limit the search based on the upper and lower case letters of text typed in the Search field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field.

**Whole Word**

Search only for the words that match the text typed in the Search field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word.

**Location****Exact Match**

Search for entries that exactly match the text entered in the Search field.

**Begins With**

Search for entries that begin with the text entered in the Search field.

**Ends With**

Search for entries that end with the text entered in the Search field.

**Contains**

Search for entries that contain, anywhere in the entry, the text entered in the Search field.

**Direction**

Select one of the following:

**Forward**

Search forward from the cursor position to the end of the table. A confirmation message displays for each possible replacement.

**Backward**

Search backward from the cursor position to the beginning of the table. A confirmation message displays for each possible replacement.

**Replace With**

Type the replacement text for the entry in the Search field.

4. Press **Enter (OK)** to start the search.
5. When a match is found, the Confirm dialog box displays with the Original word and the Replacement word. Select one of the following:

**Yes**

Apply the replacement to this occurrence and search for any other occurrence.

**Yes To All**

Apply the replacement to all occurrences of the Original word.

**Goto Next**

Do not apply the replacement to this occurrence and search for any other occurrence.

**Done**

Do not apply the replacement to any occurrences and close the Confirm dialog box.

## Case Numberconversion file

Have you ever needed a slightly different number conversion format for a series of jobs but didn't really want to change your Numberconversion file just for these jobs? You can copy your NumberConversion.ini file to a Case, modify, delete or insert a conversion format and when an automatic number conversion takes place, it will be using the NumberConversion.ini file in the Case and not the one in the System File case. Let's say you are reporting a series of depositions concerning articles in a city and community environment. When they refer to a city article reference, the number should be a Roman numeral. When referring to a community article, it should be a digit. You copy your Numberconversion file from your System Files folder to your current case and then modify the Numberconversion file in the case to have "City Article" followed by a number convert to a Roman numeral and "Community Article" followed by a number convert to a digit. If there are any future jobs in this case, you won't have to modify the Numberconversion file in this case for these two article conversions formats.

If you copy your NumberConversion.ini file to the Case, modify the case's NumberConversion.ini file to convert numbers/words very specific to the job/case, it does not affect number conversions in all your other jobs outside of this case. This feature is only available for regular translate and not CATalyst BCS and captioning files.

If you select File, Open, List/Table, NumberConversion, your System Files NumberConversion file displays. When you open the Case NumberConversion file, it opens in Notepad or your default text editor. Editing this way is fine. However, if you have trouble editing within Notepad, do the following: In the System Files case, copy your NumberConversion file to the System Files location and name it Default NumberConversion (or another name). Open your original NumberConversion file and make the necessary changes and save it. Move that file to the case where you want the specific number conversion rules. In the System Files case, rename the Default NumberConversion file (or whatever you named your file) back to the original NumberConversion.

### To copy your System Files NumberConversion.ini to a Case:

- Highlight the NumberConversion file in your System Files case.
- Press Ctrl + c, the Copy dialog box displays with the NumberConversion file selected.
- In the upper, right-hand corner make sure the Keep Case Structure option is deselected.
- In the user box below, highlight the Case name you want to copy the numberconversion to and click OK.

When looking at a Job History file where a numberconversion file was copied to the case, the Translate tab will reflect Files Used verses Dictionary Used and will list the Case Numberconversion file along with all the names of the dictionaries used to translate the file. If a file was translated without a case specific numberconversion file, the Translate tab will reflect Dictionaries Used and list all the names of the dictionaries used to translate the file.

## Personal Globals Table

Use the Personal Globals table to build a list of mistyped words that automatically corrects typed words while editing. For example, when you are typing quickly, because you missed the word "the," while writing and now you type "teh" instead, the Personal Global table would be automatically correct "teh" when you pressed the Spacebar. The default Personal Global table contains an entry with the incorrect spelling of "teh" and the correct spelling "the." Each entry in the Personal Global table contains the text you may incorrectly type along with the text that automatically replaces the incorrectly typed word or words.

EZ Choice and Second Choice are translation features that resolve conflicts. You can include conflicts for correction in the Personal Globals table to resolve occurrences for a conflict while editing. For example, the Personal Global table contains the entry, "interpreted ^ by ^ bye" with the correction of "interpreted by." Use the Case CATalyst [Apply Personal Globals](#) feature to quickly apply the Personal Globals to the file.

A Personal Global entry that automatically corrects a word or words while editing, is placed in the Global Table for that job. Only Personal Global entries used in the job display in the Global Table. If you open the Personal Globals table while editing and modify an entry that has already been used in the current job, the global remains active in the job. To deactivate the global, open the Global Table for the job and [delete](#) it.

You can also copy, cut and paste entries from one Personal Global table to another. You can use Windows marking conventions to mark consecutive and non-consecutive listed entries. For example, you and a few reporters shared Personal Global tables or table ideas and you want to add some of their personal global table entries to your existing Personal Global table without overwriting your Personal Global table. You could put each unique Personal Global table in a separate user and then copy (or cut) entries from one user's Personal Global table and go into the other user or your user and paste entries into the Personal Global table.

By default, the *Use Personal Globals* option is active. Case CATalyst automatically corrects typed words while editing. You can change the default in [Advanced Global Options](#).

Case CATalyst comes with a default list of Personal Globals that you can [modify](#). The [font and font size for the Personal Global table](#) list and headings are customizable. If you make changes to the Personal Globals table while editing, the changes apply in Edit once you save the table. The Personal Globals table is stored in the System Files case.

To access the Personal Globals table, press **Alt + f, o, i, g** (**File/Open/List/Table/Personal Globals**).

[Keyboard Map](#) Function: Open Personal Globals

## Insert/Modify Personal Globals

The Personal Global table contains entries used to automatically correct typed text while editing. You can add and modify entries. You can also copy, cut and paste entries from one Personal Global table to another. You can use Windows marking conventions to mark consecutive and non-consecutive listed entries. For example, you and a few reporters shared Personal Global tables or table ideas and you want to add some of their personal global table entries to your existing Personal Global table without overwriting your Personal Global table. You could put each unique Personal Global table in a separate user and then copy (or cut) entries from one user's Personal Global table and go into the other user or your user and paste entries into the Personal Global table.

## Modify the Personal Globals List

1. From anywhere in Case CATalyst, press **Alt + f, o, i, g** (**File/Open/List/Table/Personal Globals**). The Personal Globals table displays.
2. Do one of the following:
  - Press **Ctrl + i** (**Edit/Insert**) to add a new entry. The Insert Personal Global Entry dialog box displays.
  - Highlight an entry to modify. If necessary, You can use the [Search](#) and [Filter](#) features to quickly locate entries in the table. Press **Ctrl + m** (**Edit/Modify**). The Modify Personal Global Entry dialog box displays.
3. Make necessary entries:

### Match Text

Type the text you want Case CATalyst to replace. For example, let's say you sometimes type "hvæ" instead of "have." You would type **hvæ** as the text that needs to be matched.

### FS

Display the list of available [format symbols](#). To always display the format symbol list, check the box, Always Show Format Symbols. Double click the format symbol to insert. You can insert a format symbol at any point in the *Match Text* entry.

### Insert Field

Display the [Insert Field](#) dialog box from which you can select a field to insert into the *MatchText* entry.

### Case Sensitive

Check this box to create a Personal Global for text based on the case of the entry in the *Match Text* field. For example, you tend to type, "Your Honor." In the *Match Text* field, type, "Honor" and check the *Case Sensitive* option. The Case Sensitive option is not remembered when inserting the next entry.

### Replacement Text

Type the correct spelling of the word. For example, type **have**.

### FS

Display the list of available [format symbols](#). To always display the format symbol list, check the box, Always Show Format Symbols. Double click the format symbol to insert. You can insert a format symbol at any point in the *Replacement Text* entry.

### Insert Field

Display the [Insert Field](#) dialog box from which you can select a field to insert into the *Replacement Text*.

4. Press **Enter (OK)**.
5. When finished making changes, press **Ctrl + s** (**File/Save**) to save the file.

## Modify Personal Globals Table Fonts

The font type and size for the body and heading text in the Personal Globals table are customizable. The font type and size applies equally to the body and heading text.

### Modify the Font

1. Press **Alt + f, o, i, u** (**File, Open, List/Table, Personal Globals**). The Personal Globals (.sgpgb) table displays.
2. Do either of the following:
  - If the Dictionary/List Toolbar (  ) is displaying, go to Step 3.
  - If the Dictionary/List Toolbar is not displaying, right click a toolbar and select Dictionary/List Toolbar.
3. Do any of the following:
  - Click the Font style icon (  ) to change the font type.
  - Click the Font size icon (  ) to change the font size.
4. Closing the Personal Globals file saves the font change information. If you have made other changes, you will be prompted to save your changes.

## Search Personal Globals Table

Search allows you to locate text or a specific entry type in the Personal Globals table. You can search forward or backward for a whole word, part of a word, or multiple words. Once a searched entry displays, you can repeat Search for the same text and search parameters by using Repeat Search Forward or Repeat Search Backward.

### Search the Personal Globals Table

1. From anywhere in Case CATalyst, press **Alt + f, o, i, g** (**File/Open/List/Table/Personal Globals**). The Personal Globals table displays.
2. Press **Ctrl + f** (**Edit/Search**). The Search dialog box displays.
3. Select the method by which you want to search the Personal Globals table.

#### Specific Text

Search by specific text. In the *Search* field, type the text you want to find.

#### Entry Type

Check this box to search by entry type. Case CATalyst searches all the columns for entries that contain selected entry type. Click the down arrow to select an entry type from the list:

##### Numbers

The first entry that contains numbers.

##### All Capped

The first entry that contains all capped text.

##### Contains capped

The first entry that contains at least one capital letter.

**Phrase**

The first entry that contains two or more words separated by a space.

**Contains punctuation**

The first entry that contains punctuation.

**Numeral Words**

The first entry that contain a word number including hundred, thousand, million, etc.

4. Use the remaining fields as necessary:

**Case Sensitive**

Check this box to limit the search based on the upper and lower case letters of text typed in the *Search* field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field. This option is unavailable when searching by *Entry Type*.

**Whole Word**

Search only for the words that match the text typed in the *Search* field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. This option is unavailable when searching by *Entry Type*.

**Location**

Select search parameters. This option is unavailable when searching by *Entry Type*.

**Exact Match**

Search for entries that exactly match the text entered in the *Search* field.

**Begins With**

Search for entries that begin with the text entered in the *Search* field.

**Ends With**

Search for entries that end with the text entered in the *Search* field.

**Contains**

Search for entries that contain, anywhere in the entry, the text entered in the *Search* field.

**Direction**

Select the direction for the search.

**Forward**

Search forward, from the cursor position to the end of the file.

**Backward**

Search backward, from the cursor position to the beginning of the file.

5. Press **Enter (OK)** to start the search. If no match is found for the search item, a message displays.
6. To repeat the same search, press **F3 (Edit/Repeat Search Forward)** or **Shift + F3 (Edit/Repeat Search Backward)**.

## Filter Personal Globals Entries

The Filter feature allows you to customize the display of Personal Global entries using specific criteria. You can select entries to display according to Match text, Replacement text or Entry Type, such as a number or all capped words. A filtered display is [searchable](#).

Filter does not remove entries from the Personal Globals table. All entries display when you return to Full Display. To delete entries from the table, highlight the entries and use the Delete command.

### Filter Entries

1. From anywhere in Case CATalyst, press **Alt + f, o, i, g** (**File/Open/List/Table/Personal Globals**). The Personal Globals table displays.
2. Press **Ctrl + y** (**View/Filter**). The Filter dialog box displays.
3. Make necessary entries:

#### Match Text

Filter by *Match Text*. Type the text in the field. This is the text you want Case CATalyst to replace. For example, type "hvæ" to display all entries that include the text "hvæ."

#### Replacement Text

Filter by *Replacement Text*. Type the text. This is the correct spelling of the word. For example, type "have" to display all entries that include the text "have."

#### Entry Type

Filter by entry type, displaying only entries that contain the entry type selected. Click the arrow to select an entry type.

#### Entry Types

##### Numbers

All entries that contains numbers.

##### All Capped

All entries that contains all capped text.

##### Contains capped

All entries that contains at least one capital letter.

##### Phrase

All entries that contains two or more words separated by a space.

##### Contains punctuation

All entries that contains punctuation.

##### Numerical Words

All entries that contain a word number including hundred, thousand, million, etc.

#### Case Sensitive

Check this box to limit the filter based on the upper and lower case letters of text typed in the *Filter* field. If you do not select Case Sensitive, the Filter displays all words containing the indicated characters, regardless of the case typed into the field. This options is unavailable when filtering by *Entry Type*.

#### **Whole Word**

Filter only the words that match the text typed in the *Filter* field. If you do not select Whole Word, the Filter displays words that both stand alone and as part of another word. This option is unavailable when filtering by *Entry Type*.

#### **Location**

Select filter parameters. This option is unavailable when filtering by *Entry Type*.

##### **Exact Match**

All entries that exactly match the steno or text entered in the Filter field.

##### **Begins With**

All entries that begin with the text entered in the *Filter* field.

##### **Ends With**

All entries that end with the text entered in the *Filter* field.

##### **Contains**

All entries that contain, anywhere in the entry, the text entered in the *Filter* field.

4. Press **Enter (OK)** to filter the entries. If no match is found, a message displays. If you search within a filtered display, the search is limited to the filtered entries. If your search cannot locate the entry, unfilter the display or filter by different criteria.
5. Press **Alt + v, u (View/Unfilter)** to redisplay all the entries. If you close the Personal Globals table in a filtered display, all entries display when you open the table.

### **Add E-Defines from Global Table**

You can add E-Defines from other Global tables to your Personal Global table. For example, some reporters, before the Personal Global table was available, created a global table of E-defines and applied it to every job. If you have a global table specially for correcting typos, you might want to add those E-defines to your Personal Global table.

#### **Add E-Defines**

1. From anywhere in Case CATalyst, press **Alt + f, o, i, g (File/Open/List/Table/Personal Globals)**. The Personal Globals table displays.
2. Select **Edit/Add E-defines from Global Table**. The Browse for Global Table dialog box displays.
3. Select the file name that contains the E-defines you want to add and click **Open**. The Select E-defines to add to Personal Globals dialog box displays. Only E-Defines that are not already a part of your Personal Globals table show.
4. Do one of the following:
  - Press the Spacebar to select or deselect individual E-Defines. Use the Up and Down Arrows to move from global to global.
  - Choose all the globals, click **Select All**.

- When finished, click **OK** to add the selected E-Defines to the Personal Globals file.

## Add Autocorrect Entries from Wordlist

Wordlist Autocorrect entries are part of the Case CATalyst [Spell Check](#) and CATalyst BCS Spell Check feature. You can have Spell Check automatically change a word in the transcript to the correct word when spell checking when you put the incorrect word in a wordlist and use the Autocorrect option. For example, let's say you often type "teh" for "the." You put "teh" in your Personal Wordlist and then set it to auto correct to the word "the." You can now add all the "autocorrect" entries in a wordlist to your Personal Global table.

### Add Autocorrect entries from a Wordlist to the Personal Global table

- Press **Alt + f, o, i, g** (**File/Open/List/Table/Personal Globals**). The Personal Globals table displays.
- Select **Edit/Add Autocorrect Entries from Wordlist**. The Browse for Wordlist dialog box displays.
- Select the file name that contains the Autocorrect entries you want to add and click **Open**. A message displays indicating the number of entries added to the Personal Globals table.

## Phonetic Table

The Phonetic Table contains steno outlines and phonetic text equivalents. When the Advanced Translate option, [Phonetic untranslates display as words](#) is set to **No** and you select the [Phonetic Translation](#) option or use the [Toggle Phonetic Mode](#) during realtime, steno outlines normally displayed as untranslates translate phonetically based on the text equivalent entry in the Phonetic Table.

Each user has a Phonetic Table located in the System Files case. The default Phonetic Table contains 60 text equivalent entries in all capital letters. You can change the entries to use lower case. Stenograph recommends you review entries in the Phonetic Table and modify them according to your writing style. The Phonetic Table is not accessible in CATalyst BCS during an active session.

### Example

The proceedings include the name Jaymes. If no dictionary entry for the steno SKWRAEUPLZ exists, the steno outline displays as an untranslate. Using the Phonetic Table, each steno combination matches to the text equivalent. The result displays as JAIMZ in the transcript instead of SKWRAEUPLZ, as shown:

SKWR = J

A = A

EU = I

PL = M

-Z = Z

When the Advanced Translate option, [Phonetic untranslates display as words](#) is set to **Yes**, Case CATalyst use a phonetic algorithmic logic to determine the intended pronunciation. The Phonetic Table is not used.

Phonetically translated words appear in the selected untranslate color. If your [Scan For Options](#) are set to stop on untranslates, then **F8 (Scan)** and **Shift + F8 (Scan Backward)** stop on phonetically translated words.

## Modify Entries

1. From anywhere in Case CATalyst, press **Alt + f, o, i, p** (**File/Open/List/Table/Phonetic Table**). The Phonetic Table displays.

2. Do **any** of the following:

### Insert an Entry

Press **Ctrl + i** (**Edit/Insert**). The Insert Entry dialog box displays with empty Steno and Text fields.

### Modify an Entry

Highlight the entry you want to modify. Press **Ctrl + m** (**Edit/Modify**). The Modify Entry Dialog box displays with the steno and text.

### Delete an Entry

Highlight the entry and press **Delete**. A confirmation message displays. Press **Enter**.

3. Make entries as necessary:

### Steno

Type new or modify existing steno outlines. Type a - (hyphen) before the steno outline to indicate final steno (right bank). If you want to stay consistent with the default entries, type the text in capital letters. The *Steno is invalid.* message displays if no steno characters are in the Steno field when inserted or modified.

### Text

Type a new or modify the existing text equivalent or phonetic sound for the steno outline. The text characters are limited to 11 characters. Although more than 11 characters can be typed in the Text field, when the entry is inserted or modified, the *Text is too long.* message displays. The Text field also cannot include spaces. If the Text field contains at least one space, the *No spaces allowed.* message displays when the entry is inserted or modified. The user will need to adjust the Text field characters to eliminate the messages.

4. Press **Enter** (**OK**). To exit the Insert dialog box, press **Esc** (**Cancel**).
5. Press **Ctrl + s** (**File/Save**) to save the changes.

## Change Phonetic Table Font

The font type and size for the body and heading text in the Phonetic Table are customizable. The font type and size applies equally to the body and heading text.

### Modify the Font:

1. Press **Alt + f, o, i, u** (**File, Open, List/Table, Phonetic Table**).
2. When the phonetic table displays, do either of the following:
  - If the Dictionary/List Toolbar (  ) is displaying, go to Step 3.
  - If the Dictionary/List Toolbar is not displaying, right click a toolbar and select Dictionary/List Toolbar.

3. Do any of the following:

- Click the Font style icon () to change the font type.
- Click the Font size icon () to change the font size.

4. Closing the Phonetic Table saves the font change information. If you have made other changes, you will be prompted to save your changes.

## Prefixsuffixrules File

The Prefixsuffixrules.ini file contains spelling rules that enhance prefix and suffix handling when using the Case CATalyst and CATalyst BCS EZ Link translate option and the Case CATalyst [QuickFix Prefix](#) and [QuickFix Suffix](#) Edit features. The Prefixsuffixrules files allows you to customize the handling of prefixes and suffixes beyond the normal spelling rules. For example, the basic spelling rule when adding a 's' to a word ends in 'y' is to change the 'y' to 'i' and add 'es'. An exception is when the base word ends in a 'f', the rule is to change the 'f' to 'v' and add es. The Prefixsuffixrules file allows you create exceptions to the basic rules.

A starter Prefixsuffixrules.ini provided with Case CATalyst contains samples rules. The starter Prefixsuffixrules.ini file is automatically loaded when you install Case CATalyst, only if one does not already exist in the System Files case. You can [modify](#) the starter file. The Prefixsuffixrules.ini file must reside in the System Files case. Do not change the name or location of this file. Changing the name or location disables the feature.

### Example

You have an entry that contains the following series of rules:

```
^s=s,es,^[y]ies,^[f]ves,^[fe]ves,^[ies]y,^[ches]ch,^[shes]sh,^[xes]x,^[ses]s,^[ves]fe,^[ves]f,^[s],^[es]
```

You write steno defined as "shelf" and "{Suffix}s"

Case CATalyst analyzes the word using first rule, ^s which means *delete the last character and add 's'*. The result is "shels" which is not a valid word. Case CATalyst continues the analysis using the second rule, ^[y]ies which means *if the word ends in 'y', remove the 'y' and add 'ies'*. The word doesn't end in 'y' so the rule is ignored. Case CATalyst continues the analysis using the third rule, ^[f]ves. The result is "shelves". This is a correct spelling. Case CATalyst stops the analysis.

## Modify the Prefixsuffixrules File

The [Prefixsuffixrules.ini](#) file is used in conjunction with the Translate's EZ Link feature. The Prefixsuffixrules files allows you to customize how prefix and suffixes are handled. You can modify the Prefixsuffixrules file by opening the file in Notepad. Punctuation symbols are used to identify prefix or suffix rules. Use the following guidelines to create new or modify existing rules in the Prefixsuffixrules.ini file. A single prefix or suffix may have multiple rules but once spell check recognizes the root word with the prefix or suffix, EZ Link ignores the rest of the rules. Multiple rules in an entry are separated by commas. Do not use spaces. For example, ^on=&on,^on,on

Do not change the name or location of this file. Changing the name or location disables the feature.

## Modify the File

To modify the prefixsuffixrules.ini file:

1. Be sure you are in your User name.

2. From Manage Jobs, open the **System Files** case.
3. Double click the **Prefixsuffixrules.ini** file. The Prefixsuffixrules.ini file displays in Notepad or Word Pad.
4. Do any of the following:

**Add an entry**

Press **Enter** to add a blank line. Position your cursor on the blank line and type the prefix or suffix information. Type a comma between each rule. Do not use a space.

**Add a rule to an entry**

Locate the prefix or suffix and type the entry using a comma to separate each entry.

**Modify an entry**

Locate the entry to modify and make necessary changes.

**Delete an entry**

To delete all the rules in an entry, highlight all the rules on the line and press **Delete**. Delete the blank line if one is left.

5. Press **Ctrl + s** (**File/Save**).
6. Press **Alt + f, x** (**File/Exit**).

**Default Prefixsuffixrules Rules**

Symbol	Action Taken	Result
^ plus suffix e.g. ^ing	Drop the last letter of root word and attached the suffix.	date + {Suffix}ing = dating
^^ plus suffix e.g. ^^ing	Drop the last two letters of root word and attach the suffix.	dates + {Suffix}ing = dating
& plus suffix e.g. &ing	Double the last letter of root word and attach the suffix.	run + {Suffix}ing = running
no symbol e.g. ing	Add the suffix to the root word.	bark + {Suffix}ing = barking
^[letter]suffix e.g. ^[c]cally	Apply the rule only to words that end in the letter or letters specified in the brackets and attach the suffix.	frantic+{Suffix}cally = frantically
multiple rule example	^able=&ible,&able,ible,able,^[e]able,^[e]ible,^[y]iable	

prefix plus ^ e.g. a^	Add the prefix to beginning of root word	a{Prefix} + way = away
prefix-^ e.g. pre-^	Indicates prefix may or may not be hyphenated	pre{Prefix}+ serve = preserve pre{Prefix}+ planned = pre-planned
prefix-^=option1, option2 e.g. dis-^=dis,dys	Add the correct prefix based on the root word	dis{Prefix}+functional = dysfunctional dis{Prefix}+allow = disallow
		The text portion of the dictionary entry is defined as: dis-{Prefix}.

## Steno Shortcut Table

Case CATalyst uses the Steno Shortcut Table to convert keyboard characters you type in the *Steno* field of a dialog box into steno equivalents. For example, if you type the word James in the *Steno* field of a dictionary Insert dialog box, the steno SKWRAEUPLS automatically displays based on the default entries in the Steno Shortcut Table.

The predefined Steno Shortcut Table contains initial (left side) and final (right side) steno equivalents for each alphabetic character. It also contains the steno equivalent for a comma (,), question mark (?), asterisk (\*), and a period (.). Since all steno theories differ, Stenograph recommends you review the Steno Shortcut Table to delete entries that are incorrect, insert new entries, and [modify any existing](#) entries.

Each user has a Steno Shortcut Table. It is located in the System Files case.

To open the Steno Shortcut Table, press **Alt + f, o, i, s** (**File/Open/List/Table/Steno Shortcut Table**).

## Delete a Steno Shortcut Table Entry

The Undo command is not available when you delete entries in the Steno Shortcut table. You can, however, exit the file without saving.

1. From anywhere in Case CATalyst, press **Alt + f, o, i, s** (**File/Open/List/Table/Steno Shortcut Table**). The Steno Shortcut Table displays.
2. Do **one** of the following to select entries for deletion:

### Select one entry at a time

Highlight the entry.

### Select specific entries

Press and hold **Ctrl** while you click the individual entries to highlight.

### Select a consecutive group of entries

Click to highlight the first entry of the group. Locate the last entry. Press and hold **Shift**, while you click the last entry you want to delete. All the entries in-between highlight.

3. Press **Delete**.
4. Press **Ctrl + s** (**File/Save**) to save the changes.

## Insert Steno Shortcut Table Entries

1. From anywhere in Case CATalyst, press **Alt + f, o, i, s** (**File/Open/List/Table/Steno Shortcut Table**). The Steno Shortcut Table displays.
2. Press **Ctrl + i**. The Insert Steno Shortcut dialog box displays.
3. Make entries:

### Key

Type the text character on the computer keyboard.

### Position

Select **one** of the following:

#### Initial

Select Initial if the character and steno is for the initial (left) side of the steno keyboard. Use Initial for the vowels, A and O.

#### Final

Select Final if the character and steno is for the final (right) side of the steno keyboard. Use Final for the vowels E and U.

### Steno

Type the steno outline you want to generate when you type the associated key on the computer keyboard.

4. Press **Enter** (**OK**) to add the entry to the table.
5. Press **Ctrl + s** (**File/Save**) to save the file.

## Modify Steno Shortcut Table Entries

1. From anywhere in Case CATalyst, press **Alt + f, o, i, s** (**File/Open/List/Table/Steno Shortcut Table**). The Steno Shortcut Table displays.
2. Highlight the entry you want to modify and press **Ctrl + m**. The Modify Steno Shortcut dialog box displays. You can change the steno and position from the Modify dialog box.
3. Make changes as necessary:

### Key

The text character on the computer keyboard. When modifying an entry, this field is not accessible. To change the Key, you must delete the entry and use the Insert command to add a new entry.

### Position

Select **one** of the following:

#### Initial

Select Initial if the character and steno is for the initial side of the steno keyboard.

#### Final

Select Final if the character and steno is for the final side of the steno keyboard.

### Steno

Type the steno outline you want to generate when you type the associated key on the computer keyboard.

4. Press **Ctrl + s (File/Save)** to save the file.

## Change Steno Shortcut Table font

The font type and size for the body and heading text in the Steno Shortcut Table are customizable. The font type and size applies equally to the body and heading text.

### Modify the Font:

1. Press **Alt + f, o, i, u (File, Open, List/Table, Steno Shortucut Table)**.
2. When the steno shortcut table displays, do either of the following:
  - If the Dictionary/List Toolbar (  ) is displaying, go to Step 3.
  - If the Dictionary/List Toolbar is not displaying, right click a toolbar and select Dictionary/List Toolbar.
3. Do any of the following:
  - Click the Font style icon (  ) to change the font type.
  - Click the Font size icon (  ) to change the font size.
4. Closing the Steno Shortcut Table saves the font change information. If you have made other changes, you will be prompted to save your changes.

## User Definitions Table

The User Definitions table, UserDefinitions.sgudf, works in conjunction with Spell Check allowing you to [add](#) a word with comments, definitions or alternate word Suggestions accessible from the Spell Check or Spelling Lookup dialog boxes. There is one User Definitions Table per user. It is stored in the User's System Files case.

When you add a word to the User Definitions table and add the same word to a Wordlist set to Suggest, Spell Check stops on the word which displays with a Red Squiggle. Alternate words set in the User Definitions table display in the Spell check Suggestions list. Clicking the User Def button, you can view the comment or definition for the word.

If the word from the User Definitions table is spelled correctly or in a wordlist and the Suggest attribute is not set for that word in a wordlist, Spell Check does not stop on the word. Use the Spelling Lookup feature to access any alternate suggestions. Clicking the User Def button displays the customized definition if one exists.

### Example

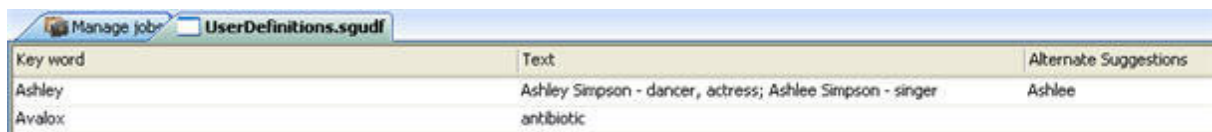

Using the User Definitions Table, add a word to a wordlist and create a comment. For example, you come across the name "Ashley" and want to add an alternate spelling and comment to the wordlist identifying the different spellings of celebrity Ashley. In the User Definitions Table you add the word "Ashley," with "Ashley Simpson, dancer; actress"; Ashlee Simpson, singer" as the comment and "Ashlee" as the alternate spelling, as shown below:

Manage job: UserDefinitions.sgudf		
Key word	Text	Alternate Suggestions
Ashley	Ashley Simpson - dancer, actress; Ashlee Simpson - singer	Ashlee

You then add the word "Ashley" to your Personal or Job Wordlist and set it to Suggest the word "Ashlee." When Spell Check stops on the occurrence of Ashley in the job, it suggests "Ashlee." Click the User Def button in the Spell Check dialog box to view the comment associated with Ashley and determine the correct spelling for the person mentioned in the job.

### Example

The User Definitions Table can also be used to add a customized definition for a word in the Personal or Job wordlist. The customized definition might be for a word a definition is not available or an existing definition for which you need additional clarification. For example, the word Avalox occurs in several medical depositions. You add the word "Avalox" with the definition "antibiotic" to help identify the correct word as shown below.

Key word	Text	Alternate Suggestions
Ashley	Ashley Simpson - dancer, actress; Ashlee Simpson - singer	Ashlee
Avalox	antibiotic	

The word "Avalox" is spelled correctly. It is not in a wordlist and Spell Check does not stop on it. Invoke Spelling Lookup and click on the User Def button to access the definition.

You can change the [font type and/or font size in the User Definitions Table](#) to make it more readable.

## Add/Modify User Definitions

You can add, modify and delete entries from the User Definitions table. There is one User Definitions Table per user. It is stored in the User's System Files case. The [font size can be change](#) to make it more readable.

### Add or Modify a User Definitions Entry

1. Press **Alt + f, o, i, u** (**File/Open/List Table/User Definitions Table**). The UserDefinitions.sgudf. file displays.
2. Do one of the following:
  - Press **Ctrl + i** (**Edit/Insert**) to add a new user definition. The Insert User Definition dialog box displays.
  - Highlight an entry to modify. If necessary, use [Search](#) to help locate the entry. Press **Ctrl + m** (**Edit/Modify**). The Modify User Definition dialog box displays.
3. Make necessary entries:

#### Keyword

Type the word to which you want to add a definition or comment.

#### Definition

Type the text that displays when you press the User Definitions button during Spell Check or Spelling Lookup.

#### Alternates

Add, modify or delete alternate words for the Keyword. These words display in the Spell Check dialog box as Suggestions.

**New**

Type a word in the blank field that displays. To modify a word, double click on it and type the change.

**Delete**

Delete a word from the list. Highlight a word and click the **Delete** icon.

**Move Up**

Move the word up in the Suggestion list. Highlight the name and click the **Move Up** icon.

**Move Down**

Move the word down in the Suggestion list. Highlight the name and click the **Move Down** icon.

4. Press **Enter (OK)** to add the word to the User Definitions table.
5. Press **Ctrl + s (File/Save)** to save the changes to the User Definitions table.
6. Press **Ctrl + F4**, to close the User Definitions table.

## Delete an Entry from the User Definitions Table

1. Press **Alt + f, o, i, u (File/Open/List Table/User Definitions Table)**. The UserDefinitions.sgudf table displays.
2. Highlight an entry to delete. If necessary, use [Search](#) to help locate the entry. Click the **Delete**  icon. A message displays prompting you to confirm the deletion.
3. Press **Enter (OK)** to delete the entry.
4. Press **Ctrl + s (File/Save)** to save the changes to the User Definitions table.
5. Press **Ctrl + F4**, to close the User Definitions table.

## Change User Definitions Table Fonts

The font type and size for the body and heading text in the User Definitions table are customizable. The font type and size applies equally to the body and heading text.

### Modify the Font:

1. Press **Alt + f, o, i, u (File, Open, List Table, User Definitions Table)**. The UserDefinitions (.sgudf) table displays.
2. Do any of the following:
  - If the Dictionary/List Toolbar (  ) is displaying, go to Step 3.
  - If the Dictionary/List Toolbar is not displaying, right click a toolbar and select Dictionary/List Toolbar.
3. Do any of the following:
  - Click the Font style icon (  ) to change the font style.

- Click the Font size icon (  ) to change the font size.
4. Closing the User Definitions Table saves the font change information. If you have made other changes, you will be prompted to save your changes.

## Filter User Definitions Table

The Filter feature allows you to limit the display of the User Definitions Table entries to specific Key word, Text or Alternate Suggestion. You can further customize the filtered display using additional criteria. Filter does not remove entries from the User Definitions Table. All entries display when you apply the Unfilter feature. A filtered display is [searchable](#).

## Filter Keyboard Functions

1. Press **Ctrl + y (View/Filter)**. The Filter dialog box displays.
2. Make necessary entries:

### Filter

#### Key word

Filter on a specific word or words in the *Key word* field. Type the text in the field. To filter on a specific type of *Key word*, check the option, **Entry Type**, and select a type from the drop down list.

#### Text

Filter on specific text the *Text* field. Type the text. To filter on a specific type of *Text*, check the option, **Entry Type**, and select a type from the drop down list.

#### Alternate Suggestion

Filter on specific text in the *Alternate Suggestion* field. Type the text. To filter on a specific type of *Alternate Suggestion*, check the option, **Entry Type**, and select a type from the drop down list.

#### Entry Type

Filter the display by entry type. Select an entry type from the drop down list.

#### Case Sensitive

Filter on the text identified in the field, as it is typed in upper and lower case. If you do not select Case Sensitive, the filter includes all words containing the indicated characters, regardless of the case typed into the field.

#### Whole Word

Filter only on whole words that match the text typed in the field. When Whole Word is not selected, the search finds the word both as it stands alone and as part of another word.

### Location

Select the filter parameter. This option is unavailable when filtering by *Entry Type*.

#### Exact Match

Filter on text that matches the text in the field exactly as it is entered.

**Begins With**

Filter on text that begins with the text entered in the field.

**Ends With**

Filter on text that ends with the text entered in the field.

**Contains**

Filter on text that contains, anywhere in the entry, the text entered in the field.

3. Press **Enter (OK)**. The Filter dialog box closes and the screen displays the filtered entries. If no entry matches the filter criteria, a message displays.

If you search within a filtered display, the search is limited to the filtered entries. If your search cannot locate the desired entry, unfilter the display or filter by different criteria.

4. To return the display to a full view with all the entries, press **Alt + v, u (View/Unfilter)**.

**Search User Definitions Table**

Search allows you to locate a word or words in the User Definitions table. You can locate information in the Keyword, Text and Alternate Suggestions columns, searching forward or backward for a whole word, part of a word or a phrase. Once a searched entry displays, you can repeat the Search by using Repeat Search Forward or Repeat Search Backward.

**Search**

1. Press **Alt + f, o, i, u (File/Open/List Table/User Definitions Table)**. The UserDefinitions.sgudf. file displays.
2. Press **Ctrl + f (Edit/Search)**. The Search dialog box displays.
3. Select the method by which you want to search the User Definitions table.

**Search**

Type the text you want to locate in the field. Use the remaining options, as necessary.

**Entry Type**

Check this box to search by entry type. Case CATalyst searches all the columns for entries that contain the selected entry type. Click the down arrow to select an entry type from the list:

**Numbers**

The first entry that contains numbers.

**All Capped**

The first entry that contains all capped text.

**Contains capped**

The first entry that contains at least one capital letter.

**Phrase**

The first entry that contains two or more words separated by a space.

**Contains punctuation**

The first entry that contains punctuation.

**Numeral Words**

The first entry that contain a word number including hundred, thousand, million, etc.

4. Use the remaining field as necessary:

**Case Sensitive**

Check this box to limit the search based on the upper and lower case letters of text typed in the Search field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field. This option is unavailable when searching by *Entry Type*.

**Whole Word**

Search only for the words that match the text typed in the Search field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. This option is unavailable when searching by *Entry Type*.

**Location**

Limit the search to include one of the following criteria. This option is unavailable when searching by *Entry Type*.

**Exact Match**

Search for entries that exactly match the text entered in the Search field.

**Begins With**

Search for entries that begin with the text entered in the Search field.

**Ends With**

Search for entries that end with the text entered in the Search field.

**Contains**

Search for entries that contain, anywhere in the entry, the text entered in the Search field.

**Direction**

Select one of the following:

**Forward**

Search forward from the cursor position to the end of the table.

**Backward**

Search backward from the cursor position to the beginning of the table.

5. Press **Enter (OK)** to start the search. If no match is found for the search item, a message displays.
6. To repeat the same search, press **F3 (Edit/Repeat Search Forward)** or **Shift + F3 (Edit/Repeat Search Backward)**.

## Search and Replace User Definitions

Search and Replace allows you to search for and replace the Keyword in a User Definitions entry. You can search forward or backward. Once a searched entry displays, you can repeat Search for the same text and search parameters by using Repeat Search Forward or Repeat Search Backward.

### Search and Replace

1. Press **Alt + f, o, i, u** (**File/Open/List Table/User Definitions Table**). The UserDefinitions.sgudf. file displays.
2. Press **Alt + e, e** (**Edit/Search and Replace**). The Search and Replace dialog box displays.
3. Make necessary entries:

#### Search

Type the text you want to locate in the field. Use the remaining options, as necessary.

##### Case Sensitive

Check this box to limit the search based on the upper and lower case letters of text typed in the Search field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field.

##### Whole Word

Search only for the words that match the text typed in the Search field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word.

#### Location

##### Exact Match

Search for entries that exactly match the text entered in the Search field.

##### Begins With

Search for entries that begin with the text entered in the Search field.

##### Ends With

Search for entries that end with the text entered in the Search field.

##### Contains

Search for entries that contain, anywhere in the entry, the text entered in the Search field.

#### Direction

Select one of the following:

##### Forward

Search forward from the cursor position to the end of the table. A confirmation message displays for each possible replacement.

##### Backward

Search backward from the cursor position to the beginning of the table. A confirmation message displays for each possible replacement.

**Replace With**

Type the replacement text for the entry in the Search field.

4. Press **Enter (OK)** to start the search.
5. When a match is found, the Confirm dialog box displays with the Original word and the Replacement word. Select one of the following:

**Yes**

Apply the replacement to this occurrence and search for any other occurrence.

**Yes To All**

Apply the replacement to all occurrences of the Original word.

**Goto Next**

Do not apply the replacement to this occurrence and search for any other occurrence.

**Done**

Do not apply the replacement to any occurrences and close the Confirm dialog box.

## No Nag List

The Brief It No Nag List allows you to put words/phrases into a file that you have identified that Brief It should no longer offer as a suggestion, a reminder or display from the Personal Briefs file. Your dictionaries may contain perfectly stroked entries along with some misstrokes for the same text and you may to [put misstrokes in the No Nag List](#) so your aren't reminded of them. For example, you write "*associated with*" (without the quotes) and Brief It reminds you of your dictionary entry "SOET/W-D" which is a misstroke. You don't want to be reminded of that misstroke but you also don't want to delete it from your dictionary in the event you write it. You can now add "*associated with*" (without the quotes) to the No Nag List. Another example might be that you have 'STAURPL' defined in your dictionary as 'state your name' and you almost always write that stroke perfectly. But there are few times when you write each word out but you don't want to be reminded of your dictionary definition of 'STAURPL' because you know that steno outline and write it more often than not. You can add 'state your name' to the No Nag List.

The NoNag list is located in the System Files case and contains text entries you have sent to the No Nag List. Each word or phrase is placed on its own line. There are a variety of ways you can add words or phrases in the No Nag list file. During Translate and Edit / Edit, you can review your Brief It pane, right click a Brief It entry or highlight multiple entries, right click and select Send Text to No Nag List, click the Options icon on the Brief It toolbar and select No Nag List and type the text portion of the Brief It entries or you can open the NoNag file and type words/phrases directly into the file.

You can also create an AccelerWriter to quickly add the last brief to the No Nag List.

Keyboard Map Function: Add Last Brief To No Nag

## Troubleshooting

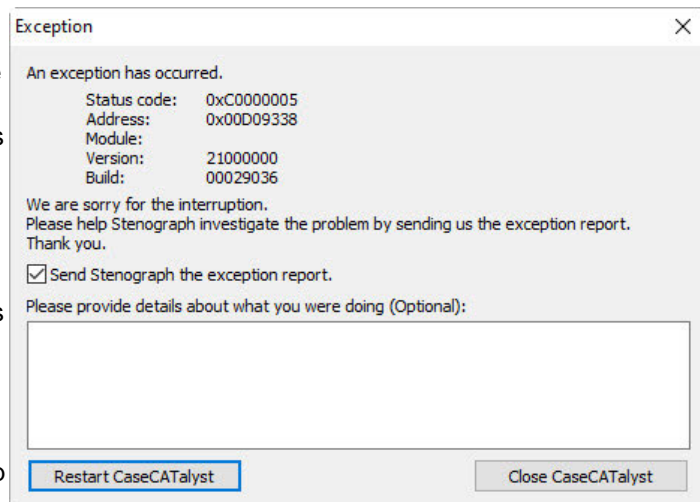

Troubleshooting suggests possible solutions to some common situations encountered when using Case CATalyst. Most users can remedy the situations themselves. For additional information, check the Stenograph Help Desk at [www.stenograph.com](http://www.stenograph.com). You can reach Stenograph Technical Support at 800.323.4247 or 630.532.5100.

### Exception Error

An Exception error may occur if an error happens while running Case CATalyst. Exception errors can happen for many different reasons. When an Exception error occurs, the Exception dialog box displays and Case CATalyst creates a \*.dmp file. The \*.dmp file contains information that may help Stenograph determine the cause of the Exception 3 error. The Exception dialog allows you to take the following actions:

#### Actions

- *Send Stenograph the exception report* - this checkbox allows you to choose if the Exception \*.dmp file(s) will be sent to Stenograph automatically. The \*.dmp files will be sent to Stenograph the next time Case CATalyst is open and there is an internet connection available.
- *Please provide details about what you were doing (Optional):* comment box - this comment box allows you to provide details about the actions you were performing in Case CATalyst when the Exception occurred. This information will be sent to Stenograph along with the dmp file(s).
- *Restart CaseCATalyst* button - Use this button to close the Exception dialog. Case CATalyst will close and reopen automatically. If there is an internet connection and the checkbox to send the exception report is checked, the dmp file(s) will be sent to Stenograph when Case CATalyst opens.
- *Close CaseCATalyst* button - Case CATalyst will close and will not reopen automatically.

### No User Root Found

A user root folder is the first hierarchical level in the Case CATalyst file structure that contains user names and files. Case CATalyst requires that at least one user root folder exists. You cannot access the Case CATalyst software without a user root. If you attempt to start Case CATalyst without a user root, a message displays:

**To start Case CATalyst, you must do the following:**

1. Enter at least one user root, where users are contained.
2. Enter at least one user.

OK

## Action

Create a User Root:

1. Press **Enter (OK)** to display the User Root Folders dialog box.
2. Review the list of folders and files on your computer system. Using the mouse, select a location for the user root, by clicking the desired folder. As you open folders, the selection displays in the *Chosen Folder* field.
3. Press **Alt + a (Add)** to add the new user root folder displayed in the *Chosen Folder* field.
4. If you make a mistake, highlight the path in the *User Root Folders* field and press **Alt + r (Remove)**. Select a new location.
5. Press **Enter (Save)** to save the changes. The Create New User dialog box displays.
6. In the *User name* field, type a new user name.
7. Select the option, **Copy Default Files** to copy the Case CATalyst default files to the new user name. The default files include: pre-made Layouts, Keyboard modes, Realtime Commands Sample Dictionary and other System files. Do not select this option if you do not want to copy the default files.
8. Select **Change Icon**, to select an icon for the user name. The Select User Icon dialog box displays where you can choose an icon from the list. You can also [change the user icon](#) from Manage Jobs.
9. Press **Enter (Open)** to create the new user name.

## No User Root on a Network

A user root folder is the first hierarchical level in the Case CATalyst file structure that contains user names and files. If a user root is not accessible when the user is connected to a network, a message displays when the user attempts to access Case CATalyst:

**Unable to locate drive and/or path for "pathname" user root.**

**Would you like to remove it from the user root list?**

**Yes / No**

**I understand the consequences of my actions. Please stop asking.**

This situation would most likely occur if you have a network user root and attempt to access Case CATalyst when not attached to the network. For example, a user runs Case CATalyst from a network drive at work and then takes the notebook home. When the user attempts to access Case CATalyst, the computer is no longer connected to the network and that user root is no longer accessible.

## Action

Do one of the following:

### Yes

Remove the user root from the user root list. This removes the user root information. You need to recreate the user root information if you want to access that user root again.

### No

Retain the user root in the user root list. This message continues to display each time the user attempts to access Case CATalyst when the user root is not accessible.

You can check the box, I understand the consequences of my actions. Please stop asking. to no longer display this message. You can also activate or deactivate the display of this message from the User Root Folders dialog box:

1. At the User Root Level, select **File/User Root Folders**. The User Root Folders dialog box displays.
2. Do **one** of the following:
  - Select the option, *Suggest to remove inaccessible user roots*. to display the warning message.
  - Uncheck the option, *Suggest to remove inaccessible user roots*. to prevent the warning message from displaying.

## Files in user with \_Review at end of file

In the rare event that Case CATalyst cannot open a User's UserSettings or Cat32AppSettings file, the following message displays:

UserSettings.SGXML is unusable at this time. CATalyst will attempt to use a previous version, if available, or default settings will be used. The original copy of %FILENAME% has been saved and is named UserSettings\_REVIEW\_YYYY-MM-DD-HHMMSS.sgxml. (YYYY-MM-DD-HHMMSS represents the Year-Month-Day-HourMinutesSeconds)

The Cat32AppSettings file is unusable at this time. CATalyst will attempt to use a Cat32AppSettings from a previous version, if available, or default settings will be used. The original copy of the Cat32AppSettings file has been saved and is named Cat32AppSettings\_REVIEW\_YYYY-MM-DD-HHMMSS.sgxml.

In the event you received either of the above messages, please contact Stenograph's Technical Support Department to report this occurrence.

Job and Case history files may also display with the \_REVIEW additional text, but no message displays.

## COM port settings

A COM port is either a physical 9 pin port on your computer or a USB to serial adapter which has a USB interface on one end and a 9 pin serial connector on the other end. When connecting your steno machine via a physical cable or via Bluetooth or outputting to CaseViewNet via a serial connection, you need to make sure that you have the correct COM port selected.

To see what COM ports are available on your computer, go to Windows Control Panel and then select Device Manager. Locate the Ports (COM & LPT) and click the arrow to the right of the label to expand the view. The following is an example of what you might see in Device Manager.

You will need to select the correct COM port in Translate options in order to successfully connect your writer or output to CaseView or CARTView. If you have an internet connections, there are options to send realtime or CART via an internet connection. Please contact Stenograph's Technical Support Department for more information.

## Edit

This section suggests possible solutions to some common situations encountered in Edit. Most users can remedy the situations themselves. For additional information, check the Stenograph Help Desk at [www.stenograph.com](http://www.stenograph.com). You can reach Stenograph Technical Support at 800.323.4247 or 630.532.5100.

### Cannot Save Macro

When you attempt to record commands for a macro that are not recordable functions, Case CATalyst displays the following message.

#### Action

Press **Enter** (**OK**) to display the Edit screen.

### Stop Realtime Warning

When you select to stop realtime translation by pressing **Ctrl + \** (File/Stop Translation) in Edit, the following message displays.

#### Action

Do one of the following:

- Press **Enter** (**Yes**) to end realtime translation.
- Press **Esc** (**No**) to continue realtime translation.

If you do not want this message to display, check the box: I understand the consequences of my actions. Please stop asking.

You can also set to this option from the Tools menu in Edit. Select **Tools/Options/Warnings** to display the Warnings in Edit dialog box. Check the options, *Warn when ending realtime...* to display the above message or uncheck the option to bypass the warning message. You can also access the Warnings by

clicking the All Options icon (  ).

## Cloud (internet) Output to CaseViewNet and/or iCVNet

A Cloud connection requires all parties (Case CATalyst reporter and realtime receive clients) to have internet access. If you cannot connect to the internet or your internet connection was dropped, the following message displays:

Re-establish the internet connection in order to proceed.

## Realtime not scrolling

If you are writing realtime and your cursor is not scrolling with the realtime text, the most common reason would be the [Follow Realtime](#) command was invoked. The purpose of the Follow Realtime command is to easily move (toggle) the cursor to the last editing location and then back to following the realtime text. Here is how the Follow Realtime command works. The first time the Follow Realtime command is invoked in a realtime file it moves the cursor to the beginning of the file. You can start editing using your arrow keys, macros, scan commands, etc., to move about the file. When you go back on the record and want to see your realtime text, you write the steno outline defined as Follow Realtime and the cursor moves to the end of the file and scrolls with the realtime text. The next time you have a break to edit, you write the steno outline for Follow Realtime and the cursor moves to the last editing location.

The Follow Realtime command remembers the last editing location based on the fact that you used the Follow Realtime command. If you manually move your cursor to a location in the transcript and edit, the Follow Realtime command will not return your cursor to the location you manually moved the cursor.

## Recover file

In the event that a job closes abnormally, Case CATalyst has an [Auto Recover](#) feature that will recover your job with the most recent changes. For example, you're in a transcript named "1-14-17 GMM" and the computer suddenly restarts after a Windows update. After the restart, you go into CATalyst and see "1-14-17 GMM" and "1-14-17 GMM (1)". **To recover the file with the most recent changes simply double click on "1-14-17 GMM"** (the original file name). Case CATalyst will then open the recovered file and save it as the original file name. The "original file" will then be renamed as "1-14-17 GMM\_original". All of the sub-files (audio, dictionary, etc.) will remain under the original filename.

## Cannot find file

There have been a few customer calls stating that they cannot find a file they were just editing. In some situations, the user has done a Save As and doesn't remember what they named the file or where the file was saved. Another situation might be that their computer had a hiccup and rebooted and they can't find the file. No matter the situation, you should easily be able to find the file. The [Recently Saved Files](#) feature lists the last 10 saved files so you can easily locate a file. You can also look in the [AutoArchive Case](#) for possible multiple versions of the file.

## Audio Playback

There may be some instances where the audio playback in a file is very, very slow or very, very fast. A situation where this might occur could be if you have more than one file open, each with

audio and different audio codec were used for each file could cause a playback issue. Since two different audio codec were used to record the audio in the files, it could negatively affect the audio playback in the files. For example, let's say that you reported a proceedings yesterday and used the ADPCM audio codec. Since you were early to today's proceedings, you have the file open and are editing and listening to the audio. Today's proceedings start and you start realtime using the 80MB/H codec. During a break, when you decide to start editing and playing back the audio, the playback is very slow.

To correct the issue, you should save and close each file, close CATalyst and then start CATalyst and open the file in which you need to play back the audio

## Globals

This section suggests possible solutions to some common situations encountered with globals in Edit. Most users can remedy the situations themselves. For additional information, check the Stenograph Help Desk at [www.stenograph.com](http://www.stenograph.com). You can reach Stenograph Technical Support at 800.323.4247 or 630.532.5100.

### Cannot Access Global Table

#### Error Message

*An error occurred accessing the Global Table. Please report the following error information to Stenograph Support.*

#### Action

Contact Stenograph Technical Support. The error information text that displays depends on the type of error that occurred.

### Cannot Add Global to Global Table

#### Error Message

*An error occurred adding the global to the Global Table, the global will not apply. Please report the following error information to Stenograph Support.*

#### Action

Contact Stenograph Technical Support. The error information text that displays depends on the type of error that occurred.

### Cannot Save Global Table

#### Error Message

*An error occurred while attempting to save the Global Table. All changes to the Global Table since the last save will be lost. Please report the following error information to Stenograph Support.*

### Action

Contact Stenograph Technical Support with the error text. The error information text that displays depends on the type of error that occurred.

## Cannot Undo Global

### Error Message

*An error occurred undoing the global, the global cannot be undone. Please report the following error information to Stenograph Support.*

### Action

Contact Stenograph Technical Support with the error text. The error information text that displays depends on the type of error that occurred.

## Selected Text Has No Associated Steno

The following message occurs when you mark text in Edit and select to create a dictionary define but there is no underlying steno.

### Action

Choose one:

#### Continue

Continue with the type of define you originally tried. You must locate the associated steno to make the type of define you selected.

#### E-Define

Case CATalyst defaults to this selection. E-Defines do not require steno and performs the global based on the text.

#### Replace

Replace for this occurrence only.

#### Cancel

Cancel the define and return to the job.

## Selected Text Has Steno Not Selected

The following message displays when you mark text in Edit and select to create a dictionary define but have not included all the steno associated with the text.

### Action

Choose one:

#### Yes

Opens the Global dialog box with the defined you selected and with the associated steno in the Steno field.

#### No

Displays error message that indicates the [selected text has no associated steno](#). Choose **Continue**, **E-Define**, **Replace** or **Cancel**.

#### Cancel

Cancel the define and return to the job.

## Translate

This section suggests possible solutions to some common situations encountered related to Translation. Most users can remedy the situations themselves. For additional information, check the Stenograph Help Desk at [www.stenograph.com](http://www.stenograph.com). You can reach Stenograph Technical Support at 800.323.4247 or 630.532.5100.

### Select Existing File to Translate

The following message occurs when, in the Translate dialog box, you select File in the Steno Source field and type a new file name in the File field.

### Action

Do one of the following:

- If you are translating an existing file, select a note file.
- If you are creating a realtime job, select **Writer** in the Steno Source field and then type a new file name in the File field.

### Selected File Contains Text and Steno

The following message occurs when, in the Translate dialog box, you select Writer in the *Steno Source* field and an existing file that contains text and steno.

### Action

Choose one:

#### Append

Add the new text and steno at the end of the existing file. If the existing file has an audio file, Stenograph strongly suggest you select Append.

#### Overwrite

Delete the existing text and steno and replace it with the new text and steno.

#### Cancel

Return to the Translate dialog box.

## Unable to Locate Personal Dictionary

When you select to translate from the writer or translate a note file and the current user does not have a Personal Dictionary in the System Files case, the following message displays.

### Action

Do the following:

1. Press **Enter (OK)**. Translate continues using the selected dictionaries.
2. Check the following:
  - If a Personal Dictionary exists for the current user, make sure it is in the System Files case.
  - If no Personal Dictionary exists, Import or create a Personal Dictionary.

## File Management

This section suggests possible solutions to some common situations encountered related to managing your jobs and files. Most users can remedy the situations themselves. For additional information, check the Stenograph Help Desk at [www.stenograph.com](http://www.stenograph.com). You can reach Stenograph Technical Support at 800.323.4247 or 630.532.5100.

### Archive not created by Case CATalyst

When you select to restore a .zip file that was not created by Case CATalyst, the following message displays.

### Action

Press **Enter (OK)** to remove the message. Use Windows or a compressing program, such as WinZip® to extract the files.

## Cannot Move Selected File

The following type of message occurs, when you select a file to move but the file is open or in use.

### Action

Close the file and perform the move function.

## Cannot Open Compress Print Configuration

The following message occurs when you attempt to open the CompressedPrintOptions.sgcpo file in Manage Jobs.

You can only view Compress Print configurations from within the Compress Print function.

### Action

1. Press **Enter (OK)** to remove the message.
2. Select a job and then open Compress Print, press **Alt + u, c (Functions/Compress Print)**.
3. Select [Configurations](#).
4. In the Change Configuration dialog box, select a configuration to view and press **Enter (OK)**. The file in the preview window reflects the current configuration.

## Open Files When Changing Users

The following message occurs when you attempt to change users but still have open files for the current user.

### Action

Choose one:

#### Close files

Close any open files in the current user. If there are any unsaved change in the open files, Case CATalyst prompts you to save each file with changes. Manage Jobs opens in the new selected user.

#### New session

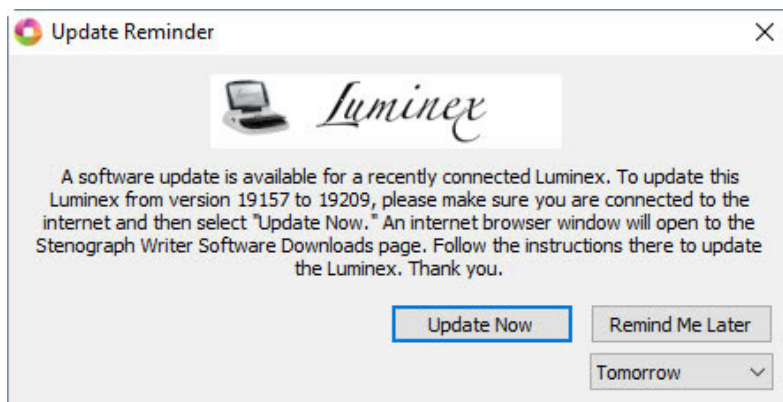

Starts another copy of the Case CATalyst software so that two session of Case CATalyst are running independent of each other.

#### Cancel

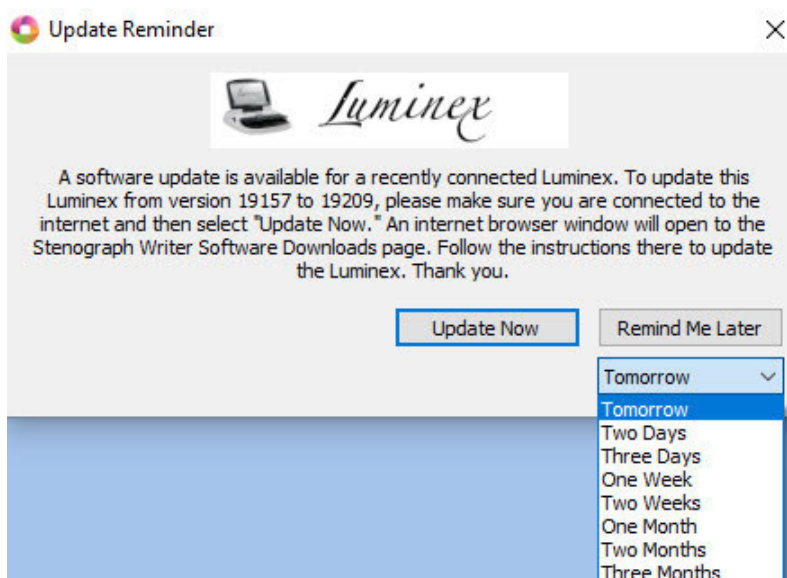

Returns to the current location without taking any action.

## Writer Update Notification

When you use a USB or WiFi connection from a Luminex and/or Luminex II during Read or Realtime translation, Case CATalyst will read the current version of software installed on the Luminex. If there is a newer software update available, you will receive the Update Reminder dialog letting you know there is an update available the next time you open Case CATalyst.

If you'd like to update the Luminex software, click the Update Now button. If you'd like to be reminded of the update later, select a reminder option from the drop-down list, ranging from Tomorrow to Three Months, and then click the Remind Me Later button.

Case CATalyst will stop reminding you of an available Luminex software update once a Luminex and/or Luminex II is connected using the latest available software update, until there is a newer update available.

## CATalyst BCS

CATalyst Broadcast Captioning Suite (BCS) is designed for steno caption providers. It utilizes integrated live display and scripted program features. A variety of windowing options allow you to view your realtime translation, make corrections to the translation, preview the text that displays on the viewers television and organize your story scripts. Additional features include the ability to view your vertical notes, session selections, and the status of the captioning mode.

All CATalyst BCS features are accessible from a menu on the Menu Bar. Several features have default [keyboard commands](#) which you can modify. All keyboard commands listed in the help topics and manual are based on the default keyboard map. If you make modifications to the default keyboard map, the default commands listed may not work. If necessary, substitute the appropriate current key combination assigned in your modified keyboard map.

Additionally, many features are available from a short menu that displays when you single click the right mouse button displaying the Right Click Menu. The available features vary depending on the CATalyst BCS function. The Right Click Menu is [customizable](#) in select CATalyst BCS functions.

The CATalyst BCS Help contains comprehensive information about all the CATalyst BCS functions and features, including steps on how to perform various tasks. You can learn about translation options, editing tools, how to customize Profiles (a collection of settings used during captioning), managing dictionaries and more.

You can easily access information in the CATalyst BCS Help through a table of contents, an index, or by topic search. All index entries have a BCS prefix. For example, to look for information in the index about NIK files, type: BCS nik files

## Preparing to Use CATalyst BCS

In order to begin captioning in CATalyst BCS, you need to:

- create a user name, if you did not create one during the installation process.
- create a Profile.
- install your Personal Dictionary.
- import any job dictionaries.
- copy other files, such as ASCII or text files for story scripts.

The first time you start Case CATalyst, you use the user name typed during installation of the Case CATalyst software. If you did not type a name during installation, Case CATalyst creates the user name "Your User Name". Once you create your own user name, you can use it to sign onto Case CATalyst.

To prepare CATalyst BCS:

1. Start Case CATalyst, do **one** of the following:
  - Double-click the Case CATalyst shortcut icon on your desktop.
  - Complete these steps:
    - a. From the Windows desktop, open the **Start** menu.
    - b. Select **Programs**.
    - c. From the Programs menu, select **Stenograph**.
    - d. From the Stenograph menu, select **Case CATalyst**.

2. The Case CATalyst sign on screen displays.
3. Select the name you entered during installation or [create](#) a new user and then press **Enter**. The Manage Jobs function opens in the user name you select.
4. Import or restore your [dictionary](#) and [other files](#) as necessary.

## Create a User Name

Before opening Case CATalyst for the first time, you must create user name if you did not create one during installation. Files are created and stored within a user name to maintain file organization. You can customize certain user options for your user.

To create a user:

1. Open Case CATalyst.
2. Click the Users Level  icon. If this button is not available, you are already at the User Level.
3. Press **Alt + f, n, u** to open the Create New User dialog box.
4. Use the following fields and options as necessary:

### Look in

Displays the User Root level. The User Root level is the location where you installed Case CATalyst. For example, C:\CAT4\USR.

### User Name

Type a new user name. You can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: ' ~ ! @ # \$ % ^ & ( ) - \_ { }

Some characters are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , | = < > ? \*

### Files of type

Displays the type of files displayed: users and cases.

### Copy Default Files

Check this box to copy the CATalyst BCS default files to the new user name. The default files include: default Layout, keyboard map, and other System files.

Uncheck this box if you do not want to copy the CATalyst BCS default files to the new user.

### Change Icon

Select this option to display the Select User Icon dialog box where you can choose a different user icon for your user name. Choose an icon from the list or select Browse to select an icon from a different folder. You can use almost any type of graphic.

You can change your user icon at any time from Manage Jobs by selecting Tools/Options/Select User Icon.

5. Press **Enter (Open)** to create the new user name.
6. If necessary, change to your user name.

## Changing Users

You can change to a different user once Case CATalyst is open. The current user name displays on the Title Bar.

To change users:

1. From Manage Jobs, click the User icon  or press **Alt + t, s**. The User Level window displays.
2. Select the user name to which you want to change. Double-click the name or highlight the name and press **Enter**.
3. If there are files open in the user name you are switching *from*, a message box displays:

**Files are open using the current user's User Preferences.**

**To change users, these files must be closed,**

**or a new session of Case CATalyst must be started.**

**Please select one of these options.**

Select **one** of the following:

### **Close files**

Close the files in the current user and open the selected user in the current Case CATalyst session . If there are unsaved changes in any of the open files, Case CATalyst prompts you to save them.

### **New session**

Leave the current files open in the current Case CATalyst session and open a another session of Case CATalyst. An additional session of Case CATalyst displays on the Windows taskbar. Select the User name.

4. Check the Title Bar to verify the change of user names.

## Importing a Dictionary

CATalyst BCS requires dictionaries be in Case CATalyst format. You must convert or import any dictionary that is not in Case CATalyst format. You can import your Personal or job dictionaries from:

- Case CATalyst 3.x
- RTF/CRE (Rich Text Format/Court Reporting Extensions)
- Stentura Dictionary

CATalyst BCS also requires that a dictionary named *Personal Dictionary* exists in the System Files case. If you import your dictionary and do not want to name it Personal Dictionary, you can create a Personal Dictionary with one entry.

To convert files from Case CATalyst 3.x, you must import them. If Case CATalyst 3.x and Case CATalyst 4.x or higher are on the same computer, you can import directly from the hard drive. If the Case CATalyst 3.x files are backed up, you can use the Restore function to unzip and import them at the same time.

If you sent your dictionary to Stenograph for conversion, use the Restore function in Case CATalyst. See the loading instructions included with your converted Stenograph dictionary.

## Import a Dictionary

1. Press **Alt + u, i (Functions/Import)**. The Import dialog box displays.
2. In the Import Source field, select the type of dictionary you are importing:
  - RTF/CRE - Importing a RTF/CRE formatted dictionary.
  - Case CATalyst 3.0 - Importing a Case CATalyst 3.x dictionary.
  - Stentura Dictionary
3. In the Import From field, select the location of the dictionary to import. Select the **Browse** button to locate a different source location. If the file is on diskette, make sure the diskette is in the diskette drive.
4. To display only dictionaries in the current location, in the Files of Type field, click the **Down Arrow** to make your selection.

### RTF/CRE Dictionary Files

Importing a RTF/CRE formatted dictionary.

### Case CATalyst 3.0 Dictionary Files (\*.dct)

Importing a Case CATalyst 3.x dictionary. When importing a Case CATalyst 3.x personal dictionary, the file name is PERDICT\$.DCT.

### Stentura Dictionary

Importing a Stentura dictionary. When importing a Stentura dictionary no file selection window displays so no Files of Type are available. If you saved job defines on the Stentura to a job dictionary, JDEFINES.JOB, you can import the job dictionary by checking the box, JDEFINES.JOB.

### Premier Power Dictionary Files (\*.dct; \*.job)

Importing a Premier Power dictionary.

5. In the file selection window, select the dictionary.
6. Case CATalyst defaults to keeping the original name of the dictionary when importing. If you want to be prompted for a name during the import process, do the following:
  - a. Press **Alt + o (Options)** to display the Import Options dialog box.
  - b. At the General Import Options tab, confirm the *Keep same filename as original system* option is deselected.
  - c. Select **OK** to accept the selection and return to the Import dialog box.
7. Press **Enter (OK)**. The Personal Dictionary automatically imports into the System Files case.

If you import an RTF/CRE dictionary created by Cheetah, the following message displays:

**The dictionary *dictionaryname.rtf* was exported by TurboCAT.**

**Please select whether this was from TurboCAT or by CAPtivor**

**Use my selection for all other dictionaries I'm importing right now**

**TurboCAT CAPtivor**

Select the type of dictionary. Your selection determines how Case CATalyst imports specific dictionary entries concerning format symbols for captioning.

If you are importing more than one dictionary from the same source, select the option, *Use my selection for all other dictionaries I'm importing right now* to prevent prompting for each dictionary.

8. When the import completes, a message box displays confirming the number of files imported. Click **OK**.

The Save As dialog box displays if you are importing a 3.x personal dictionary; the dictionary already exists in Case CATalyst; or you deselected the *Keep same filename as original system* option. In the Save dialog box, in the File name field, accept the default name or type a new name.

9. Press **Enter (Save)** to save the dictionary in Case CATalyst. If importing your Personal Dictionary, be sure to save it in the System Files case and name it *Personal Dictionary*.
10. Run [Dictionary Verify](#) to check the dictionary entries for any problems. When Verify Dictionary is finished, a text file (.txt) displays the Dictionary Verify Report. Select **File/Exit** to close the report dialog box.

## Add Delete and Captioning Strokes to Dictionaries

After importing your dictionary for CATalyst BCS you can add dictionary entries for your Delete stroke, such as an \* (asterisk) and captioning strokes such Flush, #\*. CATalyst BCS does not have preset Delete strokes or captioning strokes such as Flush, Block, Pass and Clear.

If you import a Case CATalyst 3.x dictionary that contains the {Delete} entry, the delete stroke entry is already in your Case CATalyst dictionary.

## Define Strokes

1. At the Manage Jobs screen, highlight the dictionary to which you want to add the delete stroke and press **Enter**.

Adding asterisk deletion and a Flush stroke, if applicable, to the Personal Dictionary is recommended. Your Personal Dictionary is stored in the System Files case. Double click the **System Files** case and then double click **Personal Dictionary**.

2. Once the dictionary opens, press **Ctrl + i (Edit/Insert)** to display the Insert dialog box.
3. In the Steno field, type the steno for the delete stroke.
4. In the Text field, press **Alt + f (FS)** to display the list of Format Symbols. Highlight the translate command, **{Delete}**, and press **Enter**.
5. Click **OK**.
6. If applicable, define any appropriate steno outlines for captioning:
  - Steno strokes used to force text to the encoder. Use the format symbol, **<Caption: Flush>** in the Text field.
  - Steno strokes used to prevent upstream captions from being sent to the encoder. Use the format symbol **<Caption:Block>** in the Text field.
  - Steno strokes used to allow upstream captions, such as captioned commercials to go to the encoder. Use the format symbol **<Caption:Pass>** in the Text field.
  - Steno strokes used to remove text from the video screen and Caption Preview window. Use the format symbol **<Caption:Clear>** in the Text field.
7. When finished inserting entries, click **Cancel** to exit the Insert dialog box.
8. Press **Ctrl + F4 (File/Exit)** to exit the Manage Dictionary function. At the Save Changes prompt, select **Yes** to save the new entries.

## Copying Script Files

CATalyst BCS allows you to use [script](#) files previously created in CAPtivor and ASCII format. When adding a story during a captioning session, the CATalyst BCS default looks in the Caption Show Folder located in the CAT4 folder. Although you can Browse to any location when adding script files during a CATalyst BCS session, you may want to copy the script files to the Caption Show Folder.

CATalyst BCS automatically creates the Caption Show Folder when you begin a captioning session for the first time. To place previously generated script files into the Caption Show Folder before running CATalyst BCS, you must create this folder.

### Copy Script Files

1. If necessary, use Windows Explorer to create a new folder in the CAT4 folder where you installed Case CATalyst. For example, C:\CAT4.
2. Name the folder **Caption Show Files**.
3. Copy your pre-scripted ASCII and text files directly into the Caption Show Files folder. Refer to your windows document for more information about creating a new folder and copying files in Windows.

## Copying NIK Files

CATalyst BCS allows you to use previously created [NIK](#) key assignments. Copy the NIK file into the Captioning case, located in the System Files case of your user name.

You can copy CAPtivor NIK files into CATalyst BCS. There is no conversion necessary. CATalyst BCS recognizes the original values.

### Copy NIK Files

1. Using Windows Explorer locate the CAT4 folder where you installed Case CATalyst. For example, C:\CAT4.
2. Locate the Captioning case within your user. For example, usr\Tiara\System Files\Captioning.
3. Copy the NIK files to the Captioning folder. Refer to your windows document for more information about copying files in Windows.

## Creating a Profile

CATalyst BCS requires a Profile selection when starting a session. A [Profile](#) is a collection of settings used during captioning based each type of captioning or each captioning company requirements. You can create as many Profiles as desired.

### Create a New Profile using the Profile Wizard

1. Press **Alt + u, c (Function/Captioning)**. The Broadcast Captioning Translate displays.
2. Select **New Profile**. The Create New Profile dialog box displays.
3. In the File name field, type a name for the new Profile and press **Enter (Open)**. The Dictionaries dialog box displays.

By default Profiles are stored by user in the Caption Files case located in the Captioning case within the System Files case. You can change the storage location of the Profiles.

4. Make necessary entries in each tab of the Profile Wizard, pressing **Enter (Next)** to move to the next one. Selecting Cancel at time during the Profile Wizard cancels any settings made and no Profile is created.

The Profile Wizard displays the following eight Profile tabs:

- [Dictionaries](#)—select dictionaries.
  - [Connections](#)—set connection information including encoder, direct connect or steno keys.
  - [Realtime](#)—select writer type and connection.
  - [Caption Styles](#)—determine default caption style, i.e. roll up, placement, etc.
  - [NIK Files](#)—create and modify Numeric Island Keys for quick caption placement changes or to send lines and Script files.
  - [Multiple Outputs](#)—send captioning data to multiple encoders.
  - [Contact Info](#)—store phone numbers and e-mail addresses.
  - [EZ Text](#)—create stock items such as a credit file, musical notes, applause line.
  - [Audit Log](#) - creates a log file that contains commands sent to the output/encoder including pass, block, clear, etc., commands.
5. When finished with EZ Text, the last tab, press **Enter (Finish)**. The Broadcast Captioning Translate dialog box displays.

## Basic Captioning Steps

Captioning in CATalyst BCS includes starting a captioning session, adding Script files and connecting to the encoder. Once you establish connection, you use captioning commands to control how text is sent to the encoder and define any untranslates that may occur during the session. When the captioning session ends, you disconnect from the encoder and perform necessary editing. The Basic Captioning Steps topics include instructions on how to complete these basic steps and then to save and export the file.

### Step 1: Opening a CATalyst BCS Session

1. Open Case CATalyst.
2. Connect your writing machine to the computer and turn it On.
3. Click the CATalyst BCS icon on the Function Bar, . The Broadcast Captioning Translate [dialog box](#) displays.
4. Make entries:

#### File

Select an existing file from the list in the Jobs window or type a new file name. All captioning files have an .sgcap extension.

#### Profile

Select an [profile](#) from the list. You must select a profile to begin a BCS session.

#### Options

Display the Caption Options dialog box to select [options](#) and [preferences](#) for the captioning session. Settings remain the same until you change them. Make changes if necessary.

5. Press **Enter (Start Session)** to begin the CATalyst BCS captioning session. The CATalyst BCS screen displays.
6. Write a stroke on your writing machine to verify connection to CATalyst BCS. If no steno displays on the screen, press **Alt + p, w (Setup/Connect Writer)**.

## Step 2: Adding Script Files

A [script](#) file is a previously prepared text file sent line by line to an encoder during a captioning session. A script file can contain one story or several stories separated by story titles (slugs).

### Add Script File for Captioning Session

1. In the Story Queue window. Click the plus "+" icon in the Story Queue window.  
By default, the Story Queue window displays on the right side of the CATalyst BCS screen. If the Story Queue window is not open, select **View/Show/Story Queue**.
2. The Import Caption Files dialog box displays.  
By default, CATalyst BCS opens the Caption Show Files folder. Use the Look in field to locate files in another folder.
3. Click a file to add to the Story Queue. To select multiple files, press and hold the Ctrl key and click on individual files; or to select multiple consecutive files, click on the first file, press and hold the Shift key and click on the last file to select.
4. Press **Enter (Open)**.
5. The stories display in the Story Queue. [Arrange](#) the stories as necessary.

## Step 3: Connecting to the Encoder

1. Press **Alt + p, m (Setup/Modem)**. The [Modem](#) dialog box displays.
2. Highlight the connection you want to dial and select **Dial**. A check mark displays next to the active connection.
3. Select **Done** to close the Modem dialog box.

## Step 4: Using Basic Captioning Commands

Use the following basic captioning commands to control how text is sent to the encoder. In addition to using the default keyboard commands listed, you can create a dictionary definition for most commands and execute them from your writing machine. Some captioning commands are also available from the Caption menu.

### Pass (F2)

The [Pass](#) mode allows upstream captions, such as captioned commercials to pass through to the encoder.

### Block (F3)

The [Block](#) mode prevents all upstream captions, such as commercials with captions, from passing through to the encoder. When you begin writing or start to send lines from a script file, you are automatically in Block mode.

### Suspend (F7)

The [Suspend](#) mode prevents all output from being sent to the encoder. This allows you to edit in the History window or write on your writing machine, such as creating a Power Define, without sending data to the encoder. To prevent text from being sent to the encoder while editing in the History window, you must be in Suspend mode.

#### **Clear (F5)**

The [Clear Video](#) feature sends a blank command to the encoder which removes the captions from the Caption Preview window and the output screen.

#### **Send a Line**

Send the next line of pre-scripted text to the encoder. Press **Ctrl + 1** to send one line; press **Ctrl + 2** to send two lines.

#### **Send a Line from Cursor**

Send the next line of pre-scripted text to the encoder from the location of the cursor. Press **Ctrl + Shift + c**.

### **Step 5: Defining Untranslates**

Untranslates are steno outlines that have not yet been defined in your dictionary. You can define a single untranslate, multiple stroke untranslates or partial translates, those steno strokes that display both text and steno on the screen.

A dictionary definition consists of steno outlines with text definitions that are contained in a file. When you define steno, all identical occurrences in the file are changed or "globalled". A global definition applies from the point of the cursor forward through the rest of the file. All global definitions are placed into the global table and where applicable, the associated dictionary.

Use the Scan (F8) key to quickly move to the next untranslate. Scan may also stop on other items in the History window depending on the settings in [Scan For Options](#).

#### **Define an Untranslate**

1. When defining untranslates while connected to the encoder, press F7 to switch to [Suspend](#) mode. The word Suspended flashes red in the Status window and a notification displays in the Caption Preview window.
2. Press **F8** to scan to the next untranslate. The cursor positions immediately before the untranslated steno outline. If the steno outline is more than one stroke, use a Mark command to highlight the strokes.
3. Do **one** of the following:

##### **Define a single steno outline**

There is no need to mark a single steno stroke. Continue with the next step.

##### **Define multiple steno outlines**

Use a mark command to highlight the steno strokes you want to define.

##### **Define partial translates**

To define steno outlines and translated text that precedes or follows the steno, use a mark command to highlight the steno outlines and the translated words.

4. Create a dictionary definition. Do **one** of the following:

**D-Define**

Press **Ctrl + d**. Use the [D-Define](#) command to globally define common steno-based words or phrases that you want to add to your Personal Dictionary. A steno-based word or phrase has associated steno. CATalyst BCS sends D-Defines to the Personal Dictionary, unless you selected to have entries go to the [Update Area](#).

**K-Define**

Press **Ctrl + k**. Use the [K-Define](#) command to globally define steno-based words or phrases that pertain specifically to this session or are not common steno-based words you want to add to your Personal Dictionary. The file must be in a case for the K-Define to be active.

**J-Define**

Press **Ctrl + j**. Use the [J-Define](#) command to globally define steno-based words or phrases that pertain specifically to this session or are not common steno-based words you want to add to your Personal Dictionary.

**Other Dictionary**

Press **Ctrl + Shift + o**. Use the [Other Dictionary](#) command to globally define steno-based words or phrases you want to place in an alternative dictionary. You select any existing dictionary or create a new job dictionary.

**E-Define**

Press **Ctrl + e**. Use the [E-Define](#) command to globally define misspelled words or phrases that you want to globally correct or global but not add to any dictionary.

5. In the Global Define dialog box, type the text for the definition in the New Text field. You can insert format symbols into the definition by pressing **Alt + f (FS)** and selecting from the list.
6. When finished defining press **Enter (OK)** to apply the definition.

**Step 6: Query Realtime**

Query Realtime Translations displays the dictionary name and definition indicating the source of the translated text along with all possible entries of the steno outline found in the dictionaries used to translate. This allows you to instantly access the dictionary entry for modification or deletion. The dictionary automatically refreshes following any changes.

You can query words during a captioning session or after translation while editing. When you use Query Realtime Translations after translation, CATalyst BCS uses the Job History file to determine which dictionaries were used for translation. If the Job History file is not available, no dictionaries are available for Query Realtime Translation after translation.

If the message "No translation available for STENO" displays, it could be a result of attempting to query on a word that was typed in and has no underlying steno. It could also result from no translation history in the Job History.

The Lookup dialog box for Query Realtime Translations lists the entries from all the dictionaries in which there is a translation for the selected steno outline, for any entry that begins with the same first stroke as the selected steno outline and for individual definitions if it is a multi-stroke entry. The dictionary name in which the translation originates, the steno and the text definition of the dictionary display first in the list. For example, you query the word "endorsement" which is written as follows:

/EPB/TKORS/PHEPBT

The Lookup dialog box displays:

Personal Dictionary	/EPB/TKORS/PHEPBT	endorsement
Personal Dictionary	/EPB/TKORS	endorse
Personal Dictionary	/EPB	even
Job Dictionary	/TKORS	Doris
Personal Dictionary	/PHEPBT	meant

## Query Translations

1. Do one of the following:
  - Place your cursor immediately before the words or highlight the words in the transcript.
  - Highlight the steno in the Vertical Notes pane.
2. Press **Ctrl + Shift + q (View/Dictionary Info/Query Realtime Translation)**. The Lookup dialog box displays with the steno outline for the selected words or steno in the Title Bar. The first entry in the list reflects the location of the translation.
3. The following information displays for each entry:

### Title Bar

Displays the steno outline for the selected word.

### Number

The priority in which the dictionary is used in translation.

### Dictionary

The dictionaries that contain the entry. Dictionaries display in priority order.

### Entry Text

The definition for the steno identified in the Title Bar.

4. Do any of the following as necessary:

### Modify

Highlight an entry and select **Modify**. The Modify Dictionary Entry dialog box displays. [Modify](#) the entry as necessary and press **Enter (OK)**. Press **Enter (OK)** in the Lookup dialog box to accept the changes. The dictionaries in use for translation automatically refresh.

### Global

Highlight an entry and select **Global** to global the definition for the current captioning session. CATalyst BCS applies the global and closes the Lookup dialog box.

### Delete

Highlight an entry and select **Delete** to remove the entry from the dictionary. A confirmation message displays by default. Check the option, *I understand the consequence of my actions. Please stop asking.* to bypass the confirmation message. Press **Enter (OK)** in the Lookup dialog box to accept the changes. The dictionaries in use for translation automatically refresh.

## Step 7: Disconnecting From the Encoder

When finished with a captioning session you can disconnect from the encoder and continue working in CATalyst BCS. You may want to disconnect from the encoder to edit the file in the History window or to [create](#) script files. Disconnecting from the encoder prevents any data from being sent to the encoder for captioning while you are working in the History window.

In the Session Information window, under Connection Options, select **Disconnect**.

Your writer remains connected. You can continue to use the writer, for example, to make dictionary definitions. To disconnect the writer, press **Ctrl + Shift + w** or **Alt + p, r** (**Setup/Disconnect Writer**).

## Step 8: Editing the File

After closing a captioning session you may want to edit the translated text in the History window. CATalyst BCS contains several features to help you make changes to the translated text. You can search for text, create dictionary definitions for untranslates, insert, replace and delete text, and make other necessary changes.

### Using Mark Commands

A Mark command highlights steno and text for the purpose of performing another command, such as defining, deleting and searching for steno and text. When text is marked, the associated steno displays with the text on the Status Bar. Use any of the following commands to Mark text.

- Shift + any basic cursor movement, such as left or right arrow
- Ctrl + [
- Click and hold left mouse button + move mouse
- Click + hold Shift + click at the end of the text
- Select Special Edit/Mark Start and Mark End

To unmark any selected text, press **Alt + s, k** (**Special Edit/Unmark**) or click the mouse once anywhere on the screen.

### Defining Untranslates

Use the Scan (F8) key to quickly move to the next untranslate; steno outlines not yet defined in your dictionary. You can [define](#) untranslates, placing the definition into a dictionary of your choice and apply the change throughout the file.

### Inserting Text

Type directly on the screen to insert text, format symbols and punctuation. When typing, the cursor pushes the text to the right as you type if you are in Insert (INS) mode. When you are in Overwrite (OVR)

mode, the text you type overwrites the existing text. The default cursor mode in Edit is Insert (INS). To change the Insert/Overwrite mode, press the Insert key.

## Replacing Text

Replace existing text for a single occurrence by typing directly on the screen or by using the Replace command. When using Replace and the Intuitive Replace is active, CATalyst BCS remembers all the replacements and suggests a word in the New Text field. Type new text or toggle through the 10 most recent replacements and select one.

To use the Replace command:

1. Position the cursor immediately before the word you want to replace. To replace more than one word, first Mark the text.
2. Press **Ctrl + r**. The Global-Replace dialog box displays.
3. In the New Text field, type the new text or press **Ctrl + r** to toggle through the last ten replacements and select one to use.
4. Press **Enter (OK)**.

## Search and Replace

Using [Search and Replace](#) (Alt + e, e) you can search forward and backward in the file to locate a word or words. You can search for a whole word, part of a word, or multiple words. Using a case sensitive filter or including format symbols with the text in the Search For field refines the search.

## Deleting Text

Delete text using any of the following:

- Position your cursor immediately after the character or word you want to delete. Press **Backspace** to delete one character at a time.
- Position your cursor immediately before the word you want to delete. Press **Ctrl + Delete** to delete the word. You can continue to delete successive words.
- Mark text and then press **Delete**. CATalyst BCS deletes only the highlighted text. If you mark a single word, CATalyst BCS deletes only the word and does not include any adjoining spaces.

## Defining Punctuation

To create a punctuation definition:

1. Position the cursor immediately before the steno outline you want to define. If the steno is more than one stroke, use a Mark command to highlight the steno strokes.
2. Press **Ctrl + d**. The Global D-Define dialog box displays.
3. In the New Text field, type the punctuation definition. Refer to the following examples as necessary:

### Period <New Line Paragraph>

To create a new paragraph following a question mark, type . (period) and then press **F4 I**.

### Question Mark <New Line Paragraph>

To create a new paragraph following a question mark, type ? (question mark) and then press **F4 I**.

### Speaker

<New Line Paragraph>>><Keep Case On>*Name*<Keep Case Off>:

### Comma

Type , (comma)

During translation, this definition gives you one space after a comma.

### Colon

Type : (colon) and then press the **Spacebar** once. During Translation, this definition gives you two spaces after a colon.

### Semi-Colon

Type ; (semicolon)

During translation, this definition gives you one space after a comma.

4. When finished defining press **Enter (OK)** to apply the definition.

## Step 9: Spell Check the File

Using [Spell Check](#) (Shift + F7) you can check the spelling of the text in the History window. Several Spell Check options allow you to customize Spell Check for your writing style. You can also select options to automatically check for errors such as punctuation, spacing, hyphenation, or repeated words.

## Step 10: Exporting to ASCII & RTF/CRE

CATalyst BCS allows you to export the current text in the History window in the following formats: ASCII, SCC, SMPTE-TT and RTF/CRE. There are two features available within CATalyst BCS to export text in ASCII, SCC and SMPTE-TT formats. You can create an simultaneous outputs for the current captioning session using the [Simultaneous ASCII Output](#), [Simultaneous SCC Output](#) and [Simultaneous SMPTE-TT](#) features or create a file after the session by using [Export to ASCII](#), [Export to SCC](#) and [Export to SMPTE-TT](#). You can select the name and destination for the exported file.

Use the [Export to RTF/CRE](#) function to export text to RTF/CRE format. You can also export steno notes or the related dictionary using the Export function.

## Step 11: Save and Close the Caption File

Save and close the caption file when you finish captioning and complete post captioning work such as editing the file or creating an ASCII.

### Save and Close the File

1. Do one of the following:
  - To save the file to the current file name press **Ctrl + s (File/Save)**.
  - To save the file to another filename press **Alt + f, a (File/Save As)**.
2. Press **Ctrl + F4 (File/Close)** to close the file and exit the captioning session. If you made any changes to the file after saving, CATalyst BCS prompts you to save the file.

## CARTView with scripting

You can use CATalyst BCS (when BCS is not enabled on your PKC) to output to CARTView with [scripting capabilities](#). For example, when providing CART for a lecture or church service, you get the lecture or sermon beforehand and then during the event, send one line at a time with a steno stroke or keyboard command.

When outputting to [CARTView](#), one CARTView window is created which you can drag to an external monitor, if you desire, and you can use the scripting capabilities. Simply right click on the CARTView to set margins, font style and size, color, transparency and hide the CARTView window. The CARTView settings are saved as part of the profile in the profile's job history file (\*.sgxml). A Case CATalyst

CARTView Settings Icon () is available in the Windows System Tray. When selected, the icon displays the CARTView screen settings such as font, transparency, color, etc. This system tray icon makes it very easy to control the CARTView settings when you do not have instant access to the CARTView window. For example, let's say you are in the back of a large convention room with CARTView displaying on a large screen in the front of the room when you realize you need to change the color or the size of the text to make it more readable. By clicking the Case CATalyst CARTView Settings icon you'll instantly have access to the CARTView settings. No need to go to the front of the room to make adjustments.

Along with providing CARTView presentations and sending script files, this version also gives you an opportunity to explore CATalyst BCS and learn more about captioning. You can set up profiles with different dictionaries for different types of jobs, different captioning styles for captioning the news versus captioning an online shopping site, create credit files and more. The Caption Preview window displays how the captions would look on an encoder.

There is no broadcast capability when BCS is not enabled on your PKC without a full upgrade to CATalyst BCS. No broadcast or transmitting capability means you cannot send to StenoKeys, internet, modem, COM ports, etc. You also cannot create simultaneous or regular ASCII, SCC or SMPTE-TT files. The menu items are grayed out and if you have a keyboard map command to invoke any of those commands, a message displays.

To get started, you need to create a [Profile](#) (series of options and dictionaries), select your writer and start a session. The following instructions are specific to outputting to CARTView and sending a script in this limited BCS version.

To clear the CARTView window, write a steno outline defined as <Caption: Clear>. The <Caption: Clear> command clears the CARTView window and the Caption Preview window. To display musical notes in the CARTView window, define a steno outline as the <Caption:Musical Note> format symbol.

### Output to CARTView and scripting using BCS instructions:

1. Click the  icon on the Function Bar or press **Alt + u, b** (Functions, Broadcast Captioning Suite).
2. In the Broadcast Captioning Translate dialog box, press **Alt + o** (Options).
3. Do the following and then click **OK** when finished:
  - a. Click the Realtime tab and confirm your writing machine is selected in the Realtime field. If not, click the drop-down list to select your writing machine.
  - b. Click the Options tab to select or deselect specific translation options.
4. At the Broadcast Captioning Translate dialog box, press **Alt + n** (New Profile) to create a settings file to output to CARTView. In the File Name field, type a name for this profile. For example, CARTView Lectures or CARTView Church.  
A Profile is a settings file that contains information as to what dictionaries will be used, how the

text is being output, EZ Speakers (if appropriate) and more. You can have multiple profiles for different types of jobs that use different dictionaries, create the profile once and they are available when you need them. For example, if you provide CART for several different lecture subjects, you may have a different profile for each subject so the appropriate dictionaries are a part of the profile and you select the profile and go.

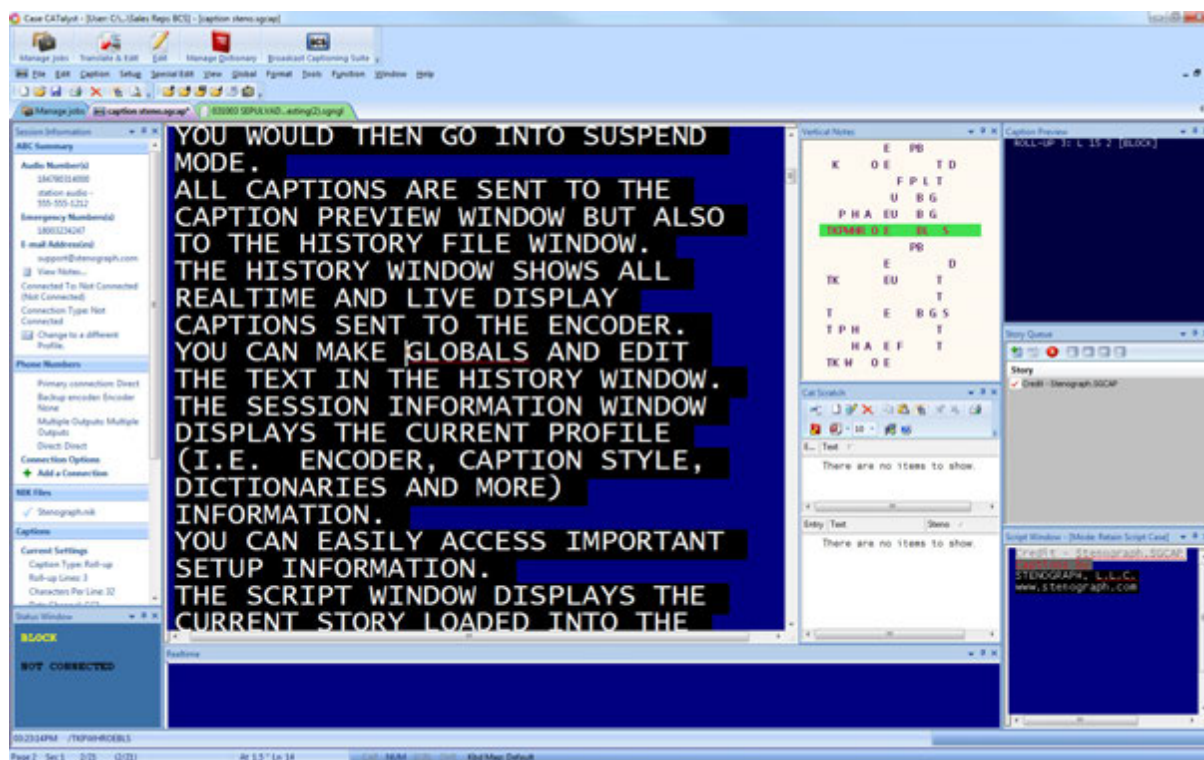

5. The Profile dialog box displays the Dictionaries tab. Select any Case and/or Job dictionaries you want to use to translate. For example, if you creating a profile for the math classes you provide CART for and you have a specific math dictionary or dictionaries, you would select those dictionaries as a part of this profile. Your Personal Dictionary and Update Area (if used) are automatically selected. When finished selecting, click **Next**.
6. The Connection tab displays. Click the **new** () icon or press Ctrl + n, type a name for your connection and press **Enter**. The name can be used to describe the connection type, such as CARTView. On the right side of the dialog box in the Encoder Model field, select CARTView and click **Next**.
7. The Caption Styles tab displays. At the top left, the Capitalize All Text option is selected by default. If you want your CARTView text (including scripted text) to display in mixed cased, deselect this option. Creating a caption style doesn't really apply to CARTView output, because your number of lines and line width are controlled by the CARTView window settings. Click **Next** through the remaining tabs and then click **Finish**. Your profile is created and you are ready to output to CARTView.  
If you want to set up EZ Text and/or EZ Speakers to use while providing CART, you can certainly do that but filling in those tabs are not necessary.
8. Connect your writing machine and write a steno stroke.
9. At the Broadcast Captioning Translate dialog box, type a file name in the File field, select your profile and click **Start Session**.
10. The Session Information pane displays on the left side of the screen. Immediately below the Phone section, click your connection name. For example, if in Step 6 you named your connection CARTView, you will see it displayed there. Click the name to establish the connection and begin writing.  
*If you do not see text in the Realtime window, click Setup, Connect Writer. Continue writing and the CARTView window will display in a few seconds.*
11. To adjust the font style and/or size, margins, color, etc, right click the CARTView window and select the options you want to change.
12. In the Story Queue pane, click the **Add a story** () icon and select the file you want to send as a script.  
A script file can be a .sgnpl, .sgcap or .txt file. You can create it or import a file. If you want to force text to a new line, type a period and <New Line Paragraph> format symbol.  
To clear the text from the CARTView window, write the steno defined as <Caption: Clear>.
13. To send lines of text from the story, click the story and then press **Ctrl + 1** to send one line at a time or **Ctrl + 2** to send two lines at a time. These are the default commands and can be changed in the default CART/captioning keyboard map or another keyboard map used for CART/captioning.

For more information, refer to the BCS section of Help. Transmitting/broadcasting is not available in this limited version of BCS.

## CATalyst BCS Work Area Navigation

The CATalyst BCS screen contains several caption windows that provide information about the captioning session and panes such as Vertical Notes, Brief It, etc. The History window always displays and cannot be deselected to show. All other windows, you can customize windows and/or panes display, where they display and if they are docked or set to auto hide. You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to move) of

the pane, your cursor will change to a horizontal double arrow (  ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen.

To show or hide the following windows, select View, Show ... Session Information, Story Queue, Caption Preview Window, Status, Script Window, Realtime, AutoFeed and Multiple Outputs Window.

### Session Information

The CATalyst BCS default displays the Session Information window as a \*tab\* on the left. The Session Information window allows you to easily access audio numbers, emergency numbers, encoder phone numbers to establish a connection, disconnect, add a new telephone number, identify NIK files and view translate options.

### Story Queue

Displays each story for the currently selected script files. You can send stories line-by-line via steno or computer keyboard or NIK files. Stories are loaded in the order they display. The current story displays in yellow lettering and the next story displays with a yellow background. You can change the order by clicking and dragging a story to a specific location or highlight a story and using the Up and Down arrows.

You can import CAPtivor™ stories, ASCII files, Case CATalyst<sup>4</sup> text files and BCS files. Story titles or "story slugs" separate the individual stories and are not sent to the encoder or History file.

**Caption Preview**

Simulates how your captions display on the video screen or television. This window also displays caption style, position and mode.

**Status Window**

Displays the modem connection status such as dialing or connecting. It also displays encoder status; Block, Pass or Suspended.

**Script Window**

Displays the entire story with the next caption line to be sent in a highlighted color. You can send script lines from the writer or computer keyboard.

**Realtime**

Displays steno outlines, translated text, and script lines before they are sent to the encoder. This allows you to view the text and make necessary corrections.

**AutoFeed**

Allows script lines to automatically be sent to the encoder based on the number of words per minute. A script can be fed line by line until the entire file is sent or you can set AutoFeed to automatically start at the beginning (loop) when it reaches the end. You may want to use the AutoFeed feature as a method to send script in a live display or for testing purposes.

**Multiple Outputs Window**

Allows you to monitor connections when sending captioning data to multiple encoders.

**History Window**

Displays all the text sent to the encoder. Both realtime and script file text appears in the History window. In the History window, you can edit, create script files for future broadcasts and export the text to ASCII or RTF/CRE. CATalyst BCS saves the History file with the .sgcap extension. The History window cannot not be hidden or set to auto hide.

To show or hide the following panes, select View, Panes...

**Vertical Notes**

Vertical notes synchronize with the realtime text. You can make dictionary definitions directly from the vertical notes. By default, the Vertical Notes window displays as a tab on the right side of the screen.

**Speaker List**

Speaker List contains designated speakers from the EZ Speakers Profile tab created using the Create EZ Speakers feature and typed speaker names in the Speaker List. The Speaker List pane allows you to insert speaker names or other fields directly into the History or Script window.

**Brief It**

Brief It is a Caption translation option that suggests conflict free brief forms for words and phrases that you write during captioning. When you write three or more steno strokes, CATalyst BCS generates a brief form or reminds you of an existing brief form and displays it in the Brief It dialog pane.

**Cat Scratch**

Allows you to add notes or reminders (virtual scratch pad) that you want to be available during the captioning session and also available in the caption edit file later. You can also send suggested briefs and Power Defines (steno & text) to the Cat Scratch.

### Search Results

Builds a list of occurrences along with context of the searched item. You can double click and entry and move instantly to that location in the History/caption edit file.

## Position Caption Windows and Panes

Captioning windows, such as the Script Window and Story Queue, and select CATalyst BCS features, such as Vertical Notes and Brief It are accessible from a small self contained resizable dialog pane. Dialog panes, when selected to show, display in a default fixed position on the CATalyst BCS screen. A fixed position is indicated by the vertical push pin  on the Title bar of the pane. You can easily click and drag the pane to a new vertical or horizontal position, change it to a "floating" pane or store the pane as an auto hide tab along the edge of the screen. The panes retain their new location until repositioned.

To display a closed dialog pane, press **Alt + v, e (View/Panes)** and then select a pane from the submenu. A check mark shows next to the feature to indicate it is displayed. To close a pane, click the X in the title bar or deselect it from the submenu. You can also quickly hide or display a dialog pane by right clicking on the title bar of any pane, selecting **Show** and then choosing the desired one.

*Dialog Pane in Default Fixed Position*

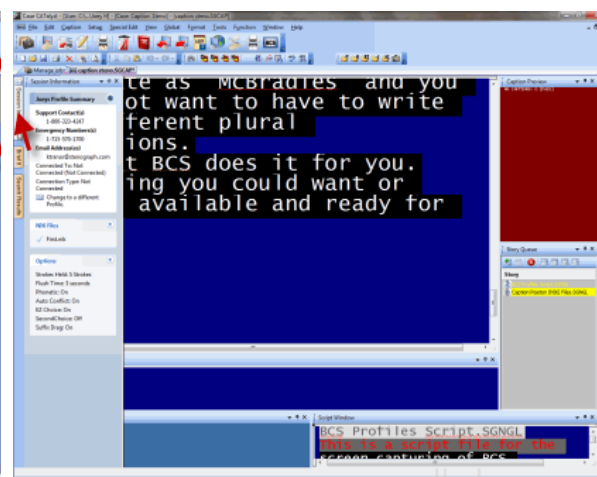

*Vertical Push Pin Shows Fixed Position*

## Auto Hide Panes

Panes in auto hide mode quickly display when you hover your cursor on the auto hide tab. To auto hide a pane, click the push pin  on the title bar, changing it to a horizontal position . The horizontal position indicates the pane is in auto hide mode. Move the cursor off the pane to hide it as a tab along the edge of the CATalyst BCS screen. Hover the cursor over or click the tab to temporarily display the pane. To return the pane to the fixed position on the screen, click the push pin from a horizontal to vertical position.

*Dialog Panes in Auto Hide Mode*

*Auto Display Session Information Pane*

## Reposition Panes

A fixed or "docked" pane and a floating pane can be repositioned. You cannot reposition a pane that is in AutoHide mode. The Title bar of a dialog pane with a vertical push pin  indicates the pane is in a "docked position. To return a dialog pane from AutoHide to a docked position, hover the cursor on the auto hide tab. When the pane displays, double click the Title bar of the pane or click the push pin to a vertical position.

To move a dialog pane, click the Title bar and hold the mouse button. As you move the pane, placement icons display on the screen. Single arrow icons display on each side of the screen and a multi-arrow icon displays in the center of the screen. These placement icons provide positioning options. Hover the cursor over an icon to view the new placement position. Release the mouse button to position the dialog pane in the new location.

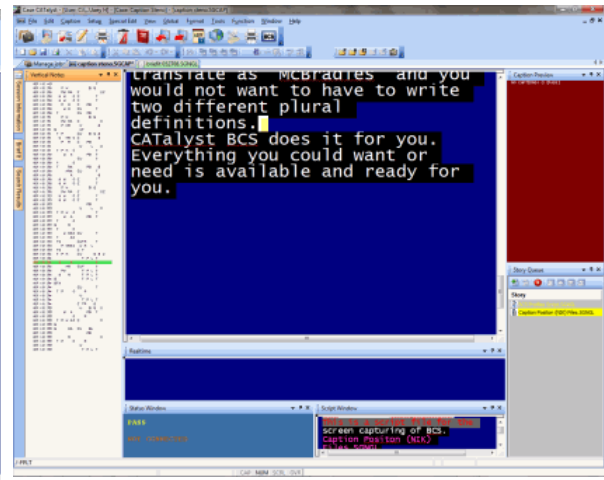

*Placement Icons*

## Position On Screen Edge

Use the single arrow icon to position a pane along an edge of the CATalyst BCS screen. Click the Title bar of a dialog pane and hold the mouse button as you move the pane. Place the tip of your cursor on the single arrow icon for the desired screen location. A transparent blue box displays, indicating the placement position. Release the mouse button.

*Moving Speaker List Pane To Left Edge*

*Speaker List Pane On Left Edge*

When another pane or panes already display along the edge of the CATalyst BCS screen, the moved dialog pane positions along the outermost edge of the screen.

*Moving Realtime Window To Bottom Edge*

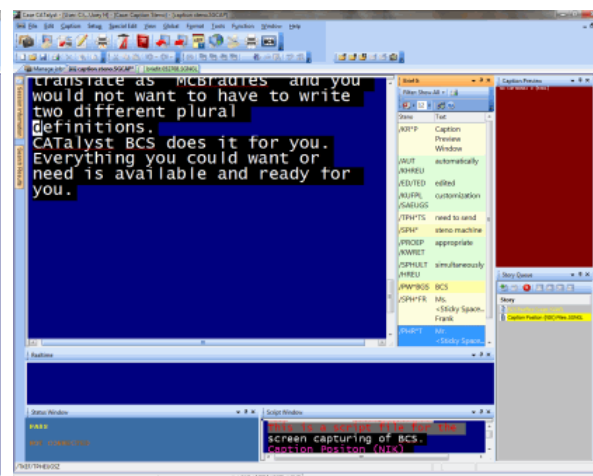

*Realtime Window On Bottom Edge*

## Position Next to Another Fixed Pane

Use the multi-arrow icon to position a dialog pane next to an existing fixed pane. Click the Title bar of a dialog pane and hold the mouse button. Place the tip of your cursor on one of the arrows in the multi-arrow icon. A transparent blue box displays, indicating the placement location. Release the mouse button. The moved dialog pane displays next to the existing fixed pane.

*Moving Brief It Pane*

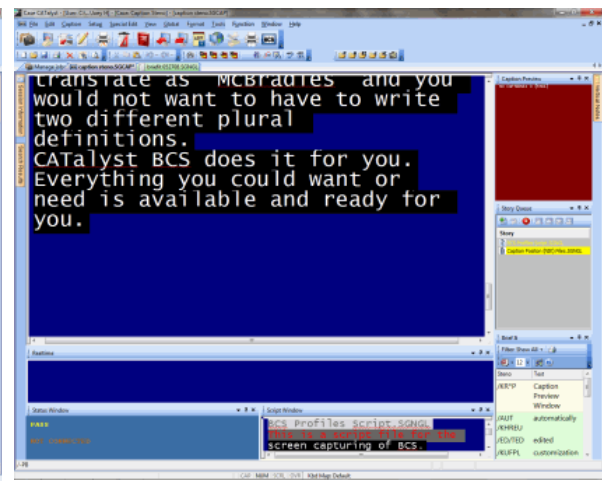

*Brief It Pane in New Position*

## Position to Share a Location

Use the multi-arrow icon position fixed dialog panes next to each other within the same location. Click the Title bar of a dialog pane and hold the mouse button as you move the pane to the desired fixed pane location. The multi-arrow icon displays in the center of the stationary pane. Place the tip of your cursor on one of the arrows. A transparent blue box displays, indicating the placement location. Release the mouse button. The moved dialog pane displays in the shared space.

Moving Brief It Pane Below Story Queue

Brief It Pane Below Story Queue

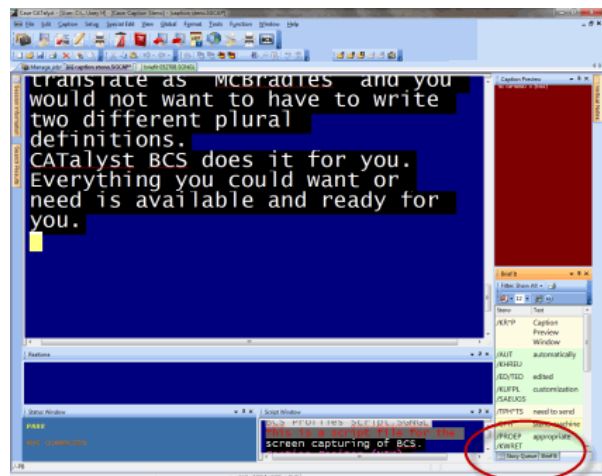

## Position to Share a Location Using Tabs

Use the multi-arrow icon to position a dialog pane in the same location of another fixed pane and add tabs. The tabs allow you to toggle the display of panes. Click the Title bar of a dialog pane and hold the mouse button as you move the pane to the desired fixed pane location. The multi-arrow icon displays in the center of the fixed pane. Place the tip of your cursor on the center of the multi-arrow icon. A transparent blue box displays, indicating the placement location. Release the mouse button. Tabs are added for each pane in that location. If tabs for multiple panes already exist, a tab is added for the moved pane.

To separate an individual pane from a shared position, double click the dialog pane tab. The selected dialog pane displays on the screen where you can move it to a new location or close it. To separate all the tabbed dialog panes, double click the title bar of the open pane.

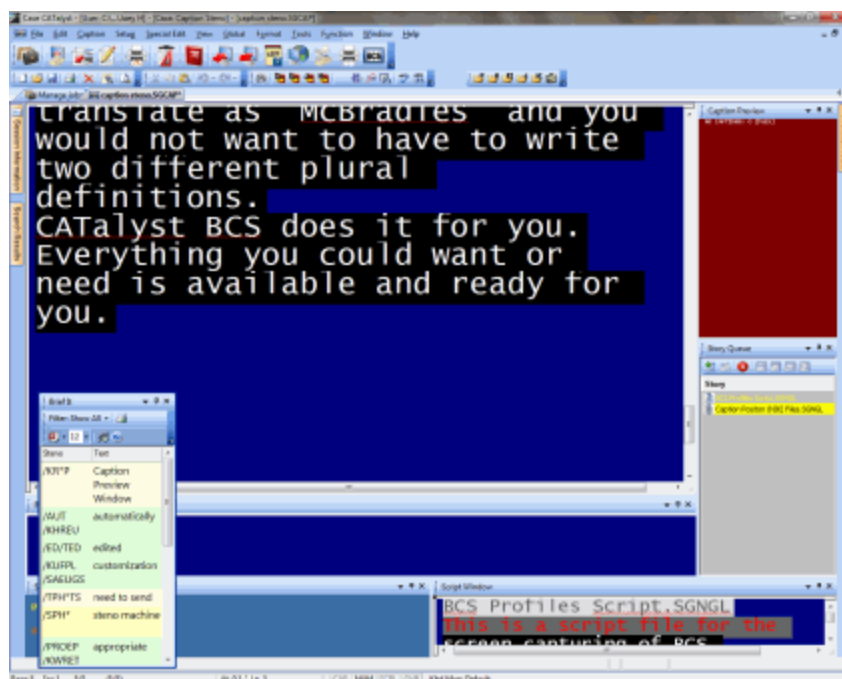

Moving Brief It Pane to Story Queue Window

Brief It Pane and Story Queue Window Tabbed

## Float Dialog Panes

You can place a floating pane anywhere on the CATalyst BCS screen. It is not anchored to a location. Double click the Title bar when the pane is floating, to place it in a fixed position.

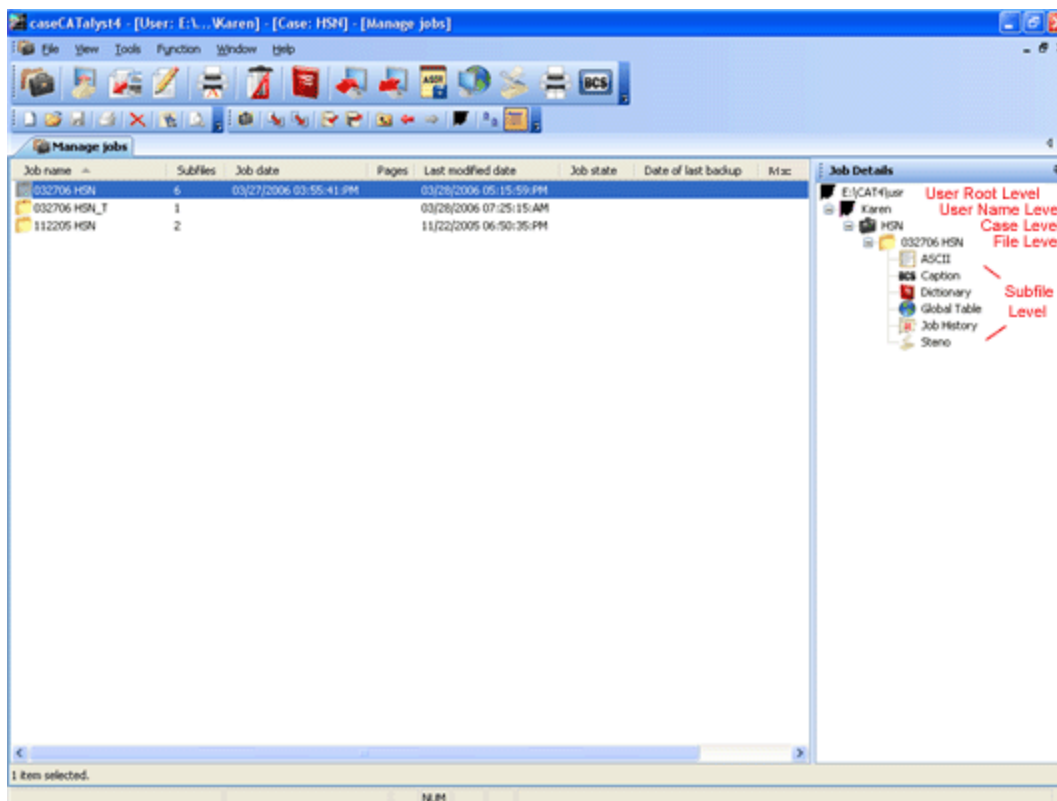

*Floating Dialog Pane*

## CATalyst BCS File Structure

CATalyst BCS uses a five-level file structure to store information:

1. User Root Level
2. User Name Level
3. Case (optional)
4. File Level
5. Subfile Level

CATalyst BCS File Structure

### User Root Level

User Root Level is the first level of information storage. The User Root contains user names and is necessary for the CATalyst BCS software to run. You cannot start CATalyst BCS without a User Root level.

### User Name Level

The User Name Level is the second level of information storage. The user name identifies all files belonging to a given user. Each user name has an associated user folder where all files for that user are stored. When you sign on with your user name, CATalyst BCS automatically goes to your user folder and displays your files. If two users create different files with the same file name, the system distinguishes the file by the user folder in which it resides. The Title Bar at the top of the screen displays the current user folder.

You can customize the user icon through User Settings in Manage Jobs.

### Case Level

Case Level is the third level of information storage. A case is a sub-folder of your user name. The use of cases is optional. You can create cases within cases. For example, the Captioning case is located within the System Files case. You may want to create a case named "Dictionaries" to store your captioning dictionaries for easy retrieval.

Certain cases are created and used by CATalyst BCS. These cases are necessary for CATalyst BCS to run properly:

### System Files Case

The System Files case contains required files for CATalyst BCS, such as user settings, dialog settings, Personal Dictionary, Keyboard Maps, Captioning case, Layouts case, Index Templates case, etc.

It is a good practice to [back up](#) your System Files and any other important cases on a regular basis in addition to using [Cloud Backup](#). Simply select Backup and put a check mark before the System Files case and before any other cases you want to back up and all files in the cases will be backed up. Some users created a case for Include files which is an important case to back up. Some users store their Includes case inside the System Files case and some store it outside the System Files case.

### AutoArchive Case

The AutoArchive case is located at the root of the user's folder and may contain multiple copies of files when the [Auto Recover](#) feature is used along with the Keep Auto Recover files in Archive option and if the [Auto Save](#) feature is used along with the Archive File on Close option. When viewing the contents of the AutoArchive case, the background displays a faded outline of a "red cross" displays to make it clearer that you are in the the AutoArchive case.

### Captioning Case

The Captioning case contains required files for captioning, such as the Caption Profiles case containing Profiles, Saved Windows Position case, NIK files, EZ Text files, etc.

### Other CATalyst BCS Cases

Examples of other cases include Saved ASCII Settings, Dictionary Builder, Macros and more.

### File Level

File Level is the fourth level of information storage. A file usually represents a single job. One deposition or hearing equals one file name. You create a new file by entering a unique name in the file name field of the dialog box.

### Subfile Level

Subfile Level is the fifth level of information storage. A subfile is a sub-unit of the file. CATalyst BCS subfiles include:

.txt ASCII

.wav Audio

	.sgsav	Auto Recover
	.sgcap	BCS Caption File
	.sgodp	BCS Caption Profile
	.ZIP	Compressed Backup File
	.sgcdb	Conflict Database
	.sgdct	Dictionary - Personal, Case or Job
	.sgezt	EZ Text Table
	.sgglb	Global Table
	.sgpgb	Global Table - Personal
	.ini	History - Case or Job
	.sgkbd	Keyboard Map
	.sgmac	Macro
	.nik	Numeric Island Keys (NIK)
	.pdf	PDF
	.sgphn	Phonetic Table
	.rtf	RTF (Rich Text Format)
	.ini	Settings
	.sgstn	Steno Notes
	.sgsys	Steno Shortcut Table
	.sgxry	Support file for élan Mira A3 and Stentura Fusion. This information can be viewed by opening a file, opening vertical notes and double clicking a specific steno outline.
	.sgxr2	Support file for Luminex and Diamante. This information can be viewed by opening a file, opening vertical notes and double clicking a specific steno outline.

.sgngl      Text File

Unknown file types not recognized by CATalyst BCS

.sgufd      User Definitions Table

.tlx          Wordlist - Personal, Case or Job

A typical file can contain several subfiles. When you perform a specific function, CATalyst BCS automatically creates a subfile. For example, when you start a captioning session, CATalyst BCS creates two subfiles: a caption (.sgcap) and Job History (.sgxml) subfile.

When viewing files in Detailed List View, you can select to show or hide subfiles on the screen. From the Options menu, select **View/Show/Subfiles**. When a check mark displays next to the Show Subfiles options, each subfile displays on the screen. For example, the CATalyst BCS session, 022505Q displays the subfiles: 022505Q.sgcap, 022505Q.sgxml, 022505Q.sgstn, 022505Q.sggbl, 022505Q.txt. No check mark indicates the job name with subfiles displays in the split window. For example, the CATalyst BCS session, 022505Q displays as 022505Q.

## Managing Job Files

The Manage Jobs function displays all the job files in the current user name. A job usually corresponds to a single captioning session. On the Manage Job screen, a job is represented as a single folder in Icon View or a text name in Detailed List View. You can put several jobs into a case.

Each job contains subfiles which are other files related to the job such as a job dictionary or the steno notes. Right clicking on subfiles displays a menu from which you can choose to perform additional actions for the subfile. To view a list of all subfiles, see the [CATalyst BCS File Structure](#) topic.

Most of your file maintenance is done through Manage Jobs. Use Manage Jobs to:

- View the contents of your user folder in the form of icons or a text list with details.
- [Copy](#), [Move](#), [Rename](#), [Backup](#), [Restore](#) and [Delete](#) jobs or files
- [Add](#), [delete](#) and [change](#) users.
- [E-mail](#) job files.
- View [Job History](#) information.
- Find [recently saved files](#).
- [AutoArchive](#) case.

## Captioning Preparation

The Case Prep feature is available from the Manage Jobs' Tools menu. Case Prep makes it easy to prepare for your next captioning session. It might be an ongoing show that you need to fill in for or a show that you haven't captioned on in a while. Case Prep makes it easy and quick to find words that are not defined or are defined in your dictionaries by comparing previous caption, ASCII and PDF files to your dictionaries. Instead of being surprised during the caption session of names and terminology, let Case Prep identify words and phrases for you from previous files. The Case Prep feature allows you to select one or more caption files (.sgcap, .sgnpl), ASCII files (.txt), .ecl (Eclipse native files) or PDF files to compare against one or more dictionaries. (Depending on the type of work you caption, Case Prep also works with PTX (e-Transcript compatible and/or XMEF (TextMap compatible) files.

Case Prep can create a list of words that are in the selected files but not in the comparing dictionaries, a list of phrases that you might want to brief or both words and phrases and Personal Briefs and/or Reminder/Used briefs that may have been in the selected files. You can also specify how many times a word or phrase must appear in the files before displaying in either list along with how you want the list sorted, frequency, defined and undefined words or by phrases.

You can select to create a [Dictionary Builder](#) file and/or a Heads-Up List. The last selected options, not selected files or dictionaries, are remembered the next time you select Case Prep. The selected files, dictionary and options information used to create the Heads-Up List is written to the Notes tab of the Heads-Up List's [Job History](#) subfile. To view the information, in Manage Jobs right click the Case Prep file name and select History or double click the Job History subfile associated with the Case Prep file, then click the Notes tab.

Phrases are generated from selected files which may or may not have underlying steno. CATalyst will find most of the phrases although line numbers and page breaks may interfere in finding all phrases. The following guidelines are used:

- Case Prep uses Brief It's Max Words Per Brief setting to determine the maximum number of words in a phrase.
- Hyphenated words count as one word in a phrase.
- Phrases that are not defined in a dictionary are checked against the [caseprepexcludelist.txt](#) and [CommonWords.txt](#) files. If all of the words in the phrase are in either list, the phrase does not display in the Heads-Up List.

### Dictionary Builder List:

The Dictionary Builder List displays words that are not found in the selected dictionaries. Phrases may also display depending your Case Prep options. The list displays occurrence headings for words and phrases based on the number of times the word or phrase appeared in the selected files. For example, if words or phrases appear more than 50 times in the selected files, the words and phrases will be listed under the //Occurred more than 50 times heading. If words or phrases only appeared 6 times in the selected files, the words or phrases will be listed under the //Occurred between 5-9 times heading.

You can quickly review the list and select the Start Dictionary Builder option, select a dictionary to use Dictionary Builder to create dictionary definitions for the words. When the Start Dictionary Builder option is selected, clicking OK will open the selected dictionary and start the [Dictionary Builder](#) feature. If you simply click OK without selecting the Start Dictionary Builder option, the list is automatically saved to the Dictionary Builder case in your System files case. The list is automatically named Case Prep followed by the date and time. For example, Case Prep 2015-01-22 07.46.

If you selected to create a Heads-Up List along with the Dictionary Builder List, the Heads-Up List will automatically open and display in Edit and the Dictionary Builder dialog box displays in the forefront. For step by step instructions, see [Dictionary Builder List](#).

## Heads-Up List

You can also use the Case Prep feature to create a Heads-Up List. The Heads-Up List displays defined and undefined words and/or phrases based on the selected caption/ASCII files selected compared to the dictionaries selected and the options you selected in the Case Prep Options. You can create a Heads-Up List along with a Dictionary Builder List or create either of the lists individually. When creating a Heads-Up List, a .sgnpl file automatically opens in a three column newspaper display. For step by step instructions, see [Heads-Up List](#).

When selecting to create a Heads-Up List and selecting to analyze .sgnpl/.sgcap files, Case Prep can also include previously suggested Personal Briefs and/or Reminders and Used Briefs in the Heads-Up list. If you select to include Personal Briefs and/or Reminders/Used briefs in the Heads-Up List, they are reported in their own section of the list with designations for the type of briefs. Let's say that you are called on a job that you had previously reported. You can now show personal briefs that were suggested in the previous transcript along with reminders and briefs you used during that job, so you are familiar with briefs from the previous jobs.

If the Case Prep icon is not displaying on a toolbar, it can be added to any toolbar by right clicking on a toolbar and selecting Customize. In the [Customize dialog box](#), click the Commands tab, locate the Case Prep menu item and drag the Case Prep icon to the desired toolbar.

### To use Case Prep, do the following:

1. In Manage Jobs, select Tools and then Case Prep.
2. At the Select transcript/ASCII files to Compare dialog box, press **Alt + a** (Add...) to select the caption/ASCII files you want to compare to selected dictionaries. If you were in a case when you selected Case Prep, the Open dialog box defaults to the case. Use Windows selection commands to select as many caption/ASCII files you want.  
If you selected a file or files you didn't want, highlight the file in the list and press **Alt + r** (Remove...) to remove the file(s) from the list. Press **Alt + n** (Next) to continue.
3. At the Dictionary selection dialog box, press **Alt + a** (Add files...) to select the dictionaries you want to use to compare with the selected files. Select the dictionaries in the order you would use to translate or after selecting the dictionaries, reorder them in the priority you want. To change the order of dictionary priority, highlight a dictionary and use the up/down arrows in the upper right hand corner to move the dictionary to a higher or lower priority. **Your Personal Dictionary (and Update Area if used) are automatically selected and, by default, will be the lowest priority (just like when you translate).**  
If you selected a dictionary or dictionaries you didn't want, highlight the dictionary in the list and press **Alt + r** (Remove File) to remove the dictionary from the list. Press **Alt + n** (Next) to continue.
4. At the Options dialog box, do the following:
  - a. In the List section, select **one** of the following:
    - i. To build a list of words found in the selected caption/ASCII files that are not found in the dictionaries, select the Words not found in dictionaries option.
    - ii. To build a list of phrases found in the selected caption/ASCII files that you might want to brief, select the Phrases you might want to brief option.
    - iii. To build a list of words found in the selected caption/ASCII files that are not found in the dictionaries and phrases that you might want to brief, select the Both option.
  - b. In the Create List section, do the following:
    - i. Select Create Dictionary Builder List for a list of undefined words/phrases in the selected files.

- ii. Select [Create Heads-up List](#) for a list of undefined/defined words/phrases in the selected files.
  - c. In the Sort list(s) by section, select one of the following:
    - i. To display the list of words or phrases based on the how often they occurred in the caption/ASCII files, select Frequency. The most frequently occurring words or phrases will be listed first.
    - ii. To display the list of words first and then phrases, select the Words then phrases option.
    - iii. To display the list of phrases first and then words, select the Phrases then words option.
  - d. In the Report words or phrases that occur at least X times field, type the number of times a word or phrase must appear in the caption/ASCII file before it shows on the list. The default setting is 3. Valid numbers are 2 – 99.
5. Press **Alt + n** (Next) to continue.
6. At the Transcript/ASCII files and Dictionary Confirmation dialog box, review the selected caption/ASCII files, selected dictionaries and options you selected. To change anything, click the Change button next to the item you want to change. To build the list, click Finish.
7. The Case Prep dialog box displays with the progress. When finished, the list displays based on the options you selected. If, in the list you see two forward slashes followed by words, it means the following words couldn't be written using the selected dictionaries because the steno for the word(s) conflict with higher priority steno outlines found in another selected dictionary. Do any of the following:
  - a. To remove a word or phrase, highlight the word or phrase and press **Alt + r** (Remove).
  - b. To change the case of a word or phrase, highlight the word or phrase and press **Alt + c** (Cap) to cycle through the capping options.
  - c. To reverse any of the changes you made (removing a word or phrase or capping), press **Alt + u** (Undo All) to undo all the changes. **The list of words and/or phrases is saved. You now have two choices. You may either click OK or use the saved list at a later time OR you may open/create a dictionary and start [Dictionary Builder](#).**
  - d. To open/create a dictionary and start Dictionary Builder to define the words in the list, select the Start Dictionary Builder option.
    - i. In the Using field, the Case or Personal Dictionary is selected by default. If you are in a Case when starting Case Prep, the Case Dictionary will be selected by default. If you are in the root of your user when starting Case Prep, your Personal Dictionary will be selected by default. To change the dictionary, click the down arrow. The following options display:
      1. Case and/or Personal Dictionary.
      2. All dictionaries selected for the comparison.
      4. Other. If you want to select a different dictionary or create a new dictionary, click the **Browse** button. In the Select Dictionary dialog box, select a dictionary or type a new dictionary name and click Save.
- e. Click **OK** to continue.
8. One of the following occurs:
  - a. If you just clicked **OK**, the Case Prep feature closes and a dialog box displays the name of the list created and that it is available in the Dictionary Builder folder located in your System Files case.

- b. If you selected to start the Dictionary Builder option, the selected dictionary opens with the Dictionary Builder feature active. Make sure the writer option is correct, your steno machine is turned on and write a stroke to establish a connection and then click **OK** to begin.

## Caption Dictionary Builder List

Use the [Case Prep](#) feature to create a Dictionary Builder List. Using Case Prep to create a Dictionary Builder List allows you to quickly and easily prepare for your next captioning session. Using Case Prep you can compare words defined and not defined in previous caption sessions to create a list in which you can easily use the [Dictionary Builder](#) feature to create dictionary entries. Instead of being surprised during the captioning session of names and terminology, let Case Prep identify words and phrases for you from previous caption or ASCII files and have your dictionary prepared. The Dictionary Builder List displays words found in selected caption/ASCII files that are not found in the selected dictionaries. Phrases may also display depending on your Case Prep options. The Dictionary Builder List uses the [CommonWords.txt](#) file when creating the list. The list displays occurrence headings for words and phrases based on the number of times the word or phrase appeared in the selected files. For example, if words or phrases appear more than 50 times in the selected files, the words and phrases will be listed under the //Occurred more than 50 times heading. If words or phrases only appeared 6 times in the selected files, the words or phrases will be listed under the //Occurred between 5-9 times heading.

You can quickly review the list and select the Start Dictionary Builder option, select a dictionary to use Dictionary Builder to create dictionary definitions for the words. When the Start Dictionary Builder option is selected, clicking OK will open the selected dictionary and start the Dictionary Builder feature. If you simply click OK without selecting the Start Dictionary Builder option, the list is automatically saved to the Dictionary Builder case in your System files case. The list is automatically named Case Prep followed by the date and time. For example, Case Prep 2015-01-22 07.46.

If you selected to create a Heads-Up List along with the Dictionary Builder List, the Heads-Up List will automatically open and display in Edit and the Dictionary Builder dialog box displays in the forefront.

Dictionary Builder List guidelines:

- Number/word combinations (for example, ES6 or Com2Us) are included in the Case Prep list. However, numbers followed by 's' (i.e. 60s, 80s, etc.), money, time and ordinals are excluded from the list.
- If untranslated steno outlines are found in the selected files, Case Prep will include the slash before the steno outline (for example, /STPHAO). Please note that when Case Prep is not able to distinguish between steno outlines and text, there may be times when a slash will not display before a potential steno outline. ,
- If there are conflicts in the selected caption files, Case Prep will process single words in a conflict as individual words when comparing them to the dictionaries.
- If words appear in the selected files in different cases (upper case, initial capped and lower case), Case Prep will show all cases of the word as long as no form of that word is found in the dictionary or in the [CommonWords.txt](#) file. The CommonWords.txt file is located in the System Files case and is also used with the [Brief It](#) feature.
- Hyphenated words are handled as follows when the Words found/not found in dictionaries option is selected:
  - All selected dictionaries are searched to see if the hyphenated word is defined, if it is, the hyphenated word will not appear in the Dictionary Builder List.
  - If both of the individual words are defined in the selected dictionaries, neither word displays in the Dictionary Builder List.

- If only one of the hyphenated words is defined in the dictionary and at least one of the words is not in the CommonWords.txt file, the hyphenated words display in the Dictionary Builder List.
- If neither word is defined in the selected dictionaries, and at least one of the words is not in the CommonWords.txt file, the hyphenated words display in the Dictionary Builder List.

**To use create a Dictionary Builder List:**

1. In Manage Jobs, select Tools and then Case Prep.
2. At the Select transcript/ASCII files to Compare dialog box, press **Alt + a** (Add...) to select the caption/ASCII files you want to compare to selected dictionaries. If you were in a case when you selected Case Prep, the Open dialog box defaults to the case. Use Windows selection commands to select as many caption/ASCII files you want.  
If you selected a file or files you didn't want, highlight the file in the list and press **Alt + r** (Remove...) to remove the file(s) from the list. Press **Alt + n** (Next) to continue.
3. At the Dictionary selection dialog box, press **Alt + a** (Add files...) to select the dictionaries you want to use to compare with the selected files. Select the dictionaries in the order you would use to translate or after selecting the dictionaries, reorder them in the priority you want. To change the order of dictionary priority, highlight a dictionary and use the up/down arrows in the upper right hand corner to move the dictionary to a higher or lower priority. **Your Personal Dictionary (and Update Area if used) are automatically selected and, by default, will be the lowest priority (just like when you translate).**  
If you selected a dictionary or dictionaries you didn't want, highlight the dictionary in the list and press **Alt + r** (Remove File) to remove the dictionary from the list. Press **Alt + n** (Next) to continue.
4. At the Options dialog box, do the following:  
The last selected options are remembered the next time you select Case Prep.
  - a. In the List section, select **one** of the following:
    - a. To build a list of words found in the selected caption/ASCII files that are not found in the dictionaries, select the Words not found in dictionaries option.
    - b. To build a list of phrases found in the selected caption/ASCII files that you might want to brief, select the Phrases you might want to brief option. Phrases are generated from caption files and are not generated from ASCII files. If you select this option, Frequency is automatically selected in the Sort lists (by) section.
    - c. To build a list of words found in the selected caption/ASCII files that are not found in the dictionaries and phrases that you might want to brief, select the Both option.
  - b. In the Create List section, do the following:
    - i. Select Create Dictionary Builder List for a list of undefined words/phrases in the selected files.
    - ii. Select [Create Heads-up List](#) for a list of undefined/defined words/phrases in the selected files.
  - c. In the Sort list(s) by section, select one of the following:
    - i. To display the list of words or phrases based on the how often they occurred in the caption/ASCII files, select Frequency. The most frequently occurring words or phrases will be listed first.
    - ii. To display the list of words first and then phrases, select the Words then phrases option.

- iii. To display the list of phrases first and then words, select the Phrases then words option.
  - d. In the Report words or phrases that occur at least X times field, type the number of times a word or phrase must appear in the caption/ASCII file before it shows on the list. The default setting is 3. Valid numbers are 2 – 99.
5. Press **Alt + n** (Next) to continue.
6. At the Transcript/ASCII files and Dictionary Confirmation dialog box, review the selected caption/ASCII files, selected dictionaries and options you selected. To change one or more of your selections, click the Change button next to the item you want to change. To build the list, click Finish.
7. The Case Prep dialog box displays with the progress. When finished, the following displays:
  - a. If you selected to build a Heads-Up List, the list is opened in Edit in a 3-column format based on the options you selected. If you selected to create a Dictionary Builder List also, the Heads-Up List opens in the background.
  - b. If you selected to build a Dictionary Builder List, the Dictionary Builder List dialog box displays.
    - i. Two forward slashes followed by words indicates the following words couldn't be written using the selected dictionaries because the steno for the word(s) conflict with higher priority steno outlines found in another selected dictionary. Do any of the following:
      - To remove a word or phrase, highlight the word or phrase and press **Alt + r** (Remove).
      - To change the case of a word or phrase, highlight the word or phrase and press **Alt + c** (Cap) to cycle through the capping options.
      - To reverse any of the changes you made (removing a word or phrase or capping), press **Alt + u** (Undo All) to undo all the changes. **The list of words and/or phrases is saved. You now have two choices. You may either click OK or use the saved list at a later time OR you may open/create a dictionary and start [Dictionary Builder](#).**
  - c. To open/create a dictionary and start Dictionary Builder to define the words in the list, select the Start Dictionary Builder option.
    - i. In the Using field, the Case or Personal Dictionary is selected by default. If you are in a Case when starting Case Prep, the Case Dictionary will be selected by default. If you are in the root of your user when starting Case Prep, your Personal Dictionary will be selected by default. To change the dictionary, click the down arrow. The following options display:
      1. Case and/or Personal Dictionary.
      2. All dictionaries selected for the comparison.
      4. Other. If you want to select a different dictionary or create a new dictionary, click the **Browse** button. In the Select Dictionary dialog box, select a dictionary or type a new dictionary name and click Save.
  - d. Click **OK** to continue.
8. One of the following occurs:
  - a. If you just clicked **OK**, the Case Prep feature closes and a dialog box displays the name of the list created and that it is available in the Dictionary Builder folder located in your System Files case.
  - b. If you selected to start the Dictionary Builder option, the selected dictionary opens with the Dictionary Builder feature active. Make sure the writer option is correct, your steno machine is turned on and write a stroke to establish a connection and then click **OK** to begin.

- c. If you selected to create a [Heads-Up List](#), you can review the list and close the file when you are finished.

## Caption Heads-Up List

Use the [Case Prep](#) feature to create a Heads-Up List. Case Prep makes it easy to prepare for your next captioning session. It might be an ongoing show that you need to fill in for or a show that you haven't captioned in a while. Case Prep makes it easy and quick to find words that are not defined or are defined in your dictionaries by comparing previous caption, ASCII, .ecl (Eclipse native file) and/or PDF files to your dictionaries. Instead of being surprised during the captioning session of names and terminology, let Case Prep identify words and phrases for you from previous selected files. The Heads-Up List displays defined and undefined words and/or phrases based on the selected files selected compared to the dictionaries selected and the options you selected in the Case Prep Options. Depending on the captioning type, you can also select PTX (e-Tran compatible) and/or XMEF (TextMap compatible) file types.

You can create a Heads-Up List along with a [Dictionary Builder](#) List or create either of the lists individually. When creating a Heads-Up List, a .sgnfl file automatically opens in a three column newspaper display. The Heads-Up List displays words and/or phrases based on your selections on the Case Prep Options dialog box. Words found in any of the selected dictionaries are boldfaced and display the shortest, most used steno outline match immediately following the word. If the Create Heads-Up List is selected, the *Include steno definitions...* option is selected by default. If you deselect the Create Heads-Up List, the *Include steno definitions...* option is grayed out. If you need to locate in which dictionary the steno outline is found, use the Query Realtime Translations command on the word or phrase. Words not found in any of the selected dictionaries display only the word. You can use the Suggest A Brief command to generate a brief for words or phrases. Common/frequent phrases display according to your selection. Phrases are generated from selected files. The Heads-Up List is automatically saved in the location where you started Case Prep and named Case Prep followed by the case name and then current date and time. For example, Case Prep [KSTP] 2015-01-21 13.38 indicates you started Case Prep in a case named KSTP. Another example, Case Prep [Tom] 2015-01-21 13.38 indicates you started Case Prep in a Case CATalyst user name Tom.

The selected files, dictionary and options information used to create the Heads-Up List is written to the Notes tab of the Heads-Up List's [Job History](#) subfile. To view the information, in Manage Jobs right click the Case Prep file name and select History or double click the Job History subfile associated with the Case Prep file, then click the Notes tab.

When creating the Heads-Up List, Case Prep uses the [caseprepexcludelist.txt](#) and [CommonWords.txt](#) files located in the System Files case for analysis. Both files can be modified by adding or deleting words. An Add to Case Prep Exclude List option has been added to Edit's Tools menu and to the right click menu. When Case Prep analyzes the selected caption/ASCII files and dictionaries, the following rules apply:

- If Case Prep determines a capitalized word is not likely a proper noun (starts a sentence), the word will be looked up as lower case in both the dictionary and the exclude list. If a word is not found in the dictionary but is found in the CommonWords.txt file (all capped, initial capped or lower case) or Case Prep Exclude List, the word will not display in the Heads-Up List.
- Words that end in an apostrophe will be looked up in the dictionary as the root word only.
- Words that end in a suffix will first be looked up in the dictionary as is, if a match is found the word displays in the defined section of the Heads-Up List unless the word is in the exclude list. If the word isn't found in the dictionary with the suffix, the root word will be looked up in the dictionary and exclude list. If a match isn't found, the word with the suffix will be displayed in the Heads-Up List.

- All words found in the CommonWords.txt file are excluded from the Heads-Up List whether the word appears in lower case, initial cap or all caps.
- Phrases are generated from caption (.sgcap) files whether there is underlying steno outlines or not.
- Case Prep recognizes a Bates number that starts with text and is followed by at least 4 numbers. If the text before the numbers matches, Case Prep will put up to three occurrences of the Bates numbers in the Heads-Up List. The reported Bates numbers will be listed under the occurrence heading based on the number of times the Bates number prefix appeared in the selected files.
- Whether the *Include steno definition...* option is selected or not, the Heads-Up List will display defined words, followed by a blank line and then undefined words under the appropriate occurrence heading.
- Hyphenated words are handled as follows when the Words found/not found in dictionaries option is selected:
  - All selected dictionaries are searched to see if the hyphenated words is defined, if it is, the hyphenated words display in the Heads-Up List.
  - If both of the individual words are defined in the selected dictionaries but are not in the caseprepexcludelist.txt or CommonWords.txt files, the hyphenated words display in the Heads-Up List.
  - If only one of the hyphenated words is defined in the dictionary and at least one of the words is not in the caseprepexcludelist.txt or CommonWords.txt files, the hyphenated words display in the Dictionary Builder List.
  - If neither word is defined in the selected dictionaries and are not found in the caseprepexcludelist.txt or the CommonWords.txt files, the individual words and hyphenated words display in the Heads-Up List.

### To create a Heads-Up List:

1. In Manage Jobs, select Tools and then Case Prep.
2. At the Select transcript/ASCII files to Compare dialog box, press **Alt + a** (Add...) to select the caption/ASCII files you want to compare to selected dictionaries. If you were in a case when you selected Case Prep, the Open dialog box defaults to the case. Use Windows selection commands to select as many ASCII files you want.  
If you selected a file or files you didn't want, highlight the file in the list and press **Alt + r** (Remove...) to remove the file(s) from the list. Press **Alt + n** (Next) to continue.
3. At the Dictionary selection dialog box, press **Alt + a** (Add files...) to select the dictionaries you want to use to compare with the selected files. Select the dictionaries in the order you would use to translate or after selecting the dictionaries, reorder them in the priority you want. To change the order of dictionary priority, highlight a dictionary and use the up/down arrows in the upper right hand corner to move the dictionary to a higher or lower priority. **Your Personal Dictionary (and Update Area if used) are automatically selected and, by default, will be the lowest priority (just like when you translate).**  
If you selected a dictionary or dictionaries you didn't want, highlight the dictionary in the list and press **Alt + r** (Remove File) to remove the dictionary from the list. Press **Alt + n** (Next) to continue.

4. At the Options dialog box, do the following:  
The last selected options are remembered the next time you select Case Prep.
  - a. In the List section, select **one** of the following:
    - a. To build a list of words found in the selected caption/ASCII files that are not found in the dictionaries, select the Words not found in dictionaries option.
    - b. To build a list of phrases found in the selected caption/ASCII files that you might want to brief, select the Phrases you might want to brief option. Phrases are generated from caption files and are not generated from ASCII files. If you select this option, Frequency is automatically selected in the Sort lists (by) section.
    - c. To build a list of words found in the selected caption/ASCII files that are not found in the dictionaries and phrases that you might want to brief, select the Both option.
  - b. In the Create List section, do the following:
    - i. Select [Create Dictionary Builder List](#) for a list of undefined words/phrases in the selected files.
    - ii. Select Create Heads-up List for a list of undefined/defined words/phrases in the selected files.  
When this option is selected, the *Include steno definition* option in Heads-Up List option is available along with the *Suggest briefs for phrases* option. If you want the steno for define words to display next to the word, select *Include steno definition* option. If you are sharing this file with another reporter and you do not want the steno outline to display, deselect this option. If you want briefs for phrases to display in the Brief It pane, select the *Suggest briefs for phrases* option. If you selected at least one .sgnfl or .sgcap file for analysis, the Case Prep - Briefs dialog box displays. If you want to see any Personal Briefs and/or Reminder/Used briefs that appeared in the selected .sgnfl/.sgcap files, select the *Report Briefs in Heads-Up List* option. **You will not see the Case Prep - Briefs dialog box if you did not select at least one .sgnfl or .sgcap file for analysis.**
      - a) Select *Personal Briefs and Reminders/Used* option if you want the Heads-Up List to display any Personal Briefs and Reminder/Used briefs that displayed in the selected .sgnfl and/or .sgcap files. If you select to include Personal Briefs and/or Reminders/Used briefs in the Heads-Up List, they are reported in their own section of the list with designations for the type of briefs. When finished selecting options, click **Next** to continue.
      - b) Select *Personal Briefs* option if you only want to see Personal Briefs that displayed in the selected .sgnfl and/or .sgcap files.
      - c) Select *Reminders/Used* option if you only want to see Reminders/Used briefs that displayed in the selected .sgnfl and/or .sgcap files.
      - d) At the *Minimum # of jobs a brief must appear in to be included in the Heads-Up List:* option, type the minimum number of jobs that a brief must appear before it is reported in the Heads-Up List.
      - e) At the *Minimum # of times a brief must be suggested or reminded/used:* option, type the minimum number of times a brief must have been suggested or reminded/used before it is reported in the Heads-Up List.
  - c. In the Sort list(s) by section, select one of the following:

- i. To display the list of words or phrases based on the how often they occurred in the caption/ASCII files, select Frequency. The most frequently occurring words or phrases will be listed first.
    - ii. To display the list of words first and then phrases, select the Words then phrases option.
    - iii. To display the list of phrases first and then words, select the Phrases then words option.
  - d. In the Report words or phrases that occur at least X times field, type the number of times a word or phrase must appear in the caption/ASCII file before it shows on the list. The default setting is 3. Valid numbers are 2 – 99.
5. Press **Alt + n** (Next) to continue.
  6. At the Transcript/ASCII files and Dictionary Confirmation dialog box, review the selected caption/ASCII files, selected dictionaries and options you selected. To change one or more of your selections, click the Change button next to the item you want to change. To build the list, click Finish.
  7. The Heads-Up List, the list is opened in Edit in a 3-column format based on the options you selected. If you selected to create a Dictionary Builder List also, the Heads-Up List opens in the background. If you selected to see Personal Briefs and Reminder/Used Briefs, at the end of the Heads-Up List the Personal Briefs and/or Reminders/Used information is listed. No analysis is performed on your dictionaries. It lists what shows in the brief it pane of the selected .sgnfl and/or .sgcap files. If you are using someone else's files, this information may not be helpful or may conflict with your own dictionaries. The heading for the Personal Briefs and/or Reminders/Used displays as follows:

**Briefs:**

[Type: P/R/U], word, steno  
[Docs/occurrences]

[P] for personal, [R] for reminder or [U] for used brief will precede the brief word, followed by the steno and then how many documents the brief appeared in and how many times the brief appeared. For example, let's say you have the following in your Heads-Up List: [P] it would have been /TWOUEFB 2/6. That indicates that the Personal Brief "it would have been" with the steno TWOUEFB appeared in two transcripts and appeared/was reminded a total of six times in the selected .sgnfl/lsgcap files. Examples of how each type brief may appear in the Heads-Up List:

**Personal Briefs:**

[P] to the best of my knowledge  
/TAOEUPBLG [2/23]  
[P] I'm sorry /AOEUPLS [2/13]  
[P] a lot of /HRAOF [2/12]  
[P] I'm not sure /AOEUPLTS [2/11]

**Reminders:**

[R] sitting here today /SH\*T [1/10]  
[R] at any time /T-PBT [1/6]  
[R] you know /UPB [1/5]  
[R] but /FWU [1/3]  
[R] did he say /TKES [1/3]

**Used Briefs:**

[U] SEBP /S\*EB [1/2]  
[U] sewer tributary /SWR\*T [1/2]  
[U] as-needed /AO\*ED [1/1]  
[U] British Columbia /PWR\*EURB [1/1]  
[U] idea or concept /AO\*EUD [1/1]

- a. If you selected to build a Dictionary Builder List, the Dictionary Builder List dialog box displays.

- i. Two forward slashes followed by words indicates the following words couldn't be written using the selected dictionaries because the steno for the word(s) conflict with higher priority steno outlines found in another selected dictionary. The list of words and/or phrases is saved. You now have two choices. You may either click **OK** or use the saved list at a later time OR you may open/create a dictionary and start [Dictionary Builder](#).
  - b. To open/create a dictionary and start Dictionary Builder to define the words in the list, select the Start Dictionary Builder option.
  - c. Click **OK** to continue.
8. One of the following occurs:
  - a. If you just clicked **OK**, the Case Prep feature closes and a dialog box displays the name of the list created and that it is available in the Dictionary Builder folder located in your System Files case.
  - b. If you selected to start the Dictionary Builder option, the selected dictionary opens with the Dictionary Builder feature active. Make sure the writer option is correct, your steno machine is turned on and write a stroke to establish a connection and then click **OK** to begin.
  - c. The Heads-Up List displays in Edit. Words found in dictionaries are boldfaced with the shortest steno stroke match displaying immediately following the word. Do any of the following:
    - i. Highlight a word and use Query Realtime Translation to locate the dictionary in which the shortest stroke can be found if multiple dictionaries were selected.
    - ii. Highlight a word or phrase and use the Suggest A Brief command to generate a brief for the word or selected phrase. The brief displays in the Brief It pane. You can print the contents of the Brief It pane by clicking the Printer icon on the Brief It pane title bar. You can also right click a brief, select Send to Case Cat Scratch and the brief will be added to the Steno Text section of the Cat Scratch pane and is available as a reminder for your next job.
    - iii. Highlight a word or phrase and use the Text to Dict Define command to define any undefined words or phrases to your Personal, case, job or other dictionary. If find yourself using this command often, you can assign it to a key combination in a keyboard map.
    - iv. Need a reminder for a word and steno, you can highlight the word and steno outline, right click and select Send to Case Cat Scratch to copy the word and steno to the text section of the Cat Scratch pane for your next job.
    - v. Highlight a word, right click and select Send to Case Prep Exclude List to prevent the word from displaying in a Heads-Up List in the future.
9. When finished, close the Heads-Up List. The Heads-Up List is saved in the location where Case Prep was started. The file is named Case Prep followed by the name of the case or Case CATalyst user name and then the current date and time. For example, Case Prep [KSTP] 2015-01-22 07.52 indicates you started Case Prep in a case called KSTP. Another example, Case Prep [Tom] 2015-01-22 07.52 indicates you started Case Prep in a Case CATalyst user name of Tom. If you made any changes to the file, you will be prompted to save the file when closing it. The selected files, dictionary and options information is written to the Notes tab of the Heads-Up List's Job History subfile. To view the information, in Manage Jobs right click the Case Prep file name and select History or double click the Job History subfile associated with the Case Prep file, then click the Notes tab.

## Translation in CATalyst BCS

When you begin a CATalyst BCS captioning session, the Broadcast Captioning Translate dialog box displays. The Broadcast Captioning dialog box allows you to select a user, file, profile and options for translation. CATalyst BCS uses translate options and customizable [Profiles](#), which contain a collection of settings, for translation during a captioning session. You can modify existing profiles and create new ones.

### Broadcast Captioning Translate Dialog Box

#### Job

##### Show All Jobs

Check this box to show all the jobs for the current user. Uncheck this box to show only the captioning files for the current user.

##### Jobs Window

Display the caption files for the current user. To display all the files for the user, select Show All Jobs.

##### File

The file name for the captioning session. Select an existing file from the list in the Jobs window or type a new name. All captioning files have a .sgcap extension.

#### Options

Display the [Caption Translate Options](#) dialog box where you can select translate options, realtime settings and [preferences](#) for the captioning session. Option settings remain the same until you change them.

#### Profile

##### Set Profile Dirs

Display the Caption Profile Search Paths dialog box where you can locate CATalyst BCS Profiles in other user folders. The default path is the current user folder.

##### Profile Window

Displays the available Profiles found in the Captioning Profiles case. The Captioning Profiles case is located in the Captioning case within the System Files case.

You can use CATalyst BCS profiles from other users. Select Set Profile Dirs to display the Caption Profile Search Paths where you can locate other Profiles.

##### Profile

The Profile selected for this captioning session.

##### New Profile

Display the first screen of the Profile Wizard to create a [new](#) Profile. The Profile Wizard successively displays each of the Profile tabs for you to make entries.

##### Clone Profile

Display the Create a copy of Profile dialog box where you can create a [copy](#) of an existing Profile.

### Modify Profile

Display the Profile dialog box where you can make [modifications](#) to the Profile in the Profile field.

### Start Session

Begin the CATalyst BCS captioning session. If you select an existing job name, a message displays asking if you want to Append, Overwrite, or Cancel. Select one of the following:

#### Append

Add the new captioning session to the existing file.

#### Overwrite

When you select to use an existing file name that also contains audio and text, Case CATalyst deletes the steno (.sgstn) and text (.sgnpl) subfiles in the existing file if you select to overwrite and sends both files to the Windows Recycle Bin. An additional message displays prompting you to continue, using the existing file name and deleting the existing audio. If you accidentally overwrite an existing file when starting a session, you may be able to recover the steno and text subfiles by restoring them from the Windows Recycle Bin.

#### Cancel

Choose a different file name.

## Achieving Optimal Conversion of Numbers

Stenograph recommends the following dictionary definition guidelines for numbers to produce the best results when using any Number Conversion, Number Trigger and Automatic Number Conversion feature.

- It is not necessary to define numbers written via the number bar as digits in your dictionary.
- Do not define hundred as 00 or thousand as 000 or ,000. If these entries exist and you plan to use CATalyst BCS number conversion to combine hundred and thousand with other numbers, modify these entries to "hundred" and "thousand".
- Define text representing multiple numbers as digits. For example, define "double oh" as 00; and "triple 7" as 777.
- Define fractions, with or without hyphens using the <No Auto Convert> format symbol. For example, to create a dictionary definition to retain the hyphen for "-1/2", define as: -1/2<No Auto Convert>. To create a dictionary definition with a space before the fraction "1/2", define as: <No Auto Convert><Sticky Space>1/2.

## Caption Translate Options

Caption Translate options are a group of settings that affect how CATalyst BCS translates steno outlines. You set translate options on the Options tab in the Caption Options dialog box prior to starting a session or during a captioning session using the Options feature on the Setup menu. Options settings remain the same until you change them.

You can access BCS options:

- each time you start a CATalyst BCS session. In the Broadcast Captioning Translate dialog box, select **Options**.
- during a BCS session. From the Setup menu, select **Options** where certain Caption Translate options are available.

- during a BCS session in the Session Information window where certain Caption Translate options are accessible.

The following list is a summary of BCS translate options. For detailed information about an each option, click the name on the list.

## Options

### [Use Update Area for Translation](#)

Select this option to use entries in the Update Area to help translate the captioning session along with your Personal Dictionary and any additional selected dictionaries.

NOTE: By default, D-defines made during a captioning session or editing a caption file, go to the Personal Dictionary. To have D-defines go to the Update Area, at Manage Jobs select Tools, Options, Dictionary and then Options...

### [A/An Resolution](#)

Use the rules of grammar to resolve a/an when the steno stroke for "a" and "an" is written the same. The dictionary definition is only "a".

### [Drag/Drop Analysis](#)

CATalyst BCS analyzes untranslates with characters you drag or drop and matches the steno outline with a dictionary definition. Specify drag/drop characters in Drag/Drop Analysis Details.

### [TrueStroke Drag/Drop](#)

Translate option that works with TrueStroke data that is created when using a Luminex or Diamante steno machine via a USB or WiFi connection or Wave steno machine via a USB connection. When active, CATalyst BCS analyzes steno outlines during captioning using [TrueStroke](#) data located in the Steno X-ray2 (.sgxr2) subfile.

### [EZ Link](#)

Attach prefixes and suffixes to the root word during translation and check the spelling against the Spell Check Wordlists.

[Exclude Caps](#)

Do not apply EZ Link rules to an all cap or mixed case root word when immediately followed by a suffix. Root word remains unchanged when suffix attaches.

[Suffix Drag](#)

Suffix Drag applies the suffix strokes -G, -S, or -D to one stroke steno outlines that are not defined in the dictionary when the dragged letter is the last character in the outline. Optionally, apply -S, -Z or both for plural suffix. If also using Drag/Drop Analysis, Drag/Drop Analysis takes priority.

[Smart Quotes](#)

Using one steno outline, create opening and closing quotes that append to the word.

[Smart Parentheses](#)

Selecting this option allows you to have only one dictionary definition for a parenthesis or bracket (I). When you write the steno defined as the open parenthesis or bracket the first time, Case CATalyst inserts an open parenthesis or bracket. When you write the same steno outline a second time in the same paragraph, Case CATalyst inserts a closed parenthesis or closed bracket. With the Smart Parenthesis option selected, writing an open bracket followed by text and a new paragraph defined with the {Caption Period} translate command will result in CATalyst adding a smart closing bracket before the paragraph. No ending punctuation will follow the closed bracket. To get this result, don't write the closing bracket.

[Intelligently Punctuate Quoted Words](#) Place the period, comma or apostrophe stroked after a quoted word or phrase inside the quotes.

[Remove Single Empty Paragraph](#)

Suppress the blank line generated when a steno outline

with a paragraph style is followed by a stroke defined with a paragraph style at the beginning of the definition.

[Replace Q&A With >>](#)

Converts Question and Answer format symbol <New Line> to chevrons (>>).

## **Numbers**

[Ignore `and'](#)

Ignore the word "and" between numbers when translating number conversion and number trigger definitions. CATalyst BCS processes the numbers before and after the word "and" as one group.

[Ignore Commas](#)

Ignore any commas when translating number conversion and number trigger definitions that separate a group of numbers. CATalyst BCS processes all numbers.

[Ignore Periods](#)

Ignore any periods when translating number conversion and number trigger definitions that separate a group of numbers. CATalyst BCS processes all numbers.

[Ignore Word Numbers](#)

Ignore words that are numbers and do not translate them as part of the number conversion or number trigger definition.

[Squish Defined Numbers](#)

Automatically translate all numbers with no space between them, regardless if they do or do not have a dictionary definition.

[Automatic Number Conversion](#)

Automatically convert numbers based on the contents of the NumberConversion.ini file.

[Display 10 and Under as Words](#)

Translate numbers 1 through 10 as words based on the NumberConversion.ini file.

[Otherwise Display as Digits](#)

Forces all numbers to automatically display as digits.

[With Thousands Separator](#)

Converts number with commas when followed by measurement keywords.

[Don't Convert Word Numbers](#)

Write word numbers along with a number conversion keyword and retain the word number rather than having it convert to a digit.

**Conflicts**

[EZ Choice](#)

Resolve conflicts when they occur in the same context as they do in the Conflict Database.

[Second Choice](#)

Automatically select the second choice of the conflict when it occurs in the same context as it does in the SecondChoice Conflict Database. When used in conjunction with EZ Choice, EZ Choice takes priority in conflict selection.

[Auto-Conflict](#)

Automatically select the first choice of every conflict. When used in conjunction with EZ Choice, EZ Choice takes priority in conflict selection.

**Tran. Delay**

[Translation Delay](#)

Prevents the Delete command stroked from deleting strokes after the specified number of milliseconds.

**Show**

[Phonetic Translation](#)

Prevents the display of untranslates by "phonetically" translating steno outlines.

[Translate Statistics](#)

Display the Caption Steno statistics dialog box.

**Hold Strokes**

[Hold Strokes](#)

Before displaying text during captioning, hold the steno strokes the specified number of strokes until a longest match is written with the number of hold strokes are written or until a specified time elapses with no steno strokes written.

[Advanced Caption Options](#)

Determine the default selection for additional translation options.

[Brief It](#)

Suggest conflict free brief forms for words and phrases written during captioning.

## A/An Resolution

A/An Resolution is a CATalyst BCS translate option. When active, CATalyst BCS uses the rules of grammar to resolve a/an when the steno stroke for "a" and "an" is written the same. To use this option, the steno stroke must be in a dictionary with the text portion of the definition defined only as a lower case "a".

The "A" steno stroke translates using the following parameters:

- as "a" when followed by a word beginning with a consonant
- as "an" when followed by a word beginning with a vowel or the number 8.
- as "a" when followed by an untranslate

CATalyst BCS takes into consideration the a/an resolution for words in a phrase. For example, in the dictionary, /HA is defined as "had a". In the job, /HA is written followed by the word "apple". The translation is "had an apple".

You can change the [color](#) of the A/An Resolution that displays on the History window. From the Setup menu, select **Colors**.

## Auto-Conflict

Auto-Conflict is a BCS translate option. When active, CATalyst BCS automatically selects the first choice of the conflict during translation. When captioning, this prevents the display of conflicts on the screen.

Auto-Conflict selected conflicts display on the History window in the same color as your conflicts. When the cursor is positioned immediately before the Auto-Conflict selection, the original conflict displays on the Status bar in the lower right hand corner of the captioning screen. When Scan For Options are set to scan to conflicts, the cursor stops on Auto-Conflict selected conflicts. To confirm (final resolve) the Auto-Conflict selection, press Enter. You can also select a different conflict choice by pressing the number for the corresponding conflict. Once you press Enter or select a different conflict, the selection is confirmed.

Auto-Conflict selected conflicts that contain a prefix or suffix display with a space between the root word and the prefix or suffix. Once you confirm the Auto-Conflict selection, CATalyst BCS removes the space. For example, you have a conflict between <Suffix>ing and "go". With Auto-Conflict active, you write RUPB/G which results in "run ing". ^ go ^ <Suffix>ing. With the cursor on "ing" you press **Enter** resulting in "running". The next time you translate using EZ Choice or Auto-Conflict and the same conflict situation occurs, CATalyst BCS displays "run ing" with "ing" in your conflict color. When you confirm the "ing" CATalyst BCS displays "running."

Auto-Conflict selected conflicts that contain a format symbol display the format symbol with a space between the format symbol and the word. Once you confirm the Auto-Conflict selection, CATalyst BCS applies the format symbol.

When exporting to RTF/CRE, unconfirmed Auto-Conflict selected conflicts export in the original conflict form, so a scopist, for example, can view the original conflict. Once you confirm the Auto-Conflict selected conflict, CATalyst BCS exports it as normal text. Use [Resolve All Chosen Conflicts](#) to confirm all the Auto-Conflict selected conflict choices at once. Resolve All Chosen Conflicts also resolves all [EZ Choice](#) selected conflict.

You can use Auto-Conflict in conjunction with EZ Choice. When EZ Choice is active, CATalyst BCS first checks the conflict database. If the conflict is not in the database, then Auto-Conflict resolves the conflict.

Auto-Conflict is accessible from the Session Information window during captioning.

### Automatic Number Conversion

Automatic Number Conversion is a Translate option that converts combinations of numbers and words such as time, dates, addresses and measurements to a specific format based on keywords and rules in the [NumberConversion.ini](#) file. The CATalyst BCS NumberConversion.ini file contains formatting rules based on word and number combinations. For example, you write 50 dollars. Based on the keyword "dollars" and the dollar rule in the NumberConversion.ini file, CATalyst BCS converts the 50 dollars to \$50.

Automatic Number Conversion converts numbers and number words to numbers or ordinal numbers and inserts punctuation when appropriate. For example, writing July two 2008 converts to July 2nd, 2008 or July 2, 2008 depending on your settings in the NumberConversion.ini file. The word "month" is a keyword in the NumberConversion.ini file. When you write a month followed by a two digit year conversion, Automatic Number Conversion automatically inserts an apostrophe in front of the year. For example, a credit card expiration date written as March 98 becomes March '98; January 09 becomes January '09. The exception to this rule is when the month is followed by numbers 10 - 31. These numbers are recognized as dates and an apostrophe is not automatically inserted before the two digit year. For example, January 10 does not convert and remains January 10. You must write an apostrophe preceding the year for Automatic Number Conversion to recognize the two digits as a year. For example, it is necessary to write "January '10."

Automatic Number Conversion, by default, inserts a comma after the year when using the {MONTH} rule. For example, "July two 2009" converts to "July 2nd, 2009," with a comma after the year. To prevent the insertion of the comma after the year, change the Advanced Caption Translate option, [Add missing comma after year in {Month} number conversion](#), to No.

The word "point," although not a keyword in the NumberConversion.ini, works in conjunction with the Automatic Number Conversion feature. When you write the word "point" or the steno outline for "<Delete Space>" with numbers to the right or the left and right, CATalyst BCS converts the number words to digits and converts "point" or "<Delete Space>" to a decimal point. For example, "six point five" or "6 .<Delete Space> five" converts to 6.5. Also, "point zero 8" converts to ".08."

Automatic Number Conversion does not convert an entry when a comma follows a keyword and precedes a number. For example, in your NumberConversion.ini file you have the word Page to initial cap if a number follows. You write the following: "the next page, 3 points I would like..." CATalyst BCS does not initial cap the word "page" because a comma separates the word "page" and the number "3."

**The following Number Conversion options are available:**

- [Number Conversion button](#)
- [With Thousands Separators](#)
- [Display 10 and Under as Words](#)
- [Otherwise Display as Digits](#)
- [Don't Convert Word Numbers](#)

You can use specific number format dictionary entries containing [Number Conversion](#) or [Number Trigger](#) commands in conjunction with the Automatic Number Conversion feature. You can also apply [Automatic Number Conversion](#) during captioning.

## NumberConversion

In the Broadcast Caption Options dialog box on the Options tab, the numberconversion option opens the [NumberConversion.ini](#) file. When you click *numberconversion*, CATalyst BCS prompts you with a message to close the Translate box, saving any changes. Select **Yes** to continue and open the NumberConversion.ini file. The *numberconversion* option is not available when CATalyst BCS cannot locate a NumberConversion.ini file in the System Files case for the current user.

## With Thousands Separators

With Thousands Separator is a Translate option that is available when [Automatic Number Conversion](#) is active. When selected, CATalyst BCS converts digit and word numbers with commas when the numbers are followed by a measurement keyword. For example, one thousand miles converts to 1,000 miles. The word "miles" is a measurement keyword.

If Otherwise Display as Digits is also selected when With Thousands Separator is selected, numbers over a thousand and not followed by a keyword convert to digits with commas. For example, "one thousand parking tickets" converts to "1,000 parking tickets".

If With Thousands Separator is selected, Otherwise Display as Digits is not selected and the (new) *Digits With words convert With commas Up To=* option in the UserSettings.sgxml file is set to thousands or millions, then CATalyst BCS converts digits followed by word numbers such as thousands and millions to numbers with commas. For example, 3 thousand 4 hundred people attended the concert would convert to 3,400. Conversion takes place without a keyword. If word numbers are written followed by word numbers, they do not convert. For example, three thousand four hundred people attended the concert would not convert.

## Display 10 and Under as Words

Display 10 and Under as Words is a Broadcast Captioning option you use in conjunction with Automatic Number Conversion. Display 10 and Under as Words is only available when Automatic Number Conversion is active. When selected, CATalyst BCS converts digits 1 through 10 to words. For example, if you write "4 boxes", the result is "four boxes". This option only affects numbers 1 through 10 and does not apply to zero. Keywords in the NumberConversion.ini file take priority over this option. For example, "a three mile backup" changes to "3-mile backup".

Automatic number conversion considers numbers to be in a series if they are separated by one or more spaces, a comma, dash, slash or the word "and," "or," "through," or "to." For example, if you write "two to four things," the result is "2 to 4 things." This prevents a mixture of numbers such as "2 to four things." Numbers in a series are translated as digits when you write steno outlines defined as digits or words. Display 10 and Under as Words does not apply to digits in a series even if selected. To disable the "numbers in a series" feature, change the Advanced Caption Translate option, [Analyze numbers in a series](#) to No, to turn off the automatic number conversion series feature.

Automatic number conversion applies after translation. For example, you have Automatic Number conversion and Display 10 and Under as Words selected. You write: "Guilty of count 2." It translates as "Guilty of Count two." The word "Count" is not in your Number Conversion list but you have a dictionary definition for "Count 2." The translation is "Count two" because you selected Display 10 and Under as Words. To change the translation result you can put the word "count" with the appropriate category, {DIGITAFTER}{CAPWITHNUM} in your Number Conversion list; use the [<No Auto Convert>](#) format symbol, Count<No Auto Convert>2 in a dictionary definition; or deselect the Display 10 and Under as Words option.

You can also use [Automatic Number Conversion](#) to affect number conversion during editing a caption file.

## Otherwise Display as Digits

Otherwise Display as Digits is a Broadcast Captioning option. When active, CATalyst BCS forces all word numbers, which are not controlled by a another number conversion keyword or rule, to automatically display as digits without commas. For example, "There were three thousand of them." translates as "There were 3000 of them." If you also select the With Thousands Separator option, then numbers, not controlled by a keyword, translate with commas.

Keywords in the NumberConversion.ini file take priority over this option. For example, "There was three thousand dollars, converts to \$3,000 because of the keyword dollars.

You can use the Otherwise Display as Digits if [Automatic Number Conversion](#) is active.

## Don't Convert Word Numbers

*Don't Convert Word Numbers* is a Broadcast Captioning option that works with Automatic Number Conversion. This option is located on the Broadcast Captioning Options tab. Selecting this option allows you to write word numbers along with a number conversion keyword and retain the word number rather than having it convert to a digit. This is a great option If you want to write a word number along with a number conversion keyword and not have it convert the word number to a digit and if you want to write a digit with a number conversion keyword and have the number conversion take place. For example, let's say in your NumberConversion file, you have "dollars" as a keyword that converts a number, if necessary, to a digit and puts the dollar sign (\$) immediately in front of the digit. With the *Don't Convert Word Numbers* option selected, if you write *two dollars*, it remains two dollars. If you write *2 dollars*, it converts to \$2. If you write *two million three hundred thousand dollars*, nothing converts. If you write *2 million 3 hundred dollars*, it converts to \$2,300,000.00.

If you write a word number and a number conversion keyword that would normally insert a hyphen between two words, there will be no hyphenation between the word number and the keyword when this option is selected. For example, you write two barrel shotgun, no hyphen would be placed between "two" and "barrel" when "barrel" is a keyword in the Numberconversion file.

## Brief It

Brief It is a Caption translation option that suggests conflict free brief forms for words and phrases that you write during captioning. When you write three or more steno strokes, CATalyst BCS generates a brief form or reminds you of an existing brief form and displays it in the [Brief It dialog pane](#). You can write the suggested/reminder brief to reduce writing multiple stroke outlines. When you write the steno for a suggested brief, CATalyst BCS moves it to the end of the Brief It list and automatically adds it to the case or job dictionary. Brief It does not suggest a brief or display a personal brief if the steno conflicts with an entry in a dictionary currently used for translation.

There are three types of briefs, Reminder, Personal and Suggested. All brief types display in the Brief It dialog pane in color coded text to easily identify the type of brief: Personal, Suggested and Reminder. Personal briefs have a light orange background, Suggested briefs have a light yellow background and Reminder briefs have a light green background. The more often the same brief is suggested without being written, the darker the background color. If you write a Suggested brief, the background color for the brief turns gray and the used brief moves to the end of the list.

Reminders briefs are existing dictionary entries which contain fewer steno strokes than what is written. The existing entries are located in dictionaries used for the current realtime translation.

Personal briefs are entries you create prior to translation. These may be briefs forms you find in books, on a forum or when exchanging ideas with other court reporters. Personal briefs are stored in the [Briefs.txt](#) file located in the System files case. Creating entries in the Briefs.txt file allows you to store words and phrases along with the brief form without placing them in a dictionary. The briefs are available and display only when they do not conflict with an entry in a dictionary currently being used for translation.

The first time you write three or more steno strokes for a word or phrase contained in the Briefs.txt file, Brief It displays the Personal brief form. For example, you have a dictionary entry for "Microsoft" as PHAOEUBG/ROE/SOFT. At a seminar, you hear about the brief PHOFT for Microsoft. You are uncertain into which dictionary you want to place the entry but want to make it available for future jobs. You open Briefs.txt file and type: **Microsoft PHOFT**. The first time you write Microsoft as PHAOEUBG/ROE/SOFT during the job, the Brief It dialog pane displays PHOFT.

Suggested briefs are generated by Brief It during realtime. When no brief exists in a dictionary currently used for translation or in the Brief It.txt file, for a word or phrase written with three or more steno strokes, CATalyst BCS uses complex algorithms and intelligent analysis to generate a brief. Entries in your [Steno Shortcut Table](#) are used as part of the analysis. It is recommended that you review the Steno Shortcut table to ensure accurate suggestions based on your writing style. If you do not like a suggested brief form, you can reject it and have Brief It suggest another brief.

Suggested briefs do not conflict with entries in the dictionaries used for realtime captioning. For example, during the job you write AB/OT/HRAB/TOERS for Abbott Laboratories. A job dictionary currently in use for translation contains the entry A\*L defined as Mr. Allen. Brief It does not suggest A\*L for the Abbott Laboratories brief. Brief It creates and suggests a brief that does not conflict, such as A\*LT.

Brief It will try to offer a singular form of a word/phrase brief along with the plural brief form when a plural word/phrase is written. For example, "world financial centers" is written, Brief It may offer W\*FBG for "world financial center" and W\*FBGS for "world financial centers". The singular version brief is displayed first and then the plural brief. If you want to use a suggested brief, you do what you always do to take one. They are not taken as a pair. Brief it uses your Plural Endings option from Edit (Tools, Options, Plural Endings...) to determine if it should offer an -S or -Z at the end of the suggested brief for plurals. If you allow both -S and -Z, Brief It will first check to see if a -S can be added to the outline to make it plural and if not, it will then try the -Z. For example, you write "provide answers" and Brief It suggests PA\*EUS. If PA\*EUS is defined in your dictionary, then Brief It will attempt to add the -Z to the steno outline and may suggest PA\*EUZ.

Brief It feature will also attempt to recognize plural versions of proper names and only provide a plural version of the brief. For example, you write "Upper Saddles" several times and Brief It offers you \*UPZ as a brief. Brief It analyzes the words to see if the first letter is upper case and the second letter is lower case and since the criteria is met, Brief It doesn't offer a singular brief to go with the plural brief for the proper name.

NOTE: If you have the double first syllable option checked, that logic takes priority over offering the singular brief along with the plural brief.

When five or more strokes are written that produce a word with no spaces, such as finger spelling a company name or acronym, Brief It suggests a brief when no shorter stroke definition exists in a dictionary being used for translation. For example, you use a dictionary with an alphabet where each letter is capitalized and defined with the [Glue translate symbol](#). In the current job, you finger spell the acronym, "SSBTC" as /S\*/S\*/PW\*/T\*/KR\* for State Street Bank and Trust Corporation. Brief It recognizes it as an acronym and suggests SPW\*T for SSBTC. When a single word is created with two or more hyphens, such as finger spelling a name with each letter separated by hyphens, Brief It suggests a brief with the hyphens removed and initial caps the word. For example, you write, "K-U-R-K-O-W-S-K-I". Brief It suggests "Kurkowski."

Brief It does not suggest briefs with certain words and punctuation. The [CommonWords.txt](#) file contains a list of words, which you can modify, that Brief It does not consider when looking for words and phrases for brief suggestions. Brief It does not suggest a brief if a question mark or exclamation is followed by a space in a phrase. When Brief It encounters a phrase with a period (.) followed by two spaces, Brief It does not suggest a brief. For example, "...high impact. Exercise..." When Brief It encounters a phrase with a period (.) followed by one space, Brief It may suggest a brief. For example, titles with surnames such as Mr. Washburn, Dr. Skaare, Ms. Kurkowski, etc. This is a built-in feature of Brief It and does not require selecting an option.

By default, when you write a steno outline that is a Suggested brief a case or job dictionary is created. If you wrote the stroke by mistake or do not want to use it, you can write the {Delete} command to remove the steno and text from the transcript. Using the Delete command does not remove the define from the dictionary. For example, you misstroke a steno outline which is the same steno as a Suggested brief. Instead of the misstroked steno outline being an untranslate, it translates as text. The brief is also added to the case or job dictionary because it was written. You use the {Delete} command to remove the Suggested brief text from the transcript. Use the Undo Last Global command to remove the brief from the dictionary. The define remains in the Global table.

Using the [Suggest a Brief](#) command, you can force Brief It to suggest a brief while captioning. For example, in the History window, you can highlight existing words or type a word or phrase and use Suggest a Brief to create a brief. The Suggest a Brief command works well in an AccelerWriter to force briefs on previously written text. For example, you create a macro that selects the two previous words and invokes the Suggest a Brief command and then create an AccelerWriter definition. During captioning, you write "fibromyalgia syndrome." You then write the stroke to invoke the Suggest a Brief AccelerWriter. Brief It displays the suggested brief in the Brief It dialog pane.

You can automatically populate the Brief It dialog pane with Suggested briefs using the [Text List Brief It](#) or [Transcript Brief It](#) Edit features. Text List Brief It analyzes a text file and creates Suggested briefs based on your Brief It options. This may be helpful when preparing for a particular type of job with unfamiliar terminology or subject matter. Transcript Brief It analyzes the open transcript to create briefs based on your Brief It options. This may be useful for an upcoming job related to a previously taken job. For example, you can open the previous job and run Transcript Brief It to create briefs related to the job.

When using the [Create EZ Speakers](#) feature or creating a speaker in the Speaker List, Brief It automatically creates a brief for the speaker and displays it in the Brief It dialog pane. Brief It inserts a Sticky Space format symbol between the title and surname and initial caps each word. When a letter contained the name is lower case, then Brief It initial caps the following letter. For example, you create the speaker MS. McLAUGHLIN. Brief It creates the brief, Ms. <Sticky Space>McLaughlin. When you create a speaker for MR. MCGREE, Brief It creates a brief for Mr. <Sticky Space>Mcgree.

Brief forms can be reviewed any time during captioning or working in the History window. The contents of the Brief It dialog pane stay with the job. For example, you may be curious about some of the Reminders that displayed during captioning and want to see how often the entry was used. You can Suggest a Brief on words or define Suggested briefs so you can write them in the future and do not have to wait for a brief to be suggested.

[Brief It options](#) allow you to customize Brief It. You can, for example, select to show only Reminders and Personal Briefs, change the default dictionary when writing a Suggested brief and customize the Suggested briefs that Brief It generates.

The Brief It option on the [Options](#) tab in the Caption Options dialog box must be checked for the Brief It feature to be active. By default, the Brief It feature is active and opens the Brief It dialog pane when starting a captioning session. To display the Brief It dialog pane while captioning, select View/Brief It. Brief It remains active when the Brief It dialog pane is hidden.

The Luminex and Diamante V2.0 or higher has optional Brief It functionality designed for situations in which you are not writing realtime to CATalyst BCS or do not want to use the CATalyst BCS Brief It feature. If you do write realtime on CATalyst BCS V13 or higher with the Luminex or Diamante Brief It option is active, defines, including briefs, are automatically exchanged between the systems. If Brief It is active on both CATalyst BCS and the Luminex or Diamante, Suggested briefs may not match. **It is strongly recommended to only use the Brief It feature on your Luminex/Diamante or CATalyst BCS but not both locations.**

If you choose to use the Brief It feature on the Luminex or Diamante with CATalyst BCS, selecting to Undo a global, Undo Last Global or delete a global in CATalyst BCS does not remove the definition from dictionary in Luminex or Diamante memory or the job dictionary for the file on the Luminex or Diamante. Refer to the Luminex or Diamante User Guide for information on removing J-Defines from the Luminex or Diamante.

You can [search/filter dictionaries](#) based on Used Briefs to review the briefs you have used.

## Brief It Options

[Brief It](#) is a Caption translation option that suggests conflict free brief forms for words and phrases that you write during captioning. When you write three or more steno strokes, CATalyst BCS generates a brief form or reminds you of an existing brief form and displays it in the [Brief It dialog pane](#). You can write the suggested/reminder brief to reduce writing multiple stroke outlines. Brief It options determine certain customized settings that control how briefs are suggested in the Brief It dialog pane during a captioning session. [Live Suggestions](#) options are also available in the Realtime Aid Options dialog box when selecting Brief It options. The Brief It and/or Live Suggestion options need to be selected on the Case CATalyst Translate Options [Realtime tab](#) in order for Brief It and/or Live Suggestions to be active. By default, the Brief It and Live Suggestions options are checked and active.

Access Brief It Options:

- in Manage Jobs. Press **Alt + t, o, e, b** (**Tools/Options/Edit/Brief It**).
- while captioning from the Brief It dialog pane, click the Brief It Settings  icon.
- while captioning, click Tools , Options, Pane Options, Brief It.

## Brief It Options

### Max Words Per Brief

Set the maximum number of words for a brief that Brief It suggests. Select between 1 and 10 words. For example, if the setting is 7 and you write "...first date you contacted Rockford Credit Union," a brief may be generated for the entire phrase. If the setting is 3, a brief might be suggested for "Rockford Credit Union." The default is 5.

This setting is also used when generating phrases for the [Case Prep](#) feature.

This option does not affect marking a phrase or using the Suggest a Brief command.

### Show Phonetic Steno

When selected, this option will change steno character combinations into the "phonetic" sound of the combined letters when offering a suggestion. The option simply changes the display of the steno characters and still keeps the normal Brief It logic. For example, let's say you select the Show Phonetic Steno option and you write the phrase "large imbalances", Brief It would display the suggestion as "LARJ" instead of "HRARPBLG." Another example might be if you wrote "to the extent that" and Brief It offered "TO\*EX" instead of "TO\*EBGS".

The Show Phonetic Steno option includes two options for words starting with Z and ending with X. The options are selected by default. If the SWR=Z option is selected, then suggested briefs for words/phrases starting with Z will display as Z. If the option is deselected, suggested briefs for words/phrases starting with Z will display as SWR. If you write SWR for the Z sound, then you most likely will leave the option selected. Since the initial Z sound can be written differently depending on the steno theory, if you write different steno for the initial Z, you may want to deselect the option. For example, let's say the captioner doesn't write SWR for the initial Z and the option is selected. During the captioning session, the name "Zimmerman" (STKEUPL/ER/PHAPB) is written several times and Brief It suggests Z\*IM. Since the captioner doesn't write SWR for initial Z (the reporter writes STK for Z), the captioner automatically writes STK\*EUPL (not SWR\*EUPL) and the steno does not translate as Zimmerman because CATalyst is expecting SWR\*EUPL. The captioner can deselect the SWR=Z option and when a Brief It suggests a brief for a word/phrase starting with Z, the steno will display SWR instead of showing a Z.

With the BGS=X option selected, suggested briefs for words/phrases ending in the X sound will display an X. If the option is deselected, the suggested briefs for words/phrases ending in the X sound will display as BGS (KS). For example, let's the captioner writes the word "hoax" several times or the captioner uses the Suggest a Brief command to get a brief suggestion. If the BGS=X option is selected, Brief It might display a suggestion using an X like HO\*X. If the BGS option is deselected, the suggestion might display as HO\*KS.

The Show Phonetic Steno option can be selected or deselect at any time. During realtime or in previous jobs, you can open the Brief It pane, then select Options and select or deselect the Show Phonetic Steno option to see the difference in how the suggestions display. The option also affects how steno outlines display in the Text/Steno section of the Cat Scratch pane.

While writing realtime with the Show Phonetic Steno option selected, Personal Briefs display the steno outline(s) as it appears in the Personal Briefs table. For example, if you have an entry such as "as a result of the accident" with the steno "SRUFBGS" that is how the steno will appear in the Brief It pane during realtime. If you close the realtime file and reopen it, the Personal Brief steno will display phonetically since the Personal Brief table is only used during realtime. For this example, when reopening the file, the steno for "as a result of the accident" will display as "VUFX".

**Note:** If you decide to change the status of one or both of the Show Phonetic Steno options during a session, the already suggested briefs will not change/display the suggested steno differently.

### Only Suggest 1 Stroke Briefs

Check this box to have Brief It suggest only one stroke Suggested briefs. By default, Brief It always suggests a one stroke brief with the asterisk before suggesting a two stroke brief. Selecting this option also affects Reminder and Personal briefs. For example, you write "neurotoxicity" in 4 or 5 strokes. When this option is active, Brief It does not remind you that you have "TPHEOR/TOX" in your Personal Dictionary as a two stroke entry.

This option only affects briefs generated by Brief It and does not affect two stroke Reminder or Personal Briefs.

### Write Twice to Define

Brief It, by default, automatically creates a J-Define or a K-Define the first time you use a Suggested brief. Checking this box requires you to consecutively write a brief twice before Brief It creates a J-Define or K-Define. You may want to use this option to try a Suggested brief before making it a definition.

For example, Brief It suggests /A\*BT for "Abbott Labs." If the Write twice to Define option is active, you would need to write /A\*BT/A\*BT to have Case CATalyst create the define, /A\*BT for "Abbott Labs." Once defined, you write A\*BT for "Abbott Labs" for the remainder of the job. By default, this option is not active.

When you have the Write Twice to Define option selected and the Allow Double First Syllable option selected, if the suggested brief has two identical strokes, Brief It will behave as if "Write Twice to Define" option was not active. (In other words, you do not need to write the brief 4 times to use it.) If the brief is one stroke or is multiple (not identical) strokes, briefs will need to be written twice to be used.

### Define to Case Dictionary

Check this box to place a Suggested brief in the case dictionary once it is written. This is the default. If the current captioning session is not in a case, then the brief is placed in the current captioning session's dictionary.

### Personal/Reminders Only

Check this box to display only Reminder and Personal briefs in the Brief It dialog pane. Suggested briefs are not created. When using the Suggest a Brief, Transcript Brief It or Text List Brief It commands, Brief It only displays Reminders or Personal Briefs. When using Suggest a Brief and no Reminders or Personal Briefs are available, a message displays indicating that a brief cannot be suggested.

### 1 Stroke Reminders for 2 Strokes

Check this box to have Brief It offer one stroke Reminders or Personal briefs when writing two stroke entries. For example, you write "you don't" in two strokes and there is a one stroke version in your Personal Dictionary. Brief It shows the one stroke brief as a Reminder. If Brief It finds two one stroke dictionary entries for the matching text, Brief It suggests the most frequently used matching one stroke entry. If the matching one stroke entries have been used the same many times, then Brief It suggests the matching one stroke entry with the least amount of steno keys.

### Auto Open Brief It

Check this box to automatically display the Brief It dialog pane when starting realtime. By default, this option is selected.

### Send Used Briefs To Cat Scratch

Check this box to automatically send a Suggested brief to the [Cat Scratch](#) dialog pane. The brief displays in the pinned area of the Steno/Text section.

### Steno Include/Exclude

Displays the Brief It Options table where you can view, insert, delete and [modify](#) the Require and Exclude entries. The Require entry contains the steno character or steno combination that you want included in every Suggested brief Brief It generates. There is only one Require entry. By default, the asterisk (\*) is the required character.

Exclude entries contain steno characters or steno combinations to exclude from every Suggested brief. In other words, if there is a steno character or steno combination that you never want as part of a suggested brief, you can exclude those steno characters. You can have multiple Exclude entries.

### Personal Briefs

Display the Briefs.txt file where you can [create](#) and [modify](#) Personal brief entries. If you select Personal Briefs, you will be prompted to save your changes and close the Realtime Aid Options dialog box. The Personal Briefs file displays. Personal briefs are brief forms you create which contain words and phrases along with the steno. These may be briefs received from magazines or another reporter which you did not want to put in a dictionary. Brief It does not use a personal brief that conflicts with dictionary entries.

### CommonWords

Display the [CommonWords.txt](#) file in Notepad or WordPad to review or [modify](#) entries. Brief It does not suggest a brief with a phrase that begins or ends with any word contained in the CommonWords.txt file.

### Allow Double First Syllable

Many reporters learned to brief speaker names and terminology by writing the first syllable of the name/terminology twice. For example, let's say the word "neurotoxicity" is used multiple times in the transcript. A reporter might write "neurotoxicity" as TPHUR/OE/TOBGS/EUS/TEU and since it is appearing multiple times in the job, the reporter might write TPHAO\*UR/TPHAO\*UR as a brief. The Allow Double First Syllable option has been added to the Brief It feature for those reporters that might want Brief It to offer the first syllable twice as a suggestion. When the Allow Double First Syllable option is selected, Brief It may offer the first syllable of the text (single word or phrase) written twice as the suggested brief. For example, the word "fluorescent" is used multiple times in the transcript. You write "fluorescent" in multiple strokes and Brief It suggests TPHRAOU/TPHRAOU. In other words, it suggests doubling the first syllable of the word "fluorescent."

When you have the Write Twice to Define option selected and the Allow Double First Syllable option selected, if the suggested brief has two identical strokes, Brief It will behave as if "Write Twice to Define" option was not active. (In other words, you do not need to write the brief 4 times to use it.) If the brief is one stroke or is multiple (not identical) strokes, briefs will need to be written twice to be used.

When this option is selected, it has the highest priority over other selected options for words and a later priority for phrases.

**PLEASE NOTE: If you do not want the asterisk (\*) as a part of any double first syllable brief suggestions, you need to put the asterisk in as an exclude stroke in the Steno Include/Exclude table. Excluding the asterisk means that asterisk will not be a part of any brief suggestion.**

## Allow Briefs with Numbers

An Allow Briefs with Numbers option has been added to Brief It. Perhaps you have been in that court proceeding or deposition where Bates numbers or dollar amounts are repeated and you wished Brief It would give you a brief for those repeated number sequences. An additional option is available in the Steno Include/Exclude list, where a Required for Numbers entry is available. The Required for Numbers entry allows you to specify particular steno characters that will be included in the number brief suggestion. For example, let's say that the Required for Numbers entry is EU. You write 23925 several times throughout the transcript, Brief It might suggest 23EU9 incorporating the first, second and third numbers along with the required entry steno characters for numbers. By using the Required for Numbers entry, you will have a consistent steno outline with a suggested numbers brief. By default, EU is the steno assigned to the Required for Numbers entry in the Brief It Include/Exclude List. The Required for Numbers steno can be modified to fit your writing style or deleted so that no steno is required for numbers.

Brief It will remove the digits and use the normal Brief It logic for a suggestion and if no suggestion is found, Brief It will suggest a brief using up to 3 digits that were written in the order the digits were written (along with the required steno from your Brief It options) and if no suggestion is found, Brief It will continue to suggest numbers written in order with non-digit sounds or digits in any order with non-digit sounds.

By default, the following number/steno key combinations are excluded in the Brief Include/Exclude Options:

#1K, #2K, #3W, #4R, #6-R, #7-B, #8-G, #9-S

- To disable the Required for Numbers entry, double click the entry and delete the existing text and press **Enter**. [none] displays in the entry.
- To modify the Required for Numbers entry, double click the entry and type the steno characters you want to be a part of brief suggestions that contain digits and press **Enter**.
- To remove a default number entry, highlight the entry and click the **Delete** icon.
- To add an exclude number/steno character entry, press **Ctrl + i** and type the number and steno character(s) and press **Enter**.
- **NOTE: To prevent any number bar number from being suggested, press Ctrl + i and type # and press Enter.**

## Live Suggestions

**When using Live Suggestions in CATalyst BCS, it is strongly recommended that you don't select a Live Suggestion until the untranslate is well out of the Caption Preview window.**

### Insert Oops when replacing with a live suggestion

By default, when you select to replace an untranslate and/or text with a Live Suggestion, an [Oops](#) (category 10 - CATalyst inserted format symbol) is inserted into the transcript at the location of the replacement. If you use the [Hotspots](#) pane, you can display all locations of the Oops format symbols in the transcript or you can set your [Scan For](#) options to stop on Oops format symbols. If you do not want the Oops format symbol inserted when replacing an untranslate and/or text with a Live Suggestion, deselect this option.

If you define an untranslate and/or text with a Live Suggestion, the Oops format symbol is not inserted into the transcript at the location. The define will be in the transcript's Global Table.

### Number of suggestions

By default, up to three Live Suggestions will display in the Brief It pane. You can adjust the number of suggestions that display from 2 to 5. To make a change, use the up/down arrows to increase or decrease the amount of Live Suggestions that display for a particular untranslate.

### **Dictionary Defines go to:**

Job Dictionary, Case Dictionary, Personal Dictionary/Update Area

Select the destination dictionary you want a defined suggestions to go to when using the Define With LS1 - LS5 commands. When this option is set to Case dictionary, if the transcript is not in a case, the destination dictionary is the job dictionary. When defining a Live Suggestion, the global is applied to the entire file. When defining with a Live Suggestion, the definition is placed in the transcripts Global Table in addition to the respective dictionary. If your [Dictionary Options](#) are set to have D-defines go to the Update Area, then if this option is set to Personal Dictionary/Update Area, the Live Suggestion definitions will go to the Update Area.

### **Show \*translated\* text as first Live Suggestion**

By default, this option is active and Drag/Drop, Suffix Drag and phonetic translated text will be the first choice in the Live Suggestion list. If Spell Check thinks the \*translated\* text is misspelled and this option is selected, the misspelled translation will **not** be offered as the first suggestion.

If you do not want the Drag/Drop, Suffix Drag or phonetic \*translated\* text offered in the Live Suggestion list, deselect this option.

### **Live Suggestions favor: Quality    Balanced    Speed**

- Quality settings are designed for faster computers. Using this setting, Live Suggestions will spend a little more time looking for a suggestion and will search more steno outlines for a longer match.
- Balanced is the default setting. Live Suggestions takes less time and fewer steno outlines than the Quality option to look for suggestion.
- Speed settings are designed for slower computers. Using this setting, Live Suggestions will take minimal time searching for a suggestion and minimal steno outlines for the longest match. If you are running Case CATalyst on older hardware and your realtime is a little sluggish and you want to use Live Suggestions, you may want to try this setting.

## **Making J-Defines from Brief It Pane**

The easiest way to make a J-define (or K-define) of a brief is to write the suggested brief. When you write the steno for a suggested brief, CATalyst BCS automatically adds it to the job dictionary. If during a break or after finishing realtime, you want to make a J-Define of a brief, you can J-Define from the Brief It dialog pane. You can also define [Live Suggestions](#) from the Brief It pane.

If during a break or after finishing realtime, you want to make a J-Define (or D, K or O define) of a brief, you can define directly from the Brief It dialog pane.

## **J-Define a Brief from the Brief It Pane**

1. Right click a Suggested or Personal brief in the dialog pane.
2. Select J-Define Suggestion. The Add Dictionary Definition - Job Dictionary dialog box displays.
3. Make necessary entries:

### **Steno (Alt + s)**

The steno for the brief form.

### **Text (Alt + t)**

The definition for the brief. Add format symbols, fields or extended characters as necessary. Press **F9** to add [extended characters](#).

### **FS (Alt + f)**

Display the list of available [format symbols](#). To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry. You can insert a format symbol at any point in the text entry.

### **Insert Field (Alt + i)**

This feature is most likely not applicable in CATalyst BCS. Display the [Insert Field](#) dialog box from which you can select a field to insert into the text portion of the definition.

### Endings (Alt + n)

CATalyst BCS analyzes the word in the *Text* field to see if a final " G", " S" or " D" can be added to the steno outline to create additional dictionary entries for active, plural or past tense versions of the word. If so, then CATalyst BCS activates the Endings button. The Global Endings dialog box displays when the Endings button is selected. You can choose any of the suggested definitions to add to your dictionary. For example, you have REPT in the Steno field and type "represent" in the Text field. The following suggested entries display when you select Endings:

REPTD = represented

REPTS = represents

The word "representing" is not suggested because the final "g" comes before the final "t" in the original steno outline.

### Global Type (Alt + n)

The Global type default to J-Define. To select a different type of global define choose from the drop down box, or press **one** of the following key combinations. When you D-Define, K-Define, or J-Define the entry, the correct steno must display in the Steno field.

- Alt + d (D-Define)
- Alt + k (K-Define)—if the file is in a case.
- Alt + j (J-Define)
- Ctrl + o (Other Dictionary)—send job dictionary defines to an alternative dictionary.

### Pick Other Dictionary (Alt + p)

This field is available if you select Other Dictionary in the Global Type field. You can send job dictionary defines to an alternative dictionary when making an O-Define. Select a current dictionary from the drop down list or use **Browse** to choose another dictionary. Depending on your [Global options](#) settings, CATalyst BCS remembers your selection for the current session or for every job. This field displays when you select Other Dictionary in the Global Type field.

### Generate All Possible Misstrokes (Alt + m)

Check this box to have CATalyst BCS generate definitions in the designated dictionary based on all the possible misstrokes of the original steno outline. Only the original steno outline goes into the current Global Table. All misstrokes are available for future translations.

CATalyst BCS generates a definition provided the generated misstroke does not conflict with an existing entry in the Personal Dictionary. For example, you define /SROEUS as "voice" with Generate All Possible Misstrokes selected. CATalyst BCS also creates a dictionary definition for the following steno outlines as "voice": /SROUS, SROES, and /SROS. The steno outline, /SRAOEUS already has a definition in your Personal Dictionary as "vice", so CATalyst BCS did not generate /SRAOEUS as a misstroke.

By default, this option is not selected. You can [change](#) the default so that this options displays selected. A separate default setting for D-Defines, J-Defines, and K-Define can be set in [Global Options](#).

### Add 2 Cat Scratch (Alt + 2)

Send the definition to the [Cat Scratch](#) dialog pane in addition to the Global Table and selected dictionary. Depending on the Cat Scratch scope, the entries are sent to the job, case or user Cat Scratch pane.

4. Press **Enter (OK)** to apply the definition.

## Modify Steno Include & Exclude Entries

The Brief It Options table contains two types of entries that CATalyst BCS considers when generating Suggested briefs: the [Require](#) entry and Exclude entries. The [Require](#) entry contains the steno character or steno combination that CATalyst BCS includes in every Suggested brief. You can only have one *Require* entry.

[Exclude](#) entries contain specific steno characters or steno combinations that you want CATalyst BCS to exclude from every Suggested brief form. You can have multiple exclude entries.

## Modify Entries in the Brief It Options Table

1. Do one of the following to display the Brief It Options dialog box:
  - in Manage Jobs. Press **Alt + t, o, e, b (Tools/Options/Edit/Brief It)**.
  - while captioning from the Brief It dialog pane. Click the Brief It Settings  icon.
2. Click the **Steno Include/Exclude** button. The Brief It Options table displays.
3. Do any of the following:

### Require Entry

By default, the asterisk ( \* ) is specified as the included character. To modify the Require entry:

- a. Highlight the Require entry and press **Ctrl + m (Edit/Modify)**. The Modify Require Steno dialog box displays.
- b. In the *Steno* field, type the character to always include in Suggested brief forms. If you do not want to specify a character in Suggested briefs, delete the existing character. CATalyst BCS displays the entry as *None*.

### Exclude Entries

By default, there are twelve Exclude entries: -TD, SD,-TZ,-SZ, #1K, #2K, #3W, #4R, #6-R, #7-B, #8-G, #9-S.

To insert new and modify existing Exclude entries:

- a. Do one of the following:
    - To insert an entry, press **Ctrl + i (Edit/Insert)**. The Insert Excluded Steno dialog box displays.  
If you use the Allow Briefs with Numbers option select and you want to prevent any number bar number from being suggested, type # and press **Enter**.
    - To modify an entry, highlight the entry and press **Ctrl + m (Edit/Modify)**. The Modify Excluded Steno dialog box displays.
  - a. In the *Steno* field, type the steno character or steno combination to always exclude from Suggested brief forms. To indicate a final letter or letters, type a hyphen before the characters. CATalyst BCS uses the Steno Shortcut table when inserting steno into the *Steno* field. For example, if you type an "n," CATalyst BCS generates the steno "TPH" to indicate an initial "n."
- To delete an entry, highlight the entry and press **Delete**. Select **Yes** when prompted with the delete confirmation message.

4. Press **Enter (OK)**.
5. Press **Ctrl + s (File/Save)**.

## Search Brief It Pane

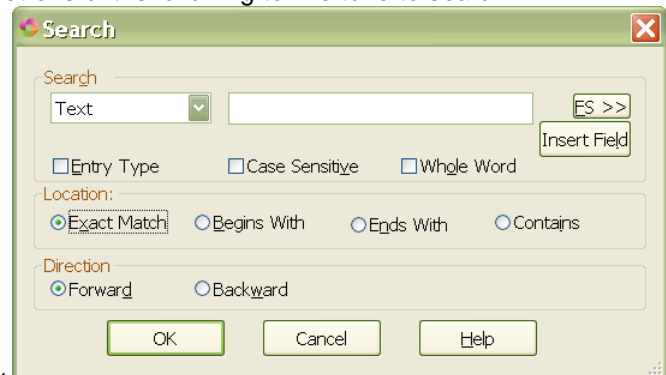

You can search the Brief It pane for briefs that might have appeared to fly by when the captioning session is fast or you just want to see if Brief It suggested a brief for a particular word or phrase. Perhaps you thought you saw what could be a great brief or you just love to see the briefs that are generated and want to review them after the captioning session. Search in Brief It allows you to quickly and easily find the brief you want. Whether you want to search when there is a commercial break to find the briefs you want to instantly incorporate, or you want to wait to the end of the session to find the perfect briefs, Brief It search is at your fingertips. You can search for either text or steno outlines.

### How to search:

- with your cursor focus in the Brief It pane, press **Ctrl + f**.
- click the Search icon (  ) on the Brief It toolbar, your cursor focus is in the Brief It pane.

### Search dialog box opens:

1. In the Search field (**Alt + c**), select whether you want to search for Text or Steno. To select Steno, click the down arrow in the Search field and select Steno. When searching for Steno, the steno characters always display regardless if you have selected the Show Phonetics option. For example, when you select Steno and type a "J" in the search field, the steno will display as SKWR regardless of whether your Brief It steno displays as SKWR or J.
2. Type the text or the steno outline to search.
  - Search defaults to a **Text** search. Select one of the following to fine tune to search.
    - Entry Type -- although available, most types do not apply to Brief It searches.
    - Case Sensitive -- allows you to search for occurrences of the text based on upper or lower case.
    - Whole Word -- allows you to search for occurrences of the text when it only the whole word.
    - FS>>> - displays the list of Format Symbols.
    - Insert Field - displays the list of fields.
  - Selecting Steno search.
    - When searching for steno, select the Partial Stroke option to search for only a part of a steno stroke/outline. For example, you know the suggested steno for the brief started with J/SKWR but you don't know the entire suggested steno outline. You can select Partial Stroke to find the entry or entries that start with or contains J/SKWR depending on the Location option you select.
3. To narrow your search, do **one** of the following:
  - Exact Match - searches for an exact match of the text or steno in the Search field.

- Begins With - searches for text or steno stroke that begins with the text or steno specified in the Search field.
  - Ends With - searches for text or steno stroke that ends with the text or steno specified in the Search field.
  - Contains - searches for text or steno stroke that contains the text or steno specified in the Search field.
4. To specify the search direction, do **one** of the following:
- Forward - searches forward from the current position in the Brief It pane. If it reaches the end and does not find the text/steno, a message displays that the text/steno was not found and *"Would you like to restart from the top?"* Select Yes to continue the search from the top of the Brief It pane or No to stop the search.
  - Backward - searches backward from the current position in the Brief It pane. If it reaches the top and does not find the text/steno, a message displays that the text/steno was not found and *"Would you like to restart from the bottom?"* Select Yes to continue the search from the bottom of the Brief It pane or No to stop the search.
5. Press **Enter** or click OK to begin the search.

#### Things to know:

- The Brief It pane must have cursor focus in order to search.
- If there are Live Suggestions in the Brief It pane, if appropriate, search may stop on a Live Suggestion.
- There are some options that are available for selection that may not apply to searching in the Brief It pane such as some Entry Type items, FS>>> within most briefs and Fields.

## Creating Personal Briefs

Personal briefs are entries you create prior to translation and are stored in the Briefs.txt file located in the System files case. A default Briefs.txt file exists for each user. Creating entries in the Briefs.txt file allows you to store words and phrases along with the brief form without placing them in a dictionary. Personal briefs display during realtime writing when the steno for the brief does not exist for an entry in a dictionary being used for translation.

The first time you write three or more steno strokes for a word or phrase contained in the Briefs.txt file, Brief It displays the Personal brief form. For example, you have a dictionary entry for Microsoft as PHAOEUBG/ROE/SOFT. At a seminar, you hear about the brief PHOFT for Microsoft. You are uncertain into which dictionary you want to place the entry but want to make it available for future jobs. You open Briefs.txt file and type: **Microsoft PHOFT**. The first time you write Microsoft as PHAOEUBG/ROE/SOFT during the job, the Brief It dialog pane displays PHOFT.

Access the Briefs.txt file in Notepad or WordPad:

- from the File menu, press **Alt + f, o, i, r (Open/List Table/Personal Briefs)**.
- in Manage Jobs, select **Tools/Options/Edit/Brief It/**. Select the **Personal Briefs** option.
- in Edit, select **Tools/Options/Brief It**. Select the **Personal Briefs** option.
- From the Brief It dialog pane. Click the Settings  button and then select the **Personal Briefs** option.

## Create a Personal Brief

1. Do either of the following:

### Add an Entry

- a. Create a blank line by pressing **Enter**. Each entry must be on a separate line.
- b. Type the word or phrase and press the **Spacebar** once.
- c. Type the steno for the brief form. To indicate a final letter or letters, type a hyphen before the characters. Use a slash (/) to separate multiple steno outlines.

### Delete an Entry

Highlight the word and press **Delete**. If a blank line remains, delete the blank line.

2. Press **Ctrl + s** (**File/Save**).
3. Press **Alt + f, x** (**File/Exit**).

The font type and size for the body and heading text in the BCS Personal Brief table are customizable. The font type and size applies equally to the body and heading text.

## Modify the Font:

1. Press **Alt + f, o, i, u** (**File, Open, List/Table, Personal Briefs**).
2. When the personal briefs displays, do either of the following:
  - If the Dictionary/List Toolbar (  ) is displaying, go to Step 3.
  - If the Dictionary/List Toolbar is not displaying, right click a toolbar and select Dictionary/List Toolbar.
3. Do any of the following:
  - Click the Font style icon (  ) to change the font type.
  - Click the Font size icon (  ) to change the font size.
4. Closing the Personal Briefs table saves the font change information. If you have made other changes, you will be prompted to save your changes.

## Exclude Common Words

Brief It does not suggest briefs with certain words and punctuation. The CommonWords.txt file contains a list of words that Brief It does not consider when looking for words and phrases for brief suggestions. If a phrase is written that begins or ends with a word from the CommonWords.txt file, no brief is suggested. For example, by default the word "about" is in the CommonWords.txt file. When a phrase is written that begins or ends with the word "about," and no Reminder or Personal brief exists for the word or phrase, Brief It does not suggest a brief.

Brief it does not suggest a brief if a question mark or exclamation is followed by a space in a phrase. When Brief It encounters a phrase with a period (.) followed by two spaces, Brief It does not suggest a brief. For example, "...high impact. Exercise..." When Brief it encounters a phrase with a period (.) followed by one space, Brief It may suggest a brief. For example, titles with surnames such as Mr. Washburn, Dr. Skaare, Ms. Kurkowski, etc. This is a built-in feature of Brief It and does not require selecting an option.

The CommonWords.txt file is automatically created the first time you translate with the [Brief It](#) or [Case Prep](#) feature. You can modify the file.

Access the CommonWords List:

- from the File menu. Press **Alt + f, o, i, c** (**Open/List Table/CommonWords**).
- from the Brief It dialog pane. Click the Settings  button and then click the **CommonWords**.
- in Manage Jobs. Select **Tools/Options/Edit/Brief It**.
- in Edit. Select **Tools/Options/Brief It**.

## Modify the CommonWords List

The CommonWords.txt file opens in Notepad or WordPad.

1. Do either of the following:

### Add an Entry

- a. Create a blank line by pressing **Enter**. Each entry must be on a separate line.
- b. Type the word. There is no limit to the number of entries.

### Delete an Entry

Highlight the word and press **Delete**. If a blank line remains, delete the blank line.

2. Press **Ctrl + s** (**File/Save**).
3. Press **Alt + f, x** (**File/Exit**).

## Brief It Keyboard Commands

There are several keyboard commands available for [assignment](#) with the Brief It feature. Some of these keyboard commands are ideally designed for captioning use by pressing the assigned key combination or recording a macro and invoking it using an [AccelerWriter](#) from your writing machine. The Brief It keyboard commands include:

### Brief It [Keyboard Map](#) Functions:

#### Brief It - Clear/Recycle Unused Briefs

Whether the captioning session was fast and furious or your file contains multiple speakers – there may be times when you want to clear out all the unused briefs in the Brief It pane to reduce clutter or free up the steno outlines for other suggestions later in the session. A Clear/Recycle Unused Briefs command is available when right clicking in the Brief It pane or assigning the command to a key combination in a Keyboard Map. The Clear/Recycle Unused Briefs command removes all unused brief suggestions and Personal Briefs from the Brief It pane. The unused briefs are recycled and made available for another word or phrase in the same captioning session. Reminders and Live Suggestions are not affected by this command and remain in the Brief It pane after using the Clear/Recycle Briefs command.

For example, let's say you have back to back interviews with different speakers. The speakers are talking a mile a minute to ensure they get all interviews completed. You find yourself hanging on for dear life as you caption the first speaker. The Brief It pane is full of suggested briefs that you didn't use. You are about to start the second speaker's interview, so you use the Clear/Recycle Briefs command to remove all the unused suggested briefs/personal briefs and recycle them so they are available for brief suggestions for the next witness. This command is available in captioning sessions and editing caption files.

### To use the Clear/Recycle Unused Briefs command:

- Position your cursor in the Brief It pane. Right click and select Clear/Recycle Unused Briefs. The unused brief suggestions and personal briefs are removed from the Brief It pane.
- The Clear/Recycle Unused Briefs command is available in the keyboard map function. You can assign the function to a key combination and/or record it as part of macro and assign it to a dictionary definition to invoke it from your writer during realtime.

### Brief It: Filter

Filter the display of the Brief It dialog pane. How the pane filters depends on the Brief It Filter command invoked. It is necessary to assign a key combination to each filter command:

- Brief It – Filter Personal Only
- Brief It –Filter Reminders Only
- Brief It –Filter Suggestions Only
- Brief It –Filter Used Only
- Brief It –Unfilter
- Live Suggestions

### Brief It: J-define Current

Insert the current brief into the job dictionary while during captioning. This keyboard command is designed for use during captioning. To J-Define a Suggested or Personal brief in the History window, right click the brief and select *J-Define Suggestion* from the menu.

### Brief It: New Suggestion for Current

Reject the most recent brief suggestion and generates a new brief. This keyboard map command is available during captioning and in the History window, but only applies to the most recent brief. To have Brief It make a new suggestion for a brief, right click the brief and select *New Suggestion* from the menu.

### Brief It: Reject Current

Reject the most recent brief suggestion. This keyboard map command is active during captioning and in the captioning window but only applies to the most recent brief translation and while editing but only affects the most recent brief. When you use the reject current or reject suggestion commands, the steno and text brief combination will not be suggested again during the current realtime session. To reject a brief suggestion, right click the brief and select *Reject Suggestion* from the menu.

### Send Last Brief to Cat Scratch

Send the last brief in the Brief It pane directly to the Cat Scratch locked Steno/Text section. If the Brief It [Show Phonetic Steno](#) option is selected, briefs sent to Cat Scratch display phonetically.

### Send Selected Brief to Cat Scratch

Highlight a brief in the Brief It pane and send it directly to the Cat Scratch locked Steno/Text section. If the Brief It Show Phonetic Steno option is selected, briefs sent to Cat Scratch display phonetically.

### **Suggest a Brief**

Force Brief It to suggest a brief during captioning or in the History window. This may be helpful when preparing for a particular type of job with unfamiliar terminology or subject matter.

### **Text List Brief It**

Displays the Open dialog box for the Edit feature, Text List Brief It. Brief It analyzes the selected text file and creates Suggested briefs based on your Brief It options. Suggest a Brief can be used on text only or steno and text based words. If you have a list of words, core list or ASCII file of terminology, you can have Brief It analyze the words as preparation for an upcoming job.

### **Transcript Brief It**

Initiates the Transcript Brief It feature that analyzes the current transcript containing underlying steno and creates Suggested briefs based on your Brief It options. You may want to use this feature to generate briefs for a current captioning session that is related to a previous one.

### **View Brief It Pane**

Toggle the display of the Brief It dialog pane. If the Brief It dialog pane is closed when you invoke this command, the Brief It dialog pane displays. If the Brief It dialog pane is open, the command closes it. If the Brief It dialog pane is set to Auto Hide when you use this keyboard map command, it closes.

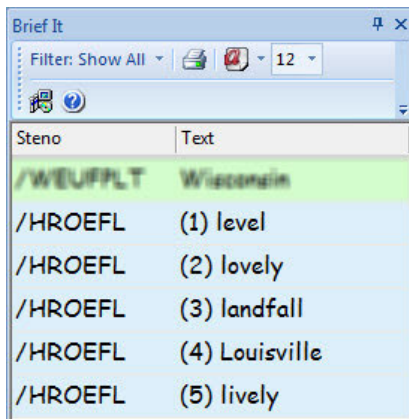

## **Live Suggestions**

Live Suggestions is an optional captioning feature that automatically offers translation suggestions when an untranslate(s) displays in the History window. You have the power to review the suggestions and to pick the right one, replace or global, to fix the untranslates. At least four "translates" need to be written after the untranslate before a Live Suggestion will be offered. Two to five suggestions will be offered in the Brief It pane in a blue background. The feature uses a similar \*suggestion\* method as Global Suggest but displays the suggestions in the Brief It pane to view at a glance as you are captioning although **it is strongly recommended that you don't select a Live Suggestion until the untranslate is well out of the Caption Preview window**. The feature looks at the individual untranslated steno and steno outlines before and/or after the untranslate to offer suggested translations. The Live Suggestion displays the steno outline, the number of the Live Suggestion and the suggested translated text. When you see a Live Suggestion that you want to use, there are translation commands to do a replace or global with one of the Live Suggestions. You can also do a keyboard command to replace or global with one of the Live Suggestions or highlight a Live Suggestion, right click a Live Suggestion, select to Replace with this Suggestion or Define this suggestion. You can also double click a Live Suggestion to replace with that suggestion.

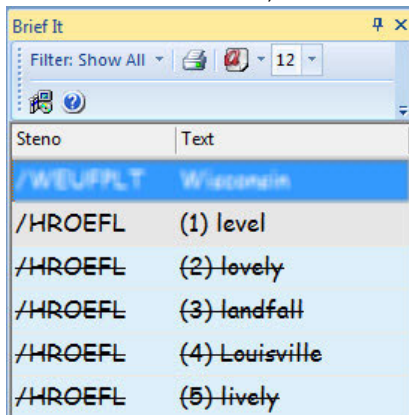

The Live Suggestion feature ignores the steno mark (character created by pressing the Mark button on your steno machine) alone or before/after an untranslate and will not include it as steno for a Live Suggestion suggestion.

You can customize the [Live Suggestion options](#), assign key combinations to [replace or define](#) the untranslate and/or text with a suggestion. [Translate commands](#) are available to global a Live Suggestion on the fly.

For example, the steno /HROEFL was written instead of HREFL for the word level. With Phonetic Translation turned on, the steno outline appeared as LOEFL in the captioning session. Live Suggestions displayed following five suggestions for the steno outline /HROEFL with 'level' being the number one suggestion.

Once 'level' is selected, the following displays:

## Live Suggestion Options

### Live Suggestion options:

There are a few Live Suggestion options available in the Realtime Aid Option dialog box.. From Manage Jobs, select Tools, Options, Edit, Brief It. If you are in a captioning session, select Tools, Options, Pane Options and then Brief It or select View, Panes, Brief It, on the Brief It pane toolbar, you can click the Options (  ) icon and the Realtime Aids Options dialog box displays. [Brief It options](#) are listed at the top of the Realtime Aid Option dialog box and Live Suggestions options are listed at the bottom. These settings affect both regular CATalyst translation and CATalyst BCS captioning.

**When using Live Suggestions in CATalyst BCS, it is strongly recommended that you don't select a Live Suggestion until the untranslate is well out of the Caption Preview window.**

### Insert Oops when replacing with a live suggestion:

Select this option to automatically insert an [Oops](#) (category 10 - CATalyst inserted format symbol) when replacing untranslate/text with a Live Suggestion. If you want to review each Live Suggestion replacement you made, you can then [scan](#) to the Oops format symbol or display the [Hotspots](#) pane to show all occurrences of the Oops format symbols along with context.

### Number of suggestions:

Select the maximum number of Live Suggestions for an untranslate. A valid numbers 2 - 5. Although you may have 5 selected, you may not always see 5 suggestions for an untranslate. Depending on the untranslate, surrounding steno outlines and dictionaries being used to translate, Live Suggestions may suggest less than 5.

**Dictionary Defines go to:**

Job Dictionary, Case Dictionary, Personal Dictionary/Update Area

Select the destination dictionary you want a defined suggestions to go to when using the Define With LS1 - LS5 commands. When this option is set to Case dictionary, if the transcript is not in a case, the destination dictionary is the job dictionary. When defining a Live Suggestion, the global is applied to the entire file. When defining with a Live Suggestion, the definition is placed in the job's Global Table in addition to the respective dictionary. If your [Dictionary Options](#) are set to have D-defines go to the Update Area, then if this option is set to Personal Dictionary/Update Area, the Live Suggestion definitions will go to the Update Area.

**Show \*translated\* text as first Live Suggestion**

By default, this option is active and Drag/Drop, Suffix Drag and phonetic translated text will be the first choice in the Live Suggestion list. If Spell Check thinks the \*translated\* text is misspelled and this option is selected, the misspelled translation will **not** be offered as the first suggestion.

If you do not want the Drag/Drop, Suffix Drag or phonetic \*translated\* text offered in the Live Suggestion list, deselect this option.

**Live Suggestions favor: Quality    Balanced    Speed**

- Quality settings are designed for faster computers. Using this setting, Live Suggestions will spend a little more time looking for a suggestion and will search more steno outlines for a longer match.
- Balanced is the default setting. Live Suggestions takes less time and fewer steno outlines than the Quality option to look for suggestion.
- Speed settings are designed for slower computers. Using this setting, Live Suggestions will take minimal time searching for a suggestion and minimal steno outlines for the longest match. If you are running Case CATalyst on older hardware and your realtime is a little sluggish and you want to use Live Suggestions, you may want to try this setting.

**Drag/Drop Analysis**

Drag/Drop Analysis is a CATalyst BCS translate option. When active, BCS analyzes steno outlines during translation. When no dictionary definition is found for a steno outline, it is checked against identified characters (keys) that you have a tendency to drag (push) or drop (leave out) when writing a correct steno outline. If BCS determines that adding one of the dragged letters to or removing one of the dropped letters from the steno outline, it can locate a match to a definition in any of the dictionaries selected for translation, the untranslate displays as a word. You must [specify](#) the keys you drag or drop in Caption Translate Options.

When applying a dragged or dropped letter results in an untranslate becoming a word, CATalyst BCS puts the translated word in the user defined color for Drag/Drop. The word is "scannable" and you can define or replace the word the same as a visible untranslate.

CATalyst BCS only examines steno outlines that have characters written on the same "side" as the dragged letter. For example, the final L is a dragged letter. The steno outline STK is written but no analysis occurs because no final letters were stroked. However, if PHROEULD is stroked, analysis occurs because L is a final letter on the right bank.

If you identify multiple characters for dragged or dropped, CATalyst BCS looks for a match with the written steno outline and each identified dragged/dropped character. For example, if you specified the final L and D as "dragged" characters, CATalyst BCS first tries to find a match with the steno outline and the final L. If no match is found, then CATalyst BCS tries to find a match with the steno outline and the final D.

If applying a dragged or dropped letter results in an untranslate becoming a steno outline that invokes a translation, Auto Include or AccelerWriter command, no analysis occurs and the steno outline remains

an untranslate. However, if the Drag/Drop translation results in a [Suffix](#), [Prefix](#) or [Glue](#) translate commands, CATalyst BCS applies the appropriate translation.

If applying a dragged or dropped letter results in a steno outline untranslate that would create a Format Symbol with text, conflict or number keyword, analysis occurs and the steno outline along with the dragged or dropped letter translates into the Format Symbol and text, conflict or number conversion. The translated text displays in the color selected for text or the color selected for conflicts. For example, if the result of the Drag/Drop analysis is a conflict, CATalyst BCS applies EZ Choice and Second Choice conflict resolution.

You may want to try adjusting your steno keyboard contacts before using this feature. For more information on key contact adjustments, see your writer documentation.

## Identifying Characters for Drag/Drop Analysis

To use the Drag/Drop Analysis option, you must identify the characters (keys) on the writing machine that you have a tendency to drag (push) or drop (leave out) when writing a steno outline.

You may want to try adjusting your steno keyboard contacts before using the Drag/Drop Analysis feature. To make adjustments to your steno keyboard refer to your writer documentation.

## Modify Dragged and Dropped Keys

1. Do one of the following to display the Caption Translate Options dialog box:
  - In the Broadcast Captioning Translate dialog box, select **Options**.
  - From the BCS screen, press **Alt + p, o (Setup/Options)**.
2. Press **Alt + L (Details)**. The Dragged/Dropped Letter Analysis dialog box displays.
3. Make entries in the fields.

### Keys I tend to Drag

Identify the letter or letters you tend to drag with other steno strokes. Do **one** of the following:

- Type the letters. You must put a hyphen before a letter to indicate its position on the right side of the keyboard. For example –L.
- Click the letters on the sample keyboard. Once a letter is selected, the sample keyboard indicates the selection by turning the letter blue.

### Keys I tend to Drop

Identify the letter or letters you tend to drop from steno strokes. Do **one** of the following:

- Type the letters. You must put a hyphen before a letter to indicate its position on the right side of the keyboard. For example –B.
  - Click the letters on the sample keyboard. Once a letter is selected, the sample keyboard indicates the selection by turning the letter blue.
5. Press **Enter (OK)**. If not already selected, CATalyst BCS automatically checks the Drag/Drop Analysis option.
  6. Press **Alt + a (Apply)** to apply the changes.

## Exclude Caps

Exclude Caps is a CATalyst BCS Translate option available when EZ Link is active. When selected, CATalyst BCS does not apply the EZ Link rule to an all capped or mixed case word with a suffix ending in "s" that is written immediately after the word. CATalyst BCS instead attaches the suffix directly to the word without altering the root word. For example, you write, "The Brady<Suffix>s went on vacation..." The EZ Link result is "Bradies." When Exclude Caps is active the result is "Bradys".

## EZ Choice

EZ Choice is a BCS translate option. When active, CATalyst BCS resolves conflicts during translation based on your previous conflict selections when occurring in similar context. When you resolve a conflict, the conflict choice plus the two words preceding the conflict are entered into the Conflict Database file. EZ Choice then uses the Conflict Database to determine the conflict resolution in future jobs.

EZ Choice selected conflicts display on the Edit screen in the same color as your conflicts. When your cursor is positioned immediately before the EZ Choice selected conflict, the original conflict displays on the Status bar in the lower right hand corner of the screen. When your Scan For Options are set to scan to conflicts, the cursor stops on EZ Choice selected conflicts. To confirm (final resolve) the EZ Choice selection, press Enter. You can also select a different conflict choice by pressing the number for the corresponding conflict. Once you press Enter or select a different conflict, the selection is confirmed. When confirmed, CATalyst BCS changes the text from the conflict [color](#) to text color.

When Automatic Number Conversion applies to any part of a Second Choice chosen conflict, CATalyst BCS automatically confirms the conflict selection. You can also change the Advanced Translate [option](#), *Automatically resolve EZ Choice/Second Choice Conflicts*, to have CATalyst BCS automatically confirm the EZ Choice conflict and prevent Scan from stopping on the confirmed conflicts. When CATalyst BCS automatically confirms the EZ Choice selection, the selection information is stored in the EZ Choice conflict database.

EZ Choice selected conflicts that contain a prefix or suffix display with a space between the root word and the prefix or suffix until confirmed. Once you confirm the EZ Choice selection, CATalyst BCS removes the space. For example, you have a conflict between "go" and <Suffix>ing. You write STOP/G which translates as: stop ^ go ^ <Suffix>ing. You select "ing" resulting in "stopping". The next time you translate using EZ Choice or Auto-Conflict and the same conflict situation occurs, CATalyst BCS displays "stop ing" with "ing" in your conflict color. When you select and confirm the "ing" CATalyst BCS displays "stopping."

EZ Choice selected conflicts that contain a format symbol display the format symbol with a space between the format symbol and the word. Once you confirm the EZ Choice selection, CATalyst BCS applies the format symbol.

When exporting to RTF/CRE, unconfirmed EZ Choice selected conflicts export in the original conflict form, so a scopist, for example, can view the original conflict. Once you confirm the EZ Choice selected conflict, CATalyst BCS exports it as normal text. To confirm all the EZ Choice selected conflict choices at one time, use Resolve All Chosen Conflicts. Resolve All Chosen Conflicts also resolves all Auto-Conflict selected conflicts.

You can use [Auto-Conflict](#) in conjunction with EZ Choice. When EZ Choice is active, CATalyst BCS first checks the conflict database. If the conflict is not in the database, then Auto-Conflict resolves the conflict.

EZ Choice is accessible from the Session Information window during captioning.

## EZ Link

EZ Link is a CATalyst BCS translate option. When active, BCS attaches prefixes and suffixes to the root word during translation applying the rules of spelling in an attempt to correctly spell the combined word. BCS first checks the Spell Check wordlist for a match. If no match exists then CATalyst BCS attaches the combined root word and suffix without any spelling changes. For example, you write STOP /-G. The dictionary define for the steno outline STOP is "stop" and -G is {Suffix}ing. The result is "stopping". You must define the prefix and suffix using the {Prefix} and {Suffix} symbols.

CATalyst BCS does resolve able/ible and er/or endings. For example, a dictionary entry {Suffix}er exists. You write the steno stroke for "tract" followed by the stroke for {Suffix}er. The strokes translate as "tractor" unless a dictionary entry exists as "tracter".

You can use the [Prefixsuffixrules.ini](#) file to enhance prefix and suffix handling when using the EZ Link translate option. The Prefixsuffixrules.ini file is located in your System Files case in your user name.

If you select the [Exclude Caps](#) option, EZ Link attaches the suffix without applying the EZ Link spelling rules to root words defined as all capped or mixed case.

## Hold Strokes

Hold Strokes is a CATalyst BCS translate option. When active, steno outlines are held before displaying the translated text on the live display. CATalyst BCS holds the steno until it finds the longest dictionary match plus the specified number of additional strokes. Once a longest match is found, CATalyst BCS re-translates the steno outlines to display the longest match text. If no steno is written for a specified amount of seconds, then the translated text or steno on the screen displays regardless of the longest match. The default is to hold strokes for 5 seconds.

When outputting, the Longest match plus X strokes affects the amount of strokes you can delete. If you have this option set to 4, you can delete 3 steno strokes because once you write the Delete stroke, it counts as the 4th stroke. If you have this option set to 7, you can delete 6 steno outlines.

Use the Hold Strokes option when you want a "smooth" translation. For example, you do not want partial strokes and misstrokes to display on the realtime screen or on the receive system when stroking a multiple stroke outline or phrase that would result in a "re-translation" once the longest match is reached.

If [Automatic](#) Number Conversion is active, CATalyst BCS automatically holds steno outlines until the last stroke.

## Hold Strokes to the Live Display

### Longest match plus \_ strokes

Check this box to hold strokes to the live display. Enter the number of strokes you want to hold before displaying the translated text. Valid entries are **0-9**.

When active, Case CATalyst holds the steno outlines before displaying the translated text on the Caption Preview window. Case CATalyst holds the steno until based on the setting in the Longest match plus X strokes option. Once the number of strokes written exceeds the Longest match plus X strokes option, Case CATalyst pushes the longest match text to the display. If no longest match is found, translation holds the strokes written for the specified amount of seconds, then pushes any translated text or steno on the screen.

For example, let's say your Longest match plus X strokes option is set to 3 and the Held for X seconds option is set to 6. You write a four stroke word which is a longest match plus three more strokes. When the longest match plus the additional strokes are written, CATalyst pushes out the translation. If translation isn't done with the longest match, it will hold back the translation for the X number of seconds specified.

### Held for \_ seconds

Enter the number of seconds you want to wait before displaying the translated text or steno outlines when there is no additional steno written. Valid entries are **0-9**.

## Ignore "and"

Ignore "and" is a CATalyst BCS translate option that applies to [Number Conversion](#) and [Number Trigger](#) definitions. When active, the word "and" is ignored when it occurs between two numbers. Numbers before and after the word "and" are considered as one number for number conversion. For example, if you write one hundred and 50 and then write a dollar number conversion stroke, the result is \$150. If Ignore "and" is not active, the result is one hundred and \$50.00.

If Ignore "and" is active during translation and the word "between" immediately precedes a number series, such as "between 50 and 100 minutes", and you write a dollar number conversion stroke, CATalyst BCS recognizes the word "and". The result is "between 50 and \$100.

The Ignore "and" option does not affect the [Automatic](#) Number Conversion feature.

## Ignore Commas

Ignore Commas is a CATalyst BCS translate option that applies to [Number Conversion](#) and [Number Trigger](#) definitions. When active, CATalyst BCS ignores any commas that separate a set of numbers and considers the numbers as a group for the conversion. For example, if you write 303, 503,143 and then write the social security number conversion stroke, the result is 303-50-3143. If Ignore Commas is not active, the social security number conversion does not take action since CATalyst BCS considers only the last three numbers for the conversion. A social security number conversion requires 9 digits or number words before taking action.

If Ignore commas is active during translation and the word "between" immediately precedes a number series, such as "between 4,800 and 15,000 items", and you write the social security number conversion, CATalyst BCS does not take action. The result is "between 4,800 and 15,000 items".

The Ignore Commas option does not affect the [Automatic](#) Number Conversion feature.

## Ignore Periods

Ignore Periods is a CATalyst BCS translate option that applies to [Number Conversion](#) and [Number Trigger](#) definitions. When active, BCS ignores any period that separates a set of numbers and considers the numbers as a group for the conversion. For example, ...fifty. Twenty-four people were...

The Ignore Periods option does not affect the [Automatic](#) Number Conversion feature.

## Ignore Word Numbers

Ignore Word Numbers is a CATalyst BCS translate option that applies to [Number Conversion](#) and [Number Trigger](#) definitions. When active, BCS ignores words that are numbers for the conversion. For example, you write "five 50 dollar bills" and a dollar number conversion. The result is five \$50 dollar bills.

The Ignore Word Numbers option does not affect the [Automatic](#) Number Conversion feature.

## Intelligently Punctuate Quoted Words

Intelligently Punctuate Quoted Words is a CATalyst BCS translate option which places a period, comma, or apostrophe s written after a word or phrase that is defined surrounded by quotes, inside the quotes. For example, the captioning material is about the movie Spiderman 2. You have a dictionary entry defined as Spiderman 2 with quotes: "Spiderman 2" When you write the steno outline for "Spiderman 2" followed by a period, the caption output is "Spiderman 2."

To have an apostrophe work with this option, you must have a dictionary definition defined as: 's. The definition cannot contain format symbols.

## Phonetic Translation

Phonetic Translation is a CATalyst BCS Translate option. When active, CATalyst BCS phonetically translates steno outlines when no match is found in any dictionary used for translation. This prevents the display of untranslates on the captioning screen. Phonetic translation is based on your selection for the Advanced Translate option, [Phonetic untranslates display as words](#). You can select to match steno outlines with the text equivalent entry in the [Phonetic Table](#) or to translate single stroke untranslates using algorithmic logic for the intended pronunciation. Using the Phonetic Table is the default.

You can create a dictionary definition to invoke the Phonetic Translation option from your writing machine using the [Toggle Phonetic Mode](#) translate command. A steno outline defined as {Toggle Phonetic Mode} must be in a dictionary used during captioning.

The Phonetic Translation option is accessible in the Caption Translate [Options](#) dialog box when beginning a CATalyst BCS session or from the Setup menu during a captioning session. It is also available in the Session Information window during captioning.

Phonetically translated words appear in the selected untranslate color. If your [Scan For Options](#) are set to stop on untranslates, then **F8 (Scan)** and **Shift + F8 (Scan Backward)** stop on phonetically translated words.

## Remove Single Empty Paragraph

Remove Single Empty Paragraph is a CATalyst BCS translate option that suppresses the blank line generated when you write a steno outline defined with a paragraph style followed by another stroke defined with a paragraph style at the beginning of the definition. For example, you have a period defined as period <New Line Paragraph> and a speaker identification as <New Line Paragraph>>>. You write period and then the speaker identification. Catalyst BCS does not generate a blank caption line even though there are two New Line Paragraph format symbols in a row. If the option is not active, the result is a blank caption line between the period and the speaker identification.

## Replace Q&A With >>

Replace Q&A With >> is a CATalyst BCS translate option that converts Question and Answer format symbol <New Line> to chevrons (>>). You may want to use this option if you do both reporting and captioning. This allows you to use your dictionaries in either Case CATalyst or CATalyst BCS.

## SecondChoice

SecondChoice is a Translate option. When this option is active and you select a conflict choice, CATalyst BCS looks in a system file to identify the possible parts of speech for the word before and after the conflict. CATalyst BCS places the conflict choice along with the system file information in the SecondChoice conflict database. When the same parts of speech appear before and after the same conflict in future translations, CATalyst BCS selects the same conflict choice.

For example, in the conflict "Did you ^ Phillip ^ fill up the car on the way?" you select the second conflict. The word prior to the conflict is a noun. The word after the conflict is an article. CATalyst BCS records the second choice selection for this conflict when it occurs between a noun and an article.

SecondChoice selected conflicts display on the screen in the same color as your conflicts. When Scan For Options are set to scan to conflicts, using Scan Forward and Scan Backward stops the cursor on SecondChoice selected conflicts. To confirm the SecondChoice selection, press Enter or select a different conflict choice by pressing the corresponding conflict number. When Automatic Number Conversion applies to any part of a Second Choice chosen conflict, CATalyst BCS automatically confirms the conflict selection.

You can use SecondChoice in conjunction with [EZ Choice](#). When EZ Choice is active, EZ Choice resolves the conflict. If no match is found in the EZ Choice conflict database, then SecondChoice resolves the conflict.

CATalyst BCS creates a Second Choice Conflict Database in your System Files case even if you do not select the SecondChoice conflict resolution option. The SecondChoice conflict database is user specific. The SecondChoice Conflict Database file cannot be edited.

**IMPORTANT:** SecondChoice does not analyze any portion of the sentence for grammar. CATalyst BCS determines the parts of speech for the words before and after the conflict by looking the word up in a system file.

## Smart Quotes

Smart Quotes is a CATalyst BCS translate option that allows you to use one steno outline to create opening and closing quotes that append to a word or punctuation. During translation, CATalyst BCS looks for the steno outline you designated for quote. If it finds a steno outline for quote, it looks for another existing steno outline for quote that occurs before the one it is currently reading. When no previous steno outline for quote is found, an open quote is automatically created. When a previous quote is found, a closing quote is created. For example, you create a dictionary entry for quotation mark using the steno outline: KWS defined as " You write KWS/TKPWAOD/KWS during the job. The result is "good".

If you stroke an opening quote and create a new paragraph style without stroking another quote, CATalyst BCS automatically adds the ending quote at the end of the paragraph.

To use the Smart Quote feature, the dictionary definition for quote must contain only the quote (") symbol. Smart Quote does not apply when text or format symbols exist in the definition.

## Smart Parentheses

The *Smart Parentheses* option is available on Caption Options tab of the Options dialog box. When this option is selected, you can write one stroke for the opening parenthesis and the same stroke for the closing parenthesis. For example, let's say the captioner needs to write text that is surrounded by parentheses. With this option selected, the captioner writes PARPB defined as an open parenthesis, *writes this text* and then writes PARPB again. The result is (writes this text).

This option works the same way for brackets [ ] also. With the Smart Parentheses option selected, writing the open bracket followed by text and a new paragraph defined with the {Caption Period} translate command will result in CATalyst adding a smart closing bracket before the paragraph. No ending punctuation will follow the closed bracket. To get this result, don't write the closing bracket. For example, let's say you want to write text that is surrounded by brackets. With this option selected, you could write PWRABGT defined as an open bracket, *Intermission* and then write the paragraph defined with {Caption }Period (speaker in this example). The result would be [Intermission]  
>>SPEAKER

If for some reason you want ending punctuation after the closing bracket, simply write the same steno as the opening bracket and then write the steno for your change of paragraph.

If you want to use this option, you need to have only one dictionary definition for an opening parenthesis "(" or open bracket "[" and you write this same stroke for opening and closing parenthesis or bracket. No other punctuation or format symbols can be defined with the opening parenthesis. When you select this option, you would write the opening parentheses or bracket, write the text and write the same stroke used for the opening parentheses or bracket and Case CATalyst will automatically know it is a closing paren or bracket. If the opening parentheses or bracket is written and then a new paragraph style (that contains the {Caption Period} translate command) is written, a close parentheses or bracket will automatically be inserted at the end of the current paragraph and then the new paragraph is inserted.

To select or deselect the Smart Parentheses option, do the following:

1. Open the Broadcast Captioning Translate dialog box.
2. Press **Alt + o** or click the Options button.
3. Select or deselect the Smart Parentheses option.
4. Make any other changes and click **OK**.

## Squish Defined Numbers

Squish Defined Numbers is a CATalyst BCS translate option. When active, numbers defined in the dictionary automatically translate with no space between them. For example, definitions exist in the dictionary for 1, 2, 3, and 4. You write 1234. With Squish Defined Numbers selected, the result is 1234. Without the option, the result is 1 2 3 4.

When Squish Defined Numbers is not active, any defined numbers translate with a space between them. Undefined numbers always translate with no spaces.

The Squish Defined Numbers option does not affect the [Automatic](#) Number Conversion feature.

## Suffix Drag

Suffix Drag is a CATalyst BCS translate option. When active, BCS translates, by default, steno outlines accidentally stroked with a dragged suffix letter -G, -S, or -D as a suffix or suffix letter tucked inside a steno outline. For example, -D is defined in your dictionary as <Suffix>ed. You normally write the word "stopped" as STOP/-D. During a captioning session, however, you accidentally drag the final D into the first stroke, resulting in STOPD. With Suffix Drag active, CATalyst BCS translates the word as "stopped". In another example, you have a dictionary definition for KHAT with the "-G" defined as <Suffix>ed. You stroke KHAGT. Since "-G" is not the last letter of the stroke, Suffix Drag does not apply. With the Tuckable option active for the steno outline "-G," if CATalyst BCS does not find a definition for KHAGT in the dictionary, KHAGT translates as "chatting."

Suffix Drag only applies to one-stroke words in which a steno character can be added as a suffix. [Suffix Drag options](#) allow you to add other steno characters you want CATalyst BCS to consider a suffix. The [Plural Endings Options](#) allow you to use the final S, final Z or both for plural endings. To confirm the combined words are spelled correctly, set the Suffix Drag Spell Check option for the steno outline. When CATalyst BCS applies Suffix Drag, the translated word displays in the user selected [color](#) on the Edit screen.

If you are also using the [Drag/Drop Analysis](#) translate option, Drag/Drop takes priority over Suffix Drag.

## Suffix Drag Options

Use Suffix Drag Details to add steno outlines for Suffix Drag to recognize as a suffix, activate the Tuckable option for a steno outline and set Spell Check to confirm the spelling of combined words.

To access Suffix Drag Details:

1. Press **Alt + u, t (Functions/Translate & Edit)**. The Translate dialog box displays.
2. Press **Alt + p (Options)**. The Translate Options dialog box displays.
3. Click the Suffix Drag **Details** button. The Suffix Drag Options dialog box displays.
4. Make entries in the fields. When finished, click **OK**.

### Steno

Type the steno outline for the suffix that, when written with a defined steno outline, translates as a combined word. Multiple steno characters are allowed, such as -GS or -GZ used for "ings."

### Suffix

Type the text for the suffix. For example, if the steno is -D, type **ed**.

### Tuckable

Select **Yes** to consider the steno as a suffix when it is not the last character in the outline. Select **No** to consider the steno as a suffix only when it occurs at the end of the outline.

### Spellchecked

Select **Yes** to have Suffix Drag verify the newly combined word with Spell Check to confirm the combined word is spelled correctly. Select **No** to have Suffix Drag combine the word without checking the spelling.

## Translation Delay

Translation Delay is a CATalyst BCS translate option. When active, Translation Delay prevents the Delete command stroked, such as asterisk, from deleting strokes after the specified number of milliseconds. This prevents words and strokes from being deleted after they have been sent to the encoder. All pending text is held until you write a stroke other than a Delete stroke command.

A recommended initial setting is 1000. Write with this setting and then adjust the setting according to your writing style. You can use Translation Delay when Hold Strokes is active.

## Set the Translation Delay

### Translation Delay

Check this box to prevent the Delete command from deleting strokes after the specified number of milliseconds have expired. A Delete command written after the specified milliseconds is ignored.

**ms**

Enter the number of milliseconds Delete strokes are active. Delete strokes written after the specified number of milliseconds are ignored. Valid entries are 0-10000.

## Translate Statistics

Translate Statistics is CATalyst BCS translate option. When this feature is active, the Caption Steno dialog box automatically displays during translation. It provides information about the current captioning session. To display statistics, in the Caption Translate Options dialog box, select **Translate Statistics**.

Use the Translation Statistics feature to toggle the display of the Caption Steno statistics dialog box On and Off. Press **Alt + v, s, n (View/Show/Translation Statistic)**. You can also [set](#) the transparency and have CATalyst BCS remember screen placement of dialog boxes.

## TrueStroke Drag/Drop

TrueStroke Drag/Drop is a Translate option that works with TrueStroke data that is created when using a Luminex or Diamante steno machine via a USB or WiFi connection or Wave steno machine via a USB connection. When active, CATalyst BCS analyzes steno outlines during captioning using [TrueStroke](#) data located in the Steno X-ray2 (.sgxr2) subfile. When an untranslate results during realtime captioning, because no dictionary definition is found for a steno outline, CATalyst BCS analyzes the TrueStroke data against your writing to determine if there is a steno character that has been dragged or dropped. When a match to a definition is found in any one of the dictionaries selected for captioning, the untranslate becomes a word. The translated word displays with the [user defined](#) color for Drag/Drop. While editing, if TrueStroke Drag/Drop has translated the untranslate correctly, you can press Enter to confirm the translation.

For example, you have STAF defined in your dictionary as "staff." You wrote "STAF" but the TrueStroke data indicates that you dragged the "E" resulting in "STAEF." The "E" registered but was lighter than the other letters. Since you do not have a dictionary definition for "STAEF," it translates as "staff" and displays in the color designated for Drag/Drop.

TrueStroke data contains information about the timing, direction of travel and velocity of each steno key in every steno outline. The data is written to the .sgxr2 subfile on the Luminex and Diamante Data SD card or to the Wave memory along with the steno note file when the TrueStroke option is active on the writing machine. When you are captioning via USB cable or WiFi connection, the TrueStroke data is automatically sent to the job subfile, Steno X-ray2.

## Use Update Area for Translation

CATalyst BCS, by default, places all new D-Defines made during a captioning session or while editing a caption file into the Personal Dictionary. The Update Area is an optional holding area to store new [D-Defines](#) for review before moving the entries into the Personal Dictionary. If you want your D-defines to go to the Update Area so you can review them before putting them in your Personal Dictionary, open your Personal Dictionary, select Tools and then [Options](#) to change the *D-Defines go to* option to read: *D-Defines go to Update Area*. The Update Area is stored in the System Files case.

**IMPORTANT:** If your BCS Dictionary Options have D-defines going to your Update Area, make sure you review you Update Area regularly and add the entries you want to keep to your Personal Dictionary. Also, make sure you back up your Update Area when you do your regular weekly backup of your Personal Dictionary and other important broadcast captioning files.

## Caption Realtime Translate Options

Use Realtime translate options to set Audio and Connection options when captioning. To use the Audio options, you must have AudioSync capabilities.

To access the Realtime translate options, from the Broadcast Captioning Translate dialog box select **Options** and then select the **Realtime** tab. To change [options while in a captioning session](#), press **Alt + S, O** (Setup, Options).

### Realtime Writer

Select the type of writing machine you are using. If you are using a Diamante, Wave, élan Mira, Stentura Fusion or Stentura Protégé, you can direct connect to Case CATalyst for realtime writing via USB cable. The appropriate USB driver for your writing machine must be loaded on Case CATalyst in order to use the USB cable. See the user guide for your writing machine for information about loading the USB driver.

### Writing Machine Selection:

- **Stenograph Writer Serial/Bluetooth**  
This option includes Stenograph's Luminex, Diamante, Wave, élan Mira, élan Cybra, Stentura Fusion, Stentura Protégé, Stentura LX, Stentura, 200/400SRT and SmartWriter. Bluetooth is a wireless serial connection and may not be available for all writers listed.
- **Stenograph Writer USB**  
This option includes Stenograph's Luminex, Diamante, Wave, élan Mira, élan Cybra, Stentura Fusion and Stentura Protégé.
- **Stenograph Writer WiFi**  
This option includes Stenograph's Luminex, Diamante and élan Mira A3.
- **StenoRam III, III+, Ultra**  
This option includes Xscribe's StenoRam III, III+ and Ultra with a serial connection.
- **FlashWriter**  
This includes ProCAT's Flash steno machine and any other steno writer that uses the Flash serial connection protocol.
- **Baron TX**  
This includes Baron Transcriptor X (TX) steno machine and any other steno writer that uses the BOLT serial connection protocol.

### Audio

To use the Audio features, your e-Key license must have AudioSync capabilities. In addition to setting the following Audio options, you must check the Record Audio option on the [Translate](#) dialog box. It is strongly recommended that you set up and [test the microphone](#) recording and audio playback prior to realtime writing.

#### Record To

When using AudioSync, select the folder where you want to write the audio portion of the file. The default is the current user folder. If necessary, use **Browse** to select another location.

#### Compression Type

When using AudioSync, select **one** of the following to indicate the compression rate of the audio recording.

### 14 MB/Hr

This is the default setting. Recording at 14 MB per hour produces a higher quality recording but takes up more hard drive space.

### 6 Mb/Hr

Recording at 6 MB per hour slightly reduces the quality of the recording but requires less hard drive space.

### Audio Input (Advanced)

By default, AudioSync uses the Windows setting for the recording device. If you have an audio feed already using the Windows default setting, it may be necessary to change the input location for AudioSync. For example, you can change AudioSync from the Microphone port to the Line In port. Use the drop down box to select an alternate recording input device.

ViaVoice voice translation uses the microphone port for recording dictation. It is necessary to select an alternative location for the AudioSync room noise.

### Auto Pause

Check this box to automatically pause the AudioSync recording after a specific period of time, when no new steno is input from the writing machine. You must enter a value in the After Seconds field. Using this feature can help conserve disk space when recording audio on jobs where long or frequent pauses occur.

AudioSync automatically resumes recording when you begin writing new steno when you use the Auto Pause feature. If you use the translation command {Pause Audio}, you must write the {Resume Audio} stroke to resume writing.

### After Seconds

When you check the box for Auto Pause Audio, you must type the number of seconds AudioSync waits before pausing when no new steno is being input from the writing machine.

## Connection

### Comm Port

Select the appropriate COM port on the Case CATalyst system for the serial realtime cable connection to the writing machine. For more information on COM or serial ports, refer to the user guide for your computer.

If you are using a USB serial adapter, confirm the correct COM port assignment through the Windows Device Manager. For more information on Device Manager, consult your Windows documentation.

This option does not apply when you select Diamante - USB, élan – USB or Fusion USB as the Realtime Writer and you are using a USB cable.

### Direct (Cable)

Select this option when you are writing realtime directly connected to the Case CATalyst system with a serial cable. This option does not apply when you select Diamante - USB, élan – USB or Fusion USB as the Realtime Writer and you are using a USB cable.

### Modem

Select this option when you are writing realtime remotely over the phone lines. The writing machine is connected to a phone jack via a modem cable. The remote Case CATalyst system is connected to a phone jack via a modem cable.

### **Call**

Have the Case CATalyst system call the writing machine modem. Type the phone number in the *Number* field below.

### **Answer**

Have the writing machine call the Case CATalyst modem.

### **Number**

When you select *Call*, type the telephone number of the remote writing machine. If applicable, include any numbers required to access an outside telephone line. For example, if you need to dial

## **Voice Engine**

These options apply to voice translation. You must have the software for the selected voice engine installed on your computer and have your e-Key license include the CATalyst VP option. Select one of the following:

### **Dragon Naturally Speaking 8**

Select this option when using Dragon Naturally Speaking Version 8.10 or higher for voice translation.

### **ViaVoice for Windows 10**

Select this option when using ViaVoice for Windows 10 for voice translation.

## **Advanced Caption Options**

Advanced Caption Options **determine the default selection for certain CATalyst BCS translate options. You can access the Advanced Caption Options:**

- each time you start a CATalyst BCS session. In the Broadcast Captioning Translate dialog box, select **Options** and then select **Advanced**.
- during a CATalyst BCS session. From the Setup menu, select **Options** and then select **Advanced**.
- from Manage Jobs. Press **Alt + t** and then click **All Options** and navigate to the **Caption (BCS)** section, click **Options** and then **Advanced** (Tools, All Options, Caption (BCS), Options, Advanced).
- from the Standard toolbar. Click the All Options icon () and navigate to the **Caption (BCS)** section, click **Options** and then **Advanced**.

## **CATalyst BCS Advanced Caption Options**

Review the Advanced Caption Options and make necessary changes. When finished, select **OK**. To return all the settings to their original default selection, click Restore Default Settings.

### **Digits with words convert with commas up to**

Select **hundreds**, **thousands** or **millions** to have CATalyst BCS convert digits followed by the words "hundred," "thousand" or "million" to a number with commas when no automatic number keyword is written. This feature is useful if you want numbers (digits) written with the words "thousand" and "million" to format differently than when word numbers are written. For example, "5 thousand people" converts to

"5,000" people. If you write "five thousand people," it does not convert. In another example, 18 hundred converts to 1,800 and eighteen hundred converts to 1800.

CATalyst BCS converts digits and words up to the option selected. For example, if you select thousands, CATalyst BCS converts digits followed by the word "hundred" and "thousand" but not digits followed by the word "million." For example, 18 hundred converts to 1,800; 18 thousand converts to 18,000; but when you write 5 million no conversion occurs.

At least one number written must be a digit. For example, if you write eight hundred or eighteen thousand, no conversion occurs. If you write one hundred 50 thousand it converts to 150,000 because a digit number is written. However, if you write eighteen thousand and the option, [Otherwise Display As Digits](#), is active, then the number translates as 18000 with no commas inserted.

This feature works in conjunction with Automatic Number Conversion. The Automatic Number Conversion [option](#) must be selected in Translate options.

If a keyword identified in the NumberConversion.ini follows the number written, then the number conversion format from the NumberConversion.ini takes priority. For example, "2 thousand four hundred dollars" converts to "\$2,400."

Select **None**, the default, if this option does not fit your writing style.

### Automatically resolve EZ Choice conflicts

Select **Yes** to have CATalyst BCS automatically confirm conflicts selected by EZ Choice and add the resolution information to the appropriate conflict database. Resolution during translation is based on previous conflict selections while editing. Scan does not stop on the confirmed conflicts and the confirmed conflicts do not display in a conflict color.

Select **No** to confirm the selected conflicts manually while editing. No is the default.

### Default dictionary for Power Define

CATalyst BCS defaults to placing Power Define entries in the current job dictionary or a case dictionary if working within a case. You can change the dictionary to which the Power Define dictionary defaults. From the drop down list, select an alternate dictionary. If you select Other, the Other field becomes active and you must also select a location in the *Other Path* field.

### Other Path

This field is active when Other is selected in the *Default dictionary for Power Define* field is selected.

Click the Browse  button to locate the dictionary you want to set as the default when making Power Defines.

### Insert Oops FS after aborted Power Define Yes/No

By default, an [Oops](#) (category 10 - CATalyst inserted format symbol) is inserted into the caption history file where a Power Define, Scan Define, Text Define or Create EZ Speakers was aborted. Any steno outlines writing in the aborted dialog box displays grayed out in Vertical Notes. For example, let's say there is a pause in the captioning session. You start a Power Define to define a couple different steno outlines as the speaker name. You start writing the steno and move to the text field and start writing when the session starts again so you abort the Power Define. If you go into Reveal Codes you will see the <Oops 10> format symbol where you aborted the command and will see all the steno you wrote in the dialog box grayed out in Vertical Notes. Use Search, Scan or open the [Hotspots](#) pane to find all locations of the Oops format symbol. Any steno written into the Power Define dialog will appear grayed out in vertical notes at the Oops location. Select No, to prevent the <Oops 10> format symbol from being inserted when a Power Define, Scan Define, Text Define or Create EZ Speakers is aborted.

### Default action for Scan Define

The Scan Define command scans back in the caption file to the last untranslate/untranslates, opens the [Power Define](#) dialog box with the steno in the Steno Field and the cursor in the Text field. You can quickly define or replace the steno from your writing machine. For example, some captioners may feel more comfortable replacing a mistranslate rather than defining it. The captioner could set the default action to Replace Only. The option defaults to creating a Job Dictionary entry unless the job is in a case, then it defaults to the Case Dictionary. You can select the default action for the Scan Define to be Personal, Job or Case Dictionary or Replace Only. The Replace Only action will only change the current occurrence and will not global the action. Using the Power Define commands, you can also change the action at the time of the Scan Define.

### **Scan Define stop on Untranslates plus:**

By default, the Scan Define realtime command scans back in the caption file to the last untranslate(s), opens the Power Define dialog box, puts the untranslated steno in the Steno field and positions the cursor in the Text field. If you would like the Scan Define command to also stop on Drag/Drop translations and/or Suffix Drag translations, select Yes in the respective option.

**Drag/Drop** translations include translations as a result of the [Drag/Drop Analysis](#) option and [TrueStroke Drag/Drop](#) translations. Drag/Drop Analysis and/or TrueStroke Drag/Drop options must be selected in the [Caption Options](#) tab.

**Suffix Drag** translation includes translations as the result of dragging or tucking a suffix in a single stroke steno outline. The [Suffix Drag](#) option must be selected in the [Caption Options](#) tab.

### **Analyze numbers in a series**

Select **Yes** to have numbers written in a row convert to digits if they are separated by one or more spaces, a comma, dash, slash or the word "and," "or," "through," "to," or "of." For example, when selecting Yes, the display 10 and under as words option would normally result in "two to four things," the result will now be "2 to 4 things" and if the automatic number conversion result would have been "Page 2 of four," the result will now be "Page 2 of 4."

Select **No** to prevent Case CATalyst from converting numbers as a series when you use the above words or punctuation as separators. Numbers in a series are translated as digits when you write digits or if the Otherwise Display as Digits option is selected. The Display 10 and Under as Words option does not apply to digits in a series. The default setting is Yes.

This feature also works in conjunction with Automatic Number Conversion. The Automatic Number Conversion [option](#) must be selected in Translate Input options.

### **Number Triggers convert only when preceding a number**

Select **No**, the default, to have Number Trigger commands active for approximately three paragraphs after the Number Trigger is written. If CATalyst BCS finds a number that matches the Number Trigger criteria within the three paragraphs, the number converts according to the Number Trigger.

Select **Yes** to have CATalyst BCS only apply the Number Trigger if a number, either word or digit, is written immediately after the Number Trigger stroke. Captioners may want to use this feature.

### **Add missing comma after year in {Month} number conversion**

Select **Yes**, the default, to insert a comma after the year when using the {MONTH} rule with Automatic Number Conversion. For example, "July two 2009" converts to "July 2nd, 2009," with a comma after the year.

Select **No** to prevent Automatic Number Conversion from placing a comma after the year. For example, "July two 2009" converts to "July 2nd, 2009" without a comma after the year.

### **Phonetic untranslates display as words**

Select **Yes** to phonetically translate single stroke untranslates during realtime using algorithmic logic to determine the intended pronunciation. CATalyst BCS bases the logic on Stenograph Theory and the WinterTree Spell Check, Stedman's Medical and Black's Legal wordlists to create a word with the most accurate spelling of the phonetically sounded word. Phonetic translation applies when no dictionary match is found in any dictionary used for translation. Yes is the default.

You can create an exclude file of words you do not want to phonetically translate when using the *Phonetic untranslates display as words* option. For example, you are reporting a meeting and displaying the realtime text via a projector. You do not want to display inappropriate words. Using Windows Notepad or WordPad, list each word on a separate line or on single lines with a space between each word. The file must have the name, *phoneticexclude.txt*, and reside in your System Files case.

Select **No** to phonetically translate during realtime using the [Phonetic Table](#). Steno outlines that normally display as untranslates, translate phonetically based on the text equivalent entry in the table.

### **Example of Case CATalyst Phonetic Translation Methods**

You write, SKWRAEUPLS, and are using the Phonetic Table. The translation is, "JAIMZ." When you use the Advanced Translate option, *Phonetic untranslates display as words*, the same steno outline translates as "James." In another example, you write, /PAEUPLT. The Phonetic Table translation is, "Payment." The algorithmic logic translation is, "payment."

You must select [Phonetic Translation](#) in Translate Options or use the [Toggle Phonetic Mode](#) during realtime to apply either method of phonetic translation methods. Phonetically translated words appear in the selected untranslate color. If your [Scan For Options](#) are set to stop on untranslates, then **F8 (Scan)** and **Shift + F8 (Scan Backward)** stop on phonetically translated words.

### **Digits attach to {Glue} Alphabet**

When set to Yes and CATalyst BCS encounters alphabetic dictionary entries containing the {Glue} format symbol and undefined numbers either preceding or following the alphabetic character(s), the glued alphabet will attach to the number(s). For example, let's say that you do not have your number bar numbers defined in your dictionary. You have W-FPLT defined in your dictionary as {Glue}W. You write /W-FPLT/2 and the result is W2. If you write 2/W-FPLT/3, the result is 2W3. If your {Glue} definition contains a hyphen or period, undefined numbers will also attach using the rule CATalyst has always used for {Glue} defines. So 2 followed by {Glue}-W would result in 2-W. The default setting is Yes.

### **Force lowercase ordinal suffixes**

The *Force lowercase ordinal suffixes* option, by default, is set to No. If your caption style is set to capitalize all text and you want ordinal suffixes (st, nd, rd, th) to be lower case, set this option to Yes. This option affects {Number Conversion}[\*Ordinal], {Number Trigger}[\*Ordinal] commands and selecting an ordinal conversion from Edit's Number Conversion dialog box.

## **Translate Commands**

Translate commands format text during translation. Some translate commands are specific to translation while you are writing a captioning session. These commands are invoked from the writing machine. The steno outlines must be defined in your dictionary before you begin a session.

### **Caption Period**

The Caption Period translate command always ends the prior line with a period unless the previous line ends with a <New Line> format symbol, musical note or punctuation. Insert the Caption Period translate command before the new Paragraph format symbol. For example, you have STKPWHR defined as <Colloquy>>>. Modify the text portion of the dictionary definition as:

{Caption Period}<Colloquy>>>

## Create a Dictionary Definition

1. From anywhere in Case CATalyst or CATalyst BCS, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
4. In the Steno field, type the appropriate steno for the definition.
5. In the Text field, press **Alt + f**, to display the list of format symbols.
6. Use the Up and Down Arrow keys to locate **{Caption Period}** and press **Enter** to insert the highlighted format symbol into the Text field.
7. Insert the paragraph format symbol following the {Caption Period} translate command.
8. Press **Enter (OK)** to insert the definition into the dictionary.
9. Press **Esc (Cancel)** to close the Insert dialog box

## Cap Previous X Words

Cap Previous 1 Word through Cap Previous 9 Words are translate commands that allow you to initial cap the previous words during a captioning session. For example, writing the stroke for Cap-Previous 3 initial caps the last three words written. Writing the stroke for Cap-Previous 2 initial caps the last two words written. You can define strokes for each Cap Previous command, enabling you to initial cap up to nine previous words.

The Cap Previous command does not capitalize the following words unless they are the *first* word of the text being capitalized: *a, an, as, at, by, in, of, on, or, to, vs, and, for, the*. It does, however, include these words when counting backwards. For example, you stroke *united states of america*. You would stroke Cap Previous 4 to get *United States of America*.

If you define a word or words along with the Cap Previous Word command, Case CATalyst caps the words in the definition and counts the word or words as part of the number of words you are capping. For example, you want to make a definition for "street" that caps the word "street" and the previous word. In your dictionary, you define the appropriate steno as "street {Cap Previous 2 Words}". In a job you write, "pine street". The result is Pine Street.

The Cap Previous command applies only to the words for this occurrence. It does not global the change.

The Cap Previous 1 - 9 Words translation commands are another method of initial capping words during a captioning session. The [InitialCap On and Off](#) translation commands are another method of initial capping words while in a captioning session. Another method is to write a steno stroke defined as the [Cap Next](#) format symbol before each word you want initial capped. The Cap Previous X Words commands word very well if the text has not been sent to the encoder. Once the text has been sent to the encoder, the Cap Previous commands will not affect that text.

## EZ Speaker Define command

The EZ Speaker Define command allows you to [create EZ Speakers](#) from your steno machine. When the {EZ Speaker Define} command is in a dictionary being used in realtime, when the steno is written during realtime the Create EZ Speaker Entry dialog box displays. You use commands in your Power Define dictionary to navigate the Create EZ Speaker Entry dialog box. The default Realtime Commands Dictionary contains a SPEF/SPEF defined as {EZ Speaker Define} entry.

## Initial Cap On and Off

The Initial Cap On and Off translate commands allow you to turn on and off initial capitalization of words. For example, you are captioning a live broadcast where a title of an article is mentioned. The article name contains common words that are generally not capped, but since it is article title you need to cap them. All the words are translating but in this job because the article title is referenced, you need to initial cap the string of words. The title of the article is subdural hemorrhage and intradural hemorrhage. You write your steno outline defined as {InitialCap On}, write the steno for subdural hemorrhage and intradural hemorrhage and then write your steno outline defined as {InitialCap Off}. The result would be: Subdural Hemorrhage and Intradural Hemorrhage.

A word that is in your Advanced Edit *Words to suppress capping when found in middle of phrase* setting will not be initial capped unless it is the first word following the {InitialCap On} command. For example, let's say the word "the" is in your *Words to suppress capping...* option. Let's say you wrote the steno for {Initial Cap On} followed by "the winding road." The result would be: The Winding Road. The word "the" is initial capped because it is the first word in the phrase. On the other hand, if you wrote the steno for {Initial Cap On} followed by "walk for the cure," the result would be: Walk for the Cure. The word "the" is not initial capped because it appears in the middle of the phrase.

You can insert these entries into any dictionary. If you use the Realtime Commands Dictionary you may want to insert the entries into that dictionary or even your Personal Dictionary. These two realtime commands should be defined as individual definitions and not as part of or in the middle of a definition.

The InitialCap On and Off translation commands are another method of initial capping words during a captioning session. The [Cap Previous 1 - 9 Words](#) translation commands are another method of initial capping text during a captioning session. Another method would be to write a steno stroke defined as the [Cap Next](#) format symbol before each word you want initial capped. The Cap Previous X Words commands work very well if the text has not been sent to the encoder. Once the text has been sent to the encoder, the Cap Previous commands will not affect that text.

### Creating dictionary definitions:

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### InitialCap On

1. Open a dictionary, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
4. In the Steno field, type the appropriate steno for the definition.
5. Press **Alt + f (Edit/Insert/Insert Format Symbol)**, to display the list of format symbols.
6. Use the Up and Down Arrow keys to locate **{InitialCap On}** and press **Enter** to insert the highlighted format symbol into the Text field.

7. Press **Enter (OK)** to insert the definition into the dictionary.
8. Press **Esc (Cancel)** to close the Insert dialog box.

### InitialCap Off

1. Open a dictionary, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
4. In the *Steno* field, type the appropriate steno for the definition.
5. Press **Alt + f (Edit/Insert/Insert Format Symbol)**, to display the list of format symbols.
6. Use the Up and Down Arrow keys to locate **{InitialCap Off}** and press **Enter** to insert the highlighted format symbol into the *Text* field.
7. Press **Enter (OK)** to insert the definition into the dictionary.
8. Press **Esc (Cancel)** to close the Insert dialog box.

## Number Conversion

Number conversion dictionary definitions convert numbers written during captioning to a specific number format such as dollars, social security number and phone number. CATalyst BCS converts the number during captioning when you write the steno outline defined for the Number Conversion translate command containing the desired number conversion format. The numbers can be numerals, words or a combination of numerals and words and include punctuation such as commas, periods, and hyphens. Number Conversion works backward from where you write the conversion stroke and affects only numbers which meet the number conversion format criteria that occur in the last line of caption. Number conversion has no effect on a number already sent to the encoder. Number Conversion does not apply to a number you already converted once or applied the Prefix Number command.

Number Conversion definitions contain the format symbol: {Number Conversion}. The format symbol is followed by square brackets which enclose placeholders, such as [NNN NNNN] for a telephone number or [\*RomanUpper] for a number format command. You must determine the number conversion format and then define it with the designated phrase. There are a several common Number Conversion definitions contained in the Realtime Commands Dictionary. You can use this dictionary or add these entries to your Personal, case, or job dictionary. Modify them as necessary using the number conversion [guidelines](#) to create Number Conversion definitions with your own number conversion formats.

On the [Caption Translate Options](#), you can select how CATalyst BCS processes the word "and", commas, word numbers and spaces between numbers during captioning. In addition to Number Conversion, CATalyst BCS number conversion translate features include [Automatic Number Conversion](#) and [Number Triggers](#).

The Special Edit, [Number Conversion](#) feature allows you to convert numbers in the History window. The same number formats used for Number Conversion definitions are used by this feature.

## Create a Number Conversion Dictionary Definition

1. Press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)**. The Insert Dictionary Entry dialog box displays.

4. In the *Steno* field, type the steno outline you are going to write to invoke the Number Conversion command.
5. In the *Text* field:
  - a. Press **Alt + f (FS)** to display the list of format symbols and select **{Number Conversion}** from the list.
  - b. Type an open square bracket (**[**) followed by the number format, as shown in the number conversion formatting [guidelines](#). For example, the format for a social security number:  
[NNN-NNN-NNNN]
  - c. Type the closed square bracket (**]**) to complete the Number Conversion definition:  
{Number Conversion}[NNN-NNN-NNNN]
6. Press **Enter (OK)**.
7. Press **Ctrl + s (File/Save)** to save the changes.
8. When you are finished making changes, press **Ctrl + F4 (File/Exit)** to exit the dictionary.

## Number Trigger

Number Trigger dictionary definitions written during captioning allow you convert numbers to a specific number format when the number follows a designated phrase. When a phrase such as, "Article" is written and it is followed by the specific number of digits or words that match the number format, that number converts. CATalyst BCS holds the numbers until a non-number stroke is written before sending the numbers to the encoder. Number Triggers are an alternative to using the [Automatic Number Conversion](#) feature or writing a [Number Conversion](#) stroke. To have Number Trigger not apply to the next number, use Number Trigger off, {Number Trigger}[] with nothing entered between the brackets.

The CATalyst BCS default is to have Number Trigger commands active for approximately three paragraphs. If CATalyst BCS finds a number that matches the Number Trigger criteria within the three paragraphs, the number converts according to the Number Trigger. Optionally, you can have CATalyst BCS only apply the Number Trigger if a number, either word or digit, is written immediately after the Number Trigger stroke by changing the Advanced Caption [option](#), *Number Triggers convert only when preceding a number*.

There is a variety of existing number trigger [formats](#) or you can [create](#) your own. All number trigger format definitions contain the format symbol: {Number Trigger}. The format symbol is followed by square brackets which enclose the placeholders, such as [NNN NNNN] for a telephone number or [\*RomanUpper] for a [specific command](#). You must determine the number trigger format and then define it with the designated phrase.

### Example

You want numbers following the word "Article" to display as Roman numerals. You create a Number Trigger with the word "Article" followed the command for upper case Roman numeral. When you write "Article five" the result sent to the encoder is "Article V."

Article{Number Trigger}[\*RomanUpper]

### Example

Number Trigger for a phone number:

{Number Trigger}[NNN-NNNN]phone number

phone number {Number Trigger }[NNN-NNNN]

## Create a Number Trigger Dictionary Definition

1. Press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)**. The Insert Dictionary Entry dialog box displays.
4. In the *Steno* field, type the steno outline you are going to write to invoke the Number Trigger command.
5. In the *Text* field:
  - a. Type the designated phrase to invoke the Number Trigger, such as "social security number."
  - b. Press **Alt + f (FS)** to display the list of format symbols and select **{Number Trigger}** from the list.
  - c. Type an open square bracket (**[**) followed by the number format, as shown in the number conversion formatting [guidelines](#). For example, the format for a social security number:  
[NNN-NNN-NNNN]
  - d. Type the closed square bracket (**]**) to complete the definition. For example, a completed social security Number Trigger definition:  
social security number{Number Conversion}[NNN-NNN-NNNN]
6. Press **Enter (OK)**.
7. Press **Ctrl + s (File/Save)** to save the changes.
8. When you are finished making changes, press **Ctrl + F4 (File/Exit)** to exit the dictionary.

## Number Format Guidelines

Use the number format [examples](#) and these guidelines to create customized number formats for [Number Conversion](#) definitions, [Number Trigger](#) definitions and [Number Conversion](#) in the History window. Number Conversion definitions contain the command: {Number Conversion}. Number Trigger definitions contain a designated phrase along with the command: {Number Trigger}. Letters, functioning as placeholders for converted numbers, follow the translate command. Square brackets enclose the placeholders, such as [nN/NX/nn].

You can use pre-defined entries from the Realtime Commands Dictionary which contains the most common number conversion formats. You can add these entries to your Personal, case, or job dictionary and modify them as necessary using the following guidelines.

## Number Conversion/Trigger Placeholder Letters

### N (upper case)

Use an **N** whenever the number is *mandatory*. For example, the {Number Conversion}[n-nnn-NNN-NNNN] format is a telephone number in the United States. Currently, all telephone numbers have a minimum of seven digits: three digits followed by a hyphen followed by four digits. When an attorney or witness states a valid telephone number, they will always state at least seven digits. The capital letter N represents these mandatory numbers. In this example, the mandatory numbers are the seven digits of the telephone number.

### n (lower case)

Use an **n** whenever the number is *optional* and when the punctuation to the right of that number requires removal if the number is not used. For example, in the U.S. telephone number conversion format, {Number Conversion}[n-*nnn*-NNN-NNNN], an attorney or witness may or may not state the three-digit area code when they state a telephone number. When they do include the area code with the seven-digit phone number, there usually is punctuation between the area code and phone number. If no area code is given, no punctuation should appear to the left of the phone number. The lower case **n** represents an optional number that does not retain punctuation. In this example, the optional numbers are the single digit access code and the three digits for the area code.

### **X or x (upper or lower case)**

The **X** or **x** is used whenever the number is optional but the *punctuation* is mandatory. For example, the {Number Conversion}[\$*nnn*,*nnn*,*nnn*,nnX.0N] format is a dollar conversion that indicates *cents*. An attorney or witness states "It was between fifty cents and one seventy-five". You want those numbers to convert to \$.50 and \$1.75, whether or not the speaker states a dollar amount, which requires a decimal point to the left of the second digit. The **X** or **x** represents an optional number that retains punctuation to the right of the **X** or **x**, whether or not a number is written for that space.

### **0 (zero)**

Use the **0** whenever a number is optional and the number 1 through 9 replaces it and is retained if there is an **N** to the right of the zero. For example, in the dollar conversion format, {Number Conversion}[\$*nnn*,*nnn*,*nnn*,nnX.0N], if the attorney or witness states "It was five cents. No, it was two twenty-five. The result is \$.05 and \$2.25.

### **\_ (underscore)**

An **\_** (underscore) works the same as the **0** except it inserts a blank space instead of a zero.

### **\ (backslash)**

Use the **\** (backslash) whenever you want an "n", "0" (zero), or "x" to literally print in the converted number. For example, {Number Conversion}[\NnnNNN] results in N123.

## **Common Number Formats**

There are a several common [Number Conversion](#) and [Number Trigger](#) definitions contained in the Realtime Commands Dictionary. You can use this dictionary when translating or add these entries to your Personal, case, or job dictionary. Modify the entries as necessary using the [guidelines](#) to create customized number formats. All Number Conversion definitions contain the command: {Number Conversion}. All Number Trigger definitions contain a designated phrase and the command: {Number Trigger} plus text.

The Special Edit, [Number Conversion](#) feature allows you to convert numbers in the History window. You can [customize](#) the default list for this feature using the same number formatting as Number Conversion and Number Trigger definitions.

## **Common Number Conversion Formats**

Description	Format
• Date with 1-digit month (1/29/66).	{Number Conversion}[nN/Nx/NN]
• • Date with 2-digit month (11/10/64).	{Number Conversion}[NN/nn/Nn]

- When you write a date using numbers that are defined in your dictionary, the numbers will not split across a colon, slash, backslash, dash, period or space. For example, if you write a stroke defined as 11, followed by a stroke defined as 1 and then a stroke defined as 98, the number translates as 11/1/98. If you write a stroke defined as 1, followed by a stroke defined as 11 and then a stroke defined as 98, the number translates as 1/11/98.
- Dollars with commas. {Number Conversion}[\$nnn,nnn,nnn,nnN]
- Dollars and cents with commas. {Number Conversion}[\$nnn,nnn,nnn,nnX.ON]
- Number with dash, possibly a case number. {Number Conversion}[nnnnnnnnnX-NN]
- Number with decimal, possibly the caliber of a weapon. {Number Conversion}[nnnnnnnnnX.NN]
- Numbers with hyphens. {Number Conversion}[nn-nn-nN-nN]
- Numbers in parentheses. {Number Conversion}[(XXXXXXXXXXN)]
- Telephone number with area code in parentheses. {Number Conversion}[X (XXn) NNN-NNNN]  
phone{Number Trigger}[X (XXn) NNN-NNNN]
- Telephone number with hyphens. {Number Conversion}[n-nnn-NNN-NNNN]
- Time with a minimum of two digits required and maximum of six. {Number Conversion}[nN:nn:Nn]

Examples:

12 = 1:2

123 = 1:23

1234 = 1:2:34

12345 = 1:23:45

123456 = 12:34:56

- Time with a minimum of three digits required and maximum of six. {Number Conversion}[NN:nn:Nn]

Examples:

123 = 12:3

1234 = 12:34

12345 = 12:3:45

123456 = 12:34:56

- Time with a minimum of three digits. {Number Conversion}[nN:NN]

123 = 1:23

1234 = 12:34

- Social Security Number {Number Conversion}[NNN-NN-NNNN]  
social security number{Number Trigger}[NNN-NN-NNNN]
- Zip Code/Zip Code plus 4 {Number Conversion}[NNNNn-nnnn]

zip code{Number Trigger}[NNNNn-nnnn]

## Number Formatting Commands

Using the following numeric and time formatting commands in conjunction with either a [Number Conversion](#) or [Number Trigger](#) command in dictionary definitions. You can also use [number formatting commands](#) in conjunction with a Number Conversion or Number Trigger command. Formatting commands allow you to convert the number to Roman numerals, words, ordinal and certain time formats.

## Roman and Ordinal Numeric Conversion Formats

The [\*RomanUpper], [\*RomanLower] and [\*OrdinalWords] commands are one word. The text must be entered exactly as indicated for the feature to work correctly.

### [\*RomanUpper]

For example, you want a number following the word "appendix" formatted as a Roman numeral. You create a dictionary definition for the word "Appendix" with a Number Trigger and Roman numeral conversion. Enter the text portion of the dictionary entry as:

Appendix{Number Trigger}[\*RomanUpper]

To write a steno outline that converts the previous number with Roman numeral format, create a Number Conversion dictionary definition. Enter the text portion for the number conversion definition as:

{Number Conversion}[\*RomanUpper]

### [\*RomanLower]

For example, you want a number to follow the word "article" formatted as a Roman numeral in lower case. You create a dictionary definition for word "Article" with a number trigger and Roman numeral conversion. Enter the text portion of the dictionary entry as:

Article{Number Trigger}[\*RomanLower]

To write a steno outline that converts the previous number with Roman numeral format, create a Number Conversion dictionary definition. Enter the text portion for the number conversion definition as:

{Number Conversion}[\*RomanLower]

### [\*Words]

Converts digits to words. For example, 250 converts to "two hundred fifty". Enter the text portion for the number conversion definition as:

{Number Conversion}[\*Words]

### [\*OrdinalWords]

Converts digits to ordinal words. For example, 33 converts to "thirty-third". Enter the text portion for the number conversion definition as:

{Number Conversion}[\*OrdinalWords]

### [\*Ordinal]

Converts a number to an ordinal digit. For example, 33 converts to 33<sup>rd</sup>. This option also converts a word number such as "one" to 1st. This option does not convert an ordinal word number such as "first" to 1st. Enter the text portion for the number conversion definition as:

{Number Conversion}[\*Ordinal]

In the [Advanced Caption Options](#) dialog box, there is a *Force lowercase ordinal suffixes* option. If your caption style is set to capitalize all text and you want ordinal suffixes (st, nd, rd, th) to be lower case, set this option to Yes. This option affects {Number Conversion}[\*Ordinal], {Number Trigger}[\*Ordinal] commands and selecting an ordinal conversion from Edit's Number Conversion dialog box.

## Time Conversion Formats

### [\*Time]

Converts a three or four digit time with a colon before the last two numbers. Enter the text portion for the number conversion definition as:

{Number Conversion}[\*Time]

### [\*Time00]

Converts one or two digit numbers (12 and under) with a colon after the number and adds two zeros. If a three or four digit number is written, places a colon before the last two numbers. Enter the text portion for the number conversion definition as:

{Number Conversion}[\*Time00]

## Prefix Number

The Prefix Number translate command places the associated punctuation symbol in front of the last number written. For example, when you write the stroke for {Prefix Number}[\$], CATalyst BCS searches back for the last number written and puts the \$ in front of the number, such as \$50. You can use the Prefix Number command in the Reporter's Area.

CATalyst BCS comes with six predefined {Prefix Number} definitions with punctuation. They are: #, \$, ' (apostrophe), + (plus), - (hyphen), ; (semi colon) and . (period). You can add as many as you want. The text portion of the definition must start with {Prefix Number} left square bracket punctuation right square bracket. For example, {Prefix Number}[\$].

The Prefix Number command does not apply to digits that have text or punctuation touching them except for digits that have a comma, period, hyphen or an open quote when the number immediately follows the quote. {Prefix Number}['] (apostrophe) will work on numbers followed by an "s". For example, if you wrote, "It was the 60s." and then wrote your steno for the {Prefix Number}['] definition, the result would be, "It was the '80s."

## Create a Dictionary Definition

1. From anywhere in Case CATalyst or CATalyst BCS, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
4. In the Steno field, type the appropriate steno for the definition.

5. Press **Alt + f**, to display the list of format symbols.
6. Use the Up and Down Arrow keys to locate {Prefix Number} and press **Enter** to insert the highlighted format symbol into the Text field.
7. Type the open square bracket, [ followed by the punctuation or character you want inserted before the number. To finish, type the closed square bracket ]. For example, to define an apostrophe to be inserted before the last number, in the case of '99, define the steno outline of your choice as: {Prefix-Num}[']
8. Press **Enter (OK)** to insert the definition into the dictionary.
9. Press **Esc (Cancel)** to close the Insert dialog box.

### Power Define

Defining an untranslate from the writing machine is called a Power Define. When you stroke the steno outline for the [Define](#) translate command, the Power Define dialog box opens and the Power Define dictionary loads with the highest priority. Movement command definitions contained in the Power Define dictionary provide the ability to navigate the Power Define dialog box. The Power Define dictionary remains loaded as the highest priority while the Power Define dialog box is open. Once you complete the Power Define, abort the definition using the [ABORT] command while your cursor is in the Power Define dialog box or if the Power Define dialog box is in Suspend you write the {Cancel Active Dialog} command, the Power Define dialog box closes and the Power Define dictionary unloads from translation. Since the dictionary automatically loads, you do not select it for the captioning session. It is recommended that you review the [Power Define dictionary](#) default navigation commands and parameters before creating Power Defines during realtime.

You can Power Define any type of global dictionary definition. CATalyst BCS applies the rule for longest dictionary match when strokes are written in the *New Text* field of the Power Define dialog box. For example, you have /HRAOE defined as "<Suffix>ly". You also have /HRAOE/HRAOE defined as "Lee". During realtime you power define /STAEUT/HRAOE. In the *New Text* field the steno outlines display as "state <Suffix>ly" because there is another definition in the dictionary that begins with /HRAOE and CATalyst BCS is waiting for the longest match. Although CATalyst BCS is waiting for the longest dictionary match, you can correctly Power Define the entry by stroking the steno outline for [ENTER] to close and complete the entry. The define, "stately" is correctly entered into the dictionary and applied to the job.

If you don't have time to finish the Power Define, you can stroke the steno outline for the [SUSPEND] which leaves the Power Define dialog box open but returns the cursor focus to the realtime job. Once you have time to finish the Power Define, just write the stroke defined as {DEFINE} to return the cursor focus to the Power Define dialog box. If the Power Define dialog box is in Suspend, you can write the steno for {Cancel Active Dialog} command and the Power Define dialog box closes and the Power Define dictionary unloads from translation.

At any point, you can stroke the steno outline for the [ABORT] command to close the Power Define dialog box and have nothing written to the job. The steno written while in the Power Define dialog box appears grayed out in Vertical Notes. If you have the [Advanced Caption Options](#), *Insert Oops FS after aborted Power Define* option set to Yes, then an [Oops](#) category 10 format symbol is inserted into the text at the location the Power Define was aborted. If you look in Reveal Codes you will see <Oops 10> at the location and the grayed out steno that was written before the abort. The same thing will occur if you wrote too many strokes in the Steno or Text field and the Power Define automatically aborted.

Selecting the Another button or writing the [ACCEPTCONTINUE] command perform the same action. They apply the newly created definition and leave the Power Define dialog box open to define the next untranslate. The [ACCEPTCONTINUE] command continues to be active, however, writing [ACCEPTCONTINUE] does not continue to scan back to the last untranslate. The [ACCEPTCONTINUE] command may not be in your Power Define dictionary. To verify the availability of the definition, open your [Power Define dictionary](#) located in the System Files case. Add or modify the definition as necessary.

### Creating a Power Define

1. Start a captioning session. To activate Suspend mode, press **F7 (Caption/Suspend Cap Output)**.
2. Write the steno outlines for the Define translate command to open the Power Define dialog box.
3. In the *Steno* field, write up to 16 steno outlines to define. If you stroke more than 16 consecutive steno outlines in the *Steno* field, the Power Define aborts without creating any type of definition.
4. Write the steno outline defined as [TAB] in your Power Define dictionary to move to the *Text* field.
5. In the *Text* field, enter the text definition for the steno. Do **any** of the following:

- "Finger spell" the definition by writing the steno outlines defined as the individual letters. If the Power Define dictionary contains these individual letters, when you fingerspell, no space occurs between the letters, such as "Emma".
- Write a steno outline with an existing dictionary entry. For example, you misstroke a the speaker chevrons outline that is not in your dictionary -FRBLTS. In the *Steno* field write -FRBLTS. In the *New Text* field you write a stroke for answer that has a dictionary definition. CATalyst BCS puts >> in the *New Text* field.
- Use a combination of writing a word or phrase with finger spelling. For example, you write SKWROPB/SON (Johnson) in the *Steno* field. In the *New Text* field you write the stroke for "John" and then fingerspell "son" so the result is "Johnson". If you wrote the stroke for "John" and then the stroke for "son" the result would be "John son".
- Insert a Format Symbol. Write the steno outline defined as [F4] followed by the steno outline for the letter of the format symbol. For example, you might write the steno outline for "c" as KR-RBGS. F4c indicates Colloquy.

Alternately, you can write the steno outline defined as [F4 LIST]. When the Format Symbol list displays, stroke the steno outline defined as [UP ARROW] or [DOWN ARROW] to highlight the selected symbol. Then stroke the steno outline defined as [ENTER] to insert the format symbol.

- Insert a [Field](#) into the definition. In order to display the Insert Field dialog box, press **Alt + i** on your computer keyboard and navigate using your computer keyboard or mouse to insert a field. Once you close the Insert Field dialog box, you can return to using your steno machine to navigate the Power Define dialog box,
  - Insert a space between a word or after punctuation by writing the steno outline defined as [SPACE].
  - Backspace the last character or last stroke, depending on your option, by writing the steno outline defined as [DELETE].
6. In the *Global To* field, select the dictionary in which you want to place the definition. The default is the Job Dictionary. You can change the default in [Advanced Caption Options](#).

Do **one** of the following.

- Write the steno outline defined as the number for the dictionary.
- Stroke the steno outline defined as [TAB] to move to the list of dictionaries. Write the steno outline for [UP ARROW] or [DOWN ARROW] to highlight the selected dictionary.

- Write the steno outline defined as [Replace Only (No Define)] to replace the current untranslate and not place it in a dictionary. This option is only available when using the Scan Define command.
7. Optionally, select the *Add to Cat Scratch* option to send the definition to the [Cat Scratch](#) pane. Write the stroke defined as [CAT SCRATCH]. The [CAT SCRATCH] command may not be in your Power Define dictionary. To verify the availability of the definition, open your [Power Define dictionary](#) located in the System Files case. Add or modify the definition as necessary. Sending the define to the Cat Scratch pane is optional.
8. Do **one** of the following:
- Write the stroke defined as [ENTER] to apply the define and close the dialog box.
  - Write the stroke defined as [ACCEPTCONTINUE] to apply the define and have the Power Define dialog box remain open, allowing you to create another power define. If you invoked Scan Define to open the Power Define dialog box, writing [ACCEPTCONTINUE] does not continue to scan back to the last untranslate. The [ACCEPTCONTINUE] command is not a default command. You must add it to your Power Define dictionary.
  - If you need to leave the Power Define dialog box open and return to writing realtime, write the steno outline defined as [SUSPEND]. The Power Define dialog box flashes, the cursor focus changes to the realtime text and leaves the Power Define dialog box open. The Power Define dialog box flashes to indicate an action with the Power Define dialog box. You can write the Suspend command at any time the Power Define dialog box is open. To return the to the Power Define dialog box, write the steno outlined defined as {DEFINE}.  
If you want to cancel the Power Define while it is in Suspend mode, you can write a steno outline defined, in a dictionary being used to translate, as [{Cancel Active Dialogs}](#). The Power Define dialog is closed and nothing is applied.
  - To cancel the Power Define, write the [ABORT] command to disregard what is in the Power Define dialog box and cancel the command. The steno written while in the Power Define dialog box appears grayed out in Vertical Notes. If you have the Advanced Caption Options, *Insert Oops FS after aborted Power Define* option set to Yes, then an [Oops](#) category 10 format symbol is inserted into the text at the location the Power Define was aborted.
9. Press **F7** to toggle Suspend mode (**Caption/Suspend Cap Output**) off.

**Note:** If you want one steno outline to cancel the Power Define, Scan Define, Text Define and Create EZ Speaker Entries dialog box and other dialog boxes, look at your Power Define dictionary and see what the steno is for the [ABORT] entry. Then open your Personal Dictionary and insert/modify the {Cancel Active Dialog} entry steno to be the same as the Power Define [ABORT] entry.  
For example if the:

Power Define default steno for [ABORT] is PWORDT

Create a Personal dictionary (or whatever dictionary) definition Steno PWORDT defined as {Cancel Active Dialog}.

### Invalid or incomplete Power Defines

When you create an invalid define, the Power Define dialog box closes without any warnings and no global takes place. You can continue realtime writing and make the next Power Define as necessary. The steno written while in the Power Define dialog box appears grayed out in Vertical Notes. If you have the Advanced Caption Option, *Insert Oops FS after aborted Power Define* option set to Yes, then an [Oops](#) category 10 format symbol is inserted into the text at the location the Power Define was aborted.

An invalid define includes:

- No text in the *New Text* field and you write the steno outline defined as [ENTER].
- More than 1024 characters in the *Text* field.
- No steno outline in the *Steno* field and you write the steno outline defined as [ENTER].
- More than 16 steno outlines in the *Steno* field. The steno outlines written display in Vertical Notes as deleted steno.
- More than 16 consecutive steno outlines in the *Global To* field.

## Text E-Define command

The {Text E-Define} command allows you to create [E-defines](#) from your steno machine during a captioning session. The {Text E-Define} is similar to the [Power Define](#) feature except it performs an E-define instead of a dictionary define. For example, let's say you are captioning the president of an organization called Safeway. When you write Safeway, your translation is "safe way" (without the quotes). Instead of putting that define in one of your dictionaries, you quickly E-define the translation (from your writing machine) of "safe way" (without the quotes) to be "Safeway" (without the quotes). And if you write any steno outline/outlines that translate as "safe way" (without the quotes) they will automatically change to Safeway. For example, let's say you have the following steno outlines defined as "safe way" (without the quotes) /SAEUF/WAEU, /SAF/WAEU, or /SWAEF. After using the {Text E-Define} command to E-define "safe way" (without the quotes) to be "Safeway" (without the quotes) regardless of the underlying steno, the text "safe way" will change to "Safeway" during this captioning session.

When the {Text E-Define} command is invoked, a Power Text Define dialog box displays which contains an Old Text field and a New Text field. Using your steno machine, write the text you want to change in the Old Text field, "tab" to the new Text field and write the new text in the New Text field and then write the stroke to complete the E-define. Use your [Power Define commands](#) (located in the Power Define dictionary located in your System Files case) to navigate the dialog box.

The Power Define dictionary is automatically loaded as the highest priority dictionary when you write the Power Text Define command. When you close the Power Text Define dialog box, the Power Define dictionary is unloaded. You can also access the Format Symbol list and the Insert Field list to include either or both in Old Text and/or New Text fields.

The [Advanced Caption Options](#) includes an *Insert [Oops](#) FS after aborted Power Define* option that also affects Text E-defines when aborted.

### To do a Power Text Define:

1. In a dictionary, create a dictionary entry to invoke the Power Text Define dialog box. In the Steno field, type the steno you want to invoke the command. In the Text field, press **Alt + f** (FS>>) and then double click the {Text E-Define} command. Click OK to insert the entry and then save and close the dictionary.
2. Start a realtime session. Select the dictionary that contains the {Text E-define} definition if it is not in your Personal Dictionary.
3. Write the steno outline for the Power Text Define command to open the Power Text Define dialog box.  
**Please note that all "commands" referenced in the following instructions refer to commands in the Power Define dictionary (located in your System Files case).**
4. In the *Old Text* field, using your steno machine, write the text and/or steno that you want to change in the *Old Text* field. You can write an existing word or phrase and fingerspell the word/or phrase. Do

any of the following: "Finger spell" the text by writing the steno outlines defined as the individual letters or write a stroke/strokes defined in your dictionary to write a word or phrase.

- Insert a Format Symbol. Write the steno outline defined as [F4] followed by the steno outline for the letter of the format symbol. For example, you might write TPORPLT (default steno outline for [F4]) and then the steno outline for "c" as KR-RBGS. F4c indicates Colloquy.

Alternately, you can write the steno outline defined as [F4 LIST]. When the Format Symbol list displays, stroke the steno outline defined as [UP ARROW] or [DOWN ARROW] to highlight the selected symbol. Then stroke the steno outline defined as [ENTER] to insert the format symbol.

- Insert a [Field](#) into the definition. In order to display the Insert Field dialog box, press **Alt + i** on your computer keyboard and navigate using your computer keyboard or mouse to insert a field. Once you close the Insert Field dialog box, you can return to using your steno machine to navigate the Power Text Define dialog box,
- Insert a space between a word or after punctuation by writing the steno outline defined as [SPACE].
- Backspace the last character or last stroke, depending on your option, by writing the steno outline defined as [DELETE].

5. Write the steno outline defined as [TAB] to move to the *New Text* field.

6. In the *New Text* field, enter the text definition for the steno. Do **any** of the following:

- "Finger spell" the definition by writing the steno outlines defined as the individual letters or write a stroke/strokes defined in your dictionary to write a word or phrase.
- Use a combination of writing a word or phrase with finger spelling. For example, you write SKWROPB/SON (Johnson) in the *Steno* field. In the *New Text* field you write the stroke for "John" and then fingerspell "son" so the result is "Johnson". If you wrote the stroke for "John" and then the stroke for "son" the result would be "John son".
- Insert a Format Symbol. Write the steno outline defined as [F4] followed by the steno outline for the letter of the format symbol. For example, you might write the steno outline for "c" as KR-RBGS. F4c indicates Colloquy.

Alternately, you can write the steno outline defined as [F4 LIST]. When the Format Symbol list displays, stroke the steno outline defined as [UP ARROW] or [DOWN ARROW] to highlight the selected symbol. Then stroke the steno outline defined as [ENTER] to insert the format symbol.

- Insert a [Field](#) into the definition. In order to display the Insert Field dialog box, press **Alt + i** on your computer keyboard and navigate using your computer keyboard or mouse to insert a field. Once you close the Insert Field dialog box, you can return to using your steno machine to navigate the Power Text Define dialog box,
- Insert a space between a word or after punctuation by writing the steno outline defined as [SPACE].
- Backspace the last character or last stroke, depending on your option, by writing the steno outline defined as [DELETE].

7. Do **one** of the following:

- Write the stroke defined as [ENTER] to apply the E-define and close the dialog box.
- Write the stroke defined as [ACCEPTCONTINUE] to apply the define and have the Power Text Define dialog box remain open, allowing you to create another E-define.
- If you need to leave the Power Text Define dialog box open and return to writing realtime, write the steno outline defined as [SUSPEND]. The Power Text Define dialog box flashes, the cursor

focus changes to the realtime text and leaves the Power Text Define dialog box open. You can write the Suspend command at any time the Power Text Define dialog box is open. To return the to the Power Text Define dialog box, write the steno outlined defined as {Text E-Define}.

If you want to cancel the Power Text Define while it is in Suspend mode, you can write a steno outline defined, in a dictionary being used to translate, as {Cancel Active Dialogs}. The Power Text Define dialog is closed and nothing is applied.

- To cancel the Text E-Define, write the [ABORT] command to disregard what is in the Power Text Define and close the dialog box. The steno written while in the Power Define dialog box appears grayed out in Vertical Notes. If you have the Advanced Caption Option, *Insert Oops FS after aborted Power Define* option set to Yes, then an [Oops](#) category 10 format symbol is inserted into the text at the location the Power Text Define.

**Note:** If you want one steno outline to cancel the Power Define, Scan Define, Text Define and Create EZ Speaker Entries dialog box and other dialog boxes, look at your Power Define dictionary and see what the steno is for the [ABORT] entry. Then open your Personal Dictionary and insert/modify the {Cancel Active Dialog} entry steno to be the same as the Power Define [ABORT] entry. For example if the:

Power Define default steno for [ABORT] is PWORT

Create a Personal dictionary (or whatever dictionary) definition Steno PWORT defined as {Cancel Active Dialog}.

## Stitch On/Off

Use the Stitch On/Off format commands to separate letters or words with punctuation. Punctuation entered between the brackets, displays between the letters or words. For example, you write the steno {Stitch On} [-] A B C{Stitch Off} the translated result is "A-B-C". If you write the steno {Stitch On}[-] mother in law {Stitch Off}, the result is "mother-in-law."

You can add the [web] attribute after the {Stitch On} translate command to have all alpha characters translate as lowercase with no spaces between them until the {Stitch Off} command is written. This may be particularly useful in definitions for e-mail or web addresses. For example, /W/W/W {Stitch On}[web] www.<Delete Space>. You may also want to define a stroke for .com, .net or .org and include the {Stitch Off} format symbol. For example, .com{Stitch Off}.

## Create a Dictionary Definition

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Stitch On

1. Press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
4. In the Steno field, type the appropriate steno for the definition.
5. Press **Alt + f (Edit/Insert/Insert Format Symbol)**, to display the list of format symbols.
6. Use the Up and Down Arrow keys to locate {Stitch On} and press **Enter** to insert the highlighted format symbol into the Text field.

7. Do one of the following:

**Separate letters or words with punctuation**

Type [ followed by the punctuation and then type ]. To use Stitch On/Off as a "squish" command to remove spaces between letters or words, place nothing between the brackets, [].

**Keep all alpha characters lowercase**

Type [web] and then type the text you want to have all lowercase alpha characters. Add any other necessary commands or text. For example, after the {Stitch On} command type, [web] **www.<Delete Space>**. The definition displays as {Stitch On}[web]www.<Delete Space>.

8. Press **Enter (OK)** to insert the definition into the dictionary.
9. Press **Esc (Cancel)** to close the Insert dialog box.

**Stitch Off**

1. From anywhere in Case CATalyst or CATalyst BCS, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
4. In the *Steno* field, type the appropriate steno for the definition.
5. Press **Alt + f (Edit/Insert/Insert Format Symbol)**, to display the list of format symbols.
6. Use the Up and Down Arrow keys to locate **{Stitch Off}** and press **Enter** to insert the highlighted format symbol into the *Text* field.
7. Press **Enter (OK)** to insert the definition into the dictionary.
8. Press **Esc (Cancel)** to close the Insert dialog box.

**Toggle Phonetic Mode**

The Toggle Phonetic Mode translate command switches the phonetic translation mode between On and Off during captioning. If Phonetic Mode is On, untranslates that normally display in a raw steno outline are phonetically translated based on your phonetic translation method. Phonetic translation is based on your selection for the Advanced Translate option, [Phonetic untranslates display as words](#). You can choose to match steno outlines with the text equivalent entry in the [Phonetic Table](#) or to translate single stroke untranslates using algorithmic logic for the intended pronunciation, which is the default.

To invoke the Toggle Phonetic Mode command from your writing machine, a steno outline defined as {Toggle Phonetic Mode} must be in a dictionary used during captioning.

**Captioning Preferences**

Preferences are a group of settings that affect how CATalyst BCS handles certain captioning settings during the session. You set caption Preferences on the Preferences tab in the Caption Translate Options dialog box. Preference settings remain the same until changed.

Access Preferences:

- each time you start a CATalyst BCS session. In the Broadcast Captioning Translate dialog box, select **Options** and then select the **Preferences** tab.

- during a BCS session. Press **Alt + p, e (Setup/Preferences)**. When changing translate options and advanced translate options from the Setup menu, do one of the following:
  - Click **OK** to apply the changes to the current Profile for the current captioning session only and close the dialog box.
  - Click **Save** to apply the changes to the current captioning session, permanently save them to the current Profile and close the dialog box.

## Preferences Tab

In the Preferences tab, highlight the preference name on the left side of the dialog box to display the preference options on the right side. The following list is a summary of BCS translate preferences. For detailed information, click the name.

### BCS Preferences

### Preference Summary

#### [General](#)

Determine how CATalyst BCS handles files and dictionaries when it cannot locate the path when starting a session; and how to handle global tables when appending, overwriting and closing a session.

#### [Simultaneous ASCII](#)

Set this option and select a default name and location for the concurrent ASCII file created of CATalyst BCS text being sent to the encoder.

#### [Warnings](#)

Select to display message boxes for certain selections during a CATalyst BCS session.

#### [Display](#)

Set default settings for dialog pane positions when starting a CATalyst BCS session.

#### [Scripts](#)

Set Script dialog pane options for cursor movement with send commands, retaining text case, audio warning and script accessibility in the Story Queue.

## General

General preferences determine certain CATalyst BCS start up settings and History window [global options](#).

Access General preferences:

- from the Broadcast Captioning Translate dialog box. Select **Options** and click the **Preferences** tab.
- from the History window. Press **Alt + p, f (Setup/Preferences)**.

## General Preferences

### Session Startup Settings

Certain Profile items, such as dictionaries and NIK files are set to a specific path. Usually the path points to your user folder. When working in a networked situation, some files may be shared by several users and the path for the files points to a specific location on the network.

If you select a Profile that contains a specific path which does not exist, CATalyst BCS automatically checks backward through the file path to locate the file. CATalyst BCS first checks the original file path. When CATalyst BCS cannot locate the file it then looks to the current user. If the file is not found, CATalyst BCS continues to look for the file, drilling backward through the file path to the root.

For example, the original path for the NIK file in this Profile is C:\CATalyst\usr\James\System Files\Captioning\CNN.NIK but your BCS is loaded in C:\CAT4\usr\Vickie. CATalyst BCS searches for the NIK file in the following order:

C:\CAT4\usr\James\System Files\Captioning\CNN.NIK

C:\CAT4\usr\Vickie\System Files\Captioning\CNN.NIK

C:\CAT4\usr\Vickie\System Files\CNN.NIK

C:\CAT4\usr\Vickie\CNN.NIK

C:\CAT4\usr\CNN.NIK

C:\CAT4\CNN.NIK

C:\CNN.NIK

### **Notify me of Unresolved Paths**

Select to have CATalyst BCS display a message when starting a session if it cannot locate the file or the path specified.

#### **Yes**

Display a message when starting a session notifying you that the selected Profile contains paths for files which CATalyst BCS cannot locate.

#### **No**

Start a session without notification when the selected Profile contains paths for files which CATalyst BCS cannot locate.

### **Remove Unresolved Paths**

Select to remove or retain unresolved paths when CATalyst BCS cannot locate the file or the path specified.

#### **Yes**

Temporarily removes the unresolved paths for files and dictionaries that CATalyst BCS cannot locate for this session. The unresolved paths are not permanently removed from the Profile unless you make changes to the Profile and save them during the session. Then, the unresolved paths are no longer available.

#### **No**

List unresolved paths for the selected Profile which contains files and dictionaries in the current session.

### **Default Keyboard Map**

Select the active Keyboard Map when you start a captioning session or open a caption file for editing. Keyboard Maps located in the Captioning case display in the list.

## **Global Settings**

**Delete Globals on Append**

Select to delete or retain [global table](#) entries when switching Profiles or when starting a captioning session and selecting to append to an existing session.

**Yes**

Delete the existing global table entries. Globals made before switching Profiles or in the previous session are no longer available and do not apply to new text.

**No**

Retain the global table entries. Globals made before switching Profiles or in the previous session remain available and apply to new text.

**Delete Globals on Overwrite**

Select to delete or retain global table entries when starting a captioning session and selecting to overwrite an existing session.

**Yes**

Delete the existing global table entries. Globals made in the existing session are no longer available and do not apply to new text.

**No**

Retain the global table entries. Globals made in the existing session remain available and apply to new text.

**Append Global Tables**

Select to have CATalyst BCS automatically apply E-Defines made in the Script window (dialog pane) to the History window.

**Yes**

Add E-Defines made in the Script window to the Script window and History window global tables. The E Defines made in the Script window apply to realtime text in the History window.

E-Defines added to the History window global table remain in the table unless deleted or undone. Deleting or undoing an E-Define in the History global table does not affect entries in the Script window global table nor is the global removed or undone in the Script window.

CATalyst BCS does not save the Script window global table when closing the session.

**No**

E Defines made in the Script window apply only to text in the Script window. E-Defines made in the History window apply only to text in the History window. CATalyst BCS does not save E-Defines made in the Script window when closing the session.

**Omit Global/Define Save Option**

Select to save or delete the global table (History window) entries when closing a captioning session without saving changes.

**Yes**

Always save the History global table and dictionary definitions when exiting a captioning session whether or not you select to save changes.

### No

Do not save the History global table and dictionary definitions when exiting a captioning session and you select to not save changes.

## Simultaneous ASCII

Simultaneous ASCII preferences allow you to activate the Simultaneous ASCII feature and determine certain settings. The Simultaneous ASCII feature allows you to concurrently create an ASCII file of the current CATalyst BCS session being sent to the encoder. Only text sent to the encoder is included in the simultaneous ASCII. During a captioning session, you can also end one simultaneous ASCII and create a new ASCII for the captions that follow by using [Simultaneous ASCII Output](#).

When using the Simultaneous ASCII feature, CATalyst BCS inserts \m into the ASCII file when you write a musical note. Inserting \m applies only when using Simultaneous ASCII and does not apply when exporting ASCII.

Access Simultaneous ASCII preferences:

- from the Broadcast Captioning Translate dialog box. Select **Options** and click the **Preferences** tab.
- from the History window. Press **Alt + p, f (Setup/Preferences)**.

## Simultaneous ASCII Preferences

### Use Simultaneous ASCII

Check this box to automatically create an ASCII file concurrently with each open CATalyst BCS session. Leave this box blank to not create a simultaneous ASCII for each session. If you leave this box blank, you can select to create a simultaneous ASCII of the current session using [Simultaneous ASCII Output](#).

### File Path

#### Path

Select a default location for the simultaneous ASCII file. You can also create a default name. The default path places the ASCII in the current user's folder in a "case" called ASCII with the same name as the BCS session. Subsequent ASCII files created during the same session are sequentially assigned a number after the file name.

Use the following options to set the path.

- %U = user path (C:\CAT4\Usr\username)
- %R = user root (C:\CAT4\Usr)
- %C = Case CATalyst path (C:\CAT4)
- %P = Caption Profile path (C:\CAT4\Usr\Henry\System Files\Captioning\Caption Profiles)
- %S = System Files path (C:\CAT4\Usr\ username \ System Files)
- %u = User name (username)
- %M = Month (2 digits) (filename3.txt)
- %D = Day (2 digits) (filename 24.txt)
- %Y = Year (4 digits) (filename 2005.txt)
- %h = Hour (2 digits) (filename 8.txt)
- %m = Minute (2 digits) (filename 10.txt)

- %s = Seconds (2 digits) (filename 01.txt)
- %# = Next available number (filename 1.txt)
- %f = BCS session file name (filename.txt)

**Example**

The following examples assume the user name is Henry, the current date and time is March 24, 2005 at 8:10 a.m., and the current BCS file name is TWC.

**Format:** %U\%f\_%M-%D

**Result:** C:\CAT4\Usr\Henry\TWC\_3-24.txt

**Format:** %P\ASCII\%f\_%D%h

**Result:** C:\CAT4\Usr\Henry\System Files\Captioning\Caption Profiles\ASCII\TWC\_248.txt

**Format:** %U\%f\_%#

**Result:** C:\CAT4\Usr\Henry\TWC\_1.txt (first ASCII created)

C:\CAT4\Usr\Henry\TWC\_2.txt (second ASCII created)

**Format:** R:\ASCII\%u\%M-%D-%Y\%f

**Result:** R:\ASCII\Henry\3-24-2005\TWC.txt

**Options****Timestamps**

Check this box to use timestamps in ASCII file. Select one of the following options:

**Clock**

Display timestamps in actual time format. For example, 08:10:01 for 8:10 a.m.

**Elapsed**

Display timestamps indicating the quantity of time that has elapsed since starting. Use the field to specify an elapsed starting time. For example, if you start out with the elapsed time of 00:00:00 and you caption for 1 hour and 23 minutes the starting timestamps would be 00:00:00 and the ending timestamps would be 01:23:00.

**Frames (HH:MM:SS:FF)**

Check this box to display the timestamps with hour, minute, second and TV frame number.

**Overwrite existing file**

Check this box to have CATalyst BCS automatically overwrite an existing ASCII file when using the same file name.

## Simultaneous SCC

Simultaneous SCC option has been added to the BCS Preferences tab. The SCC format is most likely used with a post production DVD editor. The available Simultaneous SCC options include a customizable path for the simultaneous file type, adjustable elapsed time default and Overwrite existing file option. Simultaneous SCC Output can be selected from the File menu (**Alt + f, e**) during a BCS session.

### Access Simultaneous SCC preferences:

- from the Broadcast Captioning Translate dialog box. Select **Options** and click the **Preferences** tab.
- from the History window. Press **Alt + p, f (Setup/Preferences)**.

## Simultaneous SCC Preferences

### Use Simultaneous SCC

Check this box to automatically create a SCC formatted file concurrently with each open CATalyst BCS session. Leave this box blank to not create a simultaneous SCC for each session. If you leave this box blank, you can select to create a simultaneous SCC of the current session using [Simultaneous SCC Output](#).

### File Path

#### Path

Select a default location for the simultaneous SCC file. You can also create a default name. The default path places the SCC in the current user's folder in a "case" called SCC with the same name as the BCS session. Subsequent SCC files created during the same session are sequentially assigned a number after the file name.

Use the following options to set the path.

- %U = user path (C:\CAT4\Usr\username)
- %R = user root (C:\CAT4\Usr)
- %C = Case CATalyst path (C:\CAT4)
- %P = Caption Profile path (C:\CAT4\Usr\Henry\System Files\Captioning\Caption Profiles)
- %S = System Files path (C:\CAT4\Usr\ username \ System Files)
- %u = User name (username)
- %M = Month (2 digits) (filename3.txt)
- %D = Day (2 digits) (filename 24.txt)
- %Y = Year (4 digits) (filename 2005.txt)
- %h = Hour (2 digits) (filename 8.txt)
- %m = Minute (2 digits) (filename 10.txt)
- %s = Seconds (2 digits) (filename 01.txt)
- %# = Next available number (filename 1.txt)
- %f = BCS session file name (filename.txt)

### Example

The following examples assume the user name is Henry, the current date and time is March 24, 2005 at 8:10 a.m., and the current BCS file name is TWC.

**Format:** %U\%f\_%M-%D

**Result:** C:\CAT4\Usr\Henry\TWC\_3-24.txt

**Format:** %P\ASCII\%f\_%D%h

**Result:** C:\CAT4\Usr\Henry\System Files\Captioning\Caption Profiles\ASCII\TWC\_248.txt

**Format:** %U\%f\_%#

**Result:** C:\CAT4\Usr\Henry\TWC\_1.txt (first ASCII created)

C:\CAT4\Usr\Henry\TWC\_2.txt (second ASCII created)

**Format:** R:\ASCII\%u\%M-%D-%Y\%f

**Result:** R:\ASCII\Henry\3-24-2005\TWC.txt

## Options

**Starting Elapsed Time:** (HH:MM:SS:FF)

Use the field to specify an elapsed starting time in Frames (hour, minute, second and frame number) format. For example, if you start out with the elapsed time of 00:00:00 and you caption for 1 hour and 23 minutes the starting timestamps would be 00:00:00 and the ending timestamps would be 01:23:00.

## Overwrite existing file

Check this box to have CATalyst BCS automatically overwrite an existing SCC file when using the same file name.

## Simultaneous SMPTE-TT

Simultaneous SMPTE-TT option has been added to the BCS Preferences tab. The SMPTE-TT format is most likely used with web videos. The available Simultaneous SMPTE-TT options include a customizable path for the simultaneous file type, adjustable elapsed time default and Overwrite existing file option. Simultaneous SMPTE-TT Output can be selected from the File menu (**Alt + f, p**) during a BCS session.

### Access Simultaneous SMPTE-TT preferences:

- from the Broadcast Captioning Translate dialog box. Select **Options** and click the **Preferences** tab.
- from the History window. Press **Alt + p, f (Setup/Preferences)**.

## Simultaneous SMPTE-TT Preferences

### Use Simultaneous SMPTE-TT

Check this box to automatically create an SMPTE-TT file concurrently with each open CATalyst BCS session. Leave this box blank to not create a simultaneous SMPTE-TT for each session. If you leave this box blank, you can select to create a simultaneous SMPTE-TT of the current session using [Simultaneous SMPTE-TT Output](#).

## File Path

### Path

Select a default location for the simultaneous ASCII file. You can also create a default name. The default path places the ASCII in the current user's folder in a "case" called ASCII with the same name as the BCS session. Subsequent ASCII files created during the same session are sequentially assigned a number after the file name.

Use the following options to set the path.

- %U = user path (C:\CAT4\Usr\username)
- %R = user root (C:\CAT4\Usr)
- %C = Case CATalyst path (C:\CAT4)
- %P = Caption Profile path (C:\CAT4\Usr\Henry\System Files\Captioning\Caption Profiles)
- %S = System Files path (C:\CAT4\Usr\ username \ System Files)
- %u = User name (username)
- %M = Month (2 digits) (filename3.txt)
- %D = Day (2 digits) (filename 24.txt)
- %Y = Year (4 digits) (filename 2005.txt)
- %h = Hour (2 digits) (filename 8.txt)
- %m = Minute (2 digits) (filename 10.txt)
- %s = Seconds (2 digits) (filename 01.txt)
- %# = Next available number (filename 1.txt)
- %f = BCS session file name (filename.txt)

### Example

The following examples assume the user name is Henry, the current date and time is March 24, 2005 at 8:10 a.m., and the current BCS file name is TWC.

**Format:** %U\%f\_%M-%D

**Result:** C:\CAT4\Usr\Henry\TWC\_3-24.txt

**Format:** %P\ASCII\%f\_%D%h

**Result:** C:\CAT4\Usr\Henry\System Files\Captioning\Caption Profiles\ASCII\TWC\_248.txt

**Format:** %U\%f\_%#

**Result:** C:\CAT4\Usr\Henry\TWC\_1.txt (first ASCII created)

C:\CAT4\Usr\Henry\TWC\_2.txt (second ASCII created)

**Format:** R:\ASCII\%u\%M-%D-%Y\%f

**Result:** R:\ASCII\Henry\3-24-2005\TWC.txt

## Options

### Starting Elapsed Time: (HH:MM:SS:FF)

Use the field to specify an elapsed starting time in Frames (hour, minute, second and frame number) format. For example, if you start out with the elapsed time of 00:00:00 and you caption for 1 hour and 23 minutes the starting timestamps would be 00:00:00 and the ending timestamps would be 01:23:00.

### Overwrite existing file

Check this box to have CATalyst BCS automatically overwrite an existing SMPTE-TT file when using the same file name.

## Warnings

Warnings preferences allow you to determine when selected CATalyst BCS warning messages display.

Access Warnings preferences:

- from the Broadcast Captioning Translate dialog box. Select **Options** and click the **Preferences** tab.
- from the History window. Press **Alt + p, f (Setup/Preferences)**.

## Warnings Preferences

### Before Connection Loss

When [changing](#) a Profile or starting a new captioning session with a current session running, CATalyst BCS must disconnect the current session. Choose one of the following options:

#### Yes

Display a warning message before disconnecting the current session. The warning message allows you to continue or cancel the action. Warning message box options:

- **Yes** - Disconnect the current connection and take the selected action.
- **No** - Cancel the action and allow the current connection to continue.

You can disable the message from within the Warnings message box by checking the box, "I understand the consequences of my actions. Please stop asking."

#### No

Do not display a warning message and have CATalyst BCS automatically disconnect the current connection when you change Profiles or begin a new captioning session with a session already running.

### Conflict Connect

When attempting to establish a connection and a conflict occurs between COM port settings, you can determine how you want CATalyst BCS to handle the conflict. Choose one of the following options:

#### Yes

Display a warning message when attempting to connect with conflicting COM port settings. Choose one of the following options in the message box:

#### Yes

Display the Profile where you can make changes to the appropriate settings.

**No**

Close the dialog box and attempt to establish a connection.

**Cancel**

Close the dialog box without attempting a connection.

You can disable the message by checking the box, "I understand the consequences of my actions. Please stop asking." To turn the warning message back you on, reselect this option on the Preferences tab.

**No**

Do not display a warning message but allow CATalyst BCS to attempt to establish a connection.

**'Encoder None' Connection**

When attempting to establish a connection where the encoder type selected is None and no output is sent to the encoder, you can choose to display a warning message.

**Yes**

Display a warning message. Choose one of the following options:

**Yes**

Have CATalyst BCS open the COM port although no data is sent to the encoder.

**No**

Cancels the action.

You can disable the message by checking the box, "I understand the consequences of my actions. Please stop asking." To turn the warning message back on, reselect this option on the Preferences tab.

**No**

Do not display a warning message but allow CATalyst BCS to open the COM port. No data is sent to the encoder.

## Display

Display preferences allow you to determine how windows (dialog panes) display when starting a CATalyst BCS session.

Access Display preferences:

- from the Broadcast Captioning Translate dialog box. Select **Options** and click the **Preferences** tab.
- from the History window. Press **Alt + p, f (Setup/Preferences)**.

## Display Preferences

### Startup Windows Positions

Set the window positions when starting a CATalyst BCS session. You can choose to open a session using the window positions from the most recent CATalyst BCS session or with settings included in a user saved window position file. Files created using the [Save Window Positions](#) feature during a CATalyst BCS session display in the drop down list.

Window positions are changeable during a CATalyst BCS session by [loading](#) another saved window position file or by moving the individual panes, unless you have the panes locked.

### **Start with Locked Positions**

Select to lock or unlock window positions when starting a CATalyst BCS session. You can change this setting during a session using the [Lock Window Positions](#) feature. Choose one of the following:

#### **On**

Prevent the windows from being repositioned during the CATalyst BCS session. You can continue to show, hide, dock, float and resize a floating window and load saved window settings when Lock Window Positions is active.

#### **Off**

Allow windows to be repositioned during the CATalyst BCS session.

#### **Remember Last Setting**

Use the Locked Window Position setting from the last CATalyst BCS session.

## **Scripts**

Script preferences allow you to set options for cursor position, text case and audio warning for the Script window and script accessibility in the Story Queue. On the Preferences tab, highlight **Scripts/General** and set values as necessary.

## **Script Preferences**

### **General Settings**

#### **Send Line is Cursor Line**

##### **Yes**

Allow the current cursor position in a script file to be the send line. When you move the cursor, CATalyst BCS resets the send line.

This is similar to the cursor movement in a CAPticator script file.

##### **No**

Move your cursor anywhere in the script file. The send line is not reset unless another command is used to reset it.

#### **Beep on Warning Lines**

##### **Yes**

Have CATalyst BCS generate an audio alert prior to encountering a Warning line. You must use a Warning Line format symbol for this feature to work properly.

##### **No**

Display the Warning line without any audio alert.

#### **Start with Retain Script Case**

Always start CATalyst BCS or switch profiles during a session and retain the current case when sending the Script file to the encoder. You can turn this option on and off during a session using [Retain Script Case](#).

### **On**

Start CATalyst BCS or switch profiles during a session and always retain the current case when sending the Script file to the encoder. This takes priority over the profile option, [Capitalize All](#).

### **Off**

Start CATalyst BCS or switch profiles during a session and use the current case when sending the Script file to the encoder. When set to Off, CATalyst BCS sends the script text in all caps if the Capitalize All option is active.

### **Remember Last Setting**

Use the setting from the last CATalyst BCS session.

## **Story Queue Settings**

### **Save Last Story Queue Path**

#### **Yes**

When adding a script file to the story queue, default to opening the last folder used. You may want to use this option if you store your script files in a folder other than the Caption Show Files case.

#### **No**

When adding a script file to the story queue, always default to opening the Caption Show Files case.

### **Clear Stories before switch**

#### **Yes**

Remove stories from the Story Queue when switching profiles. You may want to choose this option if you use the Switch Profile command to start the next captioning session. New captions append to the existing captioning file.

#### **No**

Retain stories in the Story Queue when switching profiles. You may want to choose this option if you normally click the BCS icon to start a new captioning session and create a new file.

## **Profiles**

CATalyst BCS uses customizable Profiles to retain a collection of settings used during a captioning session. Profiles are designed to make the set up for a captioning session fast and easy.

A Profile contains settings contained on nine tabs that include dictionary selection, encoder connection, realtime options, caption styles, NIK assignments, contact information, multiple outputs, EZ Text and Advanced Audit Log information. You can have multiple Profiles, allowing you to create a separate Profile for different captioning environments. For example, you caption three television shows, so you set up a Profile for each of the three shows. You can also have multiple connections with one Profile using the Multiple Outputs option. For example, a single Profile may contain connection information for a Primary encoder and Backup Encoder.

If you are using BCS limited access to use CARTView and to send scripts, all tabs are not available when creating a profile. [CARTView with scripting](#) topic provides more information.

You can easily create a [new](#) Profile using the CATalyst BCS Profile wizard. Existing Profile settings can be [modified](#) before, during or after a captioning session. Profile settings remain the same until you change them.

Profiles have an .sgxml extension. By default Profiles are stored by user in the Caption Files case located in the Captioning case within the System Files case. You can change the storage location of the Profiles.

## Modifying a Profile

You can modify Profile settings before, during or after a captioning session. You can access and modify certain Profile settings during captioning from the Setup menu.

### Modify Before or After Captioning

1. Press **Alt + u, c (Function/Captioning)**. The Broadcast Captioning Translate displays.
2. Select the Profile you want to modify and select **Modify Profile** to display the Profile dialog box.
3. Modify settings on any of the nine Profile tabs.
4. When finished press **Enter (OK)** to accept the changes made in all the Profile tabs and close the Profile dialog box.

### Modify During Captioning

1. Press **Alt + p, p (Setup/Profiles)**. The Manage Profiles dialog box displays.  
If you have the warning option, *Before Connection Loss*, set to Yes in Preferences, CATalyst BCS displays a warning message prompting you with a Yes/No choice before switching Profiles.
2. Highlight a Profile to modify.
3. Select **Modify Profile**. The Profile dialog box displays where you can modify settings on any of the nine Profile tabs.
4. When finished press **Enter (OK)** to accept the changes made in all the Profile tabs and close the Profile dialog box. The Manage Profiles dialog box displays.
5. Select **Cancel** to close the Manage Profiles dialog box.

You can also access the Manage Profiles dialog box from the Session Information Window. Click **Change to a different Profile**.

## Cloning a Profile

You can easily create a copy of all or selected options in an existing Profile using the Clone Profile option in the Broadcast Captioning Translate dialog box. When you clone a Profile, you choose which source Profile information is included in the copied Profile. For example, you use a profile when captioning the cooking show for the XYZ station. You need to set up a profile for captioning the sports show at the same station. You can clone all the options of the cooking profile except dictionary options and the caption styles which differ for the two shows.

### Clone an Existing Profile

1. Press **Alt + u, c (Function/Captioning)**. The Broadcast Captioning Translate displays.
2. Select the Profile you want to copy and select **Clone Profile**. The Create a copy of Profile dialog box displays.
3. In the File name field, type the name for the new Profile and press **Enter (Save)**. If you enter the name of an existing Profile, CATalyst BCS prompts you to replace the existing file. The Clone Profile Options dialog box displays.
4. Check the box next to the each option from the source Profile you want to include in the cloned Profile. Each option represents one of the eight Profile tabs. Use other options as necessary.

### Remember Settings

Check this box to have CATalyst BCS remember the selected Profile options when cloning the next Profile.

### Select All

Check the box for each Profile option.

### Deselect All

Uncheck the box for each Profile option.

### Open Profile after cloning is done.

Check this box to open the new Profile after cloning is complete where you can modify the Profile settings.

5. Press **Enter (Make Clone)**. The Broadcast Captioning Translate dialog box displays unless you checked the box, Open Profile after cloning is done, then the Profile dialog box displays. In the Profile dialog box, modify settings on any of the eight Profile tabs. When finished, press **Enter (OK)** to accept the changes. Selecting Cancel, cancels the cloning process.

## Set Multiple Output Connection Values

CATalyst BCS allows you to set values for multiple output connections before starting a captioning session. You can include a multiple outputs connection along with other connections within the same profile.

## Set Values for Multiple Outputs

1. In the Broadcast Captioning Translate dialog box, do one of the following:

### Modify an Existing Profile

Add a multiple output connection to an existing profile. Highlight the selected profile and click the **Modify Profile** button.

### Create a New Profile

Create a [new](#) profile for the multiple output connection. Click the **New Profile** button. In the Create New Profile dialog box, type a name for the new profile and press **Enter**.

2. On the **Connections** tab, click the New  icon and type a name for the multiple outputs connection, for example Multiple Outputs, and press **Enter**.
3. Make necessary entries:

### Encoder Model

Select the encoder type. This selection specifies the caption format sent to all the multiple output connections.

### Connection Type

Select **Multiple Outputs**. The remaining Modem/Direct and Internet connection settings are unavailable. Specific connection settings for each modem are set on the Multiple Outputs tab.

### Auto Reconnect

Check this box to have CATalyst BCS automatically attempt to reconnect if a connection is lost.

4. On the Multiple Outputs tab, check the box **Use Multiple Outputs**. You must select this option to enable the multiple output connection settings in the Multiple Outputs tab.
5. The Open Multiple Outputs Profile dialog box displays. Select an existing multiple outputs profile or create a new one. To create a new one, type a name in the File name field and press **Enter**.
6. Make necessary entries in the remaining fields on the [Multiple Outputs](#) tab.
7. Do one of the following:
  - If creating a new profile continue through the Wizard.
  - If modifying an existing profile, click **OK**.

## Dictionaries

The Dictionaries tab in a Profile allows you to select dictionaries and global tables and set priority order captioning sessions using this Profile. You can also select and remove dictionaries and set dictionary priorities for the current captioning session using the [Add/Remove Dictionary](#) feature. This does not affect the dictionary selection in the Profile.

## Select Dictionaries and Global Tables

### Choose Dictionaries

Check the box next to any dictionary you want to use for translation. CATalyst BCS automatically selects the Personal Dictionary and Update Area, if used.

### Show All Users

Check this box to display all the CATalyst users. You can select a dictionary from any user. Selecting Show All Users after selecting dictionaries and global tables deselects them.

### Global Tables

Check this box to display global tables for selection. Translating with a global table allows you to use E-Defines previously created during a captioning session.

### Set Dictionary Priorities

Displays the dictionaries in the order in which they were selected. The dictionary at the top of the list has the highest priority. The total number of files selected for translation displays at the bottom of the screen. This includes any dictionaries or global tables chosen.

### Remove

Highlight a dictionary and select **Remove** to remove the dictionary from the Set Dictionary Priorities list.

### Move Up/Down

Highlight a dictionary and select Move Up and Move Down to change the priority order for translation. The dictionary priority order begins at the top of the list.

### **OK**

Accept the changes made in all the Profile tabs and close the Profile dialog box.

When accessing the Dictionaries tab during a captioning session, OK applies changes on the Dictionaries tab to the current Profile for the current captioning session only and closes the dialog box. Use Save to make permanent changes to the current Profile.

### **Apply/Save**

Accept the changes made in the Dictionaries tab.

When accessing the Dictionaries tab during a captioning session, Save displays. Save applies changes on the Dictionaries tab to the current session, permanently saves them to the current Profile and closes the dialog box.

### **Cancel**

Do not apply any changes to the Profile and close the Profile dialog box.

## **Connections**

The Connections tab in a Profile allows you to set encoder and modem values for a connection. You can create multiple connection names with different values. For example, you create two connections for the current Profile. The first connection is the modem and phone line you always use. You name it Primary Encoder. The second connection is the backup encoder, so you name that connection Backup Encoder.

You can include a multiple outputs connection along with other connections within the same Profile. For example, 95% of the time you send to a specific encoder. Your connection name for this encoder is Primary. You have a backup encoder connection, named Backup. About 5% of the time, you need to send to multiple encoders, and you have a multiple output connection.

## **Set Encoder and Modem Values**

The list of existing connections. Use the following options as necessary:

### **New**

Create a new connection name. A blank field displays in the Connections field. Type a name and press **Enter**. Modify the connection values as necessary.

### **Delete**

Delete an existing connection name from the list. Highlight a name and click the **Delete** icon.

### **Move Up**

Move the connection name up in the list. Highlight the name and click the **Move Up** icon.

### **Move Down**

Move the connection name in the list. Highlight the name and click the **Move Down** icon.

## **Connection Settings**

Connection values for the highlighted connection in the *Connections* field. Click the +/- box to expand or collapse the list as necessary.

Highlight a field to set the value. An explanation of the option displays in the lower right corner of the dialog box.

### **Encoder Name**

The name of the connection selected in the Connection field. To change the name, double click the field and type a new name.

### **Encoder Model**

Click the Down arrow to select the appropriate encoder model. Daktronics and ASCII are common model choices when captioning for a stadium output such as baseball games. [StenoKeys](#) is available when needing to write directly to another application, for example, a chat window or other windows that allow text input. When needing to caption a live streaming YouTube video, select [YouTube](#).

Outputting to [CARTView](#) displays a separate window which can display on your computer or you can drag the window to another monitor or computer screen. The CARTView window displays text with no toolbars or menus. You can [customize the display](#) by changing the color of the text, background, font style and size, background transparency, line spacing and the position of the window.

To create a blank line on the CARTView window, define a steno outline as <New Line>. You can write the <Caption: Clear> command to clear the CARTView screen.

When starting a CATalyst BCS session with the Encoder Model set as None and Connection type set to Direct or Modem, an icon displays indicating you are not connected. You can continue to write without establishing a connection to check your caption positions. The text displays in the Caption Preview window. Click the connection link when you are ready to send captions.

When using a Subtitle Encoder NEWFOR or a Daktronics Venus Matrix encoder, additional fields display that require an entry.

### **Subtitle Encoder NEWFOR**

The following fields apply when Subtitle Encoder NEWFOR is selected in the *Encoder Model* field.

#### **Encoder Language**

Click the Down arrow to select a language set for subtitles.

#### **Teletext Page**

Type the teletext page to which you are writing for subtitles.

### **Daktronics Venus Matrix**

The following fields apply when Daktronics Venus Matrix is selected in the *Encoder Model* field.

#### **Number of Lines**

Click the Down arrow to select the number of lines to display. The range is 1 - 8.

#### **Characters Per Line**

Click the Down arrow to select the number of characters per line to display. The range is 16 - 48.

### **ASCII**

When selecting ASCII as the encoder type, a *Add Carriage Return* option is available. This option is also available when setting up Multiple Outputs. Selecting the Add Carriage Return option adds a carriage return character at the end of a line to ensure a new line is created in the output data. By default, when ASCII is selected, the Add Carriage Return option is also selected. Depending on your input device, you may need to deselect this option.

### Connection Type

Click the Down arrow to select **Direct**, **Modem**, **Internet**, or **Multiple Outputs**.

When you select Multiple Outputs, the Encoder Model field is grayed out and automatically set to EEG Compatible. In addition, the remaining Modem/Direct and Internet fields are unavailable. Specific connection settings for each multiple output modem are set on the [Multiple Outputs](#) tab.

### Auto Reconnect

Automatically reconnect to the encoder if the connection is lost.

### Modem/Direct Settings

The modem values when the Connection Type selected is *Modem* or *Direct*. Click the +/- box to expand or collapse the list as necessary.

Highlight a field to set the value. Click the Down arrow to select the appropriate value based on the modem type and computer connection. In fields without a drop down list, type the appropriate entry. An explanation of the option displays in the lower right corner of the dialog box. Some settings do not apply to *Direct*.

The number of available COM ports varies among computers. When you copy a Profile from one computer that contains more available COM ports than the computer to which it is copied, CATalyst BCS retains the COM port information. On the computer with less COM ports, the COM ports are listed as unavailable in the drop down box. For example, "COM 4 not available."

### Internet Settings

Displays the Internet fields when the Connection Type selected is *Internet*. Highlight a field and type the appropriate values. An explanation of the option displays in the lower right corner of the dialog box. The User Name field recognizes a User Name or Login field. The User Name and Password information is only needed if the host requires the information.

### Dialog Box Actions

#### OK

Accept the changes made in all the Profile tabs and close the Profile dialog box.

When accessing the Connections tab during a captioning session, OK applies changes on the Connections tab to the current Profile for the current captioning session only and displays the Modem dialog box. Use Save to make permanent changes to the current Profile.

#### Apply/Save

Accept the changes made in the Connections tab.

When accessing the Connections tab during a captioning session, Save displays. Save applies changes on the Connections tab to the current captioning session, permanently saves them to the current Profile and closes the dialog box.

**Cancel**

Do not apply any changes to the Profile and close the Profile dialog box.

**Output to StenoKeys**

StenoKeys is available in the Encoder Model field of a BCS Profile Connections dialog box. StenoKeys allows you to use your steno machine and BCS to write text directly to another application such as a chat window or other windows that allows text input. When using StenoKeys, text is only written to the other application when your cursor focus is in the text window. You may want to create special dictionary [entries](#) in a StenoKeys dictionary when outputting to StenoKeys. To output to StenoKeys, do the following:

1. In a BCS profile, click the Connections tab.
2. Create a new connection name. In the Encoder Model, select **StenoKeys**. All other connection options are grayed out and not applicable.
3. Set any other Profile options and click **OK** to save your changes.
4. Start a BCS session and establish a connection with your steno machine.
5. When you are ready to write to the chat window or text application, change your cursor focus to that window and begin writing. When using StenoKeys, text is only written to the other application when your cursor focus is in the text window.
6. Once you are finished, change your cursor focus back to BCS.

**YouTube**

YouTube is available in the Encoder Model field of a BCS Profile Connections dialog box. YouTube allows you to use your steno machine and BCS to caption a YouTube video. There is also a way to set the delay of text for the YouTube Live session via the Caption menu, [Set YouTube Delay](#). Your YouTube live streaming partner may determine it is necessary to adjust this setting. To caption a YouTube video, do the following:

1. In a BCS profile, click the Connections tab.
2. Create a new connection name. In the Encoder Model, select **YouTube**.
3. In the DNS/IP Address field, type the URL you receive from the YouTube live streaming partner.
4. On the Broadcast Captioning Translate Options tab, for best results, set the Translation Delay to 1500 milliseconds.
5. Start a BCS session and establish a connection with your steno machine.
6. If necessary, use the Set YouTube Delay option available via the Caption menu. The YouTube live streaming partner may ask you to adjust this value.

Keyboard Function: Caption: YouTube Delay

NOTE: Some web protection/Anti-virus products may interfere when captioning via Google YouTube. Be sure to try a test connection before attempting live captioning. You may need to make an exception in your web protection software or you may need to disable it during your session.

## CARTView

CARTView creates a window that can be displayed on the BCS computer or can be moved to another monitor or screen when providing CART services. The CARTView window displays text with no toolbars or menus. You can [customize the CARTView window](#) by changing the color of the text, background color and/or transparency, font style and size, line spacing and the position of the window on the monitor/screen. When you customize the CARTView display, it is automatically saved with the profile and will be used the next time the profile and CARTView output is used. To modify the display, right click and make the necessary changes. The customized display will be saved as part of the profile in the profile's job history file (\*.sgxml).

Editing changes to the realtime screen are reflected on the CARTView screen. If the CARTView window is displayed on another monitor/computer, you can use editing features that display dialog boxes on the realtime screen without displaying the dialog boxes on the CARTView window. For example, you can use the Power Define feature to easily define from your writing machine.

To clear the CARTView window, write a steno outline defined as <Caption: Clear>. The <Caption: Clear> command clears the CARTView window and the Caption Preview window. To display musical notes in the CARTView window, define a steno outline as the <Caption:Musical Note> format symbol.

When ending punctuation is written at the end of a line in the BCS file, the CARTView window will make a new line before continuing. BCS sends the data to the CARTView window as an ASCII format. Since CARTView doesn't have information about when a paragraph follows or doesn't follow, the assumption is made that when a line ends in the BCS file with ending punctuation, what follows should be on a new line. This assumption works the majority of the time, but occasionally, the assumption can cause a new line when it isn't wanted.

To output to CARTView:

1. In the Broadcast Captioning Translate dialog box, do one of the following:
  - Select an existing profile and click [Modify Profile](#).
  - Select an existing profile and click [Clone Profile](#).
  - Click [New Profile](#), type a new name and click **Open**.
2. On the Connections tab, click the New  icon and type the name of the connections.
3. In the Encoder Model field, click the down arrow () and select CARTView. Once you select CARTView, the Modem/Direct and Internet settings sections gray out and do not apply to CARTView.
4. Continue with any changes or setup to the profile.
5. When finished, click **OK**.
6. The CARTView window displays once you establish the "connection" in the Session Information pane. It may take a second or two to display the CARTView window.
7. Once you stop realtime (**Ctrl + \**) the CARTView window closes.

A Case CATalyst CARTView Settings Icon () is available in the Windows System Tray. When selected, the icon displays the CARTView screen settings such as font, transparency, color, etc. The system tray icon makes it very easy to control the CARTView settings when you do not have instant access to the CARTView window. For example, let's say you are in the back of a large convention room with CARTView displaying on a large screen in the front of the room when you realize you need to change the color or the size of the text to make it more readable. By clicking the Case CATalyst CARTView Settings icon you'll instantly have access to the CARTView settings. No need to go to the front of the room to make adjustments.

## Caption Styles

The Caption Styles tab in a Profile allows you to set certain formatting values that affect how the caption appears on the screen. A caption style contains settings for the number of characters per line, baseline information and the type of caption style: Roll-up, Pop-on, or Paint-on.

Set up the caption style you want CATalyst BCS to default to when you use this Profile. Although you can set up other caption styles for this Profile, you can easily switch to a different Profile using a NIK key, dictionary definition or credit file.

## Set Display Values

### Capitalize All Text

Check this box to send all text to the encoder in all capital letters. You cannot change this option once a captioning session has begun. By default, this option is active when creating a new profile.

### Caption Styles

A list of existing caption styles. Use the following options as necessary:

**New**

Create a new caption style name. A blank field displays in the Caption Styles field. Type a name and press **Enter**. Modify the values as necessary.

**Delete**

Delete an existing caption style from the list. Highlight a name and click the **Delete** icon.

**Move Up**

Move the caption style up in the list. Highlight the name and click the **Move Up** icon.

**Move Down**

Move the caption style down in the list. Highlight the name and click the **Move Down** icon.

### Caption style name

The name of the caption style associated with the current values. To view the values for a different caption style, highlight the name in the Caption Styles field. For example, you may name the Caption style, 3 Line Bottom, to indicate the captions display 3 lines at the bottom of the screen.

### Roll-up Rows

Determine the maximum amount of lines that display on the screen when using the Roll-up caption style. Valid entries are **2 - 4**. This feature only applies when Roll-up is selected in the Caption mode field.

**Column**

The horizontal position, indent, where you want the caption to begin. Valid entries are **1 – 28**.

**Char Per Line**

The number of characters allowed on a caption line. Valid entries are **8 – 32**.

**Baseline**

The vertical placement of the captions on the screen. This is the line number on which the bottom line of the caption displays. Valid entries are **1 – 15**.

**Caption mode**

Determines how the captions appear on the screen:

**Roll-up**

Display up to four caption lines as soon as caption is decoded. You must also make an entry in the Roll-up Rows field.

**Pop-on**

Display all caption lines, up to four, when all the lines of the caption have been decoded.

**Paint-on**

Display one character at a time as it is decoded so the line of text scrolls onto the screen from left to right.

**OK**

Accept the changes made in all the Profile tabs and close the Profile dialog box.

When accessing the Caption Styles tab during a captioning session, OK applies changes on the Caption Styles tab to the current Profile for the current captioning session only and closes the dialog box. Use Save to make permanent changes to the current Profile.

**Apply/Save**

Accept the changes made in the Caption Styles tab.

When accessing the Caption Styles tab during a captioning session, Save displays. Save applies changes to the Caption Styles tab, permanently saves them to the current Profile and closes the dialog box.

**Cancel**

Do not apply any changes to the Profile and close the Profile dialog box.

**NIK Files**

The NIK tab in a Profile allows you to create or modify Numeric Island Keys (NIK) files for the selected Profile. NIK key assignments, used in Cheetah's CAPtivor captioning software, allow you to easily change the placement of the captions, the caption style, the line length and horizontal placement of the captions. You can invoke NIK keys from the computer keyboard or from the steno keyboard with a dictionary definition.

There are 10 available NIK keys. On a standard, full-size keyboard, NIK keys refer to the number keypad, 0 - 9. In order to invoke NIK keys from the number pad, you must have Num Lock active. If you use a notebook computer, you can assign the NIK keys to other keys on your keyboard to take advantage of the NIK key assignments.

For example, you can send credit files using a NIK key assignment. You may have NIK 1 change the caption to the top of the screen, Pop-on style and send to EOC (end of caption); and NIK 2 return the caption to the bottom of the screen and 3 line roll-up.

You can copy CAPticator NIK files into CATalyst BCS. Place the NIK files in the user's caption case located in the System Files case. There is no conversion necessary. CATalyst BCS recognizes the original values.

## Create and Modify NIK Files

### Caption NIK Files

A list of existing NIK files. Use the following options as necessary:

#### New

Add an existing NIK file to the Profile. A blank field displays in the Caption NIK Files field. Do the following:

- Click the Browse button  on the right to search for an existing NIK file. The Open dialog box displays, by default, with existing NIK files located in the Captioning case within the System Files case.
- Select a NIK file from the list or Browse to another location to select a NIK file.
- Press **Enter**. The NIK file name and path display in the Caption NIK Files field.

#### Delete

Delete an existing NIK file from the list. Highlight a name and click the **Delete** icon.

#### Move Up

Move the NIK file up in the list. Highlight the name and click the **Move Up** icon.

#### Move Down

Move the NIK file down in the list. Highlight the name and click the **Move Down** icon.

### Create NIK File

Display the Create New Caption NIK file dialog box where you can type a file name for the new NIK file. Type a name and press **Enter (Save)**. The Numeric Island Keys dialog box displays where you can [set](#) the NIK key values.

### Load NIK File

Displays the Load an Existing Caption dialog box, where you can select and load an existing NIK file from another location. Press **Enter (Open)** after selecting a file to return to the NIK tab.

### Modify NIK File

Highlight the NIK file and click **Modify**. The Numeric Island Keys dialog box displays where you can [change](#) the NIK key values.

## Setting NIK Assignment Values

There are various settings available for each NIK key. In the Numeric Island Keys dialog box, highlight a NIK key and then select a value from the drop down menu in each field. You can also type a value. Depending on the field, type a number or the beginning letter of the selection. To change the entry, select or type another value. To remove an entry from the field, select the empty value from the drop down list or click the field and press Delete.

### Set Values for a NIK Key

Use the [toolbar](#) icons as necessary.

#### NIK File "*name*.NIK" is the selected File.

The name of the NIK file for which you are making entries.

When you select the Numeric Island Keys feature from the Setup menu during a CATalyst BCS session, you can choose any NIK file to modify. Click the down arrow to display other NIK Files listed in the NIK File tab for this Profile. To modify values for another NIK File, select the file and then click **Select**.

#### Manage

Display the [NIK Files](#) tab where you can add or modify a NIK file for the current Profile. This option is available when you select the Numeric Island Keys feature from the Setup menu during a CATalyst BCS session.

#### Key Number

Represents the number on the Numeric Island Keypad or your keyboard map assignment for NIK assignments, 0 -9. Valid values are **0 – 9**. Select a key and then set values in the remaining fields.

#### Caption Style

Determine how the caption displays on the screen. Choose one of the following:

##### Roll-up

Display up to four caption lines as soon as caption is decoded. You must also make an entry in the Roll-up Rows field.

##### Pop-on

Display all caption lines, up to four, when all the lines of the caption have been decoded. This caption style is usually used when sending a credit or fund file.

##### Paint-on (currently unavailable)

Display one character at a time as it is decoded so the line of text scrolls onto the screen from left to right.

#### Line Width

Determine the number of characters that display on a caption line. Valid entries are **8 – 32**.

#### Justification

The horizontal alignment of the caption text. Valid entries are **Left, Right, Center, and Widest Right**.

If you select Center, you must also enter a value in the Col field equal to half the value of the Line Width. For example, if the Line Width is 32 characters and Justification is Center, then "16" is the correct value for Col.

**Row**

The vertical position where you want to place the caption. This is the row number on which you want the first caption line to display. For example, if you select 3 lines roll-up with a Row placement of 15, the first caption line appears on line 15. When you write the second line, the first line rolls up to line 14. When you write the third line of captions, the first line rolls up to line 13.

**Column**

The horizontal position, indent, where you want the caption to begin. Valid entries are **1 – 28**.

If you select Center in the Justification field, enter a column value equal to half the value of the Line Width. For example, if the Line Width is 32 characters and Justification is Center, then "16" is the correct value for Col.

**Alignment**

Alignment is set to Bottom. Currently all captions align at the Bottom regardless of selection.

**Roll-up Rows**

Determine the maximum amount of lines that display on the screen when using the Roll-up caption style. Valid entries are **2 - 4**. This feature only applies when Roll-up is selected in the Caption Style field.

**Send Lines**

The number of lines sent to the encoder. Valid entries are **1 – 4**. **EOC** (End of Caption) is available when using the current NIK. Use a blank setting to change a caption position but not send a line.

If you use a NIK with Caption Styles set to Roll-up, CATalyst BCS defaults to sending 1 line when you begin writing or sending script.

The EOC value searches up to 4 lines for an EOC format symbol and sends that many lines. If no EOC format symbol is found, 2 lines are sent. Use EOC if setting a Pop-on caption style and you want all the lines of a credit file sent.

**Data Channel**

The channel through which data is sent. Valid entries are CC1 – CC4. If you do not select a channel, CATalyst BCS uses CC1.

**OK**

Save the changes and close the Numeric Island Keys dialog box.

When you select OK during a CATalyst BCS session, the changes apply to the current session only and return to the original values when you close the session. To make permanent changes during a CATalyst BCS session, select **Save**.

**Cancel**

Do not apply any changes and close the Numeric Island Keys dialog box.

**Save**

Save the changes permanently to the file and close the Numeric Island Keys dialog box. To make a temporary change that applies only to the current CATalyst BCS session, select **OK**.

This option only displays during a CATalyst BCS session.

**Apply**

Save the current changes and continue modifying the NIK file. The Numeric Island Keys dialog box remains open. To save the changes and close the dialog box, select **OK**.

This option only displays when creating or modifying a NIK file before beginning a CATalyst BCS session.

### Help

Highlight a field and select Help to display additional information about the option.

## NIK Assignment Toolbar Icons

Use the toolbars icons as necessary to assist in [setting](#) the NIK key values. You can cut, copy and paste individual elements or all values from one NIK key to another.

If an NIK key contains an invalid entry, the CATalyst BCS displays an alert,  to indicate a modification is necessary.

### Cut

Remove the NIK values from one NIK key and insert them into the fields of another NIK key. Highlight the NIK key and click the Cut icon. Highlight another NIK key and click the Paste icon.

### Copy

Copy the values from one NIK key and insert the values into the fields of another NIK key. To copy, highlight the NIK key and click the Copy icon. Highlight another NIK key and click the Paste icon.

### Paste

Insert the values from the copied or cut NIK key. To copy, cut and paste, highlight a NIK key and click the Copy or Cut icon. Highlight another NIK key and click the Paste icon.

### Delete

Delete the NIK key values. Highlight the NIK key and click the Delete icon.

### Reset

Reset the values in the NIK key fields to the last saved assignments. Any changes made since the last Save are not retained.

### Print

Display the Print dialog box allowing you to print the NIK key assignments.

## EZ Text

The EZ Text tab in a Profile allows you to create up to 20 strings of text which you can insert as text, XDS file or credit file. Each text line can contain up to approximately 900 characters including conflicts, scan stops and format symbols. EZ text entries are stored in the Caption Profiles case located in the System Files case.

You can insert an EZ Text line into the Script Window during captioning. With the cursor focus in the Script Window, press the assigned key combination insert the EZ Text line into the Script window. For example, EZ Text line 1 is, [APPLAUSE]<New Line>. You press F4 1 to send a script file and inserting [APPLAUSE]. You can also assign your own key combination in the [keyboard map](#).

You can also create EZ Text lines for insertion into the *Text* field of a dialog box. You may want to create EZ Text entries that contain format symbols which do not have a shortcut key combination, allowing you to quickly insert the format symbols into dictionary definitions or a dialog box. You can include [translation commands](#) in an EZ Text entry, however, they are not available from the FS list. It is necessary to type a translate command into the EZ Text entry. For example, to create an EZ Text entry for {Caption Period}<Colloquy>, type **{Caption Period}** and then press F4 c to insert the Colloquy format symbol.

## Create an EZ Text Entry

Access the EZ Text table:

- when you start a CATalyst BCS session. In the Broadcast Captioning Translate dialog box, select the Profile you want to change and click **Modify Profile**. In the Profile dialog box, click the **EZ Text** tab.
- during a captioning session. Press **Alt + p, z (Setup/EZ Text)**.

Use the fields and options as necessary:

### Number

Identifies the number associated with the EZ Text line listed in the Text field. The first ten lines are numbered #1 through #10 and the next five lines are numbers Shift + 1-5.

### Text

The current text for the EZ Text entry, if any, displays in this field.

### Modify (Ctrl + m)

Highlight the EZ Text line to modify and click the **Modify EZ Text Entry** icon. The EZ Text Assignment dialog box displays with the text from the highlighted EZ Text line. Make necessary entries and press **Enter (OK)**.

### Text

Type new or modify existing text. Each text line can contain up to approximately 900 characters including conflicts, scan stops, format symbols, etc. The maximum number of EZ Text lines is 20.

You can also add extended characters to the text. Place the cursor in the Text field and press **F9**. The Insert Character dialog box displays. Double click a character to insert. CATalyst BCS inserts the character at the cursor location.

### Insert Auto Include

Display the EZ Text Auto Include dialog box. Select an Include file to associate with the selected EZ Text key. Do the following:

- Select **Browse** to display the Choose Include File dialog box.
- Navigate to the location of the file you want to insert. This may be a credit or XDS file.

- c. Select a file and press **Enter (Open)**. The file name displays in the Entry Text field. The "at" symbol, @, at the beginning of the entry designates the file as an Include. CATalyst BCS brings the file following the @ symbol into the Script window.

### Insert Field

Not applicable in CATalyst BCS.

### FS

Display the list of available format symbols. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol you want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry.

To have the format symbol list always display, check the Always Show Format Symbols box. You can also use shortcut keys to insert a format symbol.

### Insert Auto Include File

Highlight the EZ Text line to which you want to add the Auto Include and click the **Insert Auto Include File** icon. The EZ Text Auto Include dialog box displays with the current text from the highlighted EZ Text key. Choose an Include file to associate with the selected EZ Text key:

- a. Select **Browse** to display the Choose Include File dialog box.
- b. Navigate to the location of the file you want to insert. This may be a credit or XDS file.
- c. Select a file and press **Enter (Open)**. The file name displays in the Entry Text field. The "at" symbol, @, at the beginning of the entry designates the file as an Include. CATalyst BCS brings the file following the @ symbol into the Script window.

### Delete

Highlight the EZ Text line and press **Delete** or select the **Delete** icon. Select **Yes** at the confirmation prompt.

### Print

Print the EZ Text table. In the Print dialog box, make any necessary changes and press **Enter (OK)**.

### OK

Accept the changes made in all the Profile tabs and close the Profile dialog box.

When accessing the EZ Text tab during a captioning session, OK applies changes on the EZ Text tab to the current Profile for the current captioning session only and closes the dialog box. Use Save to make permanent changes to the current Profile.

### Apply/Save

Accept the changes made in the EZ Text tab.

When accessing the EZ Text tab during a captioning session, Save displays. Save applies changes on the EZ Text tab to the current captioning session, permanently saves them to the current Profile and closes the dialog box.

### Cancel

Do not apply any changes to the Profile and close the Profile dialog box.

## Insert EZ Text

Insert an EZ Text entry by pressing **F4** plus the EZ Text entry number. For example, to insert EZ Text entry 2, press **F4 2**. To insert EZ Text entry 10, press **F4 0**. To insert EZ Text entry 12, press **F4 Shift + 2**.

## Captioning Session

During a Captioning session, position the cursor focus in the Script Window and press **F4** plus the EZ Text entry number.

## Caption File

While working in a Caption file, position your cursor at the location in the file where you want the text and press **F4** plus the EZ Text entry number.

## Text Field

To insert an EZ Text entry into the *Text* field of a dialog box, position the cursor in the *Text* field, press **F4** and then press the EZ Text entry number.

## EZ Speakers

The EZ Speakers Profile tab allows you to pre-define speakers names for the active Profile. For example, if you caption Monday Night Football, you can pre-define an EZ Speaker for each announcer, such as >>Jawarski, >>Kornheiser and >>Tirico. Every time you use that Profile, the speaker names are available.

You can insert the speaker names during a captioning session using the Insert Speaker feature using the assigned keyboard command for the Insert Speaker feature or for the assigned macro.

## Manage EZ Speakers

### New Speaker

Type a new speaker name including the chevrons (>>) if you use them to identify a speaker and any punctuation you might include after the speaker, such as a colon.

The Select EZ Speaker dialog box displays with the next sequential speaker number. Use the displayed number in the Enter Value field or type a new number and press **Enter (OK)**. Valid number are **1 - 99**. A new speaker name field displays with the assigned speaker number. Type the name in the field and press **Enter**.

### Fill in Speaker

Modify an existing speaker name. Highlight the speaker name and select **Fill in Speaker**. Type the speaker name and press **Enter**.

### Delete

Delete an existing entry. Highlight the speaker name and press Delete or click the Delete icon.

### Filter

Select this option to display all the available speaker lines with associated speaker numbers. Deselect this option to only display speaker numbers with assigned speaker names.

### All Cap Text

Select this option to type the speaker name in all capital letters regardless of the state of the caps lock key. Deselect this option to type the Speaker Name in upper and lower case letters.

### Help

Display the CATalyst BCS Help.

### Apply/Save

Accept the changes made in the EZ Speakers tab.

When you are not in a captioning session, the Apply button displays when you access the EZ Speakers tab. Apply allows you to save the changes you have made and move to the next tab. When accessing the EZ Speakers tab during a captioning session, the Save button displays in place of Apply. Save applies changes on the EZ Speakers tab to the current captioning session, permanently saves them to the current Profile and closes the dialog box.

### Cancel

Do not apply any changes to the Profile and close the Profile dialog box. If you are using a writing machine when you create EZ Speakers during a captioning session using the Create EZ Speakers feature, the speaker names are added to the EZ Speakers list.

## Multiple Outputs

The Multiple Outputs tab in a profile allows you to set connection values when sending captioning data to multiple encoders. CATalyst BCS stores the connection values in a Multiple Outputs (.sgodp) file. When you create a new profile, the Multiple Outputs file is automatically created using the same name as the profile. The default location for a Multiple Outputs file is the same folder as the profile. CATalyst BCS remembers the multiple output values stored in the .sgodp file for the specific profile.

It is necessary to change the file name and location of any existing Multiple Output files for profiles created prior to CATalyst version 7.x. The Multiple Outputs file name must match the Profile name and be located in the same folder as the profile.

## Set Connection Values

The list of existing connections. Use the following options as necessary:

### Copy Connection

The Copy Profile Connections dialog box displays where you can copy existing modem connection information from the Connections tab to the Multiple Outputs tab. Check the box next to the name of each connection to copy. Uncheck the box to exclude the connection information from copying. Use Select All to choose all listed connections. Use Unselect All to uncheck all the boxes. When finished press **Enter** (**Copy**). Make any other necessary changes after copying the information.

### New

Add a new connection to the list. A blank field displays in the *Connections* field. Type the number or address and press **Enter**. Modify Connection Settings as necessary.

To modify a connection name, double click on it and type the changes.

**Delete**

Delete a connection from the list. Highlight a connection and click the **Delete** icon.

**Move Up**

Move the connection up in the list. Highlight the name and click the **Move Up** icon.

**Move Down**

Move the connection down in the list. Highlight the name and click the **Move Down** icon in the appropriate field.

## Connection Settings

Connection values for the highlighted connection in the *Connections* field. Click the +/- box to expand or collapse the list as necessary.

Highlight a field to set the value. An explanation of the option displays in the lower right corner of the dialog box.

**Encoder Name**

The name of the connection selected in the Connection field. To change the name, double click the field and type a new name.

**Unique Identifier**

Unique identifier assigned automatically by CATalyst BCS for each connection created.

**Encoder Model**

Click the Down arrow to select the appropriate encoder model. Daktronics and ASCII are common model choices when captioning for a stadium output such as baseball games.

When starting a CATalyst BCS session with the Encoder Model set as None and Connection type set to Direct or Modem, an icon displays indicating you are not connected. You can continue to write without establishing a connection to check your caption positions. The text displays in the Caption Preview window. Click the connection link when you are ready to send captions.

When using a Subtitle Encoder NEWFOR or a Daktronics Venus Matrix encoder, additional fields display that require an entry.

**Subtitle Encoder NEWFOR**

The following fields apply when Subtitle Encoder NEWFOR is selected in the *Encoder Model* field.

**Encoder Language**

Click the Down arrow to select a language set for subtitles.

**Teletext Page**

Type the teletext page to which you are writing for subtitles.

**Daktronics Venus Matrix**

The following fields apply when Daktronics Venus Matrix is selected in the *Encoder Model* field.

**Number of Lines**

Click the Down arrow to select the number of lines to display. The range is 1 - 8.

**Characters Per Line**

Click the Down arrow to select the number of characters per line to display. The range is 16 - 48.

**Connection Type**

Select **Direct**, **Modem** or **Internet**.

**Auto Reconnect**

Automatically reconnect to the encoder if the connection is lost.

**Modem/Direct Settings**

The modem values when the Connection Type selected is *Modem* or *Direct*. Click the +/- box to expand or collapse the list as necessary.

Highlight a field to set the value. Click the Down arrow to select the appropriate value based on the modem type and computer connection. In fields without a drop down list, type the appropriate entry. An explanation of the option displays in the lower right corner of the dialog box. Some settings do not apply to *Direct*.

The number of available COM ports varies among computers. When you copy a Profile from one computer that contains more available COM ports than the computer to which it is copied, CATalyst BCS retains the COM port information. On the computer with less COM ports, the COM ports are listed as unavailable in the drop down box. For example, "COM 4 not available."

**Internet Settings**

Displays the Internet values when the Connection Type selected is *Internet*. Highlight a field and type the appropriate values. An explanation of the option displays in the lower right corner of the dialog box.

**Dialog Box Actions**

**OK**

Accept the changes made in all the Profile tabs and close the Profile dialog box.

When accessing the Multiple Outputs tab during a captioning session, OK applies changes on the Multiple Outputs tab to the current Profile for the current captioning session only and displays the Modem dialog box. Use Save to make permanent changes to the current Profile.

**Apply/Save**

Accept the changes made in the Multiple Outputs tab.

When accessing the Multiple Outputs tab during a captioning session, Save displays. Save applies changes on the Multiple Outputs tab to the current captioning session, permanently saves them to the current Profile and closes the dialog box.

**Cancel**

Do not apply any changes to the Profile and close the Profile dialog box.

## Contact Info

The Contact Info tab in a Profile allows you to store telephone numbers, e-mail addresses and notes if needed. There are 3 sections, Emergency Numbers, Audio Numbers, E-mail Addresses along with a Notes section. Any information you add to the Contact tab, displays in the Session Information pane for easy accessibility.

In the Emergency and Audio Numbers and E-mail Address section, use the following four icons to create, prioritize or delete information.

### New

Add a new telephone number or e-mail Address to the list. A blank field displays in the associated field. Type the number or address and press **Enter**.

To modify an existing telephone number or e-mail address, double click it and type the changes.

### Delete

Delete a telephone number or e-mail address from the list. Highlight a number or address and click the **Delete** icon in the appropriate field.

### Move Up

Move the telephone number or e-mail address up in the list. Highlight the name and click the **Move Up** icon.

### Move Down

Move the telephone number or e-mail address down in the list. Highlight the name and click the **Move Down** icon.

## Notes

Click in the Notes section to type any miscellaneous information. For example, you may want to add a note for contact information during holidays or special information about the encoder. In the Session Information pane, click the View Notes... to see the Notes details for the Profile.

## OK

Accept the changes made in all the Profile tabs and close the Profile dialog box.

When accessing the Contact Info tab during a captioning session, the OK option applies the changes to the current Profile for the current captioning session only. Use Save to make permanent changes to the current Profile.

## Apply/Save

Accept the changes made in the Contact Info tab.

When accessing the Contact Info tab during a captioning session, the Save option displays. Save applies the changes and permanently saves them to the current Profile; then closes the dialog box.

## Cancel

Do not apply any changes to the Profile and close the Profile dialog box.

## Advanced

The Advanced tab in a profile is used to log BCS connected outputs. The log file contains commands sent to the output/encoder including pass, block, clear, etc. All connected outputs except ASCII and StenoKeys will be logged. (ASCII and StenoKeys are options available in a Profile's Connection tab, Encoder Model field.)

1. To turn logging On, select a Profile and then select the Advanced tab.
2. At the Generate Log for Each Output option, select Yes. (By default, this option is set to No.)
3. In the Audit Logs Save Location option, type the path or click the Browse button () to navigate to the location where the log file should be saved. (By default, it is saved to the current CATalyst user's System Files Captioning case in a case called Audit Logs. For example: C:\CAT4\usr\Amy\System Files\Captioning\Audit Logs)
4. Click OK to close the Profile. If you need to make other changes to the Profile, click Apply and continue with your other changes.

## Captioning in CATalyst BCS

Captioning in CATalyst BCS includes starting a captioning session, adding [Script files](#) and connecting to the encoder. Once you establish connection, you use [captioning commands](#) to control how text is sent to the encoder. [Profiles](#), a collection of settings used during a captioning session, are usually set prior to beginning a captioning session but can be [modified](#) while writing. Several editing features, editing tools and options assist your captioning translation and editing of the text.

### File - New - Caption File

The Caption File feature allows you to create a new caption file. In most cases, this feature is used for [creating Credit files](#) or [creating Script files](#).

### Adding a New Connection

Using the Add a Connection feature in the Session Information window, you can quickly add a new telephone number during a captioning session. The Add a connection feature, by default, creates a connection named "QuickAddNumber". The new connection with the typed telephone number and remaining connection settings from the selected existing connection are added to the current Profile.

To add a connection:

1. In the Session Information Window under Connection Options, click **Add a Connection**.

2. The Add a connection dialog box displays. Make necessary entries:

#### Encoder Name

Use the default name, QuickAddNumber or type a name to describe the connection.

### Phone Number

Type the telephone number for the new connection. Use commas to indicate a pause in dialing. Hyphens are not required to separate the numbers. For example: 9,18003234247.

### Use Settings From

Select a connection from the drop down list. The existing encoder and other settings from the selected connection are used for the new connection.

### Dial After Add

Check this box to immediately attempt to establish a connection with the new telephone number. CATalyst BCS remembers this option.

3. Click **Add Connection** to add the connection to the current Profile.

## Create a Credit File

A credit file contains information identifying the company that captioned the show. When creating a credit file, use format symbols as necessary to format the text. For example, use the format symbols <Caption: KeepCaseOn> and <Caption:KeepCaseOff> to retain the case for text.

To center text, use the NIK placement settings: Line width, Justification and Column. Do not use Centered Paragraph style. For example, you have 32 characters on a line and want to center a credit file and use the Pop-on credit style. The NIK file settings are:

Caption Style: POP

Line Width: 32

Justification: Center

Column: 16 (half of the line width)

Send Lines: EOC

To create a credit file for CATalyst BCS:

1. Create a Caption text file, select **File/New/Caption File**.
2. Type the text for the credit file.

### Example

In this example, you want to display the credit information on three lines and retain the case for text.

<New Line><KeepCaseOn>Captions provided by<KeepCaseOff>

<New Line>CAPTIONING COMPANY NAME

<New Line><KeepCaseOn>[www.captioncompany.com](http://www.captioncompany.com)<KeepCaseOff>

<New Line>

### Example

In this example, you want to display the credit information on three lines, display the captioning name in yellow text, the web site in cyan text and retain the case of the text.

<New Line><KeepCaseOn>Captions provided by<KeepCaseOff>

<New Line><Color Yellow>CAPTIONING COMPANY NAME<Color White>

<New Line><Color Cyan><KeepCaseOn>www.captioncompany.com<Color White><KeepCaseOff>

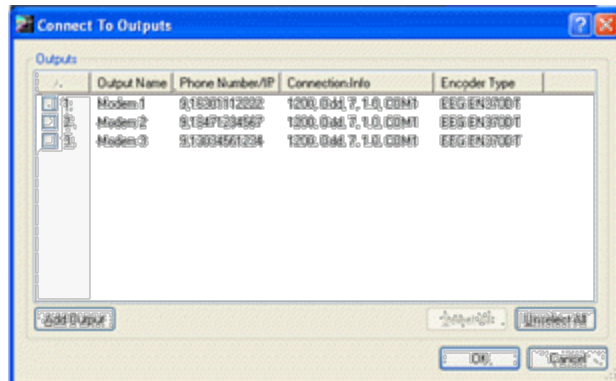

<New Line>

## Starting a Multiple Outputs Connection

1. In the Session Information window click the name of the Multiple Outputs connection.

2. The Connect To Outputs dialog box displays.

3. Check the box next to each multiple output connection you want to use. Choose **Select All** to choose all connections and **Unselect All** to deselect all connections.

To temporarily add another multiple output connection for this session, select **Add Output** to display the Multiple Outputs profile tab. Make necessary entries and press **Enter (OK)**. If you need to create a permanent connection use *Setup/Multiple Outputs*.

4. Press **Enter (OK)**. The Multiple Outputs dialog pane displays. You can navigate within the pane using keyboard commands. For example, press F7, the default command to suspend output.

3. Do any of the following:

### Connect

Click the **Connect** button next to the selected modem to establish an individual modem connection. When the modem connects, the Connect button changes to Disconnect. To disconnect an individual modem, click the **Disconnect** button.

The Status window displays Multiple Outputs instead of "connected." All connection information displays in the Multiple Outputs window. The following color coded indicators reflect connection status:

- **Yellow**—dialing
- **Purple**—connecting failed
- **Green**—connected
- **Red**—lost connection
- **Brown**—CATalyst BCS cannot determine the status.

### Suspend

Suspend the output for the selected modem. The modem does not disconnect. Output resumes when you select Unsuspend.

### Remove

Remove the selected modem from the list.

### Add a Connection

Click the  button to temporarily add a connection to this session. To permanently add a connection, [modify](#) the Profile.

### Remove a Connection

Click the  button to temporarily remove a connection from this session. A list of connections display. Click the connection you want to remove. To permanently remove a connection, modify the Profile.

### **Connect All**

Attempt to establish a connection for all listed modems.

### **Disconnect All**

Hang up all listed connections.

## **Set Active Window**

Set Active Window is a command that displays a dialog box listing the available CATalyst BCS dialog panes from which you can select one to set the cursor focus. Each dialog pane in the list has an associated number. The list always displays in the same order with the same associated number. This assures the dialog panes retain the same number so you can include this command in a macro.

To use the Set Active Window command during a CATalyst BCS session you must first open the desired keyboard map and [assign](#) a key to the command. You can [record](#) a macro using this command to set the focus to a window and then invoke a subsequent command.

To use Set Active Window:

1. Press the assigned key combination to invoke the Set Active Window command. The Set Active Window dialog box displays.
2. Select the associated number of the window on which you want to set the cursor focus. You can select to set the cursor focus on any available dialog pane in the list. If the dialog pane is closed, selecting the number opens the dialog pane and sets the cursor focus.

## **Using Script Files**

Script files are previously prepared text files sent line by line to an encoder during a captioning session. You can create a script file from a CATalyst BCS history file, from a captioning file (.sgcap), from a Case CATalyst text file or create it in an ASCII editor such as Notepad/WordPad. If you have CAPtivor™ script files, you can copy those files into a folder and load them directly into the CATalyst BCS [Story Queue](#).

A script file can contain one story or several stories. A file with several stories uses a "story slug" format symbol or title. Story slug format symbols allow the captioner to recognize the end of one story and the beginning of the next story. When the script file [loads](#) into the story queue, each story title displays in the story queue regardless how many stories are contained in a file. Story slugs are not sent to the encoder.

You can include [other](#) format symbols within a script file to perform specific functions when sending the script file. For example, you can include <Clear><Pass> format symbols at the end of a story in the script file. When you send the story, captions are automatically cleared from the screen and the encoder is set to the Pass mode to allow upstream captions or, commercials with captions, to be sent to the encoder.

Once a script file displays in the Script window (dialog pane), you can make text and global changes, deletions and E-Defines. To globally change a spelling in the Script window, use an [E Define](#). E Defines are saved to the Script window global table. The global table entries are available for the current session and are not saved when you exist the session. You can, however, choose to automatically add the Script globals to the History window [global table](#) where they apply to the realtime text.

Use Script Preference [options](#) to customize certain Script window and Story Queue features.

## Load Script Files to the Story Queue

Using the Story Queue window you can quickly load, arrange and remove script file stories in the story queue. The Story Queue allows you to organize script files for delivery to the encoder. Once files are loaded to the story queue, you can also arrange them using the [Story Queue](#) feature located on the Setup menu.

By default, the Story Queue window displays on the right side of the CATalyst BCS screen. If the Story Queue window is not open, select **View/Show/Story Queue**.

Use the following features as necessary:

### Add a Story

Add stories to the story queue. The Import Caption Files dialog box displays. Select files and press Enter (Open). By default, CATalyst BCS opens the Caption Show Files folder. Use the Look in field to locate files in another folder.

The selected files display in the Story Queue window. The following icons indicate the status of the story:

### Paper Clip With Paper

A paper clip with paper indicates the story is being sent to the encoder. The filename text displays in yellow.

### Paper Clip

A paper clip indicates the story is waiting to be sent to the encoder. The next story in position to be sent displays highlighted in yellow.

### Check Mark

A check mark indicates the story has been sent to the encoder. If the first couple lines of a script are Story Slugs, a check mark may displays immediately when you add the file to the story queue.

### Remove a Story

Highlight a story in the story queue and then click this button. The story is only removed from the queue. To reinsert the story into the story queue, use Add a Story.

### Clear All

Remove all the stories from the story queue.

### Move Story to First Position

Move the highlighted story to the first position in the story queue.

### Move Story Up

Move the highlighted story up one position in the story queue.

### Move Story Down

Move the highlighted story down one position in the story queue.

### **Move Story to Last Position**

Move the highlighted story to the last position in the story queue.

## **Script File Format Symbols**

Use the appropriate format symbol or command for the selected product in which you are creating a script file.

CATalyst BCS	CAPtivator or ASCII		Description
<Story Slug On> <Story Slug Off>	\S		Identify the title of the story. Title information between the Story Slug On/Off format symbols is not sent to the encoder or appear in the History file.
N/A	\W		To use a "warning" line similar to CAPtivator, insert <Story Slug On/Off> format symbols around text, such as "blank warning line".
<Clear><Pass>	\P		Clear (blank) screen and allow upstream captions to pass through to the encoder.
<Clear><Block>	\B		Clear (blank) the screen and Block upstream captions from being sent to the encoder.
<EOC>	\E		Indicates the end of a caption.
<Color>	\Aciu\		Indicate color in the script file. The selected color continues until CATalyst BCS encounter the color white format symbol or it reaches the end of the caption line.  In CATalyst BCS color includes italics and underlining.
<Position>	*Cf		Use the <Position> format symbol to change the position of the story. You can also use a NIK assignment to change the position of captions.
Insert Extended characters via keyboard assignments in the keyboard map	A acute	\a	In a CATalyst BCS file, you may need to assign the extended character to a keyboard map.
	E acute	\e	
	i acute	\i	In an ASCII editor, use the appropriate symbols. For example,
	o acute	\o	

u acute	\u	the following text in a ASCII or CAPtivorator file:
a circumflex	\a	89\\$
e circumflex	\e	\L400
i circumflex	\i	Produces the following caption:
o circumflex	\o	89¢
u circumflex	\u	£400
a grave	\`a	
e grave	\`e	
n-tilde	\n	
capital n-tilde	\N	
cedilla	\c	
cents	\\$	
pounds sterling	\L	
degrees	\o	
inverse query	\?	
music note	\M	
division symbol	\d	
one half	\2	
registered trademark	\4	
trademark	\3	

## Create a Script File in a CATalyst BCS Caption File

To create a script file in CATalyst BCS caption file (sgcap):

1. Press **Alt + f, n, a** (**File/New/Caption File**). The Create New Document dialog box displays.
2. In the File name field, type a name for the script file and press **Alt + o** (**Open**).
3. Type the title of the story and then press **F4 I** to create a new line.
4. Highlight the title of the story and press **Shift + F4** (**Edit/Insert/Insert Format Symbols**).
5. Double click the **Caption: Story Slug On** format symbol. Story Slug On/Off format symbols surround the title of the story.

To see formatting in the caption file, display Reveal Codes (**Ctrl + Shift + r**).

6. Move the cursor to the next line and type the contents of the story. Lines automatically wrap at 32 characters. To place text on a new line, type **F4 I**.
7. At the end of each story, press **Shift + F4** (**Edit/Insert/Insert Format Symbols**) and double click the **Caption: EOC** format symbol.

Insert additional stories as necessary. Surround each story title with the <Story Slug On/Off> format symbols and end each story with the <EOC> format symbol. Press **F4 I** to place text on a new line.

### Example

<Story Slug On>CATalyst BCS<Story Slug Off>  
<New Line Paragraph>CATalyst® BCS has been  
well received by the captioning industry.  
More later in this newscast.<EOC>

When the story is sent to the encoder, it displays:

CATalyst® BCS has been well  
received by the captioning  
industry.  
More later in this newscast.

8. Save and close the Caption file.

By default, the Add Stories feature in the Story Queue window opens the Caption Show Files folder. Use Save As to save the script file directly to the Caption Show Files folder located in the CATalyst BCS root (i.e. C:\CAT4) folder.

### Create a Script File from a Steno Machine

Using your writing machine, you can write a script file in CATalyst BCS and then edit the file in the History window. To create a script file from a writing machine:

1. Connect your writing machine to the computer and turn it On.
2. Click the CATalyst BCS icon. The [Translate Dialog](#) box displays.
3. In the File name field, type a name for the script file.
4. Select a Profile that contains the encoder selection, **None**. Stenograph recommends using a Profile with encoder selection as None when practicing or writing script files using your writing machine.  
  
If no profile exists with an encoder selection None, create a new profile or modify an existing profile by adding a [connection](#) with an encoder selection of None.
5. Press **Enter (Start Session)**.
6. Write the contents of the story. The maximum line length in the History window is 32 characters unless you set a different line length using a position code, caption style or NIK assignment.
7. When finished writing the script, use the History window to edit the file, add Story Slug and EOC [format](#) symbols, spell check, etc. To see formatting in the caption file, use Reveal Codes (View/Reveal Codes).
8. Save and close the Caption file.

By default, the Add Stories feature in the Story Queue window opens the Caption Show Files folder. Use Save As to save the script file directly to the Caption Show Files folder located in the CATalyst BCS root (i.e. C:\CAT4) folder.

### Create a Script File from the History File During Captioning

To create a script file from the History file during a captioning session:

1. In the History window, edit the story text as needed.

To see formatting in the caption file, display Reveal Codes (**Ctrl + Shift + r**).

2. At the beginning of the story, type the title for the story.
3. Highlight the title and press **Shift + F4 (Edit/Insert/Insert Format Symbols)**.
4. Double click the **Caption: Story Slug On** format symbol. CATalyst BCS surrounds the highlighted text with <Story On> and <Story Off> format symbols.

If you do not type a title for the story and use the Load Selection as Story command, the current captioning session file name along with the current date and time become the story slug, or title, that displays in the Story Queue. For example, *storyname 2005323 93001*.

5. Make necessary editing changes and then highlight the entire story text.
6. Select **File** and select one of the following:

#### **Load Selection as Story**

Immediately load the story in the Story Queue. The story is automatically added to the end of the story queue.

#### **Save As**

- a. In the file name field, type a story name. If you also select the Load to Story Queue option, the name entered here is the story title and displays in the Story Queue.
- b. Check the box **Save Selection Only**.
- c. Press **Enter (Save)**.
- d. Save and close the Caption file.

By default, the Add Stories feature in the Story Queue window opens the Caption Show Files folder. Use Save As to save the script file directly to the Caption Show Files folder located in the CATalyst BCS root (i.e. C:\CAT4) folder.

## **Create a Script File from the History File After Captioning**

To create a script file from the History file after the captioning session has closed:

1. Press **Alt + f, o, a (File/Open/Caption File)** The Open Existing Document dialog box displays.
2. Double click the name of the captioning session. The file opens in the caption file editor.
3. Edit the story text as necessary. To see formatting in the caption file, display Reveal Codes (**Ctrl + Shift + r**).
4. To create individual stories, type a title and surround the title with the <Story Slug On/Off> format symbols. End each story with the <EOC> format symbol. Make any corrections you need to make. Press F4 | to put text on a new line.
5. Select **File** and choose one of the following:

#### **Save**

Save and close the Caption file with the same name.

#### **Save As**

Type a new file name and press **Enter (Save)**.

By default, the Add Stories feature in the Story Queue window opens the Caption Show Files folder. You may want to save the script file directly to the Caption Show Files folder located in the CATalyst BCS root (i.e. C:\CAT4) folder.

## Create a Script File from a Case CATalyst Text File

To create a script file from a Case CATalyst text (.sgnfl) file:

1. Press **Alt + f, n, t. (File/New/Text)**. The Create New Document dialog box displays.
2. In the File name field, type a name for the script file and press **Enter (Open)**.
3. Type the title of the story and then press **Enter** to create a new line.
4. Highlight the title of the story and press **Shift + F4 (Edit/Insert/Insert Format Symbols)**.
5. Double click the **Caption: Story Slug On** format symbol. Story Slug On/Off format symbols surround the title of the story.

To see formatting in the caption file, display Reveal Codes (**Ctrl + Shift + r**).

6. Move the cursor to the next line and type the contents of the story. The maximum line length when CATalyst BCS sends the story to the encoder is 32 characters unless you set a different line length using a position code, caption style or NIK assignment. Include line breaks to begin on a new line.
7. At the end of the story, press **Shift + F4 (Edit/Insert/Insert Format Symbols)** and double click the **Caption: EOC** format symbol.

Insert additional stories as necessary. Separate each story title with a Story Slug On/Off format symbols and end each story with the EOC format symbol. To place text on a new line, type **F4 I**.

### **Example**

```
<Story Slug On>CATalyst BCS<Story Slug Off>  
<New Line Paragraph>CATalyst® BCS has been  
well received by the captioning industry.  
More later in this newscast.<EOC>
```

When the story is sent to the encoder, it displays:

```
CATalyst® BCS has been well  
received by the captioning  
industry.  
More later in this newscast.
```

8. Save and close the Caption file.

By default, the Add Stories feature in the Story Queue window opens the Caption Show Files folder. Use Save As to save the script file directly to the Caption Show Files folder located in the CATalyst BCS root (i.e. C:\CAT4) folder.

## Create a Script File in an ASCII Editor

To create a script file in an ASCII editor:

1. Open the ASCII editor, such as Notepad or WordPad.
2. Using Script file commands, insert the necessary symbols to control the story text when sending to the encoder. Type as much text on a line as you want. The maximum line length when CATalyst BCS sends the story to the encoder is 32 characters unless you set a different line length using a position code, caption style or NIK assignment. Include line breaks to begin on a new line.

Insert additional stories as necessary. Separate each story with a \S followed by the title of the story. End each story with \E to indicate the end of the caption.

### **Example**

\SCATalyst BCS

CATalyst BCS has been well received by the captioning industry.

More later in this newscast.\E

When the story is sent to the encoder, it displays:

CATalyst® BCS has been well

received by the captioning

industry.

More later in this newscast.

3. Save and close the ASCII file. You may want to save the script file directly to the Caption Show Files folder located in the CATalyst BCS root (i.e. C:\CAT4) folder. By default, the Add Stories feature in the Story Queue window opens the Caption Show Files folder.

## **CATalyst BCS File Management Tools**

Several file management tools are available to assist in managing your caption files, allowing you to save files, append multiple files, break a single file into multiple files, merge files together and include files into a another file. File management tools also include saving the Script window text, loading selected text as a story, exporting captions to ASCII and selecting simultaneous ASCII output.

### **New**

New displays a menu from which you can select the type of file you want to create. When you select a file type, the Open New Document dialog box displays. Once you create the new file, it opens in the appropriate function.

Create a new file by selecting **File/New (Alt + f, n)** and then choosing the desired file type. Use the following fields and options in the Create New Document dialog box as necessary.

#### **Look in**

Defaults to the current user. Use the drop down button to display the current folder level. To create a file in a location other than the CAT4 users level, use **Browse**.

**Back**

Return to the previous folder viewed.

**Up One Level**

Move one folder level up in the file structure.

#### **File Window**

Available files for the current user. Highlight a file to open. The selected file name displays in the File name field below. To select a file within a case, double-click the case to open it.

**Create New Case**

Create a new case in which you can place related files. The case icon along with the default name, New Case, displays in the File Window. Type a new name in the highlighted area, then press **Enter**.

### Icon View

Display the files in the File Window as icons.

### Detail List View

Display the files in the File Window as a list with file details.

### File name

Type a new file name. You can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: ' ~ ! @ # \$ % ^ & ( ) - \_ { }

Some character are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , | = < > ? \* .

### Files of type

The type of file that displays in the File Window which also indicates the type of file you are creating. To change the file type, click the down arrow and select from the list.

### Layout Name

This field only displays when you select to create a new text file. Select the layout you want to apply to the new document.

### Open

Open the new file in the appropriate function.

### Browse

Locate a different folder.

### Cancel

Close the Create New Document dialog box without creating a new file.

## Open

Open allows you to open an existing file. Press **Alt + f, o** and select a file type from the Open menu or one of the submenus. When selecting a feature from the Open menu, one of the following occurs:

- the file opens in the appropriate function.
- the Open Existing Document dialog box displays files for the appropriate file type selected.

You can bypass the Open menu and submenus to display the Open Existing Document dialog box. Press **Ctrl + o (File/Open)**.

Use the following fields and options in the Open Existing Document dialog box as necessary.

### Look in

Defaults to the current user. Use the drop down button to display the current folder level. To locate a file in a location other than the CAT4 users level, use **Browse**.

**Back**

Return to the previous folder viewed.

**Up One Level**

Move one folder level up in the file structure. To move to a location other than the CAT4 users level, use **Browse**.

**File Window**

Available files for the current user. Highlight a file to open. The selected file name displays in the File name field below. To select a file within a case, double-click the case to open it.

**Create New Case**

Create a new case in which you can place related files. The case icon along with the default name, New Case, displays in the Available Files Window. Type a new name in the highlighted area, then press **Enter**.

**Icon View**

Display the files in the File Window as icons.

**Detail List View**

Display the files in the File Window as a list with file details.

**File name**

The selected file to open. Click a file to select it or type the file name. If you type a new file name, one of the following occurs:

- The Create New Document dialog box displays with a Layout Name field.
- A message displays indicating the file does not exist and prompts you to create a new file. Choose **Yes (Enter)** to continue and create a new file.

When typing a file name, you can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: ' ~ ! @ # \$ % ^ & ( ) - \_ { }

Some character are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , | = < > ? \* .

**Files of type**

The type of file that displays in the File Window which also indicates the type of file you are opening. To change the file type, click the down arrow and select from the list.

**Open**

Opens the selected file in the appropriate function.

**Browse**

Locate a different folder.

**Cancel**

Close the Open Existing Document dialog box without opening a file.

### Close

Close (Ctrl + F4) exits the current captioning session.

### Save

Save (Ctrl + s) writes the changes made in the captioning session to the hard drive under the current file name with a .sgcap extension. It is recommended to use the [Auto Recover Options](#), Auto Recover and Auto Save to automatically save the open file at specified timed intervals. You can continue working while CATalyst BCS saves the file to the hard drive.

### Save As

Save As allows you to save the current file to another name, case, user folder, or drive. The original file is saved and closed and a copy of the file with the new file name is created and opened. **You are now working in the new (Save As named) file.** When you do a Save As, you can have CATalyst BCS automatically display the Save As dialog box with the last folder location by change the option, [Remember last folder used for Save As](#).

### Save As Dialog Box Options

Press **Alt + f, a (File/Save As)**. In the Save Copy as dialog box, use the following fields and options as necessary:

#### Save in

Defaults to the current user. Use the drop down button to save a file in another location.

#### Go To Last Folder Visited

Return to the previous folder viewed.

#### Up One Level

Move one folder level up in the file structure.

#### File Window

Available files for the current user.

#### Create New Folder

Create a new folder in the File Window. The folder icon along with a default name displays in the File Window. Type a new name in the highlighted area, then press **Enter**.

#### View Menu

Display the files in the selected view: Thumbnails, Tiles, Icons, List, or Details.

#### File name

Select an existing file name or type a new file name in the field. If you type the same name as an existing file, the following message displays when you select Save: "*filename.xxxx* already exists. Do you want to replace it?" If you select Yes, the existing file is overwritten by the current file. If you select No, the Save As dialog box displays and you can type a different name.

When typing a new file name, you can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: ' ~ ! @ # \$ % ^ & ( ) - \_ { }

Some characters are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , | = < > ? \*

If you type the same name as an open file in another application, the following message displays: "This file is already in use. Select a new name or close the file in use by another application." Select **OK** and type a different file name or close the job or application and type the file name again.

### Save as type

The type of file that displays in the File Window which also indicates the type of file you are saving. To change the display of the file type, click the down arrow and select **All Files (\*.\*)**. The default file type is .sgcap.

### Save Selection

When you have selected text, this field displays allowing you to save the selection to a file. For example, you may want to save a portion of text from the current captioning session to create a script file for future use.

### Load to Story Queue

Check this box to load the saved file into the Story Queue and assign a Story Slug line using the current name of the saved file followed by the current date and time.

### Save

Save the captioning file.

### Cancel

Close the Save As dialog box without saving the file.

## Remember Save As Location

1. From Manage Jobs, press **Alt + t, o, e, a** (**Tools/Options/Edit/Advanced Edit**). The Advanced Edit Options dialog box displays.
2. Click **Remember last folder used for Save As**.
3. Select **Yes** to have CATalyst BCS display the Save As dialog box with the last folder location in which used to Save As. Select **No** to use the folder location of the current file.
4. Press **Enter (OK)** close the Advanced Edit Options dialog box and save the changes.

## Save Script Window As

Save Script Window As allows you to save the text in the Script window as a caption file (.sgcap). You may want to save the story script if you need to send the same story selections in the future.

Press **Alt + f, v** (**File/Save Script Window As**). In the Save Script Window As dialog box, use the following fields and options as necessary:

### Save in

Defaults to the current user. Use the drop down button to save a file in another location.

**Go To Last Folder Visited**

Return to the previous folder viewed.

#### **Up One Level**

Move one folder level up in the file structure.

#### **File Window**

Available files for the current user.

#### **Create New Folder**

Create a new folder in the File Window. The folder icon along with a default name displays in the File Window. Type a new name in the highlighted area, then press **Enter**.

#### **View Menu**

Display the files in the selected view: Thumbnails, Tiles, Icons, List, or Details.

#### **File name**

Select an existing file name or type a new file name in the field. If you type the same name as an existing file, the following message displays when you select Save: "*filename.xxxx* already exists. Do you want to replace it?" If you select Yes, the existing file is overwritten by the current file. If you select No, the Save Script Window As dialog box displays and you can type a different name.

When typing a new file name, you can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: '~ ! @ # \$ % ^ & ( ) - \_ { }

Some characters are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , | = < > ? \* "

If you type the same name as an open file in another application, the following message displays: "This file is already in use. Select a new name or close the file in use by another application." Select **OK** and type a different file name or close the job or application and type the file name again.

#### **Save as type**

The type of file that displays in the File Window. The only file type available is .sgcap.

#### **Save**

Save the file.

#### **Cancel**

Close the Save Script Window As dialog box without saving the file.

### **Load Selection as Story**

Load Selection As Story saves the selected text as a story and places it in the story queue of the current captioning session. Selected text is loaded in the Script dialog pane in the same case as it displays in the History window. For example, if the original text was sent in all caps and displays in the History window in all caps, it also loads as a script in all caps. If the text was sent in mixed case, it loads to the Script window in mixed case.

CATalyst BCS automatically assigns a Story Slug for the script, but you can also create a Story Slug. Story Slug lines are not sent to the encoder or History window.

To load a story:

1. Edit the text in the History window as necessary.
2. Create a Story Slug for the Story Queue by inserting Story Slug On/Off format symbols around the text in the History window you want to use to create the title line. Include the Story Slug On/Off format symbols and the surrounded text along with the highlighted text for the script. When you load the selection, the text identified with the Story Slug On/Off format symbols displays in the Story Queue.  
  
If you do not use Slug On/Off format symbols, CATalyst BCS creates a story title using the name of the current BCS session plus the current date and time. For example, *filename\_2005329\_115905*
3. Highlight the text for which you want to create a script and press **Alt + f, y (File/Load Selection as Story)**.
4. CATalyst BCS loads the selected text into the Story Queue and assigns a Story Slug line using the current name of the captioning session followed by the current date and time.

## Export Captions

The Export Captions menu item is available during a BCS session and while editing a caption file. Four export options are available: [Export to ASCII...](#), [Export to SCC...](#), [Export to SMPTE-TT...](#) and [Export to RTF/CRE...](#). Depending on the selected export type you can select capitalization, timestamps and the ability to load the exported text in the story queue.

## Export to ASCII

Export to ASCII creates an ASCII file of the text in the History window or the caption file. Export to ASCII BCS gives you the options to capitalize all text, select clock, elapsed or frames timestamps and whether to load the text selection as an ASCII file to the Story Queue.

When exporting captions to ASCII, CATalyst BCS converts Musical Note format symbols to \M. When loading an ASCII file as a script, CATalyst BCS retains the line break if the line ended with a musical note in the original session. If Story Slugs or Warnings are in the history or caption file, they are not exported.

In a BCS session or while editing a caption file, press **Alt + f, r, p (File/Export Captions/Export to ASCII)**. The Export Captions to ASCII dialog box displays.

1. Do any of the following:
  - Select All Caps to create the ASCII in all capital letters. If the caption/history file is currently in all capital letters, selecting or deselecting this option has no effect on the ASCII file.
  - Select whether to include Timestamps in the ASCII file. If you select Timestamps, select Clock or Elapsed time. If selecting Elapsed, you can customize the starting elapsed timestamp. If you select to include timestamps and timestamps are not available in the caption edit file, timestamps will be created at intervals of 2 seconds per line.
  - Select Frames to display the timestamp in hours, minutes, seconds and the TV frame number.
  - Select whether to load the ASCII file into the story queue when the export is complete. This option is only available when in a BCS session and if timestamps are not selected.
2. Click **OK** to begin the export.
3. The Save ASCII dialog box displays, do any of the following:

- **Look in**  
Defaults to the current user. Use the drop down button to display the current folder level. To locate a file in a location other than the CAT4 users level, use **Browse**.
  -  **Back**  
Return to the previous folder viewed.
  -  **Up One Level**  
Move one folder level up in the file structure. To move to a location other than the CAT4 users level, use **Browse**.
  - **File Window**  
Displays files for the current user.
  -  **Create New Case**  
Create a new case in which you can place related files. The case icon along with the default name, New Case, displays in the File Window. Type a new name in the highlighted area, then press **Enter**.
  -  **Icon View**  
Display the files in the File Window as icons.
  -  **Detail List View**  
Display the files in the File Window as a list with file details.
  - **File name**  
The name of the file you are exporting to ASCII. CATalyst BCS assigns the file name of the current captioning session with a .txt extension. Use the suggested file name or type a new file name. If you type the same name as an existing file, the following message displays when you select Save: "*filename.xxxx* already exists. Do you want to replace it?" If you select Yes, the existing file is overwritten by the current file. If you select No, the Save ASCII of dialog box displays and you can enter a different name.  
When typing a new file name, you can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: ' ~ ! @ # \$ % ^ & ( ) - \_ { }  
Some characters are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , | = < > ? \*
  - **Save as type**  
The type of file that displays in the File Window which also indicates the type of file you are exporting. The default is .txt. To change the file type that displays, click the down arrow and selecting from the list.  
**txt** is compatible with most word processing programs.  
**cv/v1** are also available although it is strongly recommended that you select the txt extension.
  - **Save**  
Save the file.
  - **Cancel**  
Closes the Save ASCII dialog box without saving the file.
4. Press **Alt + s (Save)** to complete the process.

Keyboard Map Functions: Export Captions to ASCII

## Export to SCC

Export to SCC creates a .scc (Scenarist Closed Caption) file of the text in the History window or the caption file. SCC file types are used to import closed captioning data. Export to SCC gives you the options to capitalize all text and adjust the starting elapsed timestamps.

In a BCS session or while editing a caption file, press **Alt + f, r, s** (**File/Export Captions/Export to SCC**). The Export Captions to SCC dialog box displays.

1. Do any of the following:
  - Select All Caps to create the SCC in all capital letters.
  - Select whether to customize the starting elapsed timestamp.
2. Click **OK** to begin the export.
3. The Save SCC dialog box displays, do any of the following:
  - **Look in**  
Defaults to the current user. Use the drop down button to display the current folder level. To locate a file in a location other than the CAT4 users level, use **Browse**.
  -  **Back**  
Return to the previous folder viewed.
  -  **Up One Level**  
Move one folder level up in the file structure. To move to a location other than the CAT4 users level, use **Browse**.
  - **File Window**  
Displays files for the current user.
  -  **Create New Case**  
Create a new case in which you can place related files. The case icon along with the default name, New Case, displays in the File Window. Type a new name in the highlighted area, then press **Enter**.
  -  **Icon View**  
Display the files in the File Window as icons.
  -  **Detail List View**  
Display the files in the File Window as a list with file details.
  - **File name**  
The name of the file you are exporting to SCC. CATalyst BCS assigns the file name of the current captioning session with a .scc extension. Use the suggested file name or type a new file name. If you type the same name as an existing file, the following message displays when you select Save: "*filename.xxxx* already exists. Do you want to replace it?" If you select Yes, the existing file is overwritten by the current file. If you select No, the Save SCC dialog box displays and you can type a different name.

When typing a new file name, you can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: '~ ! @ # \$ % ^ & ( ) - \_ { }

Some characters are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , | = < > ? \*

- **Save as type**  
The type of file that displays in the File Window which also indicates the type of file you are exporting. The only file type available is .scc.
- **Save**  
Save the file.
- **Cancel**  
Closes the Save SCC dialog box without saving the file.

4. Press **Alt + s (Save)** to complete the process.

Keyboard Map Functions: Export Captions to SCC

## Export to SMPTE-TT

Export to SMPTE-TT creates a .TTML (Timed Text Markup Language) file of the text in the History window or the caption file. TTML file types are used to provide captioned web videos. Export to SMPTE-TT gives you the options to capitalize all text and adjust the starting elapsed timestamps.

In a BCS session or while editing a caption file, press **Alt + f, r, m (File/Export Captions/Export to SMPTE-TT)**. The Export Captions to SMPTE-TT dialog box displays.

1. Do any of the following:
  - Select All Caps to create the TTML in all capital letters.
  - Select whether to customize the starting elapsed timestamp.
2. Click **OK** to begin the export.
3. The Save SMPTE-TT dialog box displays, do any of the following:
  - **Look in**  
Defaults to the current user. Use the drop down button to display the current folder level. To locate a file in a location other than the CAT4 users level, use **Browse**.
  -  **Back**  
Return to the previous folder viewed.
  -  **Up One Level**  
Move one folder level up in the file structure. To move to a location other than the CAT4 users level, use **Browse**.
  - **File Window**  
Displays files for the current user.

-  **Create New Case**  
Create a new case in which you can place related files. The case icon along with the default name, New Case, displays in the File Window. Type a new name in the highlighted area, then press **Enter**.
  -  **Icon View**  
Display the files in the File Window as icons.
  -  **Detail List View**  
Display the files in the File Window as a list with file details.
  - **File name**  
The name of the file you are exporting to SMPTE-TT. CATalyst BCS assigns the file name of the current captioning session with a .TTML extension. Use the suggested file name or type a new file name. If you type the same name as an existing file, the following message displays when you select Save: "*filename.xxx* already exists. Do you want to replace it?" If you select Yes, the existing file is overwritten by the current file. If you select No, the Save SMPTE-TT dialog box displays and you can type a different name.  
When typing a new file name, you can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: ' ~ ! @ # \$ % ^ & ( ) - \_ { }  
Some characters are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , | = < > ? \*
  - **Save as type**  
The type of file that displays in the File Window which also indicates the type of file you are exporting. The only file type available is .TTML.
  - **Save**  
Save the file.
  - **Cancel**  
Closes the Save SMPTE dialog box without saving the file.
4. Press **Alt + s (Save)** to complete the process.

Keyboard Map Functions: Export Captions to SMPTE-TT

## Export to RTF/CRE

RTF is an acronym for Rich Text Format. CRE is an acronym for Court Reporter Extension. RTF/CRE is universal file formats that retain much of the original file formatting and text attributes. RTF/CRE files allow you to exchange jobs between different captioning systems and possibly writing machines. You can exchange steno notes, job dictionaries, and text files by using the [Export to RTF/CRE feature](#). You can also export these files from within their respective CATalyst BCS function using the Export to RTF/CRE feature. Export note files from Manage Notes, dictionary files from Manage Dictionary and caption files from during a BCS session or while editing a caption file.

When exporting files to RTF/CRE from Manage Jobs, CATalyst BCS automatically names the RTF/CRE versions of the file with an added letter to distinguish the file type. In other words, let's say you are exporting the steno notes, dictionary and caption file of the NightlyNews file. By default, CATalyst BCS names the RTF/CRE files as follows: NightlyNews\_S.rtf (steno file), NightlyNews\_D.rft (dictionary) and NightlyNews\_T.rft (caption file). When exporting a file from its respective CATalyst BCS function, by default the RTF/CRE version becomes a subfile of the file name. For example, let's say you are exporting the Jones dictionary from within Manage Dictionary. When you export the dictionary, you will see an Jones.rtf subfile. Use the Export to RTF/CRE function to export the current text in the History window to RTF/CRE format. Text in AllCaps remains in all capital letters when exported. To export the steno notes or dictionary related to the file, use the Export function.

Press **Alt + f, r, e (File/Export Captions/Export to RTF/CRE)**. In the Save As dialog box, use the following fields and options as necessary:

### Save in

Defaults to the current user. Use the drop down button to save a file in another location. You may, for example, want to save the file to a thumb drive in the E:\ drive.

#### Go To Last Folder Visited

Return to the previous folder viewed.

#### Up One Level

Move one folder level up in the file structure.

### File Window

Available files for the current user.

#### Create New Folder

Create a new folder in the File Window. The folder icon along with the default name displays in the Available Files Window. Type a new name in the highlighted area, then press **Enter**.

#### View Menu

Display the files in the selected view: Thumbnails, Tiles, Icons, List, or Details.

### File name

The current file name displays in the File name field. CATalyst BCS assigns a file name using the current name of the file followed by \_T. The .rtf extension is added when you save the file. For example, the caption file collins.sgcaps becomes collins\_T.rtf when exported.

To use a different name, type the new name in the File name field. If you type the same name as an existing file, the following message displays when you select Save: "*filename.xxxx* already exists. Do you want to replace it?" If you select Yes, the existing file is overwritten by the current file. If you select No, the Save As dialog box displays and you can type a different name.

If you type the same name as an open file in another application, the following message displays: "This file is already in use. Select a new name or close the file in use by another application." Select **OK** and type a different file name or close the job or application and type the file name again.

When typing a new file name, you can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: ' ~ ! @ # \$ % ^ & ( ) - \_ { }

Some characters are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , | = < > ? \*

### Save as type

The type of file you are saving. The only file type available for export is .rtf.

### Save

Save the file.

### Cancel

Close the Save As dialog box without exporting the file into RTF/CRE format.

Export to RTF/CRE

## Simultaneous ASCII Output

Simultaneous ASCII concurrently creates an ASCII file of the text from the current CATalyst BCS session being sent to the encoder. Simultaneous ASCII Output allows you to stop creating the current simultaneous ASCII file and start a new ASCII file with a new file name. It also allows you to create a simultaneous ASCII file when one is not currently being created. You can set the location, filename and options for the new ASCII file. Use [Preferences](#) on the Setup menu to set a default location and other options for the simultaneous ASCII file.

When using the Simultaneous ASCII feature, inserts \m into the ASCII file when you write a musical note.

1. Press **Alt + f, u** (**File/Simultaneous ASCII Output**). The Create Simultaneous Output File dialog box displays.
2. Make entries as necessary:

### Save in

Defaults to an ASCII case in the current user or the location specified in Preferences. Use the drop down button to save a file in another location.

### Go To Last Folder Visited

Return to the previous folder viewed.

### Up One Level

Move one folder level up in the file structure.

### File Window

Available files for the current user.

### Create New Folder

Create a new folder. The folder icon along with the default name displays in the File Window. Type a new name in the highlighted area, then press **Enter**.

### **View Menu**

Display the files in the selected view: Thumbnails, Tiles, Icons, List, or Details.

### **File name**

Select an existing file name or type a new file name in the field. If you type the same name as an existing file, the following message displays when you select Save: "*filename.xxxx* already exists. Do you want to replace it?" If you select Yes, the existing file is overwritten by the current file. If you select No, the Create Simultaneous Output File dialog box displays and you can type a different name.

If you type the same name as an open file in another application, the following message displays: "This file is already in use. Select a new name or close the file in use by another application." Select **OK** and type a different file name or close the job or application and type the file name again.

When typing a new file name, you can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: ' ~ ! @ # \$ % ^ & ( ) - \_ { }

Some characters are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , | = < > ? \*

### **Save as type**

The default file type is .txt. This is the only file type available.

### **Timestamps**

Check this box to use timestamps in ASCII file. Select one of the following options:

#### **Clock**

Display timestamps in actual time format. For example, 08:10:01 for 8:10 a.m.

#### **Elapsed**

Display timestamps indicating the quantity of time that has elapsed since starting. Use the field to specify an elapsed starting time. For example, if you start out with the elapsed time of 00:00:00 and you caption for 1 hour and 23 minutes the starting timestamps would be 00:00:00 and the ending timestamps would be 01:23:00.

### **Frames (HH:MM:SS:FF)**

Check this box to display the timestamps with hour, minute, second and TV frame number.

### **Overwrite existing file**

Check this box to overwrite an existing file. CATalyst BCS prompts you to confirm you want to overwrite the existing file. If the Overwrite existing file option is not selected and you select an existing file, CATalyst BCS will automatically create a new file starting with the selected existing file name and then add the date and time to the end of the file name.

### **Save**

Save the file.

### **Cancel**

Close the Create Simultaneous Output File dialog box without starting a new ASCII file.

Caption: Simultaneous ASCII Output

## Simultaneous SCC Output

Simultaneous SCC Output concurrently creates a .scc (Scenarist Closed Caption) file of the text from the current CATalyst BCS session being sent to the encoder. Simultaneous SCC Output allows you to stop creating the current simultaneous SCC file and start a new SCC file with a new file name. It also allows you to create a simultaneous SCC file when one is not currently being created. You can set the location, filename and options for the new SCC file. Use [Preferences](#) on the Setup menu to set a default location and other options for the simultaneous SCC file.

When using the Simultaneous ASCII feature, inserts \m into the ASCII file when you write a musical note.

1. Press **Alt + f, e** (**File/Simultaneous ASCII Output**). The Create Simultaneous Output File dialog box displays.
2. Make entries as necessary:

### Save in

Defaults to an SCC case in the current user or the location specified in Preferences. Use the drop down button to save a file in another location.

### Go To Last Folder Visited

Return to the previous folder viewed.

### Up One Level

Move one folder level up in the file structure.

### File Window

Available files for the current user.

### Create New Folder

Create a new folder. The folder icon along with the default name displays in the File Window. Type a new name in the highlighted area, then press **Enter**.

### View Menu

Display the files in the selected view: Thumbnails, Tiles, Icons, List, or Details.

### File name

Select an existing file name or type a new file name in the field. If you type the same name as an existing file, the following message displays when you select Save: "*filename.xxxx* already exists. Do you want to replace it?" If you select Yes, the existing file is overwritten by the current file. If you select No, the Create Simultaneous Output File dialog box displays and you can type a different name.

If you type the same name as an open file in another application, the following message displays: "This file is already is use. Select a new name or close the file in use by another application." Select **OK** and type a different file name or close the job or application and type the file name again.

When typing a new file name, you can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: '~ ! @ # \$ % ^ & ( ) - \_ { }

Some characters are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , | = < > ? \*

### Save as type

The default file type is .scc. This is the only file type available.

### Elapsed Starting Time

The elapsed starting time for the simultaneous .scc file defaults to 00. If you want to have the file start at a different elapsed time, make the adjustments in the Elapsed Starting Time field. The timestamps is always formatted as Frames (hour, minute, second and frame number).

### Overwrite existing file

Check this box to overwrite an existing file. CATalyst BCS prompts you to confirm you want to overwrite the existing file. If the Overwrite existing file option is not selected and you select an existing file, CATalyst BCS will automatically create a new file starting with the selected existing file name and then add the date and time to the end of the file name.

### Save

Save the file.

### Cancel

Close the Create Simultaneous Output File dialog box without starting a new SCC file.

Caption: Simultaneous SCC Output

## Simultaneous SMPTE-TT Output

Simultaneous SMPTE Output concurrently creates a TTML (Timed Text Markup Language) file of the text from the current CATalyst BCS session being sent to the encoder. Simultaneous SMPTE-TT Output allows you to stop creating the current simultaneous SMPTE file and start a new SMPTE file with a new file name. It also allows you to create a simultaneous SMPTE file when one is not currently being created. You can set the location, filename and options for the new SCC file. Use [Preferences](#) on the Setup menu to set a default location and other options for the simultaneous SMPTE file.

When using the Simultaneous ASCII feature, inserts \m into the ASCII file when you write a musical note.

1. Press **Alt + f, p** (**File/Simultaneous ASCII Output**). The Create Simultaneous Output File dialog box displays.
2. Make entries as necessary:

### Save in

Defaults to an ASCII case in the current user or the location specified in Preferences. Use the drop down button to save a file in another location.

**Go To Last Folder Visited**

Return to the previous folder viewed.

### Up One Level

Move one folder level up in the file structure.

### File Window

Available files for the current user.

### Create New Folder

Create a new folder. The folder icon along with the default name displays in the File Window. Type a new name in the highlighted area, then press **Enter**.

### View Menu

Display the files in the selected view: Thumbnails, Tiles, Icons, List, or Details.

### File name

Select an existing file name or type a new file name in the field. If you type the same name as an existing file, the following message displays when you select Save: "*filename.xxxx* already exists. Do you want to replace it?" If you select Yes, the existing file is overwritten by the current file. If you select No, the Create Simultaneous Output File dialog box displays and you can type a different name.

If you type the same name as an open file in another application, the following message displays: "This file is already in use. Select a new name or close the file in use by another application." Select **OK** and type a different file name or close the job or application and type the file name again.

When typing a new file name, you can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: ' ~ ! @ # \$ % ^ & ( ) - \_ { }

Some characters are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , | = < > ? \*

### Save as type

The default file type is .ttml. This is the only file type available.

### Elapsed Starting Time

The elapsed starting time for the simultaneous .ttml file defaults to 00. If you want to have the file start at a different elapsed time, make the adjustments in the Elapsed Starting Time field. The timestamps is always formatted as Frames (hour, minute, second and frame number).

### Overwrite existing file

Check this box to overwrite an existing file. CATalyst BCS prompts you to confirm you want to overwrite the existing file. If the Overwrite existing file option is not selected and you select an existing file, CATalyst BCS will automatically create a new file starting with the selected existing file name and then add the date and time to the end of the file name.

### Save

Save the file.

### Cancel

Close the Create Simultaneous File dialog box without starting a new SMPTE file.

Caption: Simultaneous SMPTE-TT Output

## Stop Translation

End the realtime captioning session by pressing **Ctrl + \ (Stop Translation)**. The Connect Writer command is not available once you use the Stop Translation feature.

## Include

Include allows you to copy the entire text of another file into the current text in the History or Script window. The original file selected to include remains unchanged. The included file copies into the current job immediately before the cursor position.

When the file you are including has steno associated with the text, the steno also copies into the current session.

You can include a file from your user name, another user name, or a case.

To include a file:

1. Position the cursor to the right of where you want to include the file and press **F9**. The Include File dialog box displays.
2. Make entries as necessary:

### Look In

Choose the user name from which you want to select the include file. The default is the current user. To locate a file in a location other than the CAT4 user level, use **Browse**.

### File Window

Available files for the current user. Highlight a file to open. The selected file name displays in the File name field below. To select a file within a case, double-click the case to open it.

### File name

The name of the selected file to Include.

### Files of type

Displays the type of file to Include. The default subfile type is a text (.sgn!) file.

### Browse

Locate a different folder.

### Bring Fields

If there are field values in the file you are including, decide whether you want to bring those fields values into the current file. If you bring the field values and they conflict with existing field values in the current file you will be prompted to select the field value you want.

### Bring Layout

This option is usually not used when including in a caption session or caption file.

### Options

Select Options to modify the available [include settings](#).

3. Press **Enter (Open)**.

## Break

Break allows you to split the text in the History window or captioning file into two portions and save the second portion to a new file or existing file. When you break a text file, CATalyst BCS puts a copy of the vertical notes and a copy of the job wordlist for that portion of the file into the new file. If you Undo a Break, text and steno are restored to the original file. The text and steno broken from the original file remains intact in the new or existing file.

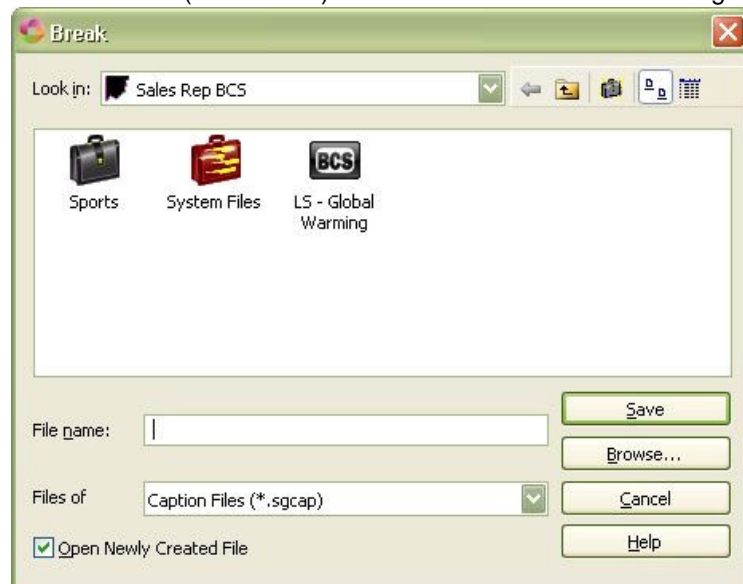

When you break a file and save it to an existing file, CATalyst BCS displays a confirmation message with a Yes/No option to continue. Selecting Yes inserts a New Page format symbol at the end of the existing file and appends the text beginning on the new page. CATalyst BCS includes the layout information with the broken text.

When you break a file that has an associated audio file, the audio file is copied to the new or existing file. CATalyst BCS creates a link in the new or existing file that allows the audio to play from the point at which the file was split.

When you break a file that contains fields, field values are copied from the original transcript to the newly created file.

To break a file:

1. If necessary, open the caption file you want to split.
2. Do **one** of the following:
  - Position the cursor in the History file where you want to break the job. Everything after the cursor is moved to the new or existing file.
  - Use a Mark command to highlight the specific text you want to break. Only the text that is highlighted is moved.
3. Press **Ctrl + b (File/Break)** to break the file. The Break dialog box displays.

4. Make entries as necessary:

**Look in**

Defaults to the current user. Use the drop down button to display the current folder level.

**File Window**

Available files for the current user. To append the broken text to an existing file, highlight the file. The name displays in the File name field. To select a file within a case, double-click the case to open it.

**File name**

Type a new file name or select an existing file name. When you select an existing file name, the following message displays: *This will append the text to the end of the selected file. Do you wish to continue?* Press **Enter (OK)**.

**Files of type**

The type of file that displays in the File Window. The only file type available is a .sgcap file.

**Open Newly Created File**

Select this option to automatically open the newly created file with the new name. When the option is selected, the newly created file is saved under the new name and the file opens in a new caption Edit tab. This option's status is remembered.

**Browse**

Locate a different folder.

5. Press **Enter (Save)**. The text following the cursor or the marked text is removed from the current job and placed in the new job or at the end of the existing selected job. CATalyst BCS automatically saves the new or existing file and then closes it.
6. Continue to work in the current captioning file. If you want to confirm the moved text, press **Ctrl + o** to display the Open Existing Document dialog box and select the file to which you moved the text.

## Append

Append attaches a copy of a selected text file to the end of the current text in the History or Story Queue window. The original text selected to append remains unchanged. When the text you are appending has steno associated with the text, the steno also copies into the current session.

When appending a file that contains audio into a file that contains audio, the portion of file you are appending does not remain linked to its original audio. CATalyst BCS displays a warning message allowing to continue or cancel appending the file.

You can append text from a file in your user name, another user name, or a case.

To append:

1. With your cursor in any position, press **Alt + f, d (File/Append)**. The Append dialog box displays.
2. Make entries as necessary:

**Look in**

Choose the user name from which you want to select the file to append. The default is the current user. To locate a file in a location other than the CAT4 user level, use **Browse**.

**File Window**

Available files for the current user. Highlight the file you want to copy to the end of the current History or Story Queue file. The name displays in the File name field. To select a file within a case, double-click the case to open it.

**File name**

Type the name of the file to append. If you highlight a file to append, that file name displays here.

**Files of type**

Displays the type of file to append. The only file types available are .sgnpl and .txt.

**Browse**

Locate a different folder.

**Bring Layout**

Stenograph strongly recommends not using this option with the Append feature.

3. Press **Enter (Open)** to Append the selected file.

## Merge

Merge allows you to merge a selected file at the end of the current session in the History or Story Queue window. The original file that you merge becomes a part of the current file and is deleted. Depending on where you send your deleted files, you can restore the original file from the Windows recycle bin.

When merging a file that contains audio into a file that contains audio, the portion of file you are merging does not remain linked to its original audio. CATalyst BCS displays a warning message allowing to continue or cancel merging the file.

To merge a file:

1. With your cursor in any position, press **Ctrl + m (File/Merge)**. The Merge dialog box displays.
2. Make entries as necessary:

**Look in**

Choose the user name from which you want to select the merge file. The default is the current user.

**File Window**

Available files for the current user. Highlight the file you want to merge. The name displays in the File name field. To select a file within a case, double-click the case to open it.

**File name**

Type the name of a file to merge. If you highlight a file to merge, that file name displays here.

**Files of type**

The file type displayed in the Files Window. The only file types available are .sgnpl and .txt.

**Browse**

Locate a file in a folder other than the CAT4 user level.

**Bring Layout**

Stenograph strongly recommends not using this option with the Merge feature.

3. Press **Enter (Open)** to Merge the selected file.

## CATalyst BCS Edit Commands

Edit Command features provide the ability to manage movement from within the History Window, such as jumping to a designated page and searching for text. You can also copy, cut and paste text, insert items like format symbols and speakers, look for a definition and conduct an Internet search. The Send to Cat Scratch feature allows you to send items such as text, dictionary definitions and briefs directly to the [Cat Scratch](#) dialog pane.

### Copy/Cut

The Copy (Ctrl + c) feature copies selected text leaving it in its original location in the file and places a copy on the Windows clipboard. The Cut (Ctrl + x) feature removes selected text from its original location and places it on the Windows clipboard. With the [paste](#) feature, you can place copied or cut text within the same file or into another file as many times as you want. Use the Copy, Cut and Paste features to move text in a captioning session, globals between Global tables, dictionary entries between dictionaries and wordlists entries between Wordlists.

There is no limit to the amount of text you can copy or cut but only one set of copied or cut text can exist on the clipboard at one time. Each time you use the Copy or Cut command, the new text replaces any previous text on the clipboard.

### Retain Steno When Pasting

The CATalyst BCS default includes the underlying steno from the copied or cut text. You can change this setting to not include the underlying steno or to have CATalyst BCS automatically prompt you with a Yes/No option to include the underlying steno:

1. From Manage Jobs, press **Alt + t, o, e, a** (**Tools/Options/Edit/Advanced Edit**). The Advanced Edit Options dialog box displays.
2. Click **Retain Steno when pasting**.  
From the drop down box, select **Yes** to include the underlying steno; **No** to not include the steno; or **Ask** to have CATalyst BCS automatically prompt you with a Yes/No option to include the underlying steno.
3. Press **Enter (OK)** close the Advanced Edit Options dialog box and save the changes.

### Definition Search

The Definition Search feature connects you to the web site specified in the [Definitions Search option](#) where you can view definitions and information. Press **Esc** to return to the Spell Check dialog box., when you have an active Internet connection. If your cursor is immediately before a word or a phrase is highlighted when you select Definition Search, CATalyst BCS connects to the web site specified in the Advanced Caption Options, Definition Search, displays the word or phrase in the Text field and displays the search results. Definition Search is also available from the [Word Definition](#) dialog box.

To access the Definition Search feature from Edit, press **Alt + e, f** (**Edit/Definition Search**). You can assign a key combination to the Definition Search feature in a keyboard map.

### Go To

Go To (Ctrl + g) allows you to move quickly to a specific page in the current session.

To move to a specific page:

1. Press **Ctrl + g** (**Edit/Go To**). The Go To dialog box displays.

2. Type a number in **one** of the following fields and then press **Enter (OK)**.
  - **Section Number (Not Applicable in CATalyst BCS)**
  - **Page Number**
  - **Line Number (Not Applicable in CATalyst BCS)**

## Insert

The Insert feature provides the ability to insert:

- [Conflict Text](#)
- [Format Symbols](#)
- [Hidden Text and Comments](#)
- [Extended Characters](#)
- [Speakers](#)

### Insert Format Symbols

Insert Format Symbols displays the Insert Format dialog box from which you can select format symbols for insertion into the text. You can add other format symbols to the default list in the CATalyst BCS Insert Format Symbol dialog box by modifying your [Format Symbols Options table](#).

To display the Insert Format Symbol dialog box, do **one** of the following:

- From the menu select **Edit/Insert/Insert Format Symbols**.

- Click  on the toolbar.

### Insert Hidden Text/Comment

Insert Hidden Text/Comment displays the Hidden Text dialog box to include a note that is not visible on the History screen. For example, you may want to use hidden text to for instructions or to make a note for yourself. CATalyst BCS displays a push pin in the History window to indicate hidden text. Double click the push pin to display the hidden text. If you select text in the History window to send as a script, CATalyst BCS removes all Hidden text from the selected script text.

You can add format symbols to the hidden text, such as bold and italics. The format symbol is placed at the cursor position. When adding a paired format symbol, such as Bold On/Off or Index On/Off, highlight the text and then select the format symbol that turns the formatting on. CATalyst BCS automatically surrounds the text with the appropriate On and Off symbols.

You can enter up to 1792 characters in the Hidden Text dialog box. If you exceed the limitation CATalyst BCS displays a message. When you insert more than one hidden text entry on a line, an arrow displays in the lower right corner of the Hidden text dialog box. Click the arrow to expand the dialog box to display all the hidden text entries. A number displays above each entry. CATalyst BCS numbers the entries in the order you create them.

You can set your [Scan For](#) options to scan for hidden text. To view the hidden text, use Reveal Codes, **Ctrl + Shift + r (View/Review Codes)**.

To insert hidden text:

1. Press **Alt + e, i, h (Edit/Insert/Hidden Text/Comment)**. The Hidden Text dialog box displays.

2. Type the text you want to insert. Use the following options as necessary:

#### **FS (Alt + f)**

Display the list of available format symbols. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol you want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry. To have the format symbol list always display, check the box, Always Show Format Symbols.

You can also use shortcut keys to insert a format symbol. Press **F4** and then press the appropriate letter or symbol.

#### **Insert Field**

This feature is not applicable in CATalyst BCS.

#### **Extended Characters**

Press **F9** to display the Insert Character dialog box where you can select an [extended character](#) to insert into the hidden text.

3. Press **Enter (OK)** to insert the hidden text. If the Transcript Spell Check option, [Spell Check While Defining](#), is active, CATalyst BCS spell checks the text.

### **Insert Conflict/Text**

Insert Conflict/Text (Ctrl + i) displays the Insert Conflict/Text dialog box allowing you to insert a conflict into the file. CATalyst BCS uses a caret (^) to identify a conflict. To insert a conflict, you must use the Insert Conflict/Text feature to have CATalyst BCS recognize the caret (^) as a conflict. CATalyst BCS does not recognize a caret (^) as a conflict when it is typed directly on the screen. There must be a space between the caret and the text when you type the conflict. When defining steno to be a conflict, use a define command.

For example, to create the conflict ^tin ^continue, press Ctrl + i to display the Insert Conflict/Text dialog box. Type the conflict into the Text field. A ^ (caret) must precede each conflict choice and a space must follow each caret.

**^ Spacebar tin Spacebar ^ Spacebar continue**

To use the insert command:

1. Position the cursor to the left of where you want to insert the text and press **Ctrl + i (Edit/Insert/Conflict)**.
2. In the Text field, create the conflict. Type a caret (^) followed by a space and then the word or words; then type a space, caret, space, followed by the second word. Continue with this format until you have entered all your conflict choices. Do not put a space after the last word. For example, to create a conflict between "there", "their", and "they're", type:

**^ Spacebar there Spacebar ^ Spacebar their Spacebar ^ Spacebar they're**

It displays as ^ there ^ their ^ they're.

You can include a format symbol, extended character, field and additional text in the command. To include a format symbol, select **FS** and choose one from the list or use a format symbol shortcut key. To insert an extended character, press F9 and select from the list. To insert a field or make it part of the entry, select Insert Field and choose from the list. To include additional text following the

conflict that is not part of the conflict, use the Conflict End format symbol after the last word in the conflict.

3. Press **Enter (OK)**.

Type directly on the screen to insert text, format symbols, and punctuation.

## Insert Extended Characters

Insert Extended Characters allows you to insert Upper ANSI characters into the file. The current font selection in the history window determines the extended characters available for selection. You can change the font, however changing the font may result in a difference in the availability of characters.

### Insert an extended character into the job:

To display extended characters in the captions, the encoder to which you are sending must support extended characters.

1. Press **Alt + e, i, x (Edit/Insert/Extended Characters)**. The Insert Character dialog box displays. To change the font, press **Alt + t**. The Font dialog box displays where you can modify the font characteristics.
2. Double click a character to insert. CATalyst BCS inserts the character at the cursor location.

### Insert an extended character into a dialog box:

1. With the cursor in the Text or New Text field, press **F9**. The Insert Character dialog box displays. To change the font, press **Alt + t**. The Font dialog box displays where you can modify the font characteristics.
2. Double click a character to insert. CATalyst BCS inserts the character at the cursor location in the Text or New Text field.

## Insert Speaker

The Insert Speaker feature allows you to insert a speaker name from the list on the [EZ Speaker](#) profile tab.

To insert a speaker name:

1. Press **Alt + e, i, s (Edit/Insert/Speaker)**. The Select EZ Speaker dialog box displays.  
You can also assign a [keyboard command](#) or create a [macro](#) invoke to the Insert EZ Speaker feature.
2. In the Enter Value field, type the speaker number associated with the speaker name you want to insert and press **Enter (OK)**.

To modify entries on the EZ Speakers Profile while captioning, select **Setup/EZ Speaker** to open the EZ Speaker profile tab.

## Internet Search

The Internet Search feature allows you to do an Internet search from CATalyst BCS when you have an active Internet connection. If your cursor is immediately before a word or a phrase is highlighted when you select Internet Search, CATalyst BCS connects to the search engine, displays the word or phrase in the Text field and displays the search results. The default search engine is Google. You can [change](#) the search engine.

To access the Internet Search feature, press **Alt + e, n (Edit/Internet Search)**. You can assign a key combination to the Internet Search feature in a keyboard map.

## Internet Search Option

The CATalyst BCS Internet Search feature, by default, uses Google as the default Internet search engine. To specify a different search engine:

1. From Manage Jobs, press **Alt + t, o, e, a (Tools/Options/Edit/Advanced Edit)**. The Advanced Edit Options dialog box displays.
2. Click **Default Internet search engine**.
3. From the drop down menu, select a Internet Search Engine. The default Internet Search Engine displays at the top of the list. When the default is selected, the Internet Explorer search engine is retrieved from the registry. If this registry entry is not located, Google is used. If you use an International website, select the default Internet Search Engine.
  - Google
  - Yahoo
  - MSN
  - Lycos
  - Dogpile
  - OneLook
  - Ask.com
4. Press **Enter (OK)** to close the Advanced Edit Options dialog box and save the changes.

## Paste

Paste (Ctrl + v) is a feature that inserts copied or cut text from the Windows clipboard into the file. You can Paste text into the current captioning session or another file.

There is no limit to the amount times you can paste the text. Only the last set of copied or cut text exists on the clipboard. When you use the Copy or Cut command again, the new text replaces any existing text on the clipboard. When you exit the CATalyst BCS function, all text is removed from the clipboard and no longer available for pasting in any function.

You can use paste to copy or cut text within a captioning session, globals between Global tables, dictionary entries between dictionaries and wordlist entries between Wordlists.

## Redo

Redo (Ctrl + Shift + z) is a feature that allows you to restore the most recent changes or actions in the current file. Only consecutive actions can be redone. If you cannot redo an action, the Redo option on the menu is unavailable. You can undo an action by pressing **Ctrl + z (Undo)**.

To redo the most recent changes, do **one** of the following:

- Press **Ctrl + Shift + z (Edit/Redo)**. Repeat until you restore all the desired actions. You can only select consecutive actions to restore.
- Use the  icon on the Standard Plus toolbar to do **any** of the following:
  - Click the **Redo** arrow until you restore all the desired actions.
  - Click the **Down Arrow** next to the Redo button to display a list of most recent actions.

Highlight down the list to select the number of changes you want to restore and then click the left mouse button. You can only select consecutive actions to restore.

## Search

The Search command in CATalyst BCS allows you to locate text, steno or timestamps in History Window. A text search can locate whole, partial or multiple words depending on your selection. The Search also looks for the specified text within any hidden text. A steno search can locate full or partial steno strokes depending on your selection. When searching for timestamps, Case CATalyst displays the Vertical Notes window if it is not already open. If Case CATalyst does not locate the exact timestamp, the next timestamp that occurs within one minute of the timestamp searched for is highlighted.

Once a searched entry displays, you can repeat the Search for the same search criteria. Press F3 to search for the next occurrence or Shift + F3 to search backward for a previous occurrence.

## Search the History Window

1. Press **Ctrl + f (Edit/Search)**. The Search dialog box displays.
2. Make necessary entries:

### Search For

Select the Search Type and then type the text, steno or timestamp for the search.

To add extended characters to a text search, place the cursor in the Search For field and press **F9**. The Insert Character dialog box displays. Double click a character to insert. CATalyst BCS inserts the character at the cursor location.

### Search Type

Select one:

#### Text

Search by text. In the field, type the text for which you want to search.

#### Steno

Search by steno. In the field, type the steno for which you want to search. You can look for full or partial steno strokes. Separate multiple strokes with a forward slash. When starting with a final stroke, place a – (hyphen) before the first letter.

#### Timestamp

Search by timestamp. CATalyst BCS defaults to displaying the current time based on your computer in the Search For field. The timestamp displays in hour/minutes/seconds.

If CATalyst BCS does not locate the exact timestamp, the next timestamp that occurs within one minute of the timestamp searched for is highlighted.

### Wildcard Text

Search for specific text with unknown characters. Do either of the following:

- Use a ? (question mark) in a word or phrase for a single unknown character.
- Use an \* (asterisk) in a word or phrase for an unknown number of characters following the asterisk.

### Regular Expression

Search based on a specific text string. A list of default expressions displays in the dialog box. Double click an expression to insert it into the *Search For* field. Refer to the Regular Expression Default List for details on each regular expression default formula.

To create a shortcut for an expression in the list, right click the name and select **Modify Shortcut**. Type alpha or numeric characters in the field and press **Enter (OK)**. You may want to use the shortcut key to create a [macro](#) which you can use in a regular expression. To create a macro for a regular expression, invoke the Search command and select Regular Expression. The cursor defaults to the Search For field. Press Tab to move to the Regular Expression list. Type the shortcut key and press Enter to put the formula in the Search For field..

### Regular Expression Default List

- **Acronyms** – searches for any occurrence that begins a word with a character followed by a period. There must be at least “character period character period” in order for it to be considered a match.
- **Alnum** – searches for any capital or lower case alpha/numeric character individually or part of a group.
- **Alpha** – searches for any capital or lower case alpha character individually or part of a group.
- **Digit** – searches for any numeric character individually or part of a group.
- **Contractions** – searches for any word that begins with one or more alpha characters which are followed by an apostrophe and one or more characters follow the apostrophe and end the word.
- **Dates** – searches for all occurrences of dates with the exceptions when a month is listed by itself or a digit displays before the month, such as 1 January.
- **E-mail address** – searches for any alpha character including a hyphen or period, followed by @ with any alpha character following including a hyphen or period.
- **Mixed Alpha and Digits** – searches for occurrences at the beginning of a word any alpha characters followed by numeric characters or occurrences that begin with any number character followed by alpha characters.
- **One Alnum** – searches for any alpha/numeric character.
- **One Alpha** – searches for any alpha character. This will treat each alpha character in a word as a single search item.

- **One Digit** – searches for any single numeric character. This will treat each numeric character as a single search item.
- **Phone Number** – searches for the number 1 followed by either a period or hyphen, but the search will continue even if this condition does not exist. The search will continue and look for a three digit number followed by a period or hyphen but will continue even if this condition does not exist. A match is only found when a three digit number followed by period or hyphen followed by a 4 digit number is found.
- **Repeated Words** – searches for occurrences of a word that begins and ends with alpha characters and the same word immediately follows.
- **SSN** – searches for occurrences of 3 digits followed by a hyphen, followed by 2 digits followed by a hyphen followed by 4 digits.
- **Stitched** – searches for occurrences that begins a word with a single alpha character followed by one or more hyphens.
- **Time** – searches for occurrences of time with the exception of “o’clock” time.

Optionally you can create your own regular expression formula to save for later use. Refer to the list of regular expression characters when creating your own formulas. To save your customized formula, click the **Save As** button. The Saved Named Regular Expression As dialog box displays. Type a name for the expression and press **Enter (OK)**. The name is added to the list in the dialog box.

### Regular Expression Characters for Customized Formulas

- **\d** = any one digit
- **\w** = any one alpha character
- **|** = OR (please note | is the pipe symbol)
- **[ ]** = any one character in a set
- **[^]** = any one character not in a set
- **( )** = treat group as a single item
- **\>** = at the end of a word
- **\<** = start at the beginning of a word
- **\*** = zero or more of the previous item (can be used as a\*b)
- **?** = zero or one of the previous item (can be used as a?b)
- **+** = one or more of the previous item (can be used as a+b)
- **.** = any single character
- **{n}** = specific number of occurrence (Replace n with an actual number)
- **,** = use inside squiggle brackets to specify “or more” for example {2,} indicates two or more.
- **\.** = use to make ‘period’ a character to which to be searched
- **-** = use to express “through” as in an “A through Z” or “1 thorough 9” search.
- **\n** = n can be digits 1 through 9. This finds the previous matched expression n times.

Search for a format symbol or add a format symbol to your search. Select FS and double-click a symbol from the list to select it.

You can also use shortcut keys to insert a format symbol. Place your cursor in the Search For field, press F4 and then press the appropriate letter or symbol.

This option is only available when searching for text or format symbols.

### **Case Sensitive**

Check this box to search for the text in the Search For field exactly as it is typed in upper and lower case. For example, if you only want to find occurrences of "Mark" when it is capitalized, you would type "Mark" in the Search For field and select the Case Sensitive option.

If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field. For example, if you search for "Mark" and do not check this box, CATalyst BCS finds all occurrences of word "mark" and "Mark".

This option is only available when searching for text or format symbols.

### **Whole Word**

Check this box to search only for the whole words that match the text typed in the Search For field. For example, if you only want to find occurrences of able when it is the word "able" and not part of a word like "table, you would type "able" in the Search For field and select the Whole Word option.

If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. For example, searching for "of" would result in Search stopping on "of", "officer", "coffee", "soft", etc. This is often called a wildcard search.

This option is only available when searching for text or format symbols.

### **Go to Reveal Codes after FS Search**

Not recommended for use in CATalyst BCS.

### **Search Direction**

Select **one** of the following:

#### **Forward**

Search forward, from the cursor position to the end of the job. If you do not begin the search at the beginning of the job, CATalyst BCS prompts you to continue the search from the beginning of the file.

#### **Backward**

Search backward, from the cursor position to the beginning of the job. If you do not begin the search at the beginning of the job, CATalyst BCS prompts you to continue the search from the end of the file.

#### **List Results**

Search the entire transcript and automatically display the Search information in the [Search Results](#) with the text content, page, line and section reference for each occurrence. This option is available when searching for Text, Wildcard and Regular Expression searches. When performing a [Wildcard](#) or [Regular Expression](#) search with the List Search Results option selected, the Wildcard and Regular Expression matches will be underlined. If you search for Q, A or Colloquy format symbols, the first letter following the format symbol will be underlined.

### **Deselect All**

Reset the options in the Search Text dialog box to their default values. You may want to use this feature when recording a macro to achieve consistent results when replaying the macro.

3. Press **Enter (OK)** to start the Search.

## Search and Replace

Search and Replace allows you to locate and replace a word or words in your captioning session. You can search and replace forward or backward for a whole word, part of a word, or multiple words.

To find words:

1. Press **Alt + e, e (Edit/Search and Replace)**. The Search and Replace dialog box displays.
2. Make necessary entries:

### Search For

Type the text you want to find, including any format symbols.

To add extended characters to a text search, place the cursor in the Search For field and press **F9**. The Insert Character dialog box displays. Double click a character to insert. CATalyst BCS inserts the character at the cursor location.

### Replace With

Type the replacement text for the entry in the Search For field. Add format symbols, if appropriate. Leave this field blank to search for the text in the *Search For* field and delete it from the transcript

### FS

To add format symbols to your search, select **FS** and double-click a symbol from the list to select it.

You can also use shortcut keys to insert a format symbol. Place your cursor in the Search For field, press **F4** and then press the appropriate letter or symbol.

This option does not apply to when using Search and Replace in the [Number Conversion](#) feature.

### Case Sensitive

Check this box to search and replace the text in the Search For field exactly as it is typed in upper and lower case. For example, if you only want to find occurrences of "Mark" when it is capitalized, you would type "Mark" in the Search For field and select the Case Sensitive option.

If you do not select Case Sensitive, the search and replace finds all words containing the indicated characters, regardless of the case typed into the field. For example, if you search for "Mark" and do not check this box, CATalyst BCS finds all occurrences of word "mark" and "Mark".

### Whole Word

Check this box to search only for the whole words that match the text typed in the Search For field. For example, if you only want to find occurrences of able when it is the word "able" and not part of a word like "table, you would type "able" in the Search For field and select the Whole Word option.

If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. For example, searching for "of" would result in Search stopping on "of", "officer", "coffee", "soft", etc. This is often called a wildcard search.

### Go to Reveal Codes after FS Search

Not recommended for use in CATalyst BCS.

### Search Direction

Select **one** of the following:

#### Forward

Search forward, from the cursor position to the end of the job.

#### Backward

Search backward, from the cursor position to the beginning of the job.

### Deselect All

Reset the options in the Search and Replace dialog box to their default values. You may want to use this feature when recording a macro to achieve consistent results when replaying the macro.

4. Select one of the following:

#### Selective

Selectively choose to replace occurrences of the original text with the replacement text. The Confirm dialog box displays allowing you to choose to replace for this occurrence, all occurrences, or skip replacement for this occurrence and move to the next.

#### Replace All

Replace all occurrences of the original text with the replacement text. When finished, CATalyst BCS displays the number of replacements made.

## Send To Cat Scratch

The Send To Cat Scratch Pane feature allows you to send text, dictionary definitions, Brief It entries, AccelerWriter definitions, Power Defines and Global Table entries directly to the [Cat Scratch](#) dialog pane. Depending on the selected [Cat Scratch scope](#), the entries are sent to the job, case or user Cat Scratch pane. The default scope setting is Case. When the job is not in a case, the CAT Scratch information is available in the job.

You can create a keyboard command, Send Steno & Text to Cat Scratch Pane, that sends highlighted text with the underlying steno in the transcript to the Steno/Text section of the Cat Scratch pane. If the start of the highlighted text does not have underlying steno, a message displays.

[Keyboard Map](#) Function: Send To Cat Scratch

Send Steno & Text to Cat Scratch Pane

## Undo

Undo (Ctrl + z) is a feature that allows you to reverse the most recent changes or actions in the current session. Only consecutive actions are reversible. If you cannot undo an action, the Undo option on the menu is unavailable. You can restore an action by pressing **Ctrl + Shift + z (Redo)**.

The Undo command reverses most editing actions except globals and cursor movements. There are specific commands available to [undo globals](#).

To undo the most recent changes, do **one** of the following:

- Press **Ctrl + z (Edit/Undo)**. Repeat until you reverse all the desired actions.
- Use the  icon on the Standard Plus toolbar to do **one** of the following:
  - Click the **Undo** arrow until you reverse all the desired actions.
  - Click the **Down Arrow** next to the Undo button to display a list of most recent changes.

Highlight down the list to select the number of changes you want to undo and then click the left mouse button. You can only select consecutive actions to undo.

## CATalyst BCS Caption Commands

Caption commands include features that affect the display output of the captioning session. You use caption commands to manage the display of captions on the screen and the flow of captions to the encoder.

### Line Width

Line Width is a CATalyst BCS feature that allows you to change the number of characters that display on a caption line. Changes apply to the current session.

To change the line width:

1. Press **Alt + c, w (Caption/Line Width)**. The Set Caption Characters dialog box displays.
2. Make an entry. Valid entries are **8 – 32**.
3. Press **Enter (OK)**. CATalyst BCS applies the change, inserting the appropriate format symbol in the History window. Use [Reveal Codes](#) to view the format symbol.

### Roll-up Rows

Roll-up Rows is a CATalyst BCS feature that allows you to change the maximum amount of lines that display on the screen when using the Roll-up caption style for the current session. This feature applies when the Roll-up Caption Style is active.

To change the number of roll-up rows:

1. Press **Alt + c, r (Caption/Roll-up Rows)**. The Set Roll-up Rows dialog box displays.
2. Make an entry. Valid entries are **2 - 4**.
3. Press **Enter (OK)**. CATalyst BCS applies the change, inserting the appropriate format symbol in the History window. Use [Reveal Codes](#) to view the format symbol.

### Baseline

Baseline is a CATalyst BCS feature that allows you to change the row number on which you want the first caption line to display. For example, you select 3 lines roll-up with a Row placement of 15. The first caption line displays on line 15. When you write the second line, the first line rolls up to line 14. When you write the third line of captions, the first line rolls up to line 13.

To change the baseline:

1. Press **Alt + c, a (Caption/Baseline)**. The Set Caption Baseline dialog box displays.
2. Make an entry. Valid entries are **1 15**.
3. Press **Enter (OK)** to apply the change.

### Position

Position is a CATalyst BCS feature that allows you to change the horizontal alignment, vertical position and column for the caption text for the current session.

To change the position:

1. Press **Alt + c, i (Caption/Position)**. The Set Caption Characters Rows dialog box displays.
2. Make necessary entries.

#### Justification

The horizontal alignment of the caption text. Valid entries are **Left, Right, Centered, and Widest Right**.

#### Row

The row number on which you want the first caption line to display. For example, if you select 3 lines roll-up with a Row placement of 15, the first caption line appears on line 15. When you write the second line, the first line rolls up to line 14. When you write the third line of captions, the first line rolls up to line 13.

#### Column

The horizontal position, indent, where you want the caption to begin. Valid entries are **1 28**.

If you select Centered in the Justification field, enter a column value equal to half the value of the Line Width. For example, if the Line Width is 32 characters and Justification is Center, then "16" is the correct value.

3. Press **Enter (OK)**. CATalyst BCS applies the change, inserting the appropriate format symbol in the History window. Use [Reveal Codes](#) to view the format symbol.

### Set YouTube Delay

[YouTube](#) is available in the Encoder Model field of a BCS Profile Connections dialog box. YouTube allows you to use your steno machine and BCS to caption a YouTube video. Set the delay of text for the YouTube Live session. Your YouTube live streaming partner may determine it is necessary to adjust this setting. The default setting is 3.000 and adjustments are made in .250 increments. Any adjustments to the increments is used for the current captioning of YouTube but is not saved for the captioning session.

While in a captioning/streaming session, to change the YouTube delay, do the following:

1. To display the Caption menu, press **Alt + c, d (Caption, Set YouTube Delay)**.
2. Use the scroll arrows to increase or decrease the delay.
3. To save the changes, click OK.

## Block Existing Cap

Block Existing Cap is a CATalyst BCS feature that activates Block mode. Block mode prevents all upstream captions, such as commercials with captions, from passing through to the encoder. When you begin writing or start to send lines from a script file, you are automatically in Block mode. Block mode displays in the Caption Preview window and in the Status window.

Translation Delay does not affect Block mode. When Block mode is invoked, CATalyst BCS forces all text immediately and does not wait for the Translation Delay setting to expire.

To activate Block mode, press **F3 (Caption/Block Existing Cap)**. To [create](#) a dictionary definition that invokes the Block Existing Cap from the steno keyboard, use the <Caption: Block> format symbol.

## Pass Existing Cap

Pass Existing Cap is a CATalyst BCS feature that activates Pass mode. Pass mode allows upstream captions, such as captioned commercials to pass through to the encoder. Pass mode displays in the Caption Preview window and in the Status window.

Translation Delay does not affect Pass mode. When Pass mode is invoked, CATalyst BCS forces all text immediately and does not wait for the Translation Delay setting to expire.

To activate Pass mode, press **F2 (Caption/Pass Existing Cap)**. To [create](#) a dictionary definition that invokes the Pass Existing Cap from the steno keyboard, use the <Caption: Pass> format symbol. You may also want to create a dictionary definition that includes the <Caption: Clear> with the <Caption: Pass> format symbol. For example, define the steno PA\*S as <Caption: Clear> <Caption: Pass>.

## Suspend Cap Output

Suspend Cap Output is a CATalyst BCS feature that activates and deactivates Suspend mode. Suspend mode prevents all output from being sent to the encoder. This allows you to edit in the History window or write on your writing machine without sending data to the encoder. For example, you may want to create definitions from the writing machine. The word Suspended flashes red in the Status window and a notification displays in the Caption Preview window.

Translation Delay does not affect Suspend mode. When Suspend mode is invoked, CATalyst BCS forces all text immediately and does not wait for the Translation Delay setting to expire.

Suspend Mode temporarily pauses Translate Statistics. The current time and page count continue to remain active but stroke count information is paused until Suspend Mode is closed.

To activate Suspend mode, press **F7 (Caption/Suspend Cap Output)**. You cannot create a dictionary definition to invoke Suspend mode from the steno keyboard.

## Terminal Window

Terminal Window is an advanced feature that allows you to use commands to setup, modify and test the modem and send commands to configure and reset the encoder from within CATalyst BCS. Terminal Window should only be used by those experienced in the hyperterminal function or in sending commands to the modem.

The following commands are available in the Terminal Window. You can also access command information by selecting Help from within the Terminal Window.

### Stenograph CATalyst BCS Terminal Window Commands

**/open**

Opens the comport. Use the following optional Parameters as necessary: They must be listed in order:

Baud Rate (110=110; 2400=2400; etc)

Parity (2=e; 1=o; 0=n)

Data Bits (5=5; 6=6; etc)

Stop Bits (0=1; 1=1.5; 2=2)

Flow Control (1=xon/xoff; 2=hardware; 0=none)

*Example:* /open com1 14400 0 8 0 0 or /open com1 38400 or /open com1

### **/listcoms**

Display all the available comports.

*Example:* /listcoms

### **/close, /hangup**

Close an active connection (COM or Connection).

*Example:* /close

### **/help, /hlp, /?**

Display the help.

*Example:* /?

### **/clr, /clear**

Clear the screen.

*Example:* /clr

### **/options**

Display all the current settings for the console window.

*Example:* /options

### **/localecho**

Turn on or off the local echo.

*Example:* /localecho on or /localecho off

**/commandchar**

Set the character that indicates that the current line is a command and not data that should be sent to the remote window. Only a single character is accepted.

*Example:* /commandchar / or /commandchar #

**/addlf2cr**

Add a line feed to all carriage returns.

*Example:* /addlf2cr on or /addlf2cr off

**/dial**

Dial a connection in CATalyst BCS. Type the index number of the item you want to dial.

*Example:* /dial 1 or /dial 2

**Clear Video**

Clear Video is a CATalyst BCS feature that sends a blank command to the encoder which removes the captions from the Caption Preview window and the output screen. You might use this command just before going to commercial so the realtime captions and upstream captions are not overwritten. To clear the video, press **F5 (Caption/Clear Video)**.

To [create](#) a dictionary definition that invokes the Clear Video command from the steno keyboard use the <Caption: Clear Video> format symbol.

**CATalyst BCS Setup Commands**

CATalyst BCS setup commands provide access to Profile settings, color settings for specific elements in the History window; caption translate settings and Preferences, which are a group of settings that affect how CATalyst BCS handles certain captioning settings during the session.

**Profiles**

Profiles on the Setup menu is a CATalyst BCS feature that allows you to create, modify or switch a [Profile](#) while captioning in CATalyst BCS.

To manage Profiles during a captioning session:

1. While captioning, press **Alt + p, p (Setup/Profiles)**. The Manage Profiles dialog box displays.  
If you have the warning option, *Before Connection Loss*, set to Yes in Preferences, CATalyst BCS displays a warning message prompting you with a Yes/No choice before switching Profiles.
2. Do one of the following:

**Create a New Profile**

Select **New Profile** to display the Create New Profile dialog box. In the File name field, type a name for the new Profile and press **Enter (Open)**. Follow the Profile Wizard through each of the eight Profile tabs, making necessary entries. Click **Finished** at the end of the wizard to complete the Profile.

### Modify a Profile

Highlight a Profile and select **Modify Profile**. The Profile dialog box displays where you can modify settings on any of the eight Profile tabs. When finished press **Enter (OK)**.

### Switch Profiles

Highlight the Profile you want use and select **Switch Profile**. When switching profiles, CATalyst BCS clears the Global Table, clears the Brief It dialog pane, resets the translation Brief It dictionary and deactivates the current Power Defines.

3. Select **Cancel** to close the Manage Profiles dialog box. If you selected to switch a profile, CATalyst BCS automatically closes the dialog box.

You can also access the Manage Profiles dialog box from the [Session Information Window](#). Click **Change to a different Profile**.

## Colors

Colors is a CATalyst BCS feature that allows you to change the color for specific elements in the History window, such as text, sent text, next send line, background and untranslates.

1. Press **Alt + p, c (Setup/Colors)**. The Caption Colors dialog box displays.
2. Make necessary entries:

### Sample Text Window

Identify the various types of text in the History window for which you can set colors. Move your cursor to an area in the window. The Description field shows the type of text selected. For example, position your cursor on an untranslate. The Description field at the bottom of the screen identifies the text as an untranslate.

When you identify the type of text you want to change, you can click it to select it for modification. CATalyst BCS displays the type in the drop down list to the right.

### Description

Describes the text on which the cursor is positioned in the sample window.

### Drop Down List

Select the type of text for which you want to change the color. A red box displays around the selected text type in the sample window.

Sent Text and Next Send Line have two color selections. The top color drop down list box is the text color. The bottom drop down list box is the background color.

### Color Field

The current color for the text type identified in the above field. Click the Color field to display the Color palette. Click the color you want to use and press **Enter (OK)**.

### More Colors

You can create your own color by selecting **Define Custom Color**. A color selection screen displays. To create your own color, consult your Windows documentation for more information.

### Default Colors

Reset colors for all the text types to the default settings that came with CATalyst BCS.

3. Press **Enter (OK)** to accept the changes and close the Caption Colors dialog box. CATalyst BCS remembers the new settings for the current user until changed again.

## Story Queue

Story Queue on the Setup menu is a CATalyst BCS feature that allows you to rearrange loaded stories in the Story Queue. This way of rearranging stories is similar to the CAPtivor method. You can also rearrange stories directly in the [Story Queue](#) window.

To rearrange stories using the Story Queue feature:

1. Press **Alt + p, q (Setup/Story Queue)**. The Arrange Stories dialog box displays.
2. On the Text line below the Story window, type any of the reordering commands to rearrange the stories. Press **Enter** after each command entry. Use Reset to restore the original story order when you opened the Arrange Stories dialog box.

### Reorder ( , comma)

Example: 3,4 will list stories in this order:

3

4

1

2

### Swap ( = equals sign)

Example: 2=4 results in:

1

4

3

2

### Delete ( D )

Example: D1,2,3 or D1:3 results in stories 1, 2, and 3 being removed from the list

### Place Before ( / forward slash)

Example: 4/2 results in:

1

4

2

3

### Range indicator

Example: 2:4/1 results in

2

3

4

1

3. When finished, press **Alt + d (Done)**. The stories display in the Story Queue in the rearranged order.

## Dictionaries

Dictionaries on the Setup menu is a CATalyst BCS feature that allows you to temporarily or permanently modify the Dictionary settings for the current Profile and apply the change to the current captioning session.

1. Press **Alt + p, i (Setup/Dictionaries)** to display the [Dictionaries](#) Profile tab. Add, remove or reorder the dictionaries.
2. When finished, select one of the following:

### OK

Apply the changes to the current Profile for the current captioning session only and close the dialog box.

### Save

Apply the changes to the current captioning session, permanently save them to the current Profile and close the dialog box.

## Connections

Connections on the Setup menu is a CATalyst BCS feature that allows you to dial a specific modem, hang up the current modem or modify modem information in the current Profile and apply the change to the current captioning session.

You can also quickly add a new telephone number during a captioning session using the [Add a Connection](#) feature in the Session Information window. The new connection settings are added to the current Profile.

To change the modem connection or information:

1. Press **Alt + p, c (Setup/Connections)**. The Modem dialog box displays.
2. A list of available connections for the current profile displays the associated modem telephone number.
3. Use the options as necessary:

### Dial

Highlight the connection you want to dial and select **Dial**. A check mark displays next to the active connection.

### Hang up

Highlight the connection from which you want to disconnect and select **Hang up**.

### Modify Profile

Modify [Connections](#) options, such as COM port or phone number, for the current profile. Create new, delete or change the order of connections. The first connection listed is the default for this Profile. After making changes, select one of the following:

### OK

Apply the changes to the current Profile for the current captioning session only and close the dialog box.

**Save**

Apply the changes to the current captioning session, permanently save them to the current Profile and close the dialog box.

4. When finished, select **Done** to apply the change and close the dialog box.

## Caption Style

Caption Style is a CATalyst BCS feature that allows you to temporarily or permanently modify the Caption Style for the current Profile and apply the changes to the current captioning session.

1. Press **Alt + p, y (Setup/Caption Style)** to display the Caption Styles dialog box.
2. Use the options as necessary.

**Select**

Highlight a Caption Style to use for the current session and then choose Select. CATalyst BCS applies your selection and closes the dialog box.

**Custom**

This feature is currently unavailable.

**Modify**

Display the [Caption Styles](#) tab where you can make temporary or permanent changes to the current Caption Style. Create new, delete or reorder the caption styles. The first style listed is the default for this Profile. After making changes, select one of the following:

**OK**

Apply the changes to the current Profile for the current captioning session only and close the dialog box.

**Save**

Apply the changes to the current captioning session, permanently save them to the current Profile and close the dialog box.

**Done**

Close the dialog box.

## Numeric Island Keys

Numeric Island Keys on the Setup menu is a CATalyst BCS feature that allows you to temporarily or permanently create or modify [Numeric Island Keys](#) (NIK) for the current Profile and apply the changes to the current captioning session.

1. Press **Alt + p, n (Setup/Numeric Island Keys)** to display the Numeric Island Keys dialog box.
2. When finished, select one of the following:

**OK**

Apply the changes to the current Profile for the current captioning session only and close the dialog box.

### **Save**

Apply the changes to the current captioning session, permanently save them to the current Profile and close the dialog box.

## **EZText**

EZ Text on the Setup menu is a CATalyst BCS feature that allows you to temporarily or permanently modify EZ Text settings for the current Profile and apply the changes to the current captioning session.

1. Press **Alt + p, z (Setup/EZ Text)** to display the [EZ Text](#) Profile tab. Modify, delete or insert AutoInclude files, such as credit, fund or XDS.
2. When finished, select one of the following:

### **OK**

Apply the changes to the current Profile for the current captioning session only and close the dialog box.

### **Save**

Apply the changes to the current captioning session, permanently save them to the current Profile and close the dialog box.

## **EZ Speakers**

EZ Speakers on the Setup menu is a CATalyst BCS feature that allows you to pre-define speakers names for the active Profile and apply the changes to the current captioning session.

1. Press **Alt + p, z (Setup/EZ Text)** to display the [EZ Speakers](#) Profile tab. Create new or modify existing EZ Speaker entries.
2. When finished, select one of the following:

### **OK**

Apply the changes to the current Profile for the current captioning session only and close the dialog box.

### **Save**

Apply the changes to the current captioning session, permanently save them to the current Profile and close the dialog box.

## **Multiple Outputs**

Multiple Outputs on the Setup menu is a CATalyst BCS feature that allows you to temporarily or permanently modify the Multiple Output settings for the current Profile and apply the changes to the current captioning session.

1. Press **Alt + p, m (Setup/Multiple Outputs)** to display the [Multiple Outputs](#) Profile tab. Create new, remove or reorder connections.
2. When finished, select one of the following:

### **OK**

Apply the changes to the current Profile for the current captioning session only and close the dialog box.

**Save**

Apply the changes to the current captioning session, permanently save them to the current Profile and close the dialog box.

**Contacts**

Contacts on the Setup menu is a CATalyst BCS feature that allows you to temporarily or permanently modify the Contact information for the current profile and apply the changes to the current captioning session.

1. Press **Alt + p, t (Setup/Contacts)** to display the [Contact Info](#) Profile tab. Create new, delete or reorder emergency, support and e-mail information.
2. When finished, select one of the following:

**OK**

Apply the changes to the current Profile for the current captioning session only and close the dialog box.

**Save**

Apply the changes to the current captioning session, permanently save them to the current Profile and close the dialog box.

**Realtime**

The Realtime options allows you to set writing machine options. This includes identifying the writing machine used and the type of connection used from the writer to the computer running CATalyst BCS.

When changing translate options and advanced translate options from the Setup menu, do one of the following:

- Click **OK** to apply the changes to the current Profile for the current captioning session only and close the dialog box.
- Click **Save** to apply the changes to the current captioning session, permanently save them to the current Profile and close the dialog box.

**Realtime Options**

Make necessary entries. When finished, select **OK** to apply the changes to the current captioning session only or **Save** to apply the changes to the current captioning session, permanently save them to the current Profile and close the dialog box.

**Realtime Writing Machine**

Select the type of writing machine you are using:

- **Stenograph Writer Serial/Bluetooth**  
This option includes Stenograph's Luminex, Diamante, Wave, élan Mira, élan Cybra, Stentura Fusion, Stentura Protégé, Stentura LX, Stentura, 220/400SRT and SmartWriter.
- **Stenograph Writer USB**  
This option includes Stenograph's Luminex, Diamante, Wave, élan Mira, élan Cybra, Stentura Fusion and Stentura Protégé.

- Stenograph Writer WiFi  
This option includes Stenograph's Luminex, Diamante and élan Mira A3.
- StenoRam III, III+, Ultra  
This option includes Xscribe's StenoRam III, III+ and Ultra with a serial connection.
- FlashWriter  
This includes ProCAT's Flash steno machine and any other steno writer that uses the Flash serial connection protocol.
- Baron TX  
This includes Baron Transcriptor X (TX) steno machine and any other steno writer that uses the BOLT serial connection protocol.

### Audio

To use the Audio features, your e-Key license must include the AudioSync option.

**IMPORTANT:** Do NOT change the clock time on your computer at any time during the realtime session or have any operating system setting that automatically updates your clock. Changing the clock time once Realtime begins affects the playback of the recording.

### Record Audio

Check this box to use AudioSync. When you record audio, the audio pulse meter displays in the lower right hand corner of the realtime screen. Green indicates the audio is recording to the realtime file. Gray indicates the audio is paused. When you start writing, the Resume Audio picks up the last 5 seconds of the audio.

### Record To

When using AudioSync, select the folder where you want to write the audio portion of the file. The default is the *CAT4\usr\yourusername* folder. If necessary, use **Browse** to select another location.

### Compression Type

When using AudioSync, select **one** of the following to indicate the compression rate:

#### 14 MB/Hr

This is the default setting. Recording at 14 MB per hour produces a higher quality recording but takes up more hard drive space.

#### 6 Mb/Hr

It is strongly recommended that you test the writing and recording ability of your computer to handle this setting due to the system resources required.

### Audio Input

By default, AudioSync uses the Windows setting for the recording device. If you have an audio feed already using the Windows default setting, it may be necessary to change the input location for AudioSync.

Voice translators in particular may want to use the Windows default for their ViaVoice or Dragon Naturally Speaking mask or headset and select a different device for the AudioSync Room Noise. For example, you can change AudioSync from the Microphone port to the Line In port. Use the drop down box to select an alternate recording input device.

### Auto Pause Audio

Check this box to automatically pause the AudioSync recording after a specific period of time, when no new steno is being input from the writing machine. You must enter a value in the After Seconds field. Using this feature can help conserve disk space when recording audio on jobs where long or frequent pauses occur.

AudioSync automatically resumes recording when you begin writing new steno when you use the Auto Pause Audio feature. If you use the translation command {Pause Audio}, you must write the {Resume Audio} stroke to resume writing.

### **After Seconds**

When you check the box for Auto Pause Audio, you must type the number of seconds AudioSync should wait before pausing when no new steno is being input from the writing machine.

## **Connection**

### **COM Port**

Select the appropriate COM port on the CATalyst BCS system for the realtime cable connection to the writing machine. If you are using the élan USB connection, no COM port selection is necessary. For more information on COM or serial ports, refer to the user guide for your computer.

If you are using a USB serial adapter, confirm the correct COM port assignment through the Windows Device Manager. For more information on Device Manager, consult your Windows documentation.

The number of available COM ports vary among computers. When you copy a Profile from one computer that contains more available COM ports than the computer to which it is copied, CATalyst BCS retains the COM port information. On the computer with less COM ports, the COM ports are listed as unavailable in the drop down box. For example, "COM 4 not available."

You do not need to set the COM port field when connecting via a USB port.

### **Direct (Cable)**

Select this option when you are writing realtime directly connected to the CATalyst BCS system with a realtime cable. This option does not apply when you select Stenograph Writer USB as your realtime writer.

### **Modem**

Select this option when you are writing realtime remotely over the phone lines. The writing machine is connected to a phone jack via a modem cable. The remote CATalyst BCS system is connected to a phone jack via a modem cable.

### **Answer**

Have the writing machine call the CATalyst BCS modem.

### **Number**

Have the CATalyst BCS system call the writing machine modem. Type the phone number in the Number field below.

When you select *Call*, type the telephone number of the remote writing machine. If applicable, include any numbers required to access an outside telephone line. For example, if you need to dial 9 to reach an outside line and 1 reach a different area code, the number would resemble the following: 9, 1, 123-456-7890.

## **Voice Engine**

These options apply to voice translation. You must have the software for the selected voice engine installed on your computer and have your e-Key license include the CATalyst VP option. Select one of the following:

### **Dragon Naturally Speaking 8**

Select this option when using Dragon Naturally Speaking Version 8.10 or higher for voice translation.

### **ViaVoice for Windows 10**

Select this option when using ViaVoice for Windows 10 for voice translation.

## **Preferences**

Preferences are a group of settings that affect how CATalyst BCS handles certain captioning settings during the session. You set caption Preferences on the Preferences tab in the Caption Translate Options dialog box. Preference settings remain the same until changed.

Access Preferences:

- each time you start a CATalyst BCS session. In the Broadcast Captioning Translate dialog box, select **Options** and then select the **Preferences** tab.
- during a BCS session. Press **Alt + p, e (Setup/Preferences)**. When changing translate options and advanced translate options from the Setup menu, do one of the following:
  - Click **OK** to apply the changes to the current Profile for the current captioning session only and close the dialog box.
  - Click **Save** to apply the changes to the current captioning session, permanently save them to the current Profile and close the dialog box.

## **Preferences Tab**

In the Preferences tab, highlight the preference name on the left side of the dialog box to display the preference options on the right side. The following list is a summary of BCS translate preferences. For detailed information, click the name.

### **BCS Preferences**

### **Preference Summary**

#### [General](#)

Determine how CATalyst BCS handles files and dictionaries when it cannot locate the path when starting a session; and how to handle global tables when appending, overwriting and closing a session.

#### [Simultaneous ASCII](#)

Set this option and select a default name and location for the concurrent ASCII file created of CATalyst BCS text being sent to the encoder.

#### [Warnings](#)

Select to display message boxes for certain selections during a CATalyst BCS session.

#### [Display](#)

Set default settings for dialog pane positions when starting a CATalyst BCS session.

#### [Scripts](#)

Set Script dialog pane options for cursor movement with send commands, retaining text case, audio warning and script

accessibility in the Story Queue.

## Connect Writer

Connect Writer is a CATalyst BCS feature that allows you to establish connection with the writing machine. Steno outlines written on the writing machine prior to starting a captioning session are not sent to the BCS realtime screen. When this option is grayed out, your writing machine is connected.

To connect the writing machine:

1. Be sure your writing machine is on and connected to the computer.
2. Press **Alt + p, w (Setup/Connect Writer)**.
3. Begin writing.

## Disconnect Writer

Disconnect Writer is a CATalyst BCS feature that allows you to disconnect the writing machine from the current captioning session. When this option is grayed out, your writing machine is not connected.

To disconnect the writing machine, press **Alt + p, r (Setup/Disconnect Writer)**.

## CATalyst BCS Special Edit Commands

Special Edit Commands include several features that enhance your caption editing, including but not limited to conducting special searches and scans; and changing number, punctuation and word formats.

### Fix Numbers

CATalyst BCS has two editing features that allow you to quickly change the format of numbers while working in the History Window: [Automatic Number Conversion](#) and [Number Conversion](#). Automatic Number Conversion converts numbers and words using specific formatting rules in the NumberConversion.ini file. Number Conversion converts numbers written as digits (1234), text (one thousand two hundred thirty-four), or a combination of digits and text (12 hundred) into selected text or numeric formats.

### Automatic Number Conversion

Automatic Number Conversion converts numbers and words in the History window using specific formatting rules in the [NumberConversion.ini](#) file. The formatting rules are based on word and number combinations. You can also use the [Automatic Number Conversion](#) translate option to automatically convert numbers and words using the NumberConversion.ini file during captioning. Since Automatic Number Conversion uses number formats in the NumberConversion.ini Automatic Number Conversion does not use Number Conversion or Number Trigger dictionary entries. The CATalyst BCS NumberConversion.ini file is located in the Captioning case of the System Files case.

#### Apply Automatic Number Conversion

1. In the History window, position the cursor immediately before or within the number and words you want to change.
2. Press **Alt + s, u, v (Special Edit/Fix Numbers/Automatic Number Conversion)**.

## Number Conversion

Number Conversion converts numbers written as digits (1234), text (one thousand two hundred thirty-four), or a combination of digits and text (12 hundred) into selected text or numeric formats. Some formats must have a specific number of digits in order for that number conversion to display in the Number Conversion dialog box. For example, there must be nine numbers to convert to a Social Security number.

CATalyst BCS comes with a default list of number conversion formats, such as ordinal, Roman numerals and time. You can [customize](#) the list by modifying entries in the Number Conversion section of the UserSettings file.

You can also create dictionary entries with number conversion formats to convert numbers during captioning.

## Convert a Number in the History Window

1. Select the digits or text for conversion. Do **one** of the following:
  - If the numbers are digits and contiguous (1234), place the cursor immediately before the number and press **Ctrl + u (Special Edit/Fix Numbers/Number Conversion)**.
  - If the numbers are digits, separated by a space (1234 67), to include all the numbers in the conversion, use a Mark command to highlight all the numbers and press **Ctrl + u (Special Edit/Fix Numbers/Number Conversion)**.
  - If the number appears as text or is part digits and text, use a Mark command to highlight all the text or digits and text and press **Ctrl + u (Special Edit/Fix Numbers/Number Conversion)**.
2. The Number Conversion dialog box displays. Highlight a number format. The actual number you are formatting displays in the Formatted Text field.
3. Do one of the following:

### Search and Replace

The Number Conversion dialog box closes and the [Search and Replace](#) dialog box displays allowing you to search the job for the highlighted number and replace it with the selected number format. When the Search and Replace is finished, the Search and Replace dialog box closes.

### E-Define

E-Define the highlight number using the selected number format. CATalyst BCS applies the E-Define and closes the Number Conversion dialog box.

### Enter

Press **Enter** to apply the formatting only to this occurrence.

## Number Conversion - Customize List

The [Number Conversion](#) feature in the History window uses a default list of number formats to convert numbers written as digits (1234), text (one thousand two hundred thirty-four), or a combination of digits and text (12 hundred) into selected text or numeric formats. You may have a special number format based on your type of work or work area that is not available in the default list. You can customize the list to meet your needs by modifying the entries.

An entry in the number conversion list consists of two lines: Format and FormatDesc. Located in the UserSettings file, the number conversion list displays all Format lines together and all FormatDesc lines together. The Format line includes a numeric identifier, such as "Format1," along with the actual number conversion format, such as "NNN NN NNNN." The FormatDesc line includes a numeric identifier, such as "FormatDesc1," followed by a user defined description. For example, the default entry for a social security number is:

Format1 NNN-NN-NNNN

FormatDesc1 Social security number

The number included with the words, Format and FormatDesc, is unique for each entry. The Format and FormatDesc numbers must match, such as Format1 and FormatDesc1, Format2 and FormatDesc2, etc.

## Modify the Number Conversion List

The conversion format for the Number Conversion feature uses the same [formats](#) and [guidelines](#) as Number Conversion and Number Trigger dictionary definitions. This includes the use of N, n, X, x, 0, \_, and \. The Number Conversion dialog box in Edit displays number conversion commands in alphabetical order.

To modify a Number Conversion format:

1. Be sure you are in your User name.
2. From Manage Jobs, open the **System Files** case.
3. Double click the **UserSettings.sgxml** file. The Settings Manager dialog box displays.
4. Click in the dialog box and press **Ctrl + f**. The Find dialog box displays.
5. Type **Format-1** and press **Enter** to move to the *Number-Conversion* section.
6. In the *Format* list, highlight a Format to modify and click **Edit**.
7. Type your changes using the number conversion [formats](#) and [guidelines](#) and click **OK**.
8. In the *FormatDesc* list, locate the description that contains the same number as the modified *Format* line and click **Edit**. For example, if you modified the Format12 line, locate FormatDesc12.
9. Type a new description and click **OK**.
10. Press **Alt + s (Save)** to save the settings and close the dialog box.
11. Test the new number conversion format.

## Fix Punctuation

CATalyst BCS contains several features that assist you in applying punctuation while editing in the History Window. They include:

- [Cycle Possession](#)
- [Smart Punctuation](#)
- [Smart Remove Punctuation](#)
- [Stitch](#)
- [Surround Text with Punctuation](#)
- [Toggle Punctuation](#)

## Cycle Possession

Cycle Possession allows you to cycle through a choice of possessive apostrophes. When you place your cursor on a word ending with an "s" and select Cycle Possession, you can cycle through a choice of plural possessive apostrophe, no apostrophe and single possessive apostrophe and then back to plural possessive. For example, the word "friends" displays in the transcript. Using Cycle Possession, the cycle choices would be friends', friends and friend's. Invoking the command on a singular word first makes the word plural and then cycles through the possessives. For example, "dog" becomes dogs', dogs, dog's.

In rare circumstances, Cycle Possession may not produce a desired result. For example, using Cycle Possession with the word bus, you get " bus' " and then you get "bu" because "bu" is in one of the CATalyst BCS wordlists. In this situation, you can add "bu" as an exclude to your Personal wordlist and Cycle Possession no longer offers the word. In another example, using Cycle Possession with the word "knife" results in "knifes." Knifes is considered a correct spelling but you want the word "knives." Add the word "knives" as an exclude to your Personal wordlist and Cycle Possession offers "knives."

## Use Cycle Possession

1. Place the cursor immediately before or on the word.
2. Press **Ctrl + ' (Special Edit/Fix Punctuation/Cycle Possession)** until you have selected the possessive option you want to use.

[Keyboard Map](#) Function: Cycle Possession

## Smart Punctuation

Smart Punctuation is a feature designed to help reduce steps when typing and removing certain punctuation. When you press the selected keyboard command, CATalyst BCS inserts the punctuation, preset spacing, and when appropriate, capitalizes the next word. CATalyst BCS inserts only the amount of spaces needed for the selected punctuation. For example, the default Smart Punctuation setting for a period inserts two spaces after the period. You place your cursor at the end of a word or the beginning of the next word (one space already exists between the two words) and press period. Since one space already exists, CATalyst BCS inserts the period immediately following the word (before the cursor if you cursor was immediately following a word or at the end of the previous word if your cursor was on the beginning of the next word), inserts one additional space to meet the default setting of two spaces and capitalizes the next word. When you remove punctuation, CATalyst BCS removes the punctuation, spacing and when appropriate, uncaps the next word.

Smart punctuation also replaces existing punctuation. For example, if you have the text "He was there. I know he was there." If you position your cursor either immediately after the period or immediately before "I" and you press a comma, CATalyst BCS will remove the period, replace it with the comma and remove the extra space that was following the period. In this example, it does nothing to the "I" because is capitalized and should not be lower cased. "He was there, I know he was there."

CATalyst BCS applies Smart Punctuation when you use the [Toggle Punctuation](#) feature or type punctuation, provided a space occurs before or after the point of insertion. Smart Punctuation does not apply during translation where punctuation is determined by the dictionary definition or when you type text and include punctuation, such as [www.stenograph.com](http://www.stenograph.com).

Smart Punctuation spacing is determined by the Spaces After settings in the UserSettings file. You can customize the automatic spacing by changing the settings. For example, to have one space after a period when you press the period key in the History window, change the default setting for the Spaces After Period option from two spaces to one.

The Case CATalyst Default keyboard map contains default key assignments for the Smart Punctuation commands. You can change these key assignments.

## Smart Punctuation Commands and Default Keyboard Assignments

### Colon

Attaches a colon (:) to the end of the previous word, adds two spaces, and caps the next word.

Default Key Assignment: Shift + :

### Comma

Attaches a comma (,) to the end of the previous word and adds a space.

Default Key Assignment: ,

### Exclamation

Attaches an exclamation mark (!) to the end of the previous word, adds two spaces, and caps the next word.

Default Key Assignment: Shift + 1

### Period

Attaches a period (.) to the end of the previous word, adds two spaces, and caps the next word.

Default Key Assignment: .

### Question

Attaches a question mark (?) to the end of the previous word, adds two spaces, and caps the next word.

Default Key Assignment: Shift + /

### Remove Punctuation

Removes the punctuation at the end of the previous word, removes a space, and uncaps the next word. This feature works for colon, period, exclamation mark, question mark, and semi-colon.

Default Key Assignment: None.

### Surround with Dashes

Surround with Dashes automatically inserts dashes (–) with spaces before and after each dash around the current word or marked words.

Default Key Assignment: Ctrl + =

### Semi-colon

Attaches a semi-colon (;) to the end of the previous word and adds a space.

Default Key Assignment: ;

## Customize Smart Punctuation Spacing

1. Be sure you are in your User name.
2. From Manage Jobs, open the **System Files** case.
3. Double click the **UserSettings.sgxml** file. The Settings Manager dialog box displays.
4. Click in the dialog box and press **Ctrl + f**. The Find dialog box displays.
5. Type **Spaces-After** and press **Enter**. Case CATalyst locates the *Spaces-After* section.
6. In the *Spaces-After* section, click **Edit** on the desired option.
7. Type the desired number of spaces, **0 - 5**, in the field and click **OK**. To restore the default setting, click **Default**. Use the Spaces After Options table below to review the available settings, their defaults and a brief description of their function.
8. Press **Alt + s (Save)** to save the setting and close the dialog box.

### Spaces After Options - Defaults

Spaces After Option	Default	Function
Reporters Dash	2	Sets the number of dashes (--) that are inserted when using the Reporter's Dash or Toggle Punctuation command. This setting does <u>not</u> affect the Interrupted Q/A/C command.
Spaces After Colon	2	Sets the number of spaces that follow the punctuation when a colon (:) is typed.
Spaces After Comma	1	Sets the number of spaces that follow the punctuation when a comma (,) is typed.
Spaces After Dash	1	Sets the number of spaces that follow the punctuation when inserting a dash using the Reporter's Dash or Toggle Punctuation command. This setting does <u>not</u> affect the Interrupted Q/A/C command.
Spaces After Exclamation	2	Sets the number of spaces that follow the punctuation when an exclamation mark (!) is typed.
Spaces After Period	2	Sets the number of spaces that follow the punctuation when a period (.) is typed.
Spaces After Question	2	Sets the number of spaces that follow the punctuation when a question mark(?) is typed.
Spaces After Semicolon	1	Sets the number of spaces that follow the punctuation when a semicolon (;) is typed.
Spaces Before Dash	1	Sets the number of spaces that precede the punctuation when inserting a dash using the Reporter's Dash or Toggle Punctuation command.

This setting does not affect the Interrupted Q/A/C command.

## Smart Remove Punctuation

Smart Remove Punctuation removes unnecessary punctuation and extra spaces. For example, you have the following: "Don't go down that road. Today." If your cursor is immediately before the T in "Today", when you invoke the Smart Remove Punctuation command, CATalyst BCS removes the period and the extra space.

Smart Remove Punctuation is a keyboard command feature. You must select a keyboard combination to use the feature, adding it to the desired [keyboard map](#).

## Add Smart Remove Punctuation to the Active Edit Keyboard Map

1. Double click the keyboard name in the Status bar at the bottom of the screen.
2. Press **Ctrl + i (Edit/Insert)**. The Assign Key to Function dialog box displays.
3. Click any function in the Functions list and press **Ctrl + f**. The Find dialog box displays.
4. Type **Smart Remove Punctuation**, select a direction and press **Enter (OK)**. CATalyst BCS highlights the feature.
5. In the Key field, select a key for assignment from the drop down list and then click the radio button next to **one** of the following: **Key Only**, **Ctrl + Key**, **Shift + Key**, **Ctrl + Shift + Key**. When a function is currently assigned to the selected key combination, it displays in the Currently Assigned to field. If no function is assigned, the field is blank.

When selecting a single key for assignment, consider instead, assigning Shift plus the key to prevent the possibility of invoking the capped version of the keyboard command when the Caps Lock is on.

6. Press **Enter (Assign)**. The entry displays in the Keyboard Map list.

If you select a key combination currently assigned to another function, the following message displays: "The Key: *nameofkey* is already assigned to the Function: *nameoffunction*. Do you want to replace it?" Choose **Yes** to replace the existing assignment with the new function. Choose **No** to retain the existing assignment.

7. Press **Esc (Close)** to exit the Assign Key to Function dialog box.
8. Press **Ctrl + s (File/Save)** to save the change to the keyboard map.
9. Press **Ctrl + F4**, to close the keyboard map.

[Keyboard Map](#) Function: Smart Remove Punctuation

## Stitch

Stitch cycles through options to define the character or separator between letters of a word or between words. The default characters and cycle order is hyphen, space and period. You can customize the character selection and the cycle order and select how the space is handled for the Stitch command. The default setup does the following:

- Inserts a hyphen, space, or period between the letters of one word.
- Insert a hyphen, space or period between two or more words.
- Inserts hyphens, or periods between the letters of two or more words.

**To use the Stitch command:**

1. Do **one** of the following:
  - Place the cursor in front of the word or on the word you want to Stitch.
  - Mark the words you want to Stitch.
2. Press **Ctrl + - (hyphen) (Special Edit/Fix Punctuation/Stitch)** to cycle through the selection.

[Keyboard Map](#) Function: Stitch

## Customize Stitch Characters

Customize the character selection for the Stitch command. To modify the list:

1. From Manage Jobs, press **Alt + t, o, e, a (Tools/Options/Edit/Advanced Edit)**. The Advanced Edit Options dialog box displays.
2. Click **Stitch characters in cycle order** option and type the desired characters in the desired cycle order.
3. To change how spaces are handled, click the **Stitch Spaces** and select the appropriate option. The Stitch Spaces option allows you to select how a "space" is handled if a "space" is part of your Stitch characters in cycle order options. The available options apply to the "space" in your cycle order of the stitch command. Three options on handling a space are available.
4. To include a Delete Space format symbol at the end of the stitch cycle, click the **Include Delete Space**.  
If this option is set to Yes, then the very last cycle of the Stitch command will insert a <Delete Space> format symbol between the characters/words. For example, during the testimony the witness refers to WITC and it translates as W I T C. During editing you highlight W I T C and if a <Delete Space> was at the end of the stitch cycle, then the result would be WITC and Reveal Codes would show W<Delete Space>I<Delete Space>T<Delete Space>C.  
The default setting for this option is No.
5. Press **Enter (OK)** close the Advanced Edit Options dialog box and save the changes.

## Surround Text with Punctuation

Surrounding text with punctuation is a feature designed to help reduce steps when typing and adding certain punctuation. When you highlight text and then press the designated keyboard command, Case CATalyst inserts the punctuation before and after the highlighted text. You can surround a word or phrase with single quotes, double quotes, commas and parentheses. For single quotes, double quotes and parentheses, Case CATalyst inserts the punctuation immediately in front of the highlighted text and immediately following the highlighted text. When inserting commas, Case CATalyst inserts a comma following the word preceding the highlighted text and following the last word of the highlight text.

You can also highlight the same text that includes the surrounding punctuation, press the matching opening punctuation and the surrounding punctuation is removed. Using the example, "so he said" which is surrounded by quotes, you can highlight "so he said" and press the keys assigned to " (quote) and the quotes are removed resulting in *so he said*.

If there is multiple surrounding punctuation around the highlighted text, for example, ("so he said"), in order to remove only the surrounding quotes, you would need to highlight just the text surrounded by the quotes or the quotes and the text and then press the keys assigned to " (quote). Using the same example, if you wanted to remove both sets of opening and closing punctuation, you could highlight all the punctuation and text and press the keys assigned to ( (open parenthesis) to remove the parentheses and then the keys assigned to " (quote) to remove the quotes.

## Surround Text with Selected Punctuation

1. Highlight the desired word or phrase.
2. Press one of the following default keyboard commands:

'	Single Quote
"	Double Quote
( or )	Left or Right Parenthesis
,	Comma

## Surrounding Punctuation that can be Toggled

'	Single Quote
"	Double Quote
(	Left or Right Parenthesis

## Toggle Punctuation

Toggle Punctuation allows you to cycle through several common punctuation symbols on the same line or paragraph without moving the cursor to the actual punctuation. Using three different keyboard commands, you can change punctuation on the same line as the cursor and at the end of the current paragraph.

[Smart Punctuation](#) applies when you use the Toggle Punctuation command. CATalyst BCS automatically inserts the punctuation, adjusts the spacing and when appropriate, initial caps or changes to lower case the first letter of the next word. You can change the number of spaces CATalyst BCS automatically inserts after the punctuation by [changing the settings](#) in the UserSettings.sgxml file.

Toggle Punctuation contains the following punctuation:

- Period (.)
- Question Mark (?)
- Comma (,)
- Reporter's Dashes (--)
- No Punctuation (removes punctuation)

When you select No Punctuation, you can still cycle to one of the other options, in the same punctuation location, as long as you do not move the cursor. Once you move the cursor, you cannot go back and use the Punctuation command.

- Colon (:)
- Semicolon (;)
- Exclamation Point (!)

### Toggle Punctuation Commands

#### Ctrl + , (comma)

Hold **Ctrl** and press , (**comma**) to change the first punctuation occurrence following the cursor, which occurs on the same line as the cursor. Keyboard map function assignment is Toggle All Punctuation.

#### Ctrl + . (period)

Hold **Ctrl** and press . (**period**) to change the last ending punctuation on the same line as the cursor. This command toggles period, question mark, exclamation mark, dashes, and no punctuation. Keyboard map function assignment is Toggle Sentence Ending Punctuation.

#### Ctrl + Shift + . (period)

Hold **Ctrl** and **Shift** and press . (**period**) to change the ending punctuation of the paragraph in which the cursor is located. This command toggles period, question mark, exclamation mark, dashes, and no punctuation. Keyboard map function assignment is Toggle Paragraph Ending Punctuation.

### Fix Words

CATalyst BCS contains several features that assist you in editing words in the History Window. They include:

- [Cap/Uncap](#)
- [Word Swap](#)
- [Restore Steno](#)
- [QuickFix Prefix](#)
- [QuickFix Suffix](#)
- [Remove Suffix](#)
- [Split Compound Word](#)
- [Cycle Contraction](#)
- [Cycle Homophones](#)
- [Cycle Possession](#)

## Cap/Uncap

The Cap/Uncap command cycles through three options to capitalize and lower case the letters, words or phrases in the History window and the text field of D-define, J-define, E-define, Insert, and Replace dialog boxes. The options include:

- Capitalize the first letter in a word or phrase.
- Capitalize all the letters in a word or phrase.
- Uncap the letters in a word or phrase.

When capping stitched words, the command affects each letter. For example *W o r d s*, *W O R D S*, and *w o r d s*. This command does not uncap a letter if an embedded command controls the capitalization of that letter.

The Cap/Uncap command does not initial cap articles or conjunctions, specified in the "Words to suppress capping when found in the middle of phrase" list, when they appear between a series of words such as United States of America or State of the Union. It does continue to initial cap the word when the article or conjunction occurs at the beginning of a phrase such as The Main Store. You can modify the list.

To use the Cap/Uncap command:

1. Place the cursor immediately before the word, on the word, or mark the block of text you want to cap or uncap.
2. Press **Ctrl +F5 (Special Edit, Fix Words, Cap/Uncap)** until you have the desired capitalization option.

[Keyboard Map](#) Function: Cap/Uncap

## Modify the Uncap Word List

CATalyst BCS comes with a default list of articles and conjunctions that are not capitalized when they occur between a series of words such as United States of America or State of the Union. When the article or conjunction occurs at the beginning of a phrase, CATalyst BCS capitalizes the word. For example, "The Main Store."

To modify the list:

1. From Manage Jobs, press **Alt + t, o, e, a (Tools/Options/Edit/Advanced Edit)**. The Advanced Edit Options dialog box displays.
2. Click **Words to suppress capping when found in middle of phrase**.
3. Click the  button to display the Capitalization dialog box which contains the list of words to not capitalize. To add a word to the list, click the  button and type the entry in the field that displays. To remove a word from the list, highlight the word and click the  button. Press **Enter (OK)** when finished to save the changes.
4. Press **Enter (OK)** close the Advanced Edit Options dialog box and save the changes.

## Word Swap

Word Swap reverses the position of two words. For example, in the sentence, " She would doing start the dishes." the word "doing" and "start" are reversed. Using Word Swap, you can switch the position of the words so that the sentence reads, "She would start doing the dishes."

If the words have associated steno, the steno outlines are not swapped. You cannot use the Word Swap command on untranslated steno.

To use Word Swap, place the cursor before or on the first of the two words you want to swap and press **Ctrl + w (Special Edit/Fix Words/Word Swap)**.

## Restore Steno

Restore Steno converts the selected text back to steno for possible redefining.

To restore the steno outline for text:

1. Do **one** of the following:
  - Place the cursor in front of or on the word for the steno you want to restore.
  - Mark the words for the steno you want to restore.
2. Press **Ctrl + F2 (Special Edit/Fix Words/Restore Steno)**.

## QuickFix Prefix

QuickFix Prefix attaches a suffix to a word using the [EZ Link](#) rules of spelling. QuickFix Prefix also uses the [Prefixsuffixrules.ini](#) file when the Prefixsuffixrules.ini file is located in your System Files case. CATalyst BCS attaches a prefix you select from the list of prefixes and attempts to correctly spell the combined word, first checking the Spell Check wordlist for a match. If no match exists then CATalyst BCS attaches the combined root word and suffix without any spelling changes.

The QuickFix Suffix table contains entries that determine the suffix list in the QuickFix Prefix dialog box. You can [change](#) the default entries in the list.

## Attach a Prefix

1. Place your cursor immediately before, after or on the word to which you want to add a prefix.
2. Place your cursor immediately before or on the word to which you want to add a prefix.
3. Press **Alt + s, w, x (Special Edit/Fix Words/QuickFix Prefix)**. The QuickFix dialog box displays.
4. Review the fields and options:

### Results

The root word selected for QuickFix. Once a prefix is selected, the result of the root word combined with the prefix displays.

### Window

The list of prefixes with a letter assignment for each prefix. To switch the list, click the radio button next to **Suffix**.

### Options

Display the Prefixes dialog box. The entries in this table display in the selection list for QuickFix Prefix. Make changes as necessary and then press **Enter (OK)**.

5. Make your prefix selection from the list by pressing the associated letter or highlighting the entry and pressing **Enter (OK)**.

## QuickFix Suffix

QuickFix Suffix attaches a suffix to a word using the [EZ Link](#) rules of spelling. QuickFix Suffix also uses the [Prefixsuffixrules.ini](#) file when the Prefixsuffixrules.ini file is located in your System Files case. CATalyst BCS attaches a suffix you select from the list of suffixes and attempts to correctly spell the combined word, first checking the Spell Check wordlist for a match. If no match exists then CATalyst BCS attaches the combined root word and suffix without any spelling changes.

The QuickFix Suffix table contains entries that determine the suffix list in the QuickFix Suffix dialog box. You can [change](#) the default entries in the list.

## Attach a Suffix

1. Place your cursor immediately before, after or on the word to which you want to add a suffix.
2. Press **Alt + s, w, q (Special Edit/Fix Words/QuickFix Suffix)**. The QuickFix dialog box displays. Or assign a key combination to QuickFix Suffix in a keyboard map and press that key combination.
3. Review the fields and options:

### Results

The root word selected for QuickFix. Once a suffix is selected, the result of the root word combined with the suffix displays.

### Window

The list of suffixes with a letter assignment for each suffix. To switch the list, click the radio button next to **Prefix**.

### Options

Display the Suffixes dialog box. The entries in this table display in the selection list for QuickFix Suffix. Make changes as necessary and then press **Enter (OK)**.

- a. Do any of the following:
  - a. To add a suffix from the list, press the associated letter or highlight the entry and press **Enter (OK)**.
  - b. To remove an existing suffix from the word, press **Alt + r**. Repeat if necessary. To then add a suffix from the list, press the associated letter or highlight the entry and press **Enter (OK)**.

## Remove Suffix

The Remove Suffix command is available from the Special Edit, Fix Words submenu working in the History file or caption file. The Remove Suffix uses the entries in the [PrefixSuffixRules](#).ini file to determine the shortest suffix to remove first. For example, the word *wanderings* is in the transcript. You position your cursor before *wanderings* and select Remove Suffix and the suffix "s" is removed to show the word *wandering*. If you use the Remove Suffix command again, the suffix "ing" is removed to show the word *wander*. If you used the Remove Suffix command again, the suffix "er" is removed to show the word *wand*. The PrefixSuffixRules.ini file contains prefix and suffix entries along with the rules as to how to attach the prefix or suffix. The Remove Suffix command uses these entries and rules to determine the suffix and how to remove it. In the example above, there is an entry for suffix 's' in the PrefixSuffixRules file and that is the shortest suffix to remove. Once that suffix is removed, there is an entry in the PrefixSuffixRules file for suffix 'ing', so that is the next suffix to remove. Finally, there is an entry for suffix 'er' so when the command is used again, the suffix 'er' is removed from the word 'wander' to form 'wand.'

The Remove Suffix command also spell checks the word to make sure it is a valid word once the suffix is removed. Let's say you have the word *coming* in the transcript and you use the Remove Suffix command. Depending on your PrefixSuffixRules entries, the result might be *com*. Spell Check recognizes 'com' as a word. You could open your [Personal Wordlist](#) and insert *com* and select the Exclude feature and the next time you remove the suffix from the word 'coming', it will result in 'come.'

### To remove a suffix

1. Position your cursor immediately before the word with the suffix. You can also highlight the word but it is not necessary.
2. Press **Alt + s, w, r** (Special Edit, Fix Words, Remove Suffix).  
If necessary to remove more than one suffix, repeat the command again.

Keyboard Map Function: Remove Suffix

## Split Compound Word

Split Compound Word splits compound words according to specific parameters. When the word to be split has a Suggest or Auto Replace entry in a spelling Wordlist, the word from the Wordlist entry is used. If the word to be split is not in a Wordlist, it is split only if there is just one possible way to split the word according to Spell Check. For example, if you position your cursor before "greenhouse" and use the Split Compound Word command, the result is "green house." If you cannot split a word, it is possible that it can be split multiple ways.

If the compound word has multiple split suggestions, repeat the Split Compound Word command to cycle through the choices. You can use the Spelling Lookup, with the Suggest Split Words option active, to check for multiple ways to split the word. It is not necessary for the Suggest Split Words option to be active to use Split Compound Word.

Use the Set Compound Word Priority if you want to change the priority order when multiple suggestions are offered or the Exclude Compound Word Pair to prevent a word from displaying as a suggestion. The entries for these commands are stored in the Compound Words Wordlist.

To split a compound word:

1. Position the cursor before the word to split.

2. Press **Alt + s, w, s** (**Special Edit/Fix Word/Split Compound Word**). If the word has multiple split options, you can invoke the Split Compound Word command again to cycle to the next suggestion.

[Keyboard Map](#) Function: Split Compound Word

## Compound Words Wordlist

The Compound Words Wordlist is used exclusively with the Split Compound Word command and contains entries identified with the Exclude Compound Word Pair or Set Compound Word Priority features. You can manually manage entries from the wordlist. The wordlist is stored in the System Files case.

To access the Compound Words Wordlist, Press **Alt + f, o, w, w** (**File, Open, Wordlist, Compound Words**).

## Exclude Compound Word Pair

The Exclude Compound Word Pair command (**Alt + s, w, l**) allows you to exclude a word pair suggestion when using the Split Compound Word feature. For example, you position the cursor immediately before the word “notice” and invoke the Split Compound Word command. The first split suggestion is “no tice” and the next suggestion is “not ice.” You do not want “no tice” to ever be a suggestion. With the “no tice” suggestion displayed, you invoke the Exclude Compound Word Pair command. CATalyst BCS places the suggestion, “no tice” in the Compound Words Wordlist with Action set to “Exclude” and does not display it again as a compound word split suggestion for “notice.” You can access the Compound Words Wordlist to manually manage the entries.

Repeat the Split Compound Word command to cycle through multiple split word suggestions for a compound word. The Set Compound Word Priority feature allows you to change the priority order in which the suggestions are offered. You may want to use this feature to always suggest your most commonly used choice.

## Set Compound Word Priority

The Set Compound Word Priority feature (**Alt + s, w, p**) allows you to set a suggested word as your first choice when multiple Split Compound Word suggestions are available. You may want to use this feature to always display your most commonly used choice first. For example, you position the cursor immediately before the word “notice” and invoke the Split Compound Word command. The first split suggestion is “no tice” and the next suggestion is “not ice.” You want “not ice” to be the first suggestion. With the “not ice” suggestion displayed, you invoke the Set Compound Word Priority command. CATalyst BCS places the suggestion, “not ice” in the Compound Words Wordlist with the Action set to “Suggest” and displays it as the first suggestion for “notice.” You can access the Compound Words Wordlist to manually manage the entries.

Repeat the Split Compound Word command to cycle through multiple split word suggestions for a compound word. The Exclude Compound Word Pair feature allows you to exclude a word pair from suggestion.

## Cycle Contraction

The Cycle Contraction command allows you to change contractions to whole words or whole words to contractions. For example, you have "She'll" in the transcript. Using Cycle Contraction, you cycle through "She will," "She shall," and back to "She'll."

The Cycle Contraction command is only available when the cursor is positioned on a contraction or words that can be converted to a contraction. Words available for Cycle Contraction are determined by the [Contraction Rules](#).

## Use Cycle Contraction

1. Position the cursor before the word for which you want to cycle through contractions.
2. Press **Alt + s, w, y** (**Special Edit/Fix Words/Cycle Contraction**).

[Keyboard Map](#) Function: Cycle Contraction

## Cycle Homophones

Cycle Homophones cycles through a list of homophones. Homophones are two or more words that are pronounced the same but differ in spelling or meaning or both. For example, bare and bear. The list of homophones used by the Cycle Homophones feature is a text file accessible for modification.

Some captioners and/or editors may put common complicated mistranslates in the Homophones file as a quick and easy way to cycle between the words. For example, let's say the captioner occasionally misstrokes the word "commission" when wanting "communications". The captioner might put the word "commission" in the Homophones file with the word "communication" as a homophone and then put the word "communication" in the Homophone file with the word "commission" as a homophone. This allows the captioner to quickly switch to the correct word. Homophones are case sensitive and the Cycle Homophones command works in the following ways:

- If the transcript contains an upper case version of a word but your Homophone list only contains a lower case version of the word (to start a list), the Cycle Homophones command will cycle the word and cycle back to the original case of the word. For example, if THERE is the word being cycled, Cycle Homophones will cycle through THEIR, THEY'RE and then back to THERE.
- If you have both an upper and lower case version of a word (to start a list) in the Homophone list, the Cycle Homophones command will cycle based on the right case of the word. For example, if "All-In-One" is the phrase being cycled and your Homophones list contains All-In-One and all-in-one in the list, the Cycle Homophones will cycle through all-in-one and All-In-One.
- The Cycle Homophones command cycles the case shown in the Homophone list for all other scenarios.

The list of homophones used by the Cycle Homophones feature is a text file accessible for modification. The default Homophones.txt file located in the System Files case. In addition homophones, you may want to add acronyms and their names to the list, such as FBI and Federal Bureau of Investigation, which allows you to toggle between the two. Since many users use the Homophones feature as an editing aid beyond just homophones, the Homophones menu item is available on the View menu for easy [modifying of the Homophones](#) file. and added View/Edit Homophones to the Keyboard Map function list. Both commands will open the Homophones Editor dialog box where you can easily add new homophones and/or edit/delete existing homophones.

When you start CATalyst BCS, the homophone file for the selected user is loaded and is used throughout the current CATalyst BCS session. Changes made to the homophone file during the captioning session are immediately available.

[Keyboard Map](#) Function: Cycle Homophones

View/Edit Homophones

## Use Cycle Homophones

1. Position the cursor before the word for which you want to cycle through homophones.
2. Press **Alt + s, w, h (Special Edit/Fix Words/Cycle Homophones)**. If nothing happens, it means there isn't an entry in the Homophones list that matches the text. To add and/or edit the Homophones file, do one of the following:
  - a. Press **Alt + v, h (View, Homophones)**.
  - b. Press **Alt + t, p (Tools, View/Edit Homophones)**.
3. Repeat as necessary to cycle through the available homophones.

## Mark

Use Mark Start and Mark End to highlight large blocks of steno outlines and text at one time. When using the Mark Start feature with certain commands, such as Copy, Cut or Delete, CATalyst BCS assumes the Mark End at the end of the marking.

## Mark Steno and Text

1. Position the cursor on or immediately before the steno or text and press **Alt + s, m, m (Special Edit/Mark/Mark Start)**.
2. Move your cursor to highlight the desired steno and text or use the Search feature to locate the end of the text you want to highlight.
3. Perform any other necessary command. CATalyst BCS automatically unmarks the text when using Cut, Copy or Past commands.

## UnMark

Use the Unmark feature in Edit to unmark the highlighted text. Press, **Alt + m, k (Special Edit/Mark/Unmark)**. Alternatively, you can click anywhere on the screen to unmark the text.

## Resolve All Chosen Conflicts

Resolve All Chosen Conflicts confirms all [EZ Choice](#) and [Auto-Conflict](#) resolved conflicts in the current History text. When you final resolve an EZ Choice or Auto-Conflict resolved conflict, CATalyst BCS changes the text from the conflict color to text color. CATalyst BCS also adds the EZ Choice confirmed selection to the usage count in the conflict database.

When exporting to RTF/CRE, unconfirmed EZ Choice and Auto-Conflict resolved conflicts export in the original conflict form. Once you confirm EZ Choice and Auto-conflict resolved conflicts, CATalyst BCS exports the selection as normal text.

You can also confirm each EZ Choice and Auto-conflict resolved conflict individually by scanning to it and pressing Enter or selecting another conflict choice.

To confirm all EZ Choice and Auto-conflict resolved conflicts:

1. From the Special Edit menu, select **Resolve All Chosen Conflicts**.

Depending on your [Warning](#) option selection, the following warning message may display: *Are you sure you want to final resolve all EZ Choice conflicts and AutoChosen conflicts?* displays. Press **Enter (Yes)** to continue.

You can select to not display this message by checking the box; *I understand the consequences of my actions. Please stop asking*. You can reselect to display the warning at any time in Tools/Options/Warnings.

2. The Resolving Conflicts dialog box displays the progress of the final resolve (confirmation) process.

If you press Cancel during the confirmation process, a warning message displays: *Action Aborted: xxx conflicts were finalized. Use undo if you want to change them back*. Press **Enter (OK)** to close the dialog box.

## Scan

Scan (F8) moves the cursor to the next untranslate, conflict, scan stop, or more depending on your [Scan For Options](#) settings.

To scan, press **F8 (Special Edit/Scan)**.

## Scan Backwards

Scan Backwards (Shift + F8) moves the cursor backward to the next untranslate, conflict, scan stop, or more depending on your [Scan For Options](#) settings.

To scan backward, press **Shift + F8 (Special Edit/Scan Backwards)**.

## Scan For

The Scan For feature allows you to quickly select a single specific item to scan forward for in the transcript. Available Scan For items display in a submenu when you select the Scan For feature.

To scan forward for multiple items at once, use the [Scan](#) feature. Your [Scan For options](#) determine which items CATalyst BCS locates when using Scan.

- To use Scan For, press **Alt + s, c (Special Edit/Scan For)** and select an item from the submenu. To continue to scan for the same item, press **Alt + s, c (Special Edit/Scan For)** and select the item again. Assign a key combination to the specific Scan For item to quickly scan to it.
- To search backward for a specific item, use Scan Backward For. Press **Alt + s, k (Special Edit/Scan Backward For)** and select an item from the submenu.

[Keyboard Map](#) Function: Available for each item on the Scan For submenu.

## Scan Backwards For

To scan backward for multiple items at once, use the [Scan Backward](#) feature. Your [Scan For options](#) determine which items Case CATalyst locates when using Scan Backward.

- To use Scan Backward For, press **Alt + s, k (Special Edit/Scan Backward For)** and select an item from the submenu. To continue to scan backward for the same item, press **Alt + s, k (Special Edit/Scan Backward For)** and select the item again. Assign a key combination to the specific Scan Backward For item to quickly scan to it.
- To search forward for a specific item, use Scan For. Press **Alt + s, c (Special Edit/Scan For)** and select an item from the submenu.

[Keyboard Map](#) Function: Available for each item on the Scan For submenu.

## Special Search

Special Search commands allow you to quickly find specific items within the transcript. They include searching for the next or previous:

- [Hidden text.](#)
- [Punctuation.](#)
- [Ending punctuation for a sentence.](#)
- [Paragraphs.](#)
- [Search results.](#)

## Search Next/Previous Hidden Text

Search Next Hidden Text and Search Previous Hidden Text search the file for [hidden text](#) or comments.

- To search forward in the file for the next hidden text, press **Alt + s, p, h (Special Edit/Special Search/Search Next Hidden Text)**.
- To search backward in the file for hidden text, press **Alt + s, p, v (Special Edit/Special Search/Search Previous Hidden Text)**.

## Search Next/Previous Sentence Ending Punctuation\_2

Search Next Sentence Ending Punctuation and Search Previous Sentence Ending Punctuation that search the file for a period, question mark or dash.

- To search forward in the file for the next sentence ending punctuation, press **Alt + s, p, e (Special Edit/Special Search/Next Sentence Ending Punct)**.
- To search backward in the file for the previous sentence ending punctuation, press **Alt + s, p, n (Special Edit/Special Search/Search Prev Sentence Ending Punct)**.

## Search Next/Previous Punctuation

Search Next Punctuation and Search Previous Punctuation search the file for a period, question mark, comma, colon, semicolon, hyphen, single quotes, double quotes, open parenthesis, close parenthesis and apostrophe.

- To search forward in the file for the next punctuation, select **Special Edit/Special Search/Next Punct**).
- To search backward in the file for the previous punctuation, select **Special Edit/Special Search/Search Punct**).

## Search Next/Previous Paragraph

Search Next Paragraph and Search Previous Paragraph are Edit features that search the file for the next paragraph style. CATalyst BCS positions the cursor before the paragraph format symbol.

- To search forward in the file for the next paragraph style, select **Special Edit/Special Search/Search Next Paragraph**.
- To search backward in the file for the previous paragraph style, select **Special Edit/Special Search/Search Previous Paragraph**.

## Search Next/Previous Search Result

When you invoke a Search in the History window with the *List Search Results* option selected, CATalyst BCS searches and automatically displays the results in the Search Results dialog pane. The text content, page, line and section reference display for each occurrence of the searched item.

Search Next Search Result and Search Previous Search Result are features that search the job file for the next occurrence of the [Search](#) criteria entered when is used for the initial search. The search starts from the position of your cursor in the transcript.

You can view all the search results in the [Search Results](#) dialog pane. The the text content, page, line and section reference display for each occurrence.

- To search forward in the file for the next occurrence, select **Special Edit/Special Search/Search Next Search Result**).
- To search backward in the file for the next occurrence, select **Special Edit/Special Search/Search Previous Search Result**).

## CATalyst BCS View Commands

View commands provide access to several CATalyst BCS features that affect the screen display and ability to view certain captioning related information that includes, but is not limited to Briefs, Speakers, Reveal Codes, vertical notes, Global Table and a word definition.

### Full Screen

Full screen allow you to hide all the toolbars and the Function bar, except for the Full Screen toolbar, to provide more text space on the screen. When you switch between Normal and Full Screen, CATalyst BCS remembers the settings for each view.

You can customize the toolbars that display while in Full Screen view. To change the display, click the down arrow on the right side of the Full Screen toolbar. Click **Add or Remove Buttons** and then click **Customize**. In the Customize dialog box check the box next to the toolbar you want to display on the screen. Uncheck the box to hide the toolbar.

## Global Table

A Global Table contains definitions created using D-Define, K-Define, J-Define, E-Define, Personal Globals and Other Dictionary Define commands in the captioning session or editing a captioning file. Each captioning session has its own Global Table. When you make the first [global definition](#) for the captioning session/editing a caption file, CATalyst BCS creates a Global Table, if one does not already exist. The globals display, by default, by the most current global listed at the top of the list.

[Global Table Options](#) determine how certain global features are handled and allows you to customize Global Table display settings.

You can [manage the globals](#) in the Global Table for the captioning session/editing a caption file and you can apply, undo, modify, delete and print globals. Other features allow you to add globals from other Global Tables and to copy and paste globals from one Global Table to another.

Global Tables are available for use in BCS profiles along with dictionaries and are available for use in captioning sessions. Translating with a Global Table allows you to use previously created [E-Defines](#) in the selected Global Table along with any defines in the selected dictionaries. To use Global Tables in a captioning session, in the Profile Dictionary dialog box, select the [Global Tables](#) option to display global files for selection.

Access the Global Table:

- in CATalyst BCS. Whether you are in a captioning session or editing a caption file, you can press **Ctrl + y (Global/Global Table)**.
- in Manage Jobs. Press **Alt + f, o, i, t (File, Open, List/Table, Global Table)**. In the Open Existing Document dialog box, select a Global Table and press **Enter (Open)**.

Modifying a Global Table entry from Manage Jobs does not change globals already applied to the open job. To affect globals, it is necessary to modify the globals from within CATalyst BCS. Additionally, it is only possible to Undo a global from within CATalyst BCS.

## Understanding the Global Table

The following information displays in a Global Table. The most recent global displays at the top. Use the [Search](#) and [Filter](#) features to locate a specific entry or entries with specific criteria.

You can sort globals in the table by clicking a column heading. Continue to click the column heading until the triangle points up for ascending order or down for descending order. By default, the cursor moves to the top row in the sort order. To have the cursor remain at the current line location change the [Retain position after sort](#) Global Table option.

### Number

The number of the global. When you create globals, Case CATalyst sequentially assigns a number to each global. The Global Table opens with the entries listed in descending global number order, the most recent global first in the list.

### Type

The type of global define: D-Define, K-Define, J-Define, E-Define or a Personal Global. If you made an Other global, it will be listed as a J-define type of global.

### Steno

The steno portion of the global.

### Case Sensitive

Y or N displays in this column when the entry is an [E-Define](#) or a Personal Global. Y indicates you made the global case sensitive so that it replaces only text with the upper and lower case letters as they display in the definition.

### Old Text

The text, steno and format symbols, if applicable, the global replaces.

### New Text

The replacement text for the global.

### Selective

The global was marked as [Selective](#) when the steno or text was defined. If you use the [Add Other Globals](#) command to apply the global, Case CATalyst no longer considers the global Selective. A Selective global used during realtime does not apply to new realtime text.

The Global Table option, [Exclude Selective Global](#) determines if a selective global should be included when copying and pasting.

## Panes

Select CATalyst BCS features, such as Brief It and Session Information in the History Window, are accessible from a small self contained resizable window called a [dialog pane](#). Dialog panes, when selected to show, display in a default fixed position. You can easily reposition dialog panes to vertical, horizontal, floating or auto-hide (tabbed) locations on the CATalyst BCS screen.

You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to

move) of the pane, your cursor will change to a horizontal double arrow (  ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen.

### Vertical Notes

Vertical Notes displays the steno notes in paper tape format within the Vertical Notes dialog pane. The steno notes display in the Arial Monospaced font by default. You can change the font and font style using the [Vertical Notes Font](#) feature. By default, the Vertical Notes pane displays as a tab on the right side of the screen.

The vertical notes automatically scroll with the cursor movement on the screen and also allow for manual scrolling throughout the note file. You can edit the job, making dictionary definitions from vertical notes pane. Global definitions made from vertical notes apply throughout the job in the same manner as defining from the History window.

You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to

move) of the pane, your cursor will change to a horizontal double arrow (  ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen.

Steno outlines in the vertical notes that display in light gray can indicate the steno outline:

- was deleted using asterisk delete from the writer.
- was deleted using the Delete key on the computer keyboard.
- was written while power defining. These are not the initial strokes to invoke Power Define.
- is a number converted by a Number Conversion or Number Trigger.
- was written for an AccelerWriter.

To toggle the Vertical Notes display open and closed, press **Ctrl + n (View/Panes/Vertical Notes)**. A check mark indicates that Vertical Notes is active.

## Defining from Vertical Notes

You can create dictionary definitions from the Vertical Notes pane. Defines made from the vertical notes are placed in the selected dictionary and are available for future translation. Global definitions made from vertical notes apply throughout the job in the same manner as defining from the History window.

1. Highlight the desired steno strokes in the Vertical Notes pane.
2. Press one of the following and make necessary entries.
  - **Ctrl + d (D-Define)**. The Global – D-Define dialog box displays.
  - **Ctrl + k (K-Define)**. The Global – K-Define dialog box displays.
  - **Ctrl + j (J-Define)**. The Global – J-Define dialog box displays.
  - **Ctrl + Shift + o (O-Define)**. The Global – O-Define dialog box displays.

3. Make entries:

### Steno (Alt + s)

The steno for the text selected to global.

### Text (Alt + t)

Type the text for the definition, including necessary format symbols, fields or extended characters. Press **F9** to add [extended characters](#).

### FS (Alt + f)

Display the list of available [format symbols](#). Double click the format symbol to insert it at any point in the text portion of definition.

You can also use shortcut keys to insert a format symbol. Place the cursor in the New Text field, press **F4** and then press the appropriate letter or symbol.

### **Insert Field (Alt + i)**

This feature is most likely not applicable in CATalyst BCS. Display the [Insert Field](#) dialog box from which you can select a field to insert into the text portion of the definition.

### **Endings (Alt + n)**

When you type a word in the *New Text* field, Case CATalyst analyzes the word to determine if a " G", " S" or " D" steno outline could be added to the word. If so, then Case CATalyst activates the Endings button. The Global Endings dialog box displays when the Endings button is selected. You can choose any of the suggested definitions to add to your dictionary. For example, you have REPT in the Steno field and type "represent" in the Text field. The following suggested entries display when you select Endings:

REPTD = represented

REPTS = represents

The word "representing" is not suggested because the final "g" comes before the final "t" in the original steno outline.

### **Global Type (Alt + g)**

The type of define originally selected displays. To select a different type of global define, choose from the drop down box.

### **Pick Other Dictionary (Alt + p)**

This field is available if you select Other Dictionary in the Global Type field. You can send job dictionary defines to an alternative dictionary when making an O-Define. Select a current dictionary from the drop down list or use **Browse** to choose another dictionary. Depending on your [Global options](#) settings, CATalyst BCS remembers your selection for the current session or for every job. This field displays when you select Other Dictionary in the Global Type field.

### **Add to Xtra Global Table (Alt + x)**

Check this box to Case CATalyst send the global to its destination (based on the type of global) and to the Xtra Global Table. The Xtra Global Table is a feature that allows a definition to be sent to the destination (based on the type of global) and sent to the Xtra Global Table at the same time. This feature usually applies in a reporter/scopist editing situation.

### **Generate All Possible Misstrokes (Alt + m)**

Check this box to have Case CATalyst generate definitions in the designated dictionary based on all the possible misstrokes of the original steno outline. Only the original steno outline goes into the current Global Table. All misstrokes are available for future translations.

Case CATalyst generates a definition provided the generated misstroke does not conflict with an existing entry in the Personal Dictionary. For example, you define /SROEUS as "voice" with Generate All Possible Misstrokes selected. Case CATalyst also creates a dictionary definition for the following steno outlines as "voice": /SROUS, SROES, and /SROS. The steno outline, /SRAOEUS already has a definition in your Personal Dictionary as "vice", so Case CATalyst did not generate /SRAOEUS as a misstroke.

By default, this option is not selected when you open the Global define dialog box. You can [change](#) the default so that the Global define dialog box displays with Generate All Possible Misstrokes selected. A separate default setting for D-Defines, J-Defines, and K-Define can be set.

### **Add 2 Cat Scratch (Alt + 2)**

Send the definition to the [Cat Scratch](#) dialog pane in addition to the Global Table and selected dictionary. Depending on the Cat Scratch scope, the entries are sent to the job, case or user Cat Scratch pane.

4. When finished defining, press **Enter (OK)**.

TrueStroke™ technology, available on Stenograph's Luminex and Diamante® and Wave™ steno machines, is a sophisticated algorithm that tracks the direction and velocity of keystrokes. When writing realtime via the USB cable to CATalyst BCS version 11 or higher, TrueStroke data is written to the job subfile, Steno X-ray2. You can view the TrueStroke information from Vertical Notes.

The Steno X-ray2 file is also available when you read in a steno file from the Luminex or Diamante SD card or the Wave Memory. Once you translate the file you can view the TrueStroke information.

The TrueStroke data contained in the Steno X-ray2 file displays each individual character of the keystroke in specific colors at varying intervals in the keystroke. A key initially displays in a light gray color, indicating the key is being pressed down. The key display turns green when the key registers on the writer. When the key display turns white, the key is released or is on its way up. In a multi-character steno outline, some keys are visible in the down stroke before other characters. This indicates that the keys were pressed at different times instead of all together. A key that remains light gray and never turns green indicates the key was not depressed with enough velocity to register. The blue highlighted line is generally a good indication keys of which keys were registered as part of the steno outline.

If there are steno strokes you continually misstroke, and that misstroke cannot be defined as anything else, it is strongly recommended that you define the outline in your dictionary. You can also use the CATalyst BCS [Drag/Drop Analysis](#) feature to aid in translation. You may want to consult the user guide for your writing machine regarding information on keyboard adjustments.

### Example

You are captioning the 6 o'clock news and the newscaster is talking about Palm Beach County. Your brief stroke for Palm Beach County is P\* BG. During the captioning session, you occasionally get the untranslate P\*BGS. You display your vertical notes and double click the P\*BGS steno outline. The TrueStroke data indicates that the P\*BG keys move downward equally, each one initially light gray in color to indicate the keys are pressed with equal velocity and then green to indicate they register. The data also shows the final S coming down with the other keys, turning light gray and then green. This indicates that you also depressed the final S while pressing P\*BG, including it in the stroke.

To view TrueStroke data:

1. In CATalyst BCS, open the vertical notes for the captioning file. Press **Ctrl + n (View/Panes/Vertical Notes)**. The Steno X-ray dialog box displays.
2. Double click the steno outline for which you want to view the TrueStroke data.
3. To close the Steno X-ray dialog pane, click the **X** in the upper right hand corner of the pane.

### Speaker List

The CATalyst BCS Speaker List contains designated speakers from the EZ Speakers Profile tab created using the [Create EZ Speakers](#) feature and typed speaker names in the Speaker List. The Speaker List pane allows you to insert speaker names or other fields directly into the History or Script window. For example, you may need to insert the speaker name into the script before sending it. In addition to using EZ Speaker fields, you can add user defined fields. Speaker names display in the Speaker section of the Speaker List. The selected user defined fields display in the Fields section. A voice captioner, may want to use the Fields section for the user defined fields for tran1, tran2 defines created on the fly. You can add and modify speaker entries in the Speaker List.

The Speaker section of the Speaker List displays the speaker name along with the speaker number and the associated steno, if applicable. Speaker names insert into the History or Script window at the left margin on a new line. Fields insert into the history or script file at the cursor location. If the cursor location is unknown, the field inserts at the end of the file. During captioning, inserting a field using a keyboard command places the field in either the history or script file at the cursor location, depending on which window has the cursor focus. The speaker name displays in the file with the color assigned to it in the Speaker List.

The Field section of the Speaker List displays the field value in the Name column and the empty field name in the Number column. User defined fields from the Field section insert into the history or script file as text without formatting. User defined fields can be added to the list using the [Settings](#) option in the Speaker List dialog pane.

Using the speaker names from the Speaker List, you can create a graphical [Seating Chart](#), viewable in the MiniViewer at the top of the Speaker List dialog pane or on the computer screen. Speakers display in their assigned colors. When viewing the Seating Chart on the screen, the speaker indicator includes the speaker name, speaker number and, if applicable, the associated steno.

You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to

move) of the pane, your cursor will change to a horizontal double arrow (  ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen.

To access the Speaker List pane in a captioning session or in Caption Edit, press **Alt + v, e, k** (**View/Panes/Speaker List**).

## **Speaker List Pane Features**

### **Name**

In the Speaker section, the defined speaker name or the name of the speaker field. In the Field section, the value of the field or the empty field name. Click the title bar to display the names in ascending or descending alphabetical order.

### **Number**

In the Speaker section the speaker number associated with the speaker name. In the Field section, the empty field. Click the title bar to display the token numbers in ascending or descending order.

### **Steno**

Type the steno, if any, you want to associate with the speaker. You can retain the association by checking the box in the Locked field. If you have your speaker identifications defined in a dictionary, most likely your Personal Dictionary, and you always want them to display in the speaker list, type the associated steno and select the Locked column. Instead of using the Create EZ Speakers feature, you will simply fill in the field in the transcript or Speaker List.

### **Locked**

Check this box to retain the association of the steno entered in the Steno field with the speaker number. If you have your speaker identifications defined in a dictionary, most likely your Personal Dictionary, and you always want them to display in the speaker list, type the associated steno in the Steno field and select the Locked column. Instead of using the Create EZ Speakers feature, you will simply fill in the field in the transcript or Speaker List.

### Insert

Insert the highlighted speaker name or field into the transcript. You can also double click an entry to insert it into the history or script file. Speaker fields insert on a new line at the left margin.

### New Speaker

Create a new speaker name. The Select EZ Speaker dialog box displays with the next sequential speaker number. Use the displayed number in the Enter Value field or type a new number and press **Enter (OK)**. Valid number are **1 - 99**. A new speaker name field displays with the assigned speaker number. Type the name in the field and press **Enter**.

### Fill in Speaker

Modify an existing speaker or user defined field name. Highlight an entry and select **Fill in Speaker**. When you modify a speaker name, type the change and press **Enter**. When you modify a user defined field, the [Fill in Field](#) dialog box displays. Make necessary entries and select **OK**.

### Change Color

Change the speaker name color. Highlight the field and select **Change Color**. Select a color from the color palette. The More Colors options displays the [Color](#) dialog box for additional and custom colors.

You can also change the field color assignment. Highlight a field and select **Change Color** to select a color from the color palette. The change affects the user color for all fields.

### Delete

Delete an existing speaker name entry. Highlight the entry and press **Delete** or click the Delete icon. To remove a field from the list, click the Settings icon to uncheck the field from the list in the Choose Speaker List Fields dialog box.

### Filter

Select this option to display all the available speakers with associated speaker numbers. Deselect this option to only display speaker numbers with assigned speaker names.

### Allcap Text

Select this option to enter the speaker name in all capital letters. Deselect this option to enter the Speaker Name in upper and lower case letters.

### Show/Hide Seating Chart MiniViewer

Select this option to display the [Seating Chart](#) MiniViewer above the speaker list in the Speaker List dialog pane. The MiniViewer shows the placements of the Seating Chart speakers. Deselect this option to hide the MiniViewer. You can still display the Seating Chart speakers.

### Show/Hide Seating Chart Speakers

Select this option to display [Seating Chart](#) speakers on the screen. Deselect this option to automatically hide the Seating Chart speakers. This is the default. When you move your cursor over the MiniViewer, the Seating Chart speakers display on the screen for a few seconds and then automatically hide. You can [change](#) the number of seconds the Seating Chart displays before it automatically hides or have the Seating Chart continuously display.

### Settings

Display the Speaker List / Seating Chart Options dialog box where you can choose additional fields to add to the Speaker List. Click the option, *Add fields to Speaker List* and check the box next to the fields you want to add to the Speaker List. Click **OK** when finished. You can modify the name of new user defined fields. [Field Options](#) are also accessible from the Choose Speaker List Field dialog box.

### Help

Display the CATalyst BCS Help.

The Seating Chart feature allows you to create a graphical Seating Chart of speakers from the Speaker List, placing speaker information on the computer screen in a position relative to where the speakers are sitting. You may want to use the Seating Chart if you are captioning an announcement or political debate. The Seating Chart is viewable on the computer screen and in the MiniViewer located above the [Speaker List](#) in the Speaker List dialog pane.

The Seating Chart MiniViewer, by default, displays when you open the Seating Chart. The Show/Hide Seating Chart MiniViewer  icon toggles the display of the MiniViewer. By default, the MiniViewer displays when the Speaker List opens. Add speakers to the Seating Chart by displaying the MiniViewer and dragging a speaker from the Speaker List onto the MiniViewer or right clicking the speaker and selecting Add to Seating Chart. Speaker items in the MiniViewer and the computer screen display in the assigned speaker color. Speaker items on the computer screen display in a default height and width that can be modified or temporarily changed by clicking and dragging the edges. Each speaker item on the computer screen, by default, shows the speaker name on the top line, the speaker number and, if applicable, the associated steno on the second line. To reposition a speaker item, click and drag the speaker item on the computer screen to a different location. Moving a speaker item on the computer screen changes the position of the speaker item in the MiniViewer.

You can remove individual or all speaker items from the Seating Chart by right clicking and selecting the desired option. Once a speaker item is removed, it is necessary to add the speaker item again if you want to redisplay it in the Seating Chart. If you remove all the speakers items from the Seating Chart and want to redisplay them, it is necessary to add each speaker item individually.

The Seating Chart speaker items display on the computer screen when you click the Show/Hide Seating Chart Speakers  icon or when you position your cursor over the MiniViewer. When the Seating Chart displays, the Show/Hide Seating Chart Speakers icon is highlighted. By default, the Seating Chart is set to AutoHide after displaying for 3 seconds. You can change the display time or disable the AutoHide feature to continuously display the speakers items. Changing the Seating Chart options or using the Seating Chart: Toggle AutoHide Feature key combination, you can toggle between enabling and disabling the AutoHide feature. When you display the Seating Chart speaker items while the AutoHide feature is disabled, the speaker items remain on the computer screen until you enable AutoHide. CATalyst BCS remembers the last display state of the Seating Chart.

You can modify the Seating Chart options to automatically populate the Seating Chart with speakers when you start a new session. You can set the scope of the Seating Chart to display for the session (Job), multiple related sessions (Case) or any user or session (User). When you set the Seating Chart scope, you can choose speakers to populate the seating chart. In the current session, when you write the steno for the selected speaker, the Speaker List is populated. Settings apply to new sessions or sessions and do not affect the current session or previous sessions.

[Seating Chart options](#) allow you to customize the actions and display of the Seating Chart and speaker items, such as modifying the Seating Chart display time, Seating Chart scope, speaker item transparency or changing the text layout for the speaker items.

[Keyboard Map](#) Functions: Seating Chart: Show MiniViewer

Seating Chart: Hide MiniViewer

Seating Chart: Show All Speakers

Seating Chart: Hide All Speakers

Seating Chart: Toggle AutoHide Feature

## Create Seating Chart

1. Press **Alt + v, e, k (View/Panes/Speaker List)** to display the Speaker List dialog pane.
2. Do one of the following to add speakers to the Seating Chart:
  - Right click a speaker name in the Speaker List and select **Add to Seating Chart**. The speaker name displays in the middle of the computer screen. Click the Seating Chart speaker item and drag it to the desired position on the screen.
  - Click the Show/Hide Seating Chart MiniViewer  icon to display the MiniViewer if it is not displayed. Click a speaker name and drag it to the desired position in the MiniViewer. The speaker item displays on the computer screen in the same position as the MiniViewer.
3. Do any of the following:

### Reposition a seating chart speaker

Click and drag the Seating Chart speaker item to the correct position.

### Change the size of the seating chart speaker

Click the edge or corner of a Seating Chart speaker item and drag to the desired size. The change only applies to the selected Seating Chart speaker. There is a default minimum and maximum size. You can [change](#) the default.

### Remove a speaker from the seating chart

Position the cursor on the Seating Chart speaker item, right click and select **Remove from Seating Chart**. To remove all the speakers from the Seating Chart, select **Remove All from Seating Chart**.

### Toggle the display of the seating chart items

Click Show/Hide Seating Chart Speakers  icon to toggle the display of the Seating Chart on the computer screen.

### Toggle the display of the MiniViewer

Click the Show/Hide MiniViewer  icon.

### Toggle the Auto Hide Feature

Invoke the Toggle AutoHide feature command. You must have [assigned](#) the Toggle AutoHide Feature command to a keyboard map function.

Speaker List and Seating Chart options determine certain customized settings that control Seating Chart actions and display. Access Speaker List / Seating Chart Options from the Speaker List dialog pane. In Edit, open the Speaker List. Press **Alt + v, e, k** (**View/Panes/Speaker List**). In the Speaker List dialog pane, click the Settings  icon.

## Speaker List/Seating Chart Options

Use the following fields to customize Speaker List and Seating Chart settings:

### Add fields to Speaker List

Display the Select Fields for Speaker List dialog box. Choose fields to display in the Speaker List that do not usually display. The Speaker List is populated using the Profile EZ Speakers tab, Create EZ Speaker feature and typed speaker names.

### Show MiniViewer

Select **Show** to automatically display the Seating Chart MiniViewer in the Speaker List dialog pane. Select **Hide** to manually open the Seating Chart MiniViewer Speaker.

### Show Common Speakers

Select **Yes** to display Common Speakers in the Speaker List. Select **No** to hide the Common Speakers. The default is No.

### Default Seating Chart/Scope

Automatically display selected speakers in the Seating Chart when you start a new session. You can set the scope of the Seating Chart to display for the session (Job), multiple related sessions (Case) or for all users and sessions (User). Settings apply to speakers selected for new sessions and do not affect the current session or previous sessions. Highlight the option, click the drop-down arrow, select the scope and click the Edit button to select the specific speakers you want in the Seating Chart in future sessions.

When the Default seating chart is set to Case, the seating chart information is saved in the *nameofcase\_case* settings file. When the Default seating chart is set to User, the seating chart information is saved in the *UserSettings* file located in your System Files case.

### Sticky Windows

Select **Yes** to easily align speaker items with each other or along the monitor borders using your mouse. Speaker items remain independent allowing you to reposition them individually. The default setting is No.

### Speaker Item Transition

Select how the speaker items change from visible to hidden and hidden to visible. Choose one:

#### Fade

Speaker items show on the screen and fade from the screen in their designated locations.

#### Zoom

Speaker items move on and off the screen in a zooming motion between the MiniViewer and their designated location.

### Speaker Item Transparency

Select **Yes** to have the speaker items display at a specified level of transparency when they do not have cursor focus. When you click a speaker item, the speaker item displays as a solid image until you remove the cursor focus. Set the transparency level in the *Transparency Setting* field. Select **No** to have the speaker items always display as a solid image.

#### Transparency Setting

When the *Speaker Item Transparency* option is active, use the slider bar to set the transparency level. A low setting increases the transparency and a high setting decreases the transparency.

### Speaker Item Layout

Determine the layout for the speaker items on the screen. Layouts determine the text arrangement of the speaker name, speaker number, if available, and steno for the speaker items. Choose one:

- Layout 1 – Name on the top, steno on the bottom, number on bottom left.
- Layout 2 – Steno on the top, name on the bottom, number on bottom left.
- Layout 3 – Name on the top, steno on the bottom, large number on left.
- Layout 4 – Steno on the top, name on the bottom, large number on left.
- Layout 5 – Name on the top, steno on the bottom, no speaker number.
- Layout 6 – Steno on the top, name on the bottom, no speaker number.

### Auto Hide Speakers Items

Select Yes to automatically hide the speaker items when they do not have cursor focus. Select No to continuously display the speaker items on the screen. Using the Seating Chart: Toggle AutoHide Feature command, you can toggle between enabling and disabling the AutoHide feature. You can create a [keyboard assignment](#) for the command.

### Auto Hide Close Delay

Use the slider bar to determine the number of milliseconds the speaker items display before automatically hiding when they no longer have cursor focus. This option is only available when the *Auto Hide Speakers Items* option is set to Yes.

### Auto Hide Show Delay

Use the slider bar to determine the number of milliseconds the speaker items wait before displaying

when you hover the cursor over the MiniViewer or click, , Show/Hide Seating Chart Speakers. This option is only available when the *Auto Hide Speakers Items* option is set to Yes.

### Speaker Item Size

The current width and height of the speaker items. Make entries in the *Width* and *Height* fields to customize the default size of new speaker items. If there are current speaker items that you want to reflect the default settings, remove all speakers from the Seating Chart and then add them to the Seating Chart.

To temporarily customize the size of current speaker items, click and drag the sides while displayed on the screen. Manually resizing one speaker item does not affect the other speaker items on the screen.

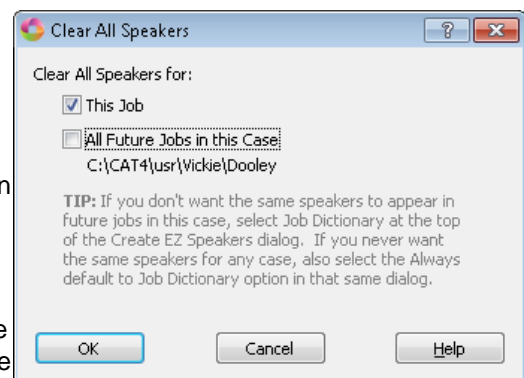

A Clear All Speakers command is available in the Speaker List. When creating EZ Speakers in a captioning session that is within a case, you have an option to create the EZ Speakers in the Case dictionary or Job dictionary. Creating the EZ Speakers with fields in the Case dictionary means the speaker field information is contained in the Case History file and all speakers will be available and appear in the speaker list for all future captioning sessions in that case. When you select Job dictionary, the speaker field information is stored in the Job dictionary and is only used for the current job and when selecting that job dictionary to help translate other jobs.

There may be times when all the speakers are no longer relevant for the current captioning session or for all future captioning sessions in the case. The Clear All Speakers command is available for just those times!

**Important:** The Clear All Speakers command will remove the speakers from the Speaker List, but if you do not use for your EZ Speakers fields and you do not want the speakers to apply to future jobs in the Case, you will also want to remove the entries from the Case dictionary. In other words, if you do not use fields in your EZ Speakers, the values for your EZ Speakers are entirely definitions created in your Case dictionary (if using a Case), not in the Case History file.

### To use the Clear All Speakers command:

1. Open the captioning session that is in a case where you want to clear all the speakers. (Note: if you are in a job and the Clear All Speakers command is not available, the job is not in a case.)
2. With the Speakers List pane displayed (**Alt + v, e, k**), highlight a speaker in the Speaker List, right click and select **Clear All Speakers...**
3. The Clear All Speakers dialog box displays. Do any of the following
  - a. Select **This Job** to remove all speakers from the speaker list for the current captioning session and clear the field values for those speakers. This option has no effect on speakers for future captioning sessions in this case. By default, the This Job option is selected.
  - b. Select **All Future Jobs in this Case** along with the **This Job** option to remove all the speakers from the speaker list and clear the field values for those speakers in the current captioning session and all subsequent captioning sessions in this case.
  - c. Select **All Future Jobs in this Case** alone to remove all the existing speakers in this case's history file and prevent them from appearing in the speaker list for all subsequent captioning

sessions in this case. Selecting only this option does not remove them in the current captioning session.

4. To remove the speakers, click **OK**.

When you select the All Future Jobs in this Case option, information displays below the option about creating EZ Speakers in a case. Understanding how creating EZ Speakers in a case works can save you time.

For example, let's say you are captioning a series of interviews and you created a case for all the interviews. When you caption the first interview in that case, you create your EZ Speakers. Since it is most likely that the same interviewer will be present in most or all of the interviews, you create the EZ Speakers in the Case dictionary. Every time you start a captioning session in that case, those same speakers display which saves you time from adding EZ Speakers every session.

On the other hand, some captioners like to organize jobs based on when the job was taken. For example, let's say you are a captioner that creates a case for the month and year of your captioning jobs. You start out creating the first case named January 2017. The only thing all the captioning sessions in that case have in common is that all the captioning session in that case were taken in January of 2017. When you start a job in the case, it is highly unlikely that the same speakers/interviewers will be in every captioning session in the case, so when creating EZ speakers, you should select Job Dictionary and select the Always default to Job dictionary option. The Always default to Job dictionary option is remembered for every captioning session in that case. Every time you create EZ Speakers for a captioning session in the January 2017 case, the entries are automatically sent to that session's dictionary and are not carried over to the next captioning session in the same case. If you needed previously created speaker definitions, you could always select the correct job dictionary to help translate the current file and use the field values from that captioning session to fill in the speakers. If you fit this second organizational method, but you accidentally selected to put your speakers in a case dictionary, you may find this new option helpful to remove those speakers from the speaker list for future captioning session in the January case.

When the Speaker List is displayed, (View, Panes, Speaker List) you can right click in the [Speaker List](#) pane and select any of the following items:

#### **Insert**

Insert the highlighted speaker name or field into the caption text and/or history window. You can also double click an entry to insert it into the caption text and/or history window. Speaker fields are inserted at the cursor location.

#### **New Speaker**

Use the New Speaker feature to create a new EZ Speaker field and add the speaker to the Speaker List. When you select New Speaker, the Select EZ Speaker dialog box displays in which you need to select an EZ Speaker [field](#) number. Valid numbers are 1 - 99. A blank speaker spot is added to the Speaker List, type the speaker name and click the down arrow to select a color, if desired, for the speaker.

#### **Add to Seating Chart**

The [Seating Chart](#) allows you to create a graphical Seating Chart of speakers from the Speaker List, placing speaker information on the computer screen in a position relative to where the speakers are sitting during the captioning session. Use the Add to Seating Chart feature to create a graphic for a speaker which you can drag to any position on your screen. Click a speaker in the Speaker List and select Add to Seating Chart. The [Speaker List/Seating Chart Options](#) control the Seating Chart graphic settings.

#### **Fill in Field**

Modify an existing speaker or user defined field name. Highlight an entry, right click and select **Fill in Field**. When you modify a speaker name, type the change and press **Enter**. When you modify a user defined field, the [Fill in Field](#) dialog box displays. Make necessary entries and select **OK**.

### Clear All Speakers

When creating EZ Speakers in a captioning session that is within a case, you have an option to create the EZ Speakers in the Case dictionary or Job dictionary. Creating the EZ Speakers with fields in the Case dictionary means the speaker field information is contained in the Case History file and all speakers will be available and appear in the speaker list for all future captioning sessions in that case. When you select Job dictionary, the speaker field information is stored in the Job dictionary and is only used for the current captioning session and when selecting that job dictionary to help translate other jobs.

There may be times when all the speakers are no longer relevant for the current captioning session or for all future captioning sessions in the case. The [Clear All Speakers](#) command is available for just those times!

**Important:** The Clear All Speakers command will remove the speakers from the Speaker List, but if you do not use for your EZ Speakers fields and you do not want the speakers to apply to future jobs in the Case, you will also want to remove the entries from the Case dictionary. In other words, if you do not use fields in your EZ Speakers, the values for your EZ Speakers are entirely definitions created in your Case dictionary (if using a Case), not in the Case History file.

### Delete

Delete an existing speaker name entry. Click the entry in the Speaker List and then select **Delete**. The speaker name is removed and if using EZ Speaker fields, the EZ Speaker field displays throughout the job.

### Case CATalyst Help

Display the Case CATalyst Help.

### Hotspots

Hotspots is a dialog pane, available in Caption Edit, that can contain occurrences of the [Oops](#) format symbol, empty (undefined) fields or untranslates in the file. The Hotspots dialog pane displays the entire line of text along with the page, line number and section on which an Oops format symbol, empty field or untranslate occurs. The different entry types display in separate color coded groups. You can set the Hotspots [options](#) to hide item types you do not want displayed. For example, while editing a caption file, you want to view occurrences the Oops format symbol to allow you to quickly check that information and send the file on to your captioning firm.

Double click a Hotspots entry to move the cursor to that location in the file. If the Hotspots entry is an Oops format symbol, CATalyst BCS moves the cursor to the location in the file. If the information is correct, it is not necessary to remove the Oops format symbol from the transcript. It does not print. Deleting an entry in the Hotspots dialog pane deletes the Oops format symbol from the text. If the Hotspots entry is an untranslate, CATalyst BCS positions your cursor immediately before the untranslate in the file. If there is more than one untranslate on a line, a Hotspots entry displays for each untranslate.

You can search, sort, modify, delete and print the Hotspots entries. Use the Hotspots icons on the title bar of the Hotspots dialog pane.

The View Hotspots dialog pane command is available in the keyboard map for assignment. These settings affect both regular CATalyst translation and CATalyst BCS captioning.

## Hotspots Dialog Pane Features

1. In Caption Edit, press **Alt + v, e, o (View/Panes/Hotspots)**. The Hotspots dialog pane displays.  
Click a column heading to sort the entries in ascending and descending order. An arrow in the column indicates the sort order.
2. Double click an entry to move the cursor to the location in the file where the selected Hotspots occurs. Review the line and use editing commands to make any necessary changes. Use the following options in the Hotspots dialog pane as necessary:

### Modify (Ctrl + m)

Highlight an entry and click the **Modify** icon. CATalyst BCS moves the cursor to the line in the job where the selected Hotspots entry occurs.

### Delete

Highlight an entry and press **Delete** or click the **Delete** icon to remove the Oops format symbol from the file. By default, a confirmation prompt displays. Choose **Yes** to delete the entry. You can change the display of the confirmation prompt by changing the Hotspots Pane option, [Prompt before deleting Oops format symbol?](#). The Delete feature is only available for Oops entries.

### Sort

When displaying the Hotspots pane in Edit, you can easily sort the entries by category. Simply click the Type column heading and the entries will sort in either ascending or descending order based on the alphabetic name of the type of item displayed in Hotspots.

### Search

Search the Hotspots entries. In the [Search dialog box](#) make necessary entries and press **Enter (OK)**.

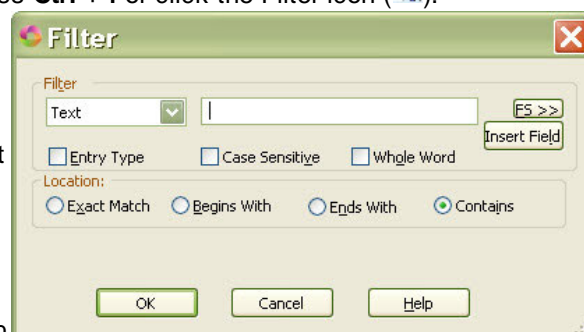

### Filter/Sort

When displaying the Hotspots pane in Edit, you can easily sort the entries by category. Simply click the **Type** column heading and the entries will sort in either ascending or descending order based on the alphabetic name of the type of item displayed in Hotspots.

### To Filter the Hotspots pane:

1. With your cursor focus in the Hotspots pane, press **Ctrl + f** or click the Filter icon (.
2. The Filter dialog box displays. Do **any** of the following:
  - The Filter dialog box defaults to a Text filter with the cursor in the Text field. Type the text you want to filter on that may be in an entry in the Hotspots pane. **Go to Step 4.**
  - To Filter on a specific type of item in the Hotspots pane such as an Oops format symbol assigned to "spelling", click the down

arrow next to Text and select Type. In the Text field type the item name to which you want to filter. **Go to Step 4.**

- To Filter on the type of item in the Hotspots pane and select from a list of items (such as untranslates or empty fields or a particular Oops category), click the down arrow next to Text and select Type and then press **Alt + e** to select the Entry Type option. The Text field will display an entry. Click the down arrow at the end of the Text field to see additional items. Select the type of Hotspots item. **This is the most popular filter option.** All other options are disabled, **go to Step 6.**
  - This is a universal Filter dialog box so there may be additional filter options that do not necessarily apply in the Hotspots pane. For example, you can filter base on a page number, line number or section number. These additional Filter options don't usually apply when filtering in Hotspots.
3. If in Step 3 you selected Text and typed the text in which you wanted to filter, you can narrow the filter:
    - Press **Alt + v** to filter on the specific text based on the case of the letters typed.
    - Press **Alt + o** to filter on the specific text as a whole word.
  4. If, based on your Filter options, the Location field is available, do **one** of the following:
    - Press **Alt + x** to filter on an exact match of the text typed.
    - Press **Alt + b** to filter on entries that begin with the typed text.
    - Press **Alt + n** to filter on entries that end with the typed text.
    - Press **Alt + i** to filter on entries that end with the typed text.
  5. To filter, press **Enter** or click **OK**.
  6. To remove the filtered display in the Hotspots pane, click the Remove Filter () icon.

### Remove Filter

Display all the Hotspots entries.

### Print

Print the Hotspots. You can print Hotspots entries to a printer or to PDF. In the [Print](#) dialog box make any necessary changes and press **Enter (OK)**.

### Settings

Modify the Hotspots dialog pane [options](#). Hotspots options allow you to change the display of items in the Hotspots pane.

### Help

Display CATalyst BCS Help.

The [Hotspots](#) Pane Options allow you to customize the display of Hotspot entries in the Hotspots dialog pane and set the audio playback option. Access Hotspots Options through the Hotspots dialog pane. You can also apply names and colors to up to 10 Oops categories. These settings affect both regular CATalyst translation and CATalyst BCS captioning.

You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to move) of the pane, your cursor will change to a horizontal double arrow (  ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen.

To modify Hotspots options:

1. In Edit, press **Alt + v, e, o (View/Panes/Hotspots)** to display the Hotspots dialog pane.
2. Click the Settings  icon. The Hotspots Pane Options dialog box displays.
3. Make necessary entries:

### Show Oops

Select **Yes** to display the line in the Hotspots dialog pane on which an [Oops](#) format symbol is located. Select **No** to hide the display of lines containing the Oops format symbol.

### Play Audio when double-clicking <Oops> entries

Select **Yes** to play the associated audio, if available, when you double click an <Oops> entry in the Hotspots dialog pane.

### Show Untranslates

Select **Yes** to display the line in the Hotspots dialog pane on which an untranslate is located. Select **No** to hide the display of lines containing untranslates. If there is more than one untranslate on a line, a Hotspots entry displays for each untranslate.

### Play Audio when double-clicking Untranslate entries

Select **Yes** to play the associated audio, if available, when you double click an untranslate entry in the Hotspots dialog pane.

### Maximum number of Untranslate entries to show

Determine the maximum number of untranslate entries to display in the Hotspots dialog pane at one time. The default setting is 5. Once you resolve an untranslate, CATalyst BCS populates the Hotspots dialog pane with the next untranslate, if another one exists in the file.

### Show undefined fields

Select **Yes** to display the line in the Hotspots dialog pane on which an undefined (empty) field is located. Select **No** to hide the display of lines containing undefined fields.

### Play Audio when double-clicking undefined fields

Select **Yes** to play the associated audio, if available, when you double click an undefined field entry in the Hotspots dialog pane.

### Prompt before deleting Oops format symbol

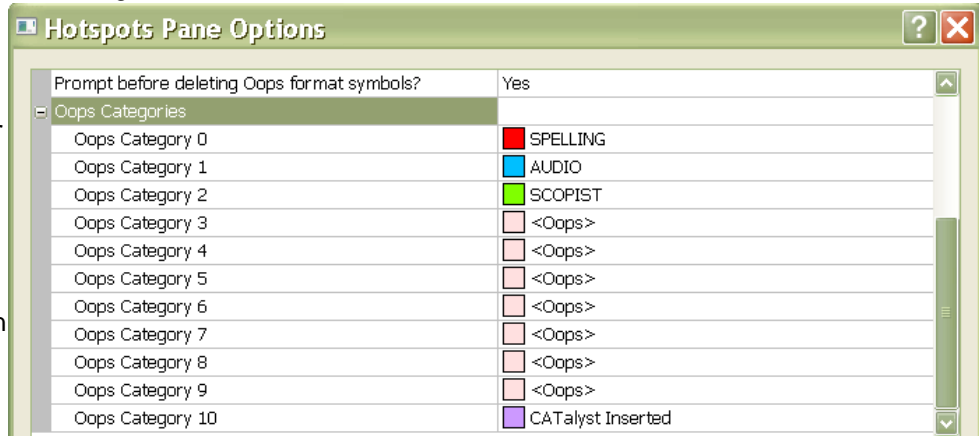

Select **Yes** to display a confirmation message when you delete an Oops format symbol. Deleting an Oops format symbol from the Hotspots dialog pane removes the Oops format symbol from the file. Select **No** to bypass the confirmation prompt when you delete an Oops format symbol.

### To assign a category to Oops and a color:

- At Manage Jobs or anywhere in CATalyst, press **Alt + t** and select **All Options** or click the All Options icon (  ) available on the toolbar. Select Edit Panes and then Hotspots. If you are in Edit, you can press **Alt + v, e, o** (View, Panes, Hotspots) to display the Hotspots pane and then click the Options icon on the Hotspots pane title bar.

- Do any of the following:

- To assign a category name, double click the Oops in the right-hand column and type the name for the Oops.

- To assign a color, click the Down arrow (  ) and select a color.

- When finished, do any of the following:

- To save and close the Oops options, press **Enter**.
- To restore the default Oops categories, press **Alt + r**.
- To forget your changes and close the dialog box, click **Cancel**.

#### Things to know:

- If you do not assign a category to any of Oops format symbols, when you insert the Oops format symbol in a job by pressing F4 and selecting the Oops format symbol, you will be prompted for a category number. Once inserted into the job, Reveal Codes will show the <Oops #> and the Hotspots pane will simply show <Oops>.
  - When displaying the Hotspots pane in a captioning session or editing a caption file, you can easily sort the entries by category. Simply click the Type column heading and the entries will sort in either ascending or descending order based on the alphabetic name of the type of item displayed in Hotspots.
  - Category 10 is reserved and assigned to CATalyst Inserted category. For example if you have the Advanced Translate option, Insert Oops FS after aborted Power Define set to Yes and you abort a Power Define, Scan Define, EZ Speakers or Text Define during realtime, the Oops category 10 format symbol is inserted into the transcript. Category 10 Oops format symbol is also inserted when translating a steno file or re-translating a realtime file that contains AccelerWriters (macros invoked from the steno machine) and/or Power Defines at the point where the AccelerWriter or Power Define was invoked.
- Click **OK** when finished making changes.

Search the [Hotspots](#) dialog pane for specific text, format symbols, fields or entry types. You can search forward or backward for a whole word, part of a word, or multiple words. Once a searched entry displays, you can repeat Search for the same text and search parameters by using Repeat Search Forward or Repeat Search Backward.

To search Hotspots entries:

1. In the Hotspots dialog pane, click the Search  icon. The Search dialog box displays.
2. Select the method by which you want to search the Hotspots entries.

### **Specific Text**

Search by specific text. In the *Search* field, type the text you want to find.

### **Entry Type**

Check this box to search by entry type. CATalyst BCS searches only for entries with the selected entry type. Click the down arrow to select an entry type from the list:

#### **Conflict**

The first entry that contains a conflict end format symbol.

#### **Scan Stop**

The first entry that contains a scan stop begin or end format symbols.

#### **Numbers**

The first entry that contains numbers.

#### **All Capped**

The first entry that contains all capped text.

#### **Contains capped**

The first entry that contains at least one capital letter.

#### **Phrase**

The first entry that contains two or more words separated by a space.

#### **Contains punctuation**

The first entry that contains punctuation.

#### **Contains format symbol**

The first entry that contains a format symbol.

#### **Contains Fields(s)**

The first entry that contains a field.

#### **Auto Include**

The first entry that begin with @.

#### **AccelerWriter**

The first entry that begin with &&.

### **Number Conversion**

The first entry that contain the {Number Conversion} translate command.

### **Number Trigger**

The first entry that contain the {Number Trigger} translate command.

### **Numerical Words**

The first entry that contain a word number including hundred, thousand, million, etc.

### **Speaker Entries**

The first entry that contain a <Colloquy> format symbol and a colon.

3. Use the remaining fields as necessary:

### **Case Sensitive**

Check this box to limit the search based on the upper and lower case letters of text typed in the Search field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field. This field is only available when you select to search for text.

### **Whole Word**

Search only for the words that match the text typed in the Search field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. This field is only available when you select to search for text.

### **FS**

Include a format symbol in the Search. Type the format symbol or display the format symbol list by clicking **FS** and double click a format symbol to choose it. This field is only available when you select to search for text.

### **Insert Field**

Include a field in the Search. Click **Insert Field** and double click a field from the list to choose it. This field is only available when you select to search for text.

### **Location**

Limit the search to include one of the following criteria. These fields are only available when you select to search for text.

#### **Exact Match**

Search for entries that exactly match the text entered in the Search field.

#### **Begins With**

Search for entries that begin with the text entered in the Search field.

#### **Ends With**

Search for entries that end with the text entered in the Search field.

#### **Contains**

Search for entries that contain, anywhere in the entry, the text entered in the Search field.

## Direction

Select one of the following:

### Forward

Search forward from the cursor position to the end.

### Backward

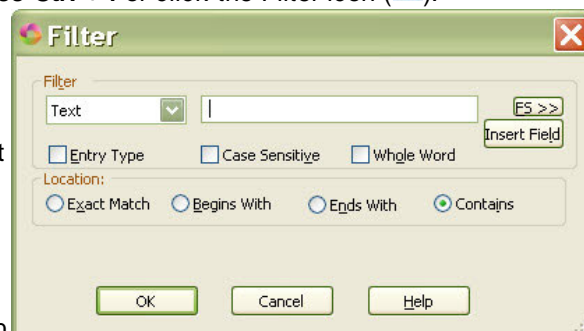

Search backward from the cursor position to the beginning.

4. Press **Enter (OK)** to start the search. If no match is found for the search item, a message displays.
5. To repeat the same search, press **F3 (Edit/Repeat Search Forward)** or **Shift + F3 (Edit/Repeat Search Backward)**.

You can filter the display of the entries in the Hotspots pane. For example, let's say that you have an Oops category named SPELLING. You insert the SPELLING Oops format symbol in locations in the history file where you made a spelling mistake or you need to check the spelling. At a break during the caption session, you display the Hotspots pane and filter by SPELLING to find all the locations you need to check the spelling. Filtering [Hotspots](#) pane entries based on text, type of Hotspot (Oops name, untranslate or empty field), page number, line number or section number.

## To Filter the Hotspots pane:

1. With your cursor focus in the Hotspots pane, press **Ctrl + f** or click the Filter icon (🔍).
2. The Filter dialog box displays. Do **any** of the following:

- The Filter dialog box defaults to a Text filter with the cursor in the Text field. Type the text you want to filter on that may be in an entry in the Hotspots pane. **Go to Step 4.**
  - To Filter on a specific type of item in the Hotspots pane such as an Oops format symbol assigned to "spelling", click the down arrow next to Text and select Type. In the Text field type the item name to which you want to filter. **Go to Step 4.**
  - To Filter on the type of item in the Hotspots pane and select from a list of items (such as untranslates or empty fields or a particular Oops category), click the down arrow next to Text and select Type and then press **Alt + e** to select the Entry Type option. The Text field will display an entry. Click the down arrow at the end of the Text field to see additional items. Select the type of Hotspots item. **This is the most popular filter option.** All other options are disabled, **go to Step 6.**
  - This is a universal Filter dialog box so there may be additional filter options that do not necessarily apply in the Hotspots pane. For example, you can filter base on a page number, line number or section number. These additional Filter options don't usually apply when filtering in Hotspots.
3. If in Step 3 you selected Text and typed the text in which you wanted to filter, you can narrow the filter:
    - Press **Alt + v** to filter on the specific text based on the case of the letters typed.
    - Press **Alt + o** to filter on the specific text as a whole word.

4. If, based on your Filter options, the Location field is available, do **one** of the following:
  - Press **Alt + x** to filter on an exact match of the text typed.
  - Press **Alt + b** to filter on entries that begin with the typed text.
  - Press **Alt + n** to filter on entries that end with the typed text.
  - Press **Alt + i** to filter on entries that end with the typed text.
5. To filter, press **Enter** or click **OK**.
6. To remove the filtered display in the Hotspots pane, click the Remove Filter () icon.

### Brief It

The [Brief It](#) translation feature suggests conflict free brief forms for words and phrases that you write during a captioning session. When you write three or more steno strokes, CATalyst BCS generates a brief form or reminds you of an existing brief form and displays it in the Brief It dialog pane. The Brief It option in the Caption Translate Options dialog box must be checked for Brief It to be active during realtime writing. By default, the option is active.

[Brief It Options](#) determine certain customized settings that control how CATalyst BCS suggests briefs in the Brief It dialog pane during realtime. You can create Personal Briefs, include and exclude keys in suggested briefs, suggest only one stroke briefs and identify common words that occur at the beginning or end of phrases to prevent a brief from being suggested. You may want to customize Brief It before beginning translation.

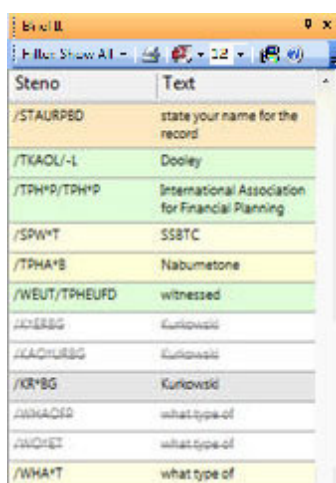

You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to

move) of the pane, your cursor will change to a horizontal double arrow () . Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen.

To display the Brief It dialog pane, press **Alt + v, e, t (View/Panes/Brief It)**. The Brief It dialog pane can be set to float or be docked anywhere on the screen.

### Brief It Dialog Pane

The briefs in the dialog pane have a color-coded background for easy identification. The more often the same brief is suggested and not used, the darker the background color.

Steno	Text
/STAURPBD	state your name for the record
/TKAOL/-L	Dooley
/TPHP/TPHP	International Association for Financial Planning
/SPW*T	SSBTC
/TPHA*B	Nabumetone
/WEUT/TPHEUFD	witnessed
/XERBG	Kurkowski
/XACHURBG	Kurkowski
/KR*BG	Kurkowski
/WHAQED	what type of
/WQDET	what type of
/WHA*T	what type of

**Green** — indicates a Reminder brief. This is a brief that exists in a dictionary being used for translation.

**Yellow** — indicates a Suggested brief. This is a brief CATalyst BCS generates.

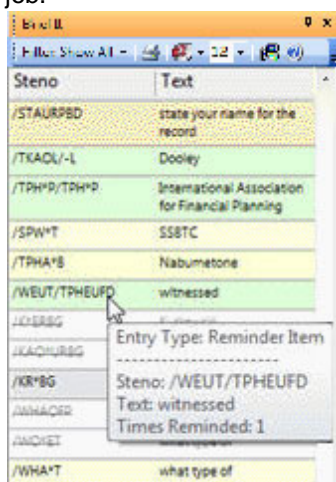

**Orange** — indicates a Personal brief. This is a brief you created and entered in the Briefs.txt file.

**Gray** — indicates a Used brief. This a any type of brief displayed in the Brief It dialog pane you used in this job.

**White with strike out** — indicates a Rejected brief. A rejected brief occurs when you use the Reject Suggestion or New Suggestion command.

## Brief Details

Rest the cursor on an entry in the dialog box to display detail information about the brief, including the type of brief, the steno and text contained in the brief, and how often the brief has been suggested in this job.

Steno	Text
/STAURPBD	state your name for the record
/TKAOL/-L	Dooley
/TPHP/TPHP	International Association for Financial Planning
/SPW*T	SSBTC
/TPHA*B	Nabumetone

/XERBG	Kurkowski
/XACHURBG	Kurkowski
/KR*BG	Kurkowski
/WHAQED	what type of
/WQDET	what type of
/WHA*T	what type of

Entry Type: Reminder Item

Steno: /WEUT/TPHEUFD

Text: witnessed

Times Reminded: 1

## Managing Briefs

Right click an entry in the Brief It dialog pane to take action on the brief. To take an action on multiple entries at once, use Windows conventions to highlight multiple briefs. Right click in the Brief It dialog pane to take an action on the briefs. Only actions applicable to all the selected entries are available. For example, if you highlight a Reminder brief and a Suggested brief, the only action available is, Send to Cat Scratch. If you highlight several Suggested briefs, the available actions include, Send to Cat Scratch, J-define Suggestions, Reject Suggestions and New Suggestions.

### Entry Type

Identifies the type of brief: Reminder, Personal, Suggested or Used.

### Send To Cat Scratch

Depending on your [Cat Scratch scope](#), Send to Job Cat Scratch, Send to Case Cat Scratch or Send to Cat Scratch displays.

### Lookup Steno

Displays the entry in the dictionary where the existing brief entry is located. This action only displays for Reminder entries. The dictionary, that contains the entry, opens with the entry highlighted.

### J-Define Suggestion

[Create a J-Define](#) from the brief. Displays the Add Dictionary Definition – Job Dictionary dialog box with the brief form in the Steno field and the definition in the Text field. This action is available for Suggested and Personal briefs.

If you have the Brief It Option, *Define to Case Dictionary*, selected, right click displays K-define Suggestions.

### Reject Suggestion

Reject the suggested brief. CATalyst BCS strikes through the brief form, changes the background to white and makes the brief unavailable. When you use the reject suggestion commands, the steno and text brief combination will not be suggested again during the current realtime session. This action is available for Suggested and Personal briefs.

### New Suggestion

Automatically rejects the brief and suggests a new brief; or suggests a new brief for a brief already rejected. This action is available for Suggested and Personal briefs.

### J-Define Rejection

[Create a J-Define](#) from a rejected brief. Displays the Add Dictionary Definition – Job Dictionary dialog box with the brief form in the Steno field and the definition in the Text field. This action only displays for rejected briefs.

## Dialog Pane Features

### Filter Type

Filter allows you to display the briefs by category or with specific criteria. Click the down arrow to select the type of entries to display. A check mark next to the item indicates it is selected to be included in the filter. Filter hides the display of specified items in the Brief It dialog pane. It does not remove them. All entries display when you return to Show All. By default, the Filter is set to Show All entries.

If you write a brief generated by Brief It that is not displayed in the Brief It dialog pane because the Filter is hiding the entry, Case CATalyst job defines.

If you are showing Live Suggestions and the Rejected filter type is not selected, when you replace/define a Live Suggestion all the other Live Suggestions offered for that steno are no longer displayed in the Brief It pane. If the Rejected filter type is selected, when you replace/define a Live Suggestion all the other Live Suggestions offered for that steno are crossed out and display in the Brief It pane until the next Live Suggestion.

### Print

Display the Print dialog box allowing you to print the list of briefs. If you select to print to PDF, by default CATalyst BCS uses the current job name followed by "\_Brief It.pdf". You can modify the name.

### Select Font Type

Select a font type from the drop down list to affect both the steno and text portions of the briefs in the Brief It dialog pane. Depending on the font style selected, briefs in the Brief It pane may wrap. Two stroke briefs wrap the second steno stroke after the slash (/). If a format symbol exists, the text wraps after the format symbol.

### Select Font Size

Select a font size from the drop down list to affect both the steno and text portions of the briefs in the Brief It dialog pane. Depending on the font style selected, briefs in the Brief It pane may wrap. Two stroke briefs wrap the second steno stroke after the slash (/). If a format symbol exists, the text wraps after the format symbol.

### Settings

Display the [Brief It](#) and [Live Suggestions](#) options in the Realtime Aids dialog box. Brief It options determine certain customized settings that control how CATalyst BCS suggests brief.

### [Export to CSV](#)

Allows you to export the contents (whatever type of briefs are displaying in the Brief It pane) to a CSV (comma separated value) file type which can be opened in Microsoft Excel or a compatible file type.

### CATalyst BCS Help

Display the Case CATalyst and CATalyst BCS help.

### Toolbar Options

Click the down arrow on the right side of the toolbar to add or remove icons from the Brief It toolbar.

## Cat Scratch

The Cat Scratch dialog pane is designed to be a virtual scratch pad. You can add notes you normally jot down on paper or the job sheet to the Cat Scratch pane. The notes remain with the job and cannot become misplaced. In addition to personal notes, the Cat Scratch pane provides quick access to briefs, dictionary entries, power define definitions or newly created AccelerWriter definitions.

There are two sections to the Cat Scratch dialog pane. A Text section and a Text/Steno section. The Text section holds all text items without steno, such as copied or text typed directly into the Cat Scratch pane such as a name, transcript order instructions, terminology or anything you want to remember. The Text/Steno section holds all items containing text and steno that are sent to the Cat Scratch pane such as used briefs, sent briefs, most used Case dictionary entries, newly created AccelerWriters, Power Defines or manually selected dictionary entries.

Each section separately numbers items and is separately sortable by column. Click on a column heading to change the sort order. The [Search](#) features allows you to quickly locate specific items within a section. Pinning an item locks it to the top of the respective section for quick accessibility. Locked items do not scroll off the screen when more item are added to the Cat Scratch pane.

The availability of information in the Cat Scratch dialog pane for the job depends on the selected Cat Scratch scope: job, case or user. When the scope is set to job, items in the Cat Scratch pane are available for that job and the information is stored in the Job History. When the scope is set to Case, items in the Cat Scratch pane are available for any job related to the case and the information is stored in the Case History. When the scope is set to User, items in the Cat Scratch pane are available for all jobs in the current user and the information is stored in the User History, System Files\_Case. Set the scope in [Cat Scratch options](#). The default scope setting is Case. When the job is not in a case, the existing CAT Scratch information is available in the job.

Action commands are available by right-clicking an item. Available actions depend on the item selected. You can insert text from the Cat Scratch pane to the job, case or your Personal Wordlist. Each word in the highlighted item is analyzed and sent to a wordlist only if it is not recognized. For example, you have a speaker named Susan Zorne. Susan is a recognized word, so it is not added to the wordlist. Zorne is not recognized so it is added. Right-click commands also allow you to add the text portion of a steno/text entry to the transcript and to the job, case or Personal dictionary and suggest a brief for the highlighted entry that is added to the Brief It pane. The [keyboard command](#), Send Steno & Text to Cat Scratch Pane, sends highlighted text with the underlying steno in the transcript to the Steno/Text section of the Cat Scratch pane.

You can copy an individual item, multiple items or all the entries in the Cat Scratch pane from your job and paste them into the Cat Scratch pane of another job regardless of scope. For example, you are working on the RWAnderson case with the scope for the Cat Scratch pane set to Case. You work on this case for a week. You have various information such as names, addresses, dictionary definitions and briefs. Each day you open a new job file, the items in the Cat Scratch pane from the previous days are available. The next week you work on a new case, JDorsinski. You copy and paste selected new briefs from the RWAnderson Cat Scratch dialog pane to the Cat Scratch pane for the new case.

The Cat Scratch toolbar is customizable. Click the down arrow located on the right side of the toolbar. Select **Add or Remove Button** and choose the toolbar to modify. Click a command to show or hide it from the toolbar. A check mark indicates the icon shows on the toolbar.

You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to

move) of the pane, your cursor will change to a horizontal double arrow (  ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen.

To display the Cat Scratch dialog pane in Edit, press **Alt + v, e, c (View/Panes/Cat Scratch)**.

[Keyboard Map](#) Function: Send To Cat Scratch Pane

Send Steno & Text to Cat Scratch Pane

Send Selected Brief to Cat Scratch

Send Last Brief to Cat Scratch

## Cat Scratch Dialog Pane Features

### Entry/Text

All text items without steno, such as transcript text sent to the Cat Scratch pane or typed text like a witness names, transcript order information or personal notes.

### Entry/Text/Steno

All items containing text and steno that are sent to the Cat Scratch pane such as most used dictionary entries, briefs you want to remember or new AccelerWriters.

### Insert

Insert an item from the text section into the transcript. Position the cursor in the transcript where you want to insert the text. Highlight the Cat Scratch item and click the Insert icon or right-click and select **Insert**.

### New

Create a new text item. A blank line displays where you can type the text.

### Modify

Modify an existing item in the Text or Text/Steno section. Highlight the item and click the Modify icon. Type the new text or steno.

### Delete

Delete an existing item in the Text or Text/Steno section. Highlight the item and press **Delete** or click the Delete icon. At the Delete confirmation message, press **Enter** to delete.

### Copy

Copy an individual item, multiple items or all the entries in the Cat Scratch pane from one job and paste them into the Cat Scratch pane of another job. Use Windows conventions to highlight the desired items and click the Copy icon.

### Paste

Paste copied items from another Cat Scratch pane into the current Cat Scratch pane.

### Search

Search the Cat Scratch pane. Depending on your cursor focus, the Search looks in the Text or the Steno/Text section.

#### **Pin/Lock**

Highlight entries and click the Pin icon to lock the items at the top of their respective sections. Locked items do not scroll when other entries are added to the Cat Scratch pane. Locking items may be useful when you have key briefs or dictionary entries that you want displayed first. Use the Unpin icon to unlock an item.

#### **Unpin/Unlock**

Highlight entries and click the Unpin icon to unlock the items from the top of their respected section. Unpinned items display in the list with their original sorting number.

#### **Add Most Used Dictionary Entries**

Automatically copy the most used Case Dictionary entries to the Steno/Text section of the Cat Scratch dialog pane. The most used entries count is based on the Usage Count information in the Case Dictionary. For example, you have an on-going case in which two weeks passed since the last proceeding. As a quick reference to the way you wrote the most commonly used names and terminology in the case, you click the Add Most used Dictionary Entries icon. The most used entries in the Case dictionary automatically display in the Cat Scratch dialog pane. The number of entries that display is determine by the setting in Cat Scratch Options.

#### **Font Type**

Select a font type for all the characters in the Cat Scratch pane. This affects both sections.

#### **Font Size**

Determine the size of the font for all the characters in the Cat Scratch pane. This affects both sections.

#### **Print**

Print the items in the Cat Scratch dialog pane.

#### **Options**

Display the [Cat Scratch Options](#) dialog box to customize the options for the Cat Scratch dialog pane.

## **Cat Scratch Options**

### **Cat Scratch Scope**

Determine the availability of information in the Cat Scratch dialog pane. This option is available from the Cat Scratch Options or Advanced Edit Options dialog box. Changing the option in one location changes it in the other location.

Select one of the following:

#### **Case**

Items in the Cat Scratch pane are available for any job related to the case and the information is stored in the Case History. The default scope setting is Case. When the job is not in a case, the CAT Scratch information is available in the job.

**Job**

Items in the Cat Scratch pane are available for that job and the information is stored in the Job History.

**User**

Items in the Cat Scratch pane are available for any job in the current user and the information is stored in the User History, System Files\_Case.

**Number of Case Dictionary entries to add**

Specify the number of Case Dictionary entries to automatically add to the Cat Scratch dialog pane. Click the Add most used entries from case dictionary icon to automatically add the specified number of most used entries. Valid settings are 1 - 25. The default is 10.

**Display text section first**

Select **Yes** to display the text section first in the Cat Scratch pane. Select **No** to display the Steno/Text section first. Changing the setting applies to any new jobs opened in Edit. It does not apply the currently open file.

## Search Cat Scratch Pane

**Search****Text Section**

Search the Text section for specific text or entry type. To search for text, type the text and include any format symbols, fields or [extended characters](#) as necessary.

To search for an entry type, check the Entry Type box and select an item from the list.

**Steno/Text Section**

Search the Steno/Text section for text or steno. To search for text, select **Text** from the list and type the text, including any format symbols, fields or extended characters as necessary.

To search for steno, select **Steno** from the list and type the steno. Separate multiple strokes with a forward slash. When starting with a final stroke, place a – (hyphen) before the first letter.

**FS**

Add format symbols to a text search. Select **FS** and double click the symbol from the list or position the cursor in the Search field, press **F4** and then press the appropriate format symbol shortcut letter or symbol.

**Insert Field**

This feature is not applicable in CATalyst BCS.

**Entry Type**

Limit a text search by entry type. Check this box and select an entry type from the Search list.

Entry Types

**Conflict**

An entry that contains a conflict end format symbol.

**Scan stop**

An entry that contains a scan stop begin or end format symbol.

**Numbers**

An entry that contains numbers.

**All Capped**

An entry that contains all capped text.

**Contains capped**

An entry that contains at least one capital letter.

**Phrase**

An entry that contains two or more words separated by a space.

**Contains punctuation**

An entry that contains punctuation.

**Contains format symbol**

An entry that contains a format symbol.

**Contains Field(s)**

An entry that contains a field.

**Auto Includes**

An entry that begin with @.

**AccelerWriter**

An entry that begin with &&.

**Number Conversion**

An entry that contain the {Number Conversion} translate command.

**Number Trigger**

An entry that contain the {Number Trigger} translate command.

**Numeral Words**

An entry that contain a word number including hundred, thousand, million, etc.

**Speaker Entries**

An entry that contain a <Colloquy> format symbol and a colon.

**Case Sensitive**

Search only for text that matches the text typed in the Search field exactly as it occurs in upper and lower case. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field.

**Whole Word**

Search only for whole words that match the text typed in the Search field.

If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. For example, searching for "of" would result in Search finding "of", "officer", "coffee", "soft", etc.

**Partial Stroke**

Search for the specified steno as an entire steno outline or as part of a steno outline. For example, searching for –FPLT with the Partial Stroke option active displays entries: -FPLT, -FPLTD, -FRPBLGTS, -FRPBLTS, etc. Searching for –FPLT without Partial Stroke, displays entries with –FPLT as a separate outline, such as: -FPLT, -FPLT/-FPLT, etc. CATalyst BCS searches all steno strokes for the letters indicated in the Steno column based on your selection in the Location field.

**Location**

Select search parameters.

**Exact Match**

Search for entries that exactly match the steno or text entered in the Search field.

**Begins With**

Search for entries that begin with the steno or text entered in the Search field.

**Ends With**

Search for entries that end with the steno or text entered in the Search field.

**Contains**

Search for entries that contain, anywhere in the entry, the steno or text entered in the Search field.

**Direction**

Select the direction of the search in the list.

**Forward**

Search forward, from the cursor position to the end of the section.

**Backward**

Search backward, from the cursor position to the end of the section.

**Search Results**

When you invoke a [Search](#) with the *List Search Results* option selected, CATalyst BCS searches the transcript and automatically displays the results of the Search in the Search Results dialog pane. The text content, page, line and section reference display for each occurrence of the searched item. When performing a [Wildcard](#) or [Regular Expression](#) search with the List Search Results option selected, the Wildcard and Regular Expression matches will be underlined. If you search for Q, A or Colloquy format symbols, the first letter following the format symbol will be underlined.

Double click an entry to move the cursor to that location in the current transcript. You can also use the [Search Next and Previous Search Result](#) to move your cursor from the current position in the transcript to the next occurrence.

To manually open the Search Result pane, press **Alt + v, e, s (View/Pane/Search Results)**.

## Search Results Dialog Pane Features

### Font Type

Select a font type for all the characters in the Search Results pane.

### Font Size

Determine the size of the font for all the characters in the Search Results pane.

### Print

Print the items in the Search Results pane.

## Dictionary Info

Dictionary Info allows you to view dictionary entries during captioning. You can view an entry in the selected dictionary or by using the [Query Realtime Translations](#) feature. When you highlight a word in the History window and select a dictionary to view the entry, the selected dictionary opens the Manage Dictionary function and displays the dictionary entry that matches the highlighted word. If CATalyst BCS cannot find the entry, the first dictionary entry displays.

When you choose to look at the definition for a particular translation/steno outline using the Query Realtime Translations feature, the Lookup dialog box displays. The outline appears in the title bar and the definition is listed along with the dictionaries in which the definition is found. You can use the Query Realtime Translations command in the History window or Vertical Notes pane while in a captioning session or while editing a caption file.

## Display

The Display menu allows you to access CATalyst BCS features that affect the display of items in the History Window. For example, this includes [setting the cursor size](#), [vertical notes font](#) and [locking](#) and/or [loading](#), [saving](#) and [resetting](#) window positions.

### Vertical Notes Font

Vertical Notes Font allows you to change the font and font style in the vertical notes dialog pane. To adjust the character size, change the size of the Vertical Notes dialog pane. The selected font and font style remains until it is changed.

To change the vertical notes font:

1. Place the cursor focus in the Vertical Notes dialog pane by clicking in the pane.
2. Press **Alt + v, d, v (View/Display/Vertical Notes Font)** or right click and select **Vertical Notes Font**. The Font dialog box displays. Make necessary changes:

#### Font

Select a font type.

### Font Style

Select a font style:

- **Regular**—no style attributes
- **Italics**—apply italics to the selected font
- **Bold**—apply bold to the selected font
- **Bold Italic**—apply italics and bold to the selected font.

### Sample

A sample of how text displays in the job with the selected font settings.

3. Press **Enter (OK)** to close the Font dialog box.
4. In the Display Font dialog box, press **Enter (OK)** to apply the changes.

### Set Cursor Size

Set Cursor Size allows you to change the size of the cursor on the screen. You can set the cursor size for the Default and all other keyboard maps when active.

To change the cursor size:

1. Press **Alt + v, d, z (View/Display/Set Cursor Size)**. The Cursor Size dialog box displays.
2. Make entries:

#### Cursor Type

Select the keyboard map type for which you want to change the cursor size. Select one:

- Default Keyboard Map
- All Other Keyboard Maps

#### Enter Value

Type a number **1 through 20**.

3. Press **Enter (OK)**.

### Set Cursor Context

Set Cursor Context allows you to select a cursor position for arrowing or scrolling through the file. The default percentage is 18. This is a percent of the screen with the bottom being 0 and the middle of the screen being 50, so that 50% is at the center of the screen. 50% is comparable to center line editing.

To set cursor context:

1. Press **Alt + v, d, e (View/Display/Set Cursor Context)**. The Set Cursor Context dialog box displays.
2. Type a number between **0 – 50** in the field. CATalyst BCS retains the settings for the current user until changed.
3. Press **Enter (OK)**.

## Lock Window Positions

Lock Window Positions prevents the CATalyst BCS dialog panes from being rearranged. The dialog panes remain set to the position on the screen they occupy when you turn this feature On. They retain their position until you turn this feature Off. You can continue to show, hide, dock, float, and resize a floating dialog pane and load saved window positions when Lock Window Positions is active.

To lock the dialog panes in position, press **Alt v, d, l (View/Display/Lock Window Positions)**. A check mark next to the menu item, Lock Window Positions, indicates the feature is active. You can also set the Preference option, [Start with Locked Positions](#), to have CATalyst BCS start each session with the window positions locked. To turn the feature Off, press **Alt v, d, l (View/Display/Lock Window Positions)** again.

## Load Window Positions

The Load Window Positions feature allows you to load a saved window position file (filename.sgcul). When you load a saved file, the dialog panes display on the screen in the same position in which they were saved. You can load saved window positions even when the Lock Window Positions option is active. You can also set the Preference option, [Startup Windows Positions](#), to automatically load a specific saved window position file when you start a captioning session.

Saved window files are stored in the Saved Windows Positions case within the Captioning case located in the System Files case.

## Load a Saved Window Position File

1. Press **Alt + v, d, w (View/Display/Load Window Positions)**. The Load Window Positions dialog box displays.
2. Select a file and press **Enter (Open)**. The saved window position file loads and the dialog panes redisplayed in the saved positions.

## Save Window Positions

Save Window Positions allows you to save the positions of the CATalyst BCS dialog panes to a named file (filename.sgcul) which you can select and load at a later time. You may want to save different window (dialog pane) arrangements based on the type of shows you caption.

Saved window files are stored in the Saved Windows Positions case within the Captioning case located in the System Files case.

## Save Edit Dialog Pane Position

1. Verify the dialog panes are in the desired position on the CATalyst BCS screen.
2. Press **Alt + v, d, s (File/View/Save Window Positions)**. The Save Window Positions dialog box displays.
3. Do one of the following:
  - In the File name field, type a name for the user settings file and press **Enter (Save)**.
  - Select an existing file. The name displays in the File name field. Press **Enter (Save)**. CATalyst BCS prompts you to replace the existing file. Press **Enter (Yes)** to overwrite the existing file.

## Reset Window Positions

Reset the display and position of the captioning dialog panes to the CATalyst BCS default. To reset the display, press **Alt + v, d, r (View/Display/Reset Window Positions)**.

## Reveal Codes

Reveal Codes displays formatting information along with text, in the History or Script window. Formatting information includes paragraph styles, format symbols, and font codes.

When Reveal Codes is active, formatting information remains visible in the History window. You can edit normally in the History window. Use Reveal Codes to identify and delete unwanted formatting information.

To toggle the Reveal Codes display open and closed, press **Ctrl + Shift, r (View/Reveal Codes)**.

## Show

The Show feature presents a selection of toolbar and window options that allows you to customize your screen view. Press **Alt + v, s (View/Show)** to display the Show menu. Click an option to select or deselect it. A check mark next a menu item indicates the feature is active. When you click Customize Toolbar, the Customize dialog box displays.

The Macro toolbar only [displays](#) by clicking and dragging the Macro submenu. Once displayed, the Macro toolbar appears in the Show menu and you can click it to remove the toolbar from the screen.

## Toolbars

CATalyst BCS comes with a default set of toolbars which you can display, hide and customize. You can add icons, remove icons and reposition icons from one toolbar to another. If the Customize Toolbar option, Show ScreenTips on toolbars, is active you can view the function of each icon. Rest your cursor on the icon to display the function. You can also view the function of each icon in the [Customize](#) Toolbar dialog box, Command tab.

### Moving Toolbars

Toolbars can be positioned for display in different locations in the CATalyst BCS screen. You can rearrange them in the upper portion of the screen, display them along the side or bottom, or float them. To move a toolbar:

1. Position the cursor on the left corner of the Toolbar.
2. Click and hold the left mouse button
3. Move the toolbar to the desired location on the side, bottom or top of the screen and release the mouse button. To have the toolbar float, release the cursor anywhere on the screen.

### CATalyst BCS Toolbars

Toolbars are shown with the CATalyst BCS default icons.

#### Function Bar

#### Job Manager

## Standard

### Standard Plus

### Edit

### Marks

## Open Special

## Table

## Dictionary/List

## Dictionary Extra

## Compress Print

## Full Screen

## Voice

## Words Per Minute

## Macro

## Status Bar

Display or hide the Status Bar at the bottom of the CATalyst BCS screen. The Status Bar displays above the stationary Status Bar. It shows steno when marking and steno strokes held, if any, when writing realtime. On the right side of the toolbar, original conflicts resolved by EZ Choice or Auto Conflict display.

Stationary Status Bar

## Translate Statistics

Display or hide the [translate statistics](#) for the current captioning session.

## Up-to-Date History

The Up to Date feature displays realtime text in the History window. This allows you to hide the Realtime window while still viewing the realtime text. If necessary, when using the Up-to-Date option, you can edit the realtime text that displays before it is sent to the encoder. Use the Caption Preview window to view caption text sent to the encoder. A check mark in front the Up-to-Date feature indicates it is active.

## Windows

You can select to display and hide captioning windows. When a check mark displays and the window is not visible, it may be set to hide. No check mark indicates the feature is not selected. Click the feature to select and deselect it.

### Vertical Notes

Vertical notes synchronize with the realtime text. You can make dictionary definitions directly from the vertical notes.

### Session Information

Allows you to easily connect and disconnect your writing machine, access your Credit files, change profiles and view your connection type, NIK files, and translate options.

### Story Queue

Displays each story for the currently selected script files. You can send stories line-By Line via steno or computer keyboard or NIK files. Stories are loaded in the order they display. You can change the order by clicking and dragging a story to a specific location or highlight a story and using the Up and Down arrows. You can also use the [Story Queue](#) feature on the Setup menu.

### Caption Preview Window

Simulates how your captions display on the video screen or television. This dialog pane also displays caption style, position and mode.

### Status

Displays the Status dialog pane with the modem connection status such as dialing or connecting. It also displays encoder status; Block, Pass or Suspend.

### Script Window

Displays the text for all the Script files with the current send line and the next send line highlighted.

### Realtime

Displays the line of text, realtime or live display, which you can edit before it is sent to the encoder. This allows you to view the text and make necessary corrections. Story lines sent to the encoder also display in this window.

### **AutoFeed**

Displays the [AutoFeed](#) dialog pane which allows you to send script lines automatically based on the number of words per minute.

## **Customize Toolbars**

You can customize the toolbars including changing the name of icons or even the icon itself. You can select what icons are on toolbars also. Display the [Customize](#) dialog box to display toolbars and modify the icon content of a toolbar.

### **AutoFeed**

Show AutoFeed displays the AutoFeed dialog pane where you can send script lines automatically based on the number of words per minute. The script can be fed line by line until the entire file is sent or you can set AutoFeed to automatically start at the beginning (loop) when it reaches the end. You may want to use the AutoFeed feature as a method to send script in a live display or for testing purposes.

You can modify your keyboard map to include AutoFeed keyboard commands. When the AutoFeed dialog pane is not displayed and you invoke an AutoFeed command, CATalyst BCS opens the AutoFeed dialog pane. The following keyboard map assignments allow you to control AutoFeed from your keyboard:

#### **<Caption: AutoFeed Start/Stop>**

Toggle between starting and stopping AutoFeed if the script is automatically being sent.

#### **<Caption: AutoFeed Decrease Speed>**

Reduce the words per minute setting at which the script file is being sent.

#### **<Caption: AutoFeed Increase Speed>**

Increase the words per minute setting at which the script file is being sent.

#### **<Caption: AutoFeed Toggle Repeat>**

Alternate between sending the script file once and sending the script file again from the beginning once the file is sent.

## **Display Auto Feed Pane**

1. Press **Alt + v, s (View/Show)** to display the Show menu.
2. Click **AutoFeed**. A check mark next the feature indicates it is active.
3. Use following options as necessary:

### **Start/Stop**

Toggles between starting and stopping the AutoFeed.

### **Output Rate**

Adjust the speed at which the script file is sent. Click the field and use the up/down arrows to increase or decrease the speed.

**Caption Style**

The type of caption style for the AutoFeed. Click the field and select a style. Currently Paint on is unavailable.

**Data Channel**

The default is CC1. Click the field and select a channel.

**Repeat**

Set the option to repeat sending the script file. Choose one of the following:

**Yes**

Restart sending the script file from the beginning once the entire file has been sent.

**No**

Send the script file once.

**Save**

Have CATalyst BCS remember the setting changes for the next time you use AutoFeed.

An asterisk displays in the AutoFeed title bar when changes have been made but have not been saved. Once you save the changes, the asterisk no longer displays.

**Customize Toolbars**

The Customize Toolbars feature allows you to add, move, or remove CATalyst BCS icons on the CATalyst BCS toolbars for each function. You can remove icons you do not use or rearrange the order in which they appear on the toolbar. CATalyst BCS remembers the new settings for current user until changed.

You can also show or hide toolbar icons by clicking the down arrow located on the right side of a toolbar. Select Add or Remove Button and then choose the toolbar you want to modify. Click next to a command to show or hide it from the toolbar. A check mark indicates the icon shows on the toolbar.

Additionally, you can change the style and appearance of toolbar icons. When the Customize dialog box is open, the right click menu allows you to modify the icons.

**Modify Toolbars**

1. Press **Alt + v, s, z (View/Show/Customize Toolbars)**. The Customize dialog box displays with three tabs: Toolbars, Commands and Options.
2. Make entries on each of the tabs as necessary:

**Toolbars**

Check the box next to the toolbar you want to display on the screen.

**New**

Create a new custom toolbar. The New Toolbar dialog box displays. Use the default name or type a new name and press **Enter (OK)**. The name displays in the Toolbar list. Once the toolbar displays on the screen, use the Command tab to drag and drop the icons you want to display.

**Rename**

Rename a custom toolbar. Highlight the toolbar in the list and select **Rename**. The Rename Toolbar dialog box displays where you can type a new name in the field. Press **Enter (OK)** to apply the new name. This field is active only when custom toolbars display in the list.

### **Delete**

Delete a custom toolbar. Highlight the toolbar in the list and select **Delete**. CATalyst BCS prompts you to confirm the deletion. Press **Enter (OK)** to remove the custom toolbar. This field is active only when custom toolbars display in the list.

### **Reset**

Reset the toolbars icons for the current function to the CATalyst BCS default command settings.

## **Commands**

Select a Category and then drag a Command from the dialog box to a toolbar. While moving an icon, the cursor displays with an X on top of a rectangular box. When you move the cursor to a valid placement location on the toolbar, CATalyst BCS removes the X and displays a black vertical bar on the Toolbar indicating the point of insertion when you release the mouse button.

Do any of the following:

### **Add a command**

Using the left mouse button, click the desired command and continue to hold the button. Move the cursor to the desired location on a toolbar or the right click menu and release the button.

### **Remove a command**

Use the left mouse button to click the desired command and hold the button. Move the cursor off the toolbar or right click menu to any location on the screen and release the button.

### **Relocate a command**

Use the left mouse button to click the desired command and hold the button. Move the cursor to the new location on the toolbar or right click menu and release the button.

## **Menus**

Customize the right click menu and right click toolbar for CATalyst BCS captioning sessions and when working in a caption edit file.

### **Select context**

From the drop down list, select to customize the BCS Right Click menu or the BCS Right Click Toolbar. Click the **Command** tab. Refer to "Commands" in this topic to add, remove or relocate a command on the right click menu or toolbar.

### **Don't show the right-click toolbars in all areas**

Check this box to hide the display of all right click toolbars the CATalyst BCS History window and CATalyst BCS edit files.

### **Don't show the right-click toolbar in the BCS area**

Check this box to hide the display of the right-click toolbar in the BCS History window.

**Reset**

Reset the right click menu or toolbar, displayed in the *Select context* field, to the default settings

**Options****Always show full menus**

Show all the commands on the menus. Uncheck this box to show only the basic and most frequently used menu features.

**Show full menus after a short delay**

When you rest the cursor on a menu, all the commands display after a short delay.

**Reset menu and toolbar usage data**

This feature is unavailable.

**Large icons**

Increase the size of the toolbar icons.

**Show ScreenTips on toolbars**

When you rest the cursor on a menu, a brief description of the toolbar function displays.

**Show shortcut keys in ScreenTips**

Display keyboard shortcut key with the ScreenTip.

**Menu animations**

Select the way menus display when you click on them. For example, Slide displays the menu in a sliding motion.

3. Press **Close** to save the changes and exit the Customize dialog box. The changes remain in effect for the current user until changed.

## Modify Toolbar Icons

The Customize Toolbars feature allows you to modify the appearance of a toolbar "button" or icon. You can switch the style of an icon between icon only, text only or icon and text. The icon text can be modified. You can also modify the icon image. The toolbar must be visible on the screen in order to make modifications.

To modify icon appearance:

1. Press **Alt + v, s, z (View/Show/Customize Toolbars)**. The Customize dialog box displays with three tabs: Toolbars, Commands and Options
2. Place your cursor on the icon you want to modify.
3. Right click the mouse to display the right-click menu. Use the following options as necessary:

**Reset**

This option is available when you place your cursor on an icon that has been modified from its default appearance. Place your cursor on the icon and click **Reset** to restore the icon to the default.

### Delete

With your cursor on the icon you want to remove from the toolbar, select **Delete**.

You can restore the icon along with any other toolbar changes from the Customize dialog box. On the Toolbar tab, highlight the toolbar to which the icon belongs and select **Reset**. Resetting restores all the default icons in their default appearance to the selected toolbar. A warning message displays prompting you to continue. Select **OK** to continue with the restore or **Cancel** to retain the changes.

### Name:

The text in this field displays on the toolbar when you select Text Only or Image and Text for the icon style. With your cursor on the selected icon, type the name you want to display.

The name you type here does not change the toolbar tip that displays when you rest your cursor on the icon.

### Set Icon Style

Select one of the following. A check mark in front of the menu item indicates the active selection.

#### Default Style

Restores the icon to the original default appearance.

#### Text Only

Display the icon with text and no image. The text that display in the *Name:* field is the text that displays on the toolbar.

#### Image and Text

Display the icon with text and image. The text that display in the *Name:* field is the text that displays on the toolbar.

### Change Icon Image

Use the following options to copy, paste and edit the icon image. To restore icon image to default, use Reset Button Image.

#### Copy Button Image

With your cursor on the icon you want to copy, select **Copy Button Image**. Use Paste Button image to copy the icon to another toolbar.

#### Paste Button Image

Paste the copied icon to another toolbar. The pasted icon replaces the icon on which your cursor is resting.

#### Reset Button Image

Return the icon image to the default.

#### Edit Button Image

The Button Editor dialog box displays where you can modify the current icon image. Select **OK** when finished to accept the changes or **Cancel** to have the icon retain the current image.

### Change Button Image

A menu of icon images displays from which you can select a different icon to replace the current image. The function of the icon remains the same.

### Begin a Group

Inserts a delineating line to the left of the icon indicating the beginning of an group of related icons on the selected toolbar. With your cursor on the selected icon, choose **Begin a Group**.

## Translate Statistics

Show Translate Statistic displays translation statistics about the current captioning session. Translate statistics include the current time, total strokes and untranslates, total number of dictionaries, and total pages for the job. When you click the down arrow  to expand the dialog box, translation status details display. Click the up arrow  to condense the dialog box. Power Defines and keyboard actions, such as defining and resolving conflicts, do not affect translation statistics.

### View Translate Statistics

To toggle the display On and Off, press **Alt + v, s, n (View/Show/Translation Status)**. The following information displays when you expand the translation status dialog box to show all the translation details for the job.

#### Name of the job

The name of the captioning session on the Title Bar of the dialog box.

#### Current Time

The current time based on the computer's clock.

#### Strokes

##### Total

The total number of strokes written. When you write a steno stroke that is an untranslate and then use a deletion stroke, such as asterisk delete, to delete the untranslated stroke, neither the steno stroke or the deletion stroke count in the total number of strokes.

##### Untrans

The number of untranslates in the job. When you write a steno stroke that is an untranslate and then use a deletion stroke, such as asterisk delete, to delete the untranslated stroke, neither the steno stroke or the deletion stroke count as an untranslate statistic.

When you write a deletion stroke at the beginning of the file or when the Reporter's Area is zero, the deletion stroke displays as an untranslate if there is nothing to delete. The deletion stroke is not added to the untranslate count because there is a definition in the dictionary for it. It is included in the total number of strokes.

##### Untran %

The percentage of untranslates.

#### Elapsed Time

##### Adjusted

The total elapsed time of the captioning session.

**Total**

The total elapsed time of the captioning session.

**Conflicts**

**Total**

The total number of conflicts written. Conflicts selected by Auto Conflict count in the total. Strokes written that result in a conflict are also included.

EZ Choice resolved conflicts do not count towards the total number of conflicts.

**Resolved**

The number of conflicts resolved by selecting conflicts from the writing machine using the Resolve Conflict Choice commands.

**Job Dictionaries**

The list of job dictionaries selected at the time of translation.

**Pages**

The total number of pages in the job.

**Options**

Displays the Used in Last Translation dialog box which indicates the translate options used during the translation of this job. This information may be helpful in the event that troubleshooting is necessary. Press **Enter (Close)** when finished viewing the information.

**Words Per Minute**

The Words Per Minute toolbar allows you to view the approximate number of words written per minute during captioning. The average number of words per minute is calculated over a minimum of two seconds up to a maximum of about 30 seconds. The software uses the longest consistent writing speed, within 25 percent. If you write substantially more words per minute for over 2 seconds, the Words Per Minute feature reflects the faster rate even if you cannot maintain the speed. For example, if you are writing at approximately 180 words per minute, the toolbar displays, 180. If you write approximately 225 words per minute for a short time, the toolbar displays, 225. When you stop writing, the display returns to 000 after a few seconds.

**Display the Words per Minute Toolbar**

1. Press **Alt + v, s (View/Show)** to display the Show menu.
2. Click **Words Per Minute**. A check mark next the feature indicates it is active.

**Word Definition**

Word Definition allows you to look up the definition of a selected word. You can view a word definition at any time during a captioning session or during Spell Check. Hyperlinks are available for words contained in a definition which exist as a defined word in the selected dictionary. These links display in underlined bold text. Links are also available for words listed as synonyms in a definition which exist as a defined word in the selected dictionary. These links display in underlined text. Links, by default, are set to

display in blue. You can modify Word Definition Dictionary dialog box colors in [Word Definition Dictionary Settings](#).

The Word Definition features uses the Merriam-Webster dictionary is the dictionary which comes with the CATalyst BCS software. Definitions are provided for approximately 215,000 words.

## View a Word's Definition

1. In the History window, place your cursor immediately before or on the word for which you want to look up a dictionary definition.
2. Press **Alt + v, w (View/Word Definition)**. The Merriam-Webster Dictionary dialog box displays with the definition for the highlighted word. If you receive the "no definition found" message, you can type a new word in the field and click **Find Word**.

Use **any** of the following dictionary dialog box options:

### Find Word

Look up another word. Type a new word in the field and press **Enter** or click the Find Word icon.

### Dictionary Search

Connect to the OneLook® website, if you have an active Internet connection, for additional definition possibilities for the same word selected in Word Definition.

### First Word

Display the first word in the dictionary.

### Previous Word

Display the word in the dictionary that occurs before the word currently displayed.

### Next Word

Display the word in the dictionary that occurs after the word currently displayed.

### Last Word

Display the last word in the dictionary.

### Settings

Modify the Word Definition Dictionary Settings. This includes limited Stenograph distributed dictionary choice and dialog box colors.

### Wordlist

Expand the Word Definition Dictionary dialog box to show the list of dictionary words. You can scroll through the Wordlist using the Up Arrow, Down Arrow, Page Up, and Page Down keys.

### Begin With

Show only those words in the dictionary that contain the word currently displayed.

3. When finished looking up word definitions, press **Esc**.

## Zoom

Zoom allows you to change the viewing size of the text in the History window by manually increasing or decreasing the viewing percent. You can select a higher zoom percentage to get a close up view of the text or select a lower Zoom setting to reduce the viewing size of the job allowing you to see more of the page. In addition to selecting a viewing percentage, you can also select **Fit Text**, which maximizes the display of text to the current size of the History window. You can also choose **Fit Page**, which maximizes the display of text to the current size of the History window in a smaller text size.

During a CATalyst BCS session, the default view is Fit Text. When editing a \*.que file, Zoom settings are remembered. For example, if you change your zoom settings to make the reduce the text size while editing, CATalyst BCS remembers the change the next time you open a \*.sgcap file.

## Change the Display Font Size

### Use the View Menu

1. Press **Alt + v, z (View/Zoom)** to display the Zoom menu. A check mark displays next to the current selection.
2. Select a new percent. To display the viewing size at a percentage other than the values provided, select **Custom**. In the Custom Zoom dialog box, enter a number between 1 and 800 in the Enter Value field.

### Click the Zoom icon

1. Click the Zoom  icon. CATalyst BCS displays the next percentage increase in the list.
2. Continue to click the Zoom icon. CATalyst BCS selects the next percentage increase in the list until it reaches the largest size. For example, the viewing percentage is set at 100%. You click the Zoom icon and the viewing percent increases to 150%. When you reach the largest size, CATalyst BCS toggles to Fit Text, Fit Page and up the list again.

Zoom Keyboard commands:

- Cycle through zoom settings
- Cycle through zoom settings (Reverse)
- Zoom 100%
- Zoom 150%
- Zoom 200%
- Zoom 400%
- Zoom 50%
- Zoom 75%
- Zoom Fit Page
- Zoom Fit Text

## CATalyst BCS Global Commands

CATalyst BCS contains several global commands that allow you to create and manage [global definitions](#), or globals, while captioning. Globals are steno-based words or phrases that you define once and are automatically applied to all occurrences from that point through to the end of the job. You can define untranslates, mistranslates, partial translates which include translated words and untranslates, or conflicts.

### About Global Definitions

Global definitions, or globals, let you define steno-based words or phrases once and then automatically apply the definition to all occurrences from that point through to the end of the job. You can define untranslates, mistranslates, partial translates (translated words and untranslates), or conflicts. Global definition types include: D-Define, K-Define, J-Define, and E-Define and Other Dictionary. Defines are created using the command of the same name from the Global menu.

When you create a global, CATalyst BCS automatically applies it forward through to the end of document. To apply globals forward and backward in the file, select the Entire File option in the Global Define dialog box when defining. To apply globals backward in the file after making a definition, use the [Apply All Globals Backward](#) command. You can undo a global if the word or phrase has not been subsequently modified.

When you create a global using the [Selective](#) option, CATalyst BCS stops on each occurrence affected by the global change. CATalyst BCS stops on the first occurrence affected by the global change. You can choose to apply the change to this occurrence, all occurrences, to the current Section only, skip the occurrence and go to the next occurrence or take no action and return to Edit. If you apply the change to all occurrences, the global is no longer selective. The Entire File option is ignored when using the Selective option but selecting Entire Section does apply the global to **all** occurrences in the current section. Selective globals (not Entire Section) do not apply to previous text. The selective global starts at the current cursor location, moves forward in the file until CATalyst is finished applying the selective global. Click OK in finished dialog box and the cursor returns to the location where the global was started.

When you create a global using the [Suggest](#) option CATalyst BCS displays a list of up to ten possible text definition for the steno displayed in the Global Definition dialog box. You can set CATalyst BCS to automatically display the Suggestion list by checking the *Open with Suggestions* option.

During realtime writing, globals apply to any incoming text. You can use the [Power Define](#) feature to apply globals forward and backward in the file and to all incoming text. Selective globals do not apply to new realtime text. If a selective global changes to no longer be selective, the global then applies to new realtime text.

You can create new definitions for future translations from the current steno outline. Select Generate All Possible Misstrokes in the global definition dialog box to generate misstroke definitions and place them in the destination dictionary. The current steno outline and text definition go to the global table and apply through the rest of the current captioning file in the History window. The generated misstroke definitions do not apply to the open file. Before generating misstroke definitions, CATalyst BCS checks the Personal Dictionary to avoid creating conflicting entries.

Selecting the Endings option in the global definition dialog box also allows you to create new definitions from the current steno outline. CATalyst BCS analyzes the word in the Text field to see if a " G", " S" or " D" steno outline could be added to the word. If so, then CATalyst BCS generates suggested definitions with the endings.

CATalyst BCS places a global define into the global table and, with the exception of E-Defines, into the appropriate dictionary. An E-Define only goes into the global table. CATalyst BCS handles global dictionary definitions as follows:

- A D-Define goes directly into your Personal Dictionary unless you select to use the [Update Area](#). A new D-Define applies during translation and is added to your Personal Dictionary the next time you open it.
- A K-Define goes into the associated case dictionary, the dictionary with the same name as the case. The current job must be in a case in order to create a K-Define.
- A J-Define goes into the associated job dictionary, the dictionary with the same name as the job. You can select a different job dictionary by pressing selecting Other Dictionary in the Global Type field.
- An Other Dictionary define goes into a selected alternative dictionary.

### D-Define

D-Define (Ctrl + d) is a command used to define untranslated steno outlines or steno outlines and text. Use D-Defines for common words or phrases that you want in your Personal Dictionary to use each time you translate. You can only D-Define words or phrases that have steno associated with them. You cannot D-Define any typed words or phrases you insert.

The D-define command globally changes the steno-based words from the point in the job you create the global through to the end of the job or throughout the entire file, depending on the option selected. It also puts the definition into the global table and, depending on your [Dictionary Options](#), into your Personal Dictionary or the Update Area.

Create D-Define

### K-Define

A K-Define (Ctrl + k) is a command used to define untranslated steno outlines or steno outlines and text. Use K-Defines for words or phrases that you want in your Case Dictionary. You can create K-Defines only if the current job is in a case and if the words or phrases have steno associated with them. You cannot K-Define any typed words or phrases you insert.

The K-define command globally changes the steno-based words from the point in the job you create the global through to the end of the job or throughout the entire file, depending on the option selected. It also puts the definition into the global table and into the Case dictionary.

CATalyst BCS automatically uses K-Defines during translation on any job file translated within the Case. Using a Case dictionary can be useful when you have several jobs in the same Case. By using a Case dictionary you can eliminate the need to remember to select the job dictionaries when translating or copying the day one job dictionary to the day two job dictionary so that all those entries can apply to the day three job.

Create K-Define

### J-Define

A J-Define (Ctrl + j) is a command used to define untranslated steno outlines or steno outlines and text. Use J-Defines for words or phrases that you want in your job dictionary. You can only J-Define words or phrases that have steno associated with them. You cannot J-Define any typed words or phrases you have inserted.

The J-define command globally changes the steno-based words from the point in the job where you create the global through to the end of the job or throughout the entire the file, depending on the option selected. It also puts the definition into the global table and into the Job dictionary.

By default, CATalyst BCS uses the job dictionary of the same name as the file for J-Defines. You can choose a different job dictionary by selecting Other Dictionary in the Global Type field of the global definition dialog box. The selection is remembered for the current session. You can also change the default job dictionary for this job using the [Change Job Dictionary](#) feature.

Create J-Define

## E-Define

E-Define (Ctrl + e) is a command used to define untranslated steno outlines, steno outlines, and text that does not have associated steno. The E-define command globally changes the words from the point in the job you create the global through to the end of the job or throughout the entire file, depending on the option selected. It also puts the definition into the global table. The definition is NOT put into a dictionary.

To create a case sensitive E-Define, select the Case Sensitive option so that the E-Define is applied to words that match the case of the word in the Old Text field. If you do not select this option, CATalyst BCS changes all occurrences of the word in the Old Text field regardless of case. For example, to change Mark to Marc throughout the job without changing the word "mark", you could select the Case Sensitive option and type "Marc".

CATalyst BCS interprets words which are automatically initial caps, such as the first word following a Q or A symbol, as lower case words. CATalyst BCS only recognizes the word as initial capped when you type it initially capped, it is initial capped as a dictionary entry and it is initial capped as the result of a Cap Previous command or Cap Next command.

When the [Apply E-Defines To Typed Text](#) option is active, CATalyst BCS applies E-define globals to text you type, paste, insert, or replace in the job. For example, you have subject matter about Michael Wolff. You have a dictionary definition for "wolf" but this surname word is spelled with two "f"s. You e-define "wolf" to "Wolff". When you type "wolf" it changes to "Wolff." When the Apply E-Defines to Typed Text option is active, E-defines apply to Include files, Appended files, Auto Include files and Realtime data. They do not apply to text restored with the Undo command or Number Conversion text.

Create E-Define

## Other Dictionary Define

Other Dictionary Define allows you to place a dictionary define into any dictionary used to translate the current job, another existing job dictionary or a new job dictionary. For example, you have a medical word that you would like to define but not necessarily put in your Personal Dictionary or the current job dictionary. Using Other Dictionary Define, you can place your define in your Medical job dictionary. CATalyst BCS remembers your Other dictionary selection for the current session.

The Other Dictionary Define command globally changes the steno-based words from the point in the job where you create the global through to the end of the job or throughout the entire the file, depending on the option selected. It puts the definition into the global table and into the other selected dictionary.

Create Other Define

## Create a Global Definition

Complete the following steps to create a D-Define, K-Define, J-Define, E-Define or Other Dictionary definition. Depending on the type of define, not all options are available. For example, the Case Sensitive option is only available when creating an E-define while the Suggest option is not available when creating an E-define.

When writing realtime using CATalyst BCS V13 or higher and the Luminex or Diamante V2.0 or higher, Luminex or Diamante J-Defines and all CATalyst BCS dictionary definitions are [automatically exchanged](#). The Delete, Undo Global, Undo Last Global or Undo Global Once commands do not remove the definition from the Luminex or Diamante. Refer to the Luminex or Diamante User Guide for information on removing J-Defines from the Luminex or Diamante.

## Steps to Create a Global Definition

1. Place the cursor immediately before the word, on the word, or mark the steno or text you want to define.
2. Press one of the following:
  - **Ctrl + d (D-Define)**. The Global – D-Define dialog box displays.
  - **Ctrl + k (K-Define)**. The Global – K-Define dialog box displays.
  - **Ctrl + j (J-Define)**. The Global – J-Define dialog box displays.
  - **Ctrl + e (E-Define)**. The Global – E-Define dialog box displays.
  - **Ctrl + Shift + o (Other Dictionary Define)**. The Global – Other Dictionary dialog box displays.
3. Make necessary entries:

### Old Text

The selected text to global.

### Steno

The steno for the text selected to global. This field is unavailable for E-Defines.

### Mark/Unmark Left

Press **Alt + [** (left bracket) to expand or **Alt + ]** (right bracket) to deselect the marking to the left.

### Mark/Unmark Right

Press **Alt + Right Arrow** or **Ctrl + g** to expand or **Alt + Left Arrow** to deselect the marking to the right.

### New Text

The cursor defaults to the New Text field when defining. Type the new text, including any format symbols. Press **F9** to add [extended characters](#).

To copy the old text to the New Text field, press **F6**. You can toggle through the last ten typed replacement words by pressing **Ctrl + r** with the cursor in the New Text field; or **Ctrl + Shift + r** to toggle backwards through the selection.

When the Open with Suggestions option is checked, a list of up to 10 suggestions display when the Global dialog box opens. To select a suggestion, press the associated suggestion number or arrow up or down to highlight a suggestion and press **Enter**. To clear the suggestion list, press any other key, such as Esc.

When the option, [Spell Check While Defining](#) is not active, press **Shift + F7** to spell check the word in the New Text field. To look up a definition, press **Ctrl + F7**.

### **FS (Alt + f)**

Display the list of available [format symbols](#). To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry. To always display the format symbol list, check the box, Always Show Format Symbols.

You can also use shortcut keys to insert a format symbol. Place the cursor in the New Text field, press **F4** and then press the appropriate letter or symbol.

### **Insert Field (Alt + i)**

This feature is most likely not applicable in CATalyst BCS. Display the [Insert Field](#) dialog box from which you can select a field to insert into the text portion of the definition.

### **Cap (Alt + a)**

Copy the text in the Old Text field to the New Text field and cycle through three Cap/Uncap options for the text in the New Text field. You can also use the Ctrl + F5 method to cycle through the capping options. Cap applies the capping options to the text. The capping options include:

- Capitalize the first letter in a word or phrase, except for words in the NoCapWords list
- Capitalize all the letters in a word or phrase
- Uncap the letters in a word or phrase

### **Conflict (Alt + o)**

This option is available when a conflict is part of the Old Text. When you select Conflict, CATalyst BCS copies the text from the Old Text field to the New Text field, automatically choosing the first conflict. If you select Conflict a second time, CATalyst BCS chooses the second conflict. If additional conflict choices exist, select Conflict until the desired choice displays in the New Text field. When more than one conflict exists in the Old Text field, your selection applies to all the conflicts.

### **Suggest (Alt + u)**

Display a list of up to ten possible text definitions for the steno in the *Steno* field. Click on a selection or press the associated number to insert the entry into the *New Text* field. If you do not want to select a suggestion, type the correct text; or press ESC or ALT. The suggestion list closes and places the cursor focus in the *New Text* field. To automatically display the Suggestion list when the Global dialog box opens, select the *Open with Suggestions* option. The list of suggestions is not available when E-Define or Replace is selected in the *Global Type* field.

Suggested definitions display based on current globals, dictionaries used to translate the job, dictionary entry usage count, recently used data, drag/drop and stacking possibilities and spell checked phonetic suggestions based on the current Phonetic Table. When editing on a computer other than the one on which the job was originally taken, you must have all dictionaries and the phonetic table used during translation.

### Open with Suggestions

Automatically display a list of up to ten possible text definitions for the steno in the *Steno* field when the Global Define dialog box opens. The change applies the next time the Global Define dialog box displays. This option is not available when E-Define or Replace is selected in the *Global Type* field.

If you do not select this option, you can manually display the list by selecting *Suggest* in the Global Define dialog box. If you are using macros or AccelerWriters to open a Global Define dialog box, do not select this option. Use a key combination, such as Alt + u to manually select *Suggest* to display the suggestion list.

If you are using macros or [AccelerWriters](#) to open a Global Define dialog box, do not select this option. Use a key combination, such as Alt + u, to display the list of suggestions.

### Endings (Alt + n)

When you type a word in the Text field, CATalyst BCS analyzes the word to see if a " G", " S" or " D" steno outline could be added to the word. If so, then CATalyst BCS activates the Endings button. Caption Edit's [Plural Endings](#) Option setting also applies to the Endings feature. The Plural Endings option allows you to set the final S, final Z or both as keys you write to indicate a plural. The Global Endings dialog box displays when the Endings button is selected. You can select any of the suggested definitions to add to your dictionary. For example, you have REPT in the Steno field and type "represent" in the Text field. The following suggested entries display when you select Endings:

REPTD = represented

REPTS = represents

The word "representing" is not suggested because the final "g" comes before the final "t" in the original steno outline.

### Spaces

When two or more words display in the Old Text field, the Spaces feature copies the text to the New Text field and toggles the placement of a [<Sticky Space>](#) format symbol between words, removes the spaces between words and returns to the original state. Spaces is also available when you type two or more words in the New Text field.

### Stitch (Alt + -)

Copy the text in the *Old Text* field to the New Text field and place hyphens between each word. Stitch is also available when you type words in the *New Text* field. If there is one word, the letters are hyphenated, if there are two words, the words are hyphenated. If you press Alt + hyphen again, CATalyst toggles to the hyphens being removed.

If there are three or more words, a drop-down list displays with different stitch choices. For example, if the highlighted words are unique CATalyst features, the drop-down list displays. You can select the number of the choice you want or click the choice:  
unique-CATalyst-features

unique-CATalyst features  
unique CATalyst-features

Using the above three examples, you can press Alt + , (comma), a list displays. You can select the number of the choice you want or click the choice:

, unique CATalyst features,  
, unique CATalyst, features  
unique, CATalyst features

Using the above three examples, you can press Alt + " (quote symbol) a list displays. You can select the number of the choice you want or click the choice:

"unique CATalyst features"  
"unique CATalyst" features  
unique "CATalyst features"

### Global Type

The type of define originally selected displays. To select a different type of global define choose from the drop down box, or press **one** of the following key combinations. When you D-Define, K-Define, or J-Define the entry, the correct steno must display in the Steno field.

- **Ctrl + d** (D-Define)
- **Ctrl + k** (K-Define) - if the file is in a case.
- **Ctrl + j** (J-Define)
- **Ctrl + e** (E-Define) - does not place the global definition into a dictionary.
- **Ctrl + r** (Replace) - for this occurrence only.
- **Ctrl + Shift + o** (Other Dictionary) - send job dictionary defines to an alternative dictionary.

### Pick Other Dictionary

Send job dictionary defines to an alternative dictionary when making an O-Define. Select a current dictionary from the drop down list or use **Browse** to choose another dictionary. Depending on your [Global Options](#) settings, CATalyst BCS remembers your selection for the current session or for every job. This field displays when you select Other Dictionary in the Global Type field.

### Entire File (Alt + I)

Check this box to apply the global change forward and backward throughout the job.

### Case Sensitive (Alt + v)

Check this box for CATalyst BCS to change any occurrence of the word in the Old Text field only when it matches the same upper and lower case letters. Uncheck this box, to change all occurrences of the word in the Old Text field regardless of the case.

This option is only available for E-Defines.

### Selective (Alt + s)

Check this box to have CATalyst BCS mark the global as [Selective](#) and identify it in the Global Table. CATalyst BCS moves to each occurrence affected by the global change. You can choose to apply the change to this occurrence, all occurrences, to the current Section only, skip the occurrence and go to the next occurrence or take no action and return to Edit. If you apply the change to all occurrences, the global is no longer selective. The Entire File option is ignored when using the Selective option but selecting [Entire Section](#) does apply the global to **all** occurrences in the current section. Selective globals (not Entire Section) do not apply to previous text. The selective global starts at the current cursor location, moves forward in the file until CATalyst is finished applying the selective global. Click OK in finished dialog box and the cursor returns to the location where the global was started., allowing you to choose to apply the change, skip the occurrence or apply the change to all occurrences. The Confirm dialog box displays for you to select the action for each occurrence. The [Entire File](#) option is ignored when using the Selective option. Selective globals do not apply to previous text. The selective global starts at the current cursor location, moves forward in the file until CATalyst is finished applying the selective global. Click OK in finished dialog box and the cursor returns to the location where the global was started.

To prevent selective globals from being added or pasted when using the [Add Other Globals](#) command or when marking and copying globals from one table to another, check the Global Table [option](#), *Exclude Selective Global*.

### **Quick add to Personal Global Table (Alt + q)**

Check this box to add the definition to the [Personal Global Table](#).

This option is only available for E-Defines.

### **Generate All Possible Misstrokes (Alt + m)**

Check this box to have CATalyst BCS generate definitions in the designated dictionary based on all the possible misstrokes of the original steno outline. Only the original steno outline goes into the current global table. All misstrokes are available for future translations.

CATalyst BCS generates a definition provided the generated misstroke does not conflict with an existing entry in the Personal Dictionary. For example, you define /SROEUS as "voice" with Generate All Possible Misstrokes selected. CATalyst BCS also creates a dictionary definition for the following steno outlines as "voice": /SROUS, SROES, and /SROS. The steno outline, /SRAOEUS already has a definition in your Personal Dictionary as "vice", so CATalyst BCS did not generate /SRAOEUS as a misstroke.

By default, this option is always unchecked when you open the Global define dialog box. You can [change](#) the default so that the Global define dialog box displays with Generate All Possible Misstrokes selected. A separate default setting for D-Defines, J-Defines, and K-Define can be set.

This option does not apply to E-Defines.

### **Add 2 Cat Scratch**

Selecting this option results in the steno and text of the global being added to the Steno/Text section of the Cat Scratch pane. The Add to Cat Scratch option is not remembered regardless of Remember selected options for D, J, K and O defines status in the Advanced Global Options dialog box.

This feature does not apply to E-Defines.

4. When finished defining, do **one** of the following:

- Press **Enter (OK)** to apply the definition.
- Press **F8** to apply the definition and scan to the next untranslate.

## Global Definition Dialog Box Shortcut Keys

F4 + #	Insert EZ Text into the <i>New Text</i> field.
F6	Copy the old text to the <i>New Text</i> field.
F9	Add extended characters to the <i>New Text</i> field.
F11 + #	Copy clipboard text to the <i>New Text</i> field.
Alt + 2	Copy text in the <i>New Text</i> field to the Text portion of the Cat Scratch pane.
Alt + -	Stitch the text in the <i>New Text</i> field. If more than two words are in the Text field, CATalyst displays a drop-down list of hyphenated options.
Alt + ,	CATalyst displays a drop-down list of comma placements depending on the number of words in the Text field.
Alt + "	CATalyst displays a drop-down list of quote placements depending on the number of words in the Text field.
Alt + →	Expand the marked text to the right.
Alt + ←	Deselect the marked text from the right.
Alt + [	Expand the marked text to the left.
Alt + ]	Deselect the marked text from the left.
Alt + a	Copy the old text to the <i>New Text</i> field and cycle capitalization options.
Alt + f	Display the list of available format symbols.
Alt + i	Insert a field into the <i>New Text</i> field. Fields are not commonly used in CATalyst BCS.
Alt + l	Apply the global change forward and backward throughout the job.
Alt + m	Generate all possible misstrokes.
Alt + n	Activate the Endings button.
Alt + o	When the old text contains a conflict, copy the text from the <i>Old Text</i> field to the <i>New Text</i> field, automatically choosing the first conflict.
Alt + q	Add the definition to the Personal Global Table.
Alt + s	Mark the global as Selective.
Alt + u	Display a list of up to ten possible text definitions for the steno in the <i>Steno</i> field.
Alt + v	Change occurrences of the word in the <i>Old Text</i> field only when it matches the same upper and lower case letters as text in the <i>New Text</i> field
Ctrl + g	Expand the marked selection.
Ctrl + r	With the cursor in the <i>New Text</i> field, toggle through the last ten typed replacement words.
Ctrl + F7	Spelling Lookup.

Ctrl + Shift + r With the cursor in the *New Text* field, toggle backward through the last ten typed replacement words.

Shift + F7 Spell check the word in the *New Text* field when the option, [Spell Check While Defining](#), is not active.

## Add Other Globals

Add Other Globals (Alt + g, a) is a command that allows you to apply global definitions from another job to your current job and places the globals into the global table of the current job. You can select individual globals or all the globals, choosing to apply them forward in the file from the cursor location or to the entire file. If you only apply the globals forward and then later decide you want to apply them backward, use the [Apply All Globals Backwards](#) command.

When you add globals using the Add Other Globals command, any globals previously identified as selective are no longer selective and CATalyst BCS no longer stops on each occurrence. The globals automatically apply when other globals apply. To prevent selective globals from being added or pasted when using the [Add Other Globals](#) command or when marking and copying globals from one table to another, check the Global Table [option](#), *Exclude Selective Global*.

To select and add globals from another job:

1. Press **Alt + g, a (Global/Add Other Globals)**. The Add Other Globals dialog box displays. When editing a job inside a case, the Open dialog box defaults to displaying global tables contained within the same case.
2. Make necessary entries:

### Look in

Defaults to the current user. To select a global file from a different case or user, click the Up One Level  icon, to select a different user.

### Available Files Window

Select a global file. If the file is in a Case, first open the case. The selected file displays in the File name field below. You can also type the name of the file in the File name field.

### File name

The global file selected to open. Type a file name or select a file from the list.

### Files of type

Identifies the file type that displays in the Available Files Window. The default is Global Files (.sgglob).

### Browse

Locate a folder outside of the CATalyst BCS folders.

3. Press **Enter (Open)**. The selected global table displays.
4. Select globals to add to the global table and apply to the open job. Do **one** of the following:

### Select one entry

Highlight the entry for selection.

### Select specific entries

Press and hold **Ctrl** while you click the individual entries to highlight.

### Select a consecutive group of entries

Click to highlight the first entry of the group. Locate the last entry you want to select. Press and hold **Shift**, while you click the last entry. CATalyst BCS highlights all the entries between the first and last selected entry.

### Select all the entries

Press **Ctrl + a (Select All)** to highlight all the entries.

5. Add and apply the scope of selected globals. Do **one** of the following:

#### Forward Only

Add the globals to the global table and apply the selected globals forward in the file, from the point of your cursor.

#### Entire File

Add the globals to the global table and apply the selected globals forward and backward throughout the job.

#### Cancel

Do not apply any globals and close the Add Globals dialog box.

## Apply All Globals Backwards

When you make a D-Define, E-Define, J-Define, K-Define or Other global, it applies forward from the point you create the global through to the end of the job. If you scroll backward or go to the beginning of the file, the global does not apply. Apply All Globals Backwards allows you to apply all globals backward in the job. The global remains active for new text, such as realtime.

If you selected the option, *Entire File*, when creating a global definition, then the global automatically applies both forward and backward in the file.

To apply all globals backward, press **Alt + g, g (Global/Apply All Globals Backward)**.

## Definition Exchange

When writing realtime via USB or WiFi connection using Case CATalyst V13 or higher and the Luminex and Diamante V2.0 or higher, J-Defines made on the Luminex or Diamante, including used briefs, are automatically sent to the global table of the Case CATalyst realtime file. Any dictionary definitions made in the Case CATalyst realtime file, including D-Defines, J-Defines, K-Defines and Other Defines, are automatically sent to the Luminex or Diamante. The exchanged definitions apply from the point of creation forward to all new realtime steno written.

If you Undo a global, Undo Last Global or delete a global in Case CATalyst, it does not remove the definition from the dictionary in the Luminex or Diamante memory or from the Luminex or Diamante job dictionary file. Refer to the Luminex or Diamante User Guide for information on removing J-Defines from the Luminex or Diamante.

## Global Suggest

When you create a [Global definition](#) using the Suggest option, a list of up to ten possible text definitions for the steno displayed in the *Steno* field of the Global definition dialog box displays. Clicking a suggested selection or pressing the associated number inserts the entry into the *New Text* field. To ignore the suggestion, click in the *New Text* field and type the correct text or press ESC or ALT to close the Suggestion List and place the cursor focus in the *New Text* field. To automatically display the Suggestion List, check the [Open with Suggestions](#) option in the Global definition dialog box. The Open with Suggestions option is only available for Global definitions.

Suggested definitions display based on current globals, dictionaries used to translate the job, dictionary entry usage count, recently used data, drag/drop and stacking possibilities and spell checked phonetic suggestions based on the current [Phonetic Table](#).

When editing on a computer other than the one on which the session was originally taken, you must have all dictionaries and the Phonetic Table used during the translation in order to use the Suggest feature.

## Global Table

The History window Global Table contains definitions created using D-Define, K-Define, J-Define, E-Define and Other Dictionary Define commands in the job. Each job has its own Global Table. When you make the first [global definition](#) for the job, CATalyst BCS creates a Global Table, if one does not already exist. [Global Table Options](#) determine how certain global features are handled and allow you to customize Global Table display settings.

You can [manage the globals](#) in the Global Table for the job. Apply, undo, modify, delete and print globals. Other features allow you add globals from other Global Tables and to copy and paste globals from one Global Table to another.

Global Tables are available for use in translation. Translating with a Global Table allows you to use previously created [E-Defines](#) during a captioning session. To use Global Tables in translation, on the [Dictionaries](#) Profile tab, select the *Global Tables* option to display global files for selection.

Access the Global Table:

- in CATalyst BCS. Position your cursor in the History window and press **Ctrl + y (Global/Global Table)**. The Global Table dialog box displays.
- in Manage Jobs. Press **Alt + f, o, i, t (File, Open, List/Table, Global Table)**. In the Open Existing Document dialog box, select a Global Table and press **Enter (Open)**.

Modifying a Global Table entry from Manage Jobs does not change the globalled text already applied to the file. To apply changes to text, it is necessary to modify the globals from within CATalyst BCS. Additionally, Undo Global along with other undo global commands are only available from within CATalyst BCS.

### Script Window Global Table

CATalyst BCS uses a Script window Global Table allowing you to make E-Defines for a script during a captioning session. CATalyst BCS deletes all the entries in the Script Global Table when you exit the session.

You can add E-Defines made in the Script window to the History window Global Table. Script E-Defines remain in the Script window Global Table. E-Defines added to the History window Global Table are retained in the History window Global Table unless deleted or undone. Deleting or undoing entries in the History window Global Table does not affect entries in the Script window Global Table.

Access the Script window Global Table:

- in CATalyst BCS. Position your cursor in the Script dialog pane and press **Ctrl + y** (**Global/Global Table**). The Global Table dialog box displays.

- 

[Keyboard Map](#) Function: Global Table

## Understanding the Global Table

The following information displays in a Global Table. The most recent global displays at the top. Use the [Search](#) and [Filter](#) features to locate a specific entry or entries with specific criteria.

You can sort globals in the table by clicking a column heading. Continue to click the column heading until the triangle points up for ascending order or down for descending order. By default, the cursor moves to the top row in the sort order. To have the cursor remain at the current line location change the [Retain position after sort](#) Global Table option.

### Number

The number of the global. When you create globals, CATalyst BCS sequentially assigns a number to each global. The Global Table opens with the entries listed in descending global number order, the most recent global first in the list.

### Type

The type of global define: D-Define, K-Define, J-Define, E-Define or a Personal Global.

### Steno

The steno portion of the global.

### Case Sensitive

Y or N displays in this column when the entry is an [E-Define](#) or a Personal Global. Y indicates you made the global case sensitive so that it replaces only text with the upper and lower case letters as they display in the definition.

### Old Text

The text the global replaces.

### New Text

The replacement text for the global.

### Selective

The global was marked as [Selective](#) when the steno or text was defined. If you use the [Add Other Globals](#) command to apply the global, CATalyst BCS no longer considers the global Selective. A Selective global used during realtime does not apply to new realtime text.

The Global Table option, [Exclude Selective Global](#) determines if a selective global should be included when copying and pasting.

## Global Table Options

Global Options determine how certain global features are handled and allow you to customize Global Table display settings. You can access Global Table Options from the Global Table.

Access the Global Table Options:

- in CATalyst BCS. Position your cursor in the History window and press **Ctrl + y (Global/Global Table)**. The Global Table dialog box for the History window displays. Press **Alt + t, o (Tools/Options)**.
- in CATalyst BCS. Position your cursor in the Script dialog pane and press **Ctrl + y (Global/Global Table)**. The Global Table dialog box for the Script dialog pane displays. Press **Alt + t, o (Tools/Options)**.
- in Manage Jobs. Press **Alt + f, o, i, t (File, Open, List/Table, Global Table)**. In the Open Existing Document dialog box, select a Global Table and press **Enter (Open)**. Press **Alt + t, o (Tools/Options)**.

Modifying a Global Table entry from Manage Jobs does not change the globalled text already applied to the file. To apply changes to text, it is necessary to modify the globals from within CATalyst BCS. Additionally, Undo Global and other undo global commands are only available from within CATalyst BCS.

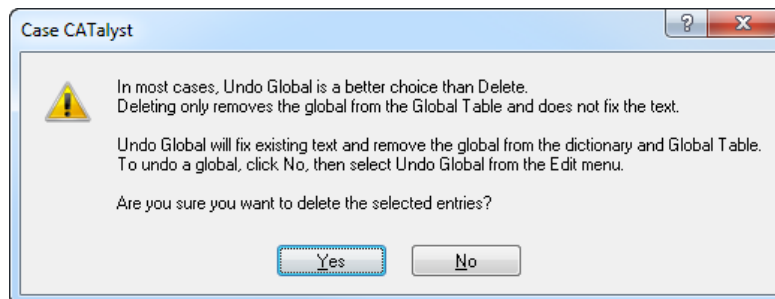

## Global Table Options

To make a change, click an option. Depending on the field, select a choice from the drop down box, type an entry or use the Browse button. When finished with all your changes, select **OK**. The *Restore Default Settings* option returns all the Global Table Options to their original CATalyst BCS default selection.

### Warn before deleting entries

Check this box to display a confirmation message when you delete global table entries. Deleting a global removes it from the global table. It does not have any effect on existing text. To reverse the affects of a global, use the [Undo Global](#) command. A confirmation message prompts you to continue the deletion.

If you open a Global Table within a History or Caption File and selected to delete globals, the following message displays:

If you open a Global Table at Manage Jobs and selected to delete globals, a Yes No confirmation message displays.

Uncheck this box to disable the confirmation message when you delete entries.

### Exclude Selective Global

Check this box to exclude [selective](#) globals from being added or pasted when using the [Add Other Globals](#) command or when copying and pasting globals from one table to another.

Uncheck this box to have selective globals available when using the Add Other Globals... feature.

### **Global Table Heading font**

The current font selection for the column headings displays in the field. Click the **Browse** button to display the Font dialog box. Select the font and click **OK**. Font style attributes do not apply.

Global Table fonts apply to the Add Globals dialog box when you use the Add Other Globals feature.

### **Global Table Steno font**

The current font selection for the steno portion of the entries displays in the field. Click the **Browse** button to display the Font dialog box. Select the font and click **OK**. Font style attributes do not apply.

When selecting font types for steno display, it is best to select a Fixed Space Font. CATalyst BCS, by default, has three fixed spaced fonts: Andale Mono, Arial Monospaced and Letter Gothic MT plus the Windows Courier New. If you select a proportional font, steno characters may not line up based on their placement on the steno keyboard.

Global Table fonts apply to the Add Globals dialog box when you use the Add Other Globals feature.

### **Global Table Text font**

The current font selection for the text that displays in the Old Text and New Text fields. Click the **Browse** button to display the Font dialog box. Select the font and click **OK**. Font style attributes do not apply.

Global Table fonts apply to the Add Globals dialog box when you use the Add Other Globals feature.

### **Global Table Other font**

The current font selection for Global Table text under the Number, Type, Case Sensitive and Selective headings displays in the field. Click the **Browse** button to display the Font dialog box. Select the font and click **OK**. Font style attributes do not apply.

### **Retain position after sort**

Select **No** to have the cursor move to the top row in the Global Table after clicking a column heading to change the sort order. This is the default.

Select **Yes** to maintain the cursor position at the current line location after click a column heading to change the sort order.

### **Add Other Globals go to dictionaries**

Select **Yes** to have the *Add Other Globals* feature add all D-Defines, K-Defines and J-Defines to the Global Table and their respective dictionaries. This is the default setting.

Select **No** to have the *Add Other Globals* feature add all D-Defines, K-Defines and J-Defines only to the Global Table.

## **Manage Global Table Entries**

You can apply, undo, add, modify and delete globals in your Global Table. The Global Table is accessible from Edit and from Manage Jobs. Modifying a Global Table entry from Manage Jobs, however, does not change globals already applied to the open job. To affect globals, it is necessary to modify the globals from within Edit. Additionally, it is only possible to Undo a global from within Edit. Personal Globals cannot be modified from the Global Table.

Use the [Search](#) feature to quickly locate an entry. The [Filter](#) feature allows you to display Global Table entries in a specified category or with specific criteria.

Access the Global Table:

- in CATalyst BCS. Position your cursor in the History window and press **Ctrl + y (Global/Global Table)**. The Global Table dialog box for the History window displays.
- in CATalyst BCS. Position your cursor in the Script dialog pane and press **Ctrl + y (Global/Global Table)**. The Global Table dialog box for the Script dialog pane displays.
- in Manage Jobs. Press **Alt + f, o, i, t (File, Open, List/Table, Global Table)**. In the Open Existing Document dialog box, select a Global Table and press **Enter (Open)**.

Modifying a Global Table entry from Manage Jobs does not change the globalled text already applied to the file. To apply changes to text, it is necessary to modify the globals from within CATalyst BCS. Additionally, Undo Global along with other undo global commands are only available from within CATalyst BCS.

## Add Other Globals to the Global Table

The [Add Other Globals](#) feature allows you to copy global definitions from another job to your current job and place the globals into the global table of the current job.

## Apply Globals Backwards in the Global Table

When making a global definition, by default the global only applies forward in the file unless you select the Entire File option. Use [Apply All Global Backward](#) to select individual or all globals in the transcript and apply them backward in the job.

## Copy and Paste Globals

To copy and paste globals from one Global Table to another:

1. Open Global Table from which you want to copy. Do one of the following:

### Select one entry

Highlight a single entry.

### Select specific entries

Press and hold **Ctrl** while you click multiple entries to highlight for selection.

### Select a consecutive group of entries

Click to highlight the first entry of the group. Press and hold **Shift**, while you click the last entry. CATalyst BCS highlights all the entries in-between for selection.

### Select all the entries

Press **Ctrl + a** to highlight all the entries for selection.

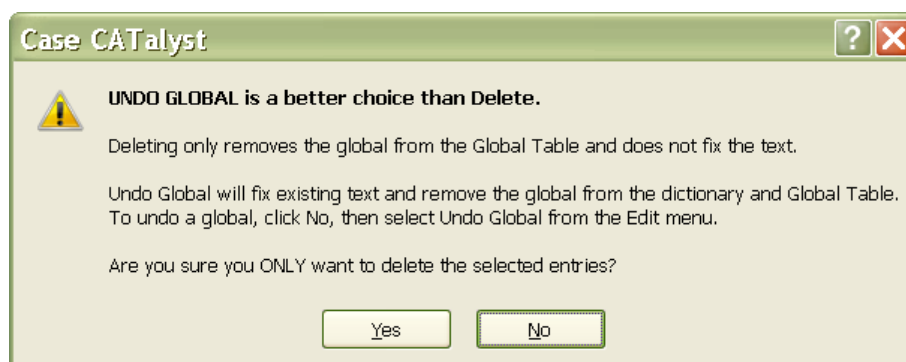

2. Right click and select **Copy** and close the Global Table.
3. Open the Global Table in which you want to Paste the entries.
4. Right click and select **Paste**.

## Delete Globals

You can remove globals from the Global Table using the Delete command but it does not fix the existing text. Most often, Undo Global is the command to use to reverse the global action in the where the global applied and remove the definition from the designated dictionary. Deleting a global **only** removes it from the Global Table and prevents it from applying to new, incoming text.

When deleting a global from a Global Table opened from Manage Jobs, an *Are you sure you want to delete?* message displays.

When deleting a global from a Global Table while in a transcript, a warning message displays explaining that deleting a global will not change or fix the existing text.

To reverse the global action, use the [Undo Global](#) command. Undo Global does not affect text modified after the global applied.

To remove globals from the global table:

1. Highlight the entries to delete. Do **one** of the following:

### Select one entry

Highlight a single entry.

### Select specific entries

Press and hold **Ctrl** while you click multiple entries to highlight for selection.

### Select a consecutive group of entries

Click to highlight the first entry of the group. Press and hold **Shift**, while you click the last entry. CATalyst BCS highlights all the entries in-between for selection.

### Select all the entries

Press **Ctrl + a** to highlight all the entries for selection.

2. Press **Delete** to remove the global from the global table. A confirmation message displays if you have the *Warn before deleting entries* option selected. Select **Yes** to continue the deletion.

## Modify Global Text

To modify the text in the New Text field of an entry:

1. Highlight the entry and press **Ctrl + m** (**Edit/Modify**)

2. CATalyst BCS positions the cursor in the *New Text* field at the end of the current text. Make necessary changes. To insert a format symbol, press **F4, F4** to display the Format Symbol list. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol you want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry.
3. Press **Enter** to complete the modification.
4. At the modify confirmation prompt, press **Enter** confirm the change.

## Print Globals

To print global entries for the open job in Edit:

1. From the Global Table, press **Ctrl + p (File/Print)**. The Print dialog box displays.
2. Select the printer and press **Enter (OK)**.

## Send Globals to Cat Scratch

Send global entries to the User, Case or Job Cat Scratch Dialog Pane, depending on the selected user scope of the Cat Scratch pane.

1. In the Global Table, highlight the entries to send. Do **one** of the following:

### Select one entry

Highlight a single entry.

### Select specific entries

Press and hold **Ctrl** while you click multiple entries to highlight for selection.

### Select a consecutive group of entries

Click to highlight the first entry of the group. Press and hold **Shift**, while you click the last entry. CATalyst BCS highlights all the entries in-between for selection.

### Select all the entries

Press **Ctrl + a** to highlight all the entries for selection.

2. Select **Edit/Send to Case Cat Scratch**.

## Undo Globals

While editing a job, you can undo globals using one of three different commands without opening the Global Table:

- [Undo Last Global](#) reverses the last global action.
- [Undo Global](#) reverses the global from the job.
- [Undo Global Once](#) reverses the global action for a single word.

## Modify Global

You can modify the text of a global in the Global Table. If you are in caption edit, you open the Global Table and you modify the text of a global, the modified text of the global is applied to all occurrences of the global in the caption file. In realtime, the modified global applies only to the existing globals in the caption file. Once the file is saved, the modified global text is saved in the destination dictionary if appropriate. If you want to change a global during realtime and have it apply, you will need to redefine it or re-global it to have it apply.

If open a Global Table at Manage Jobs, you can modify the text of a global but it does not affect the caption file text.

To modify the text in the New Text field of a Global Table entry:

1. Do one of the following:
  - In caption edit, press **Ctrl + y** (Global, Global Table).
  - At Manage Jobs, double click the Global Table subfile or highlight the Global Table subfile, right click and select Open.
2. Highlight the entry and press **Ctrl + m** (Edit/Modify)
3. Case CATalyst positions the cursor in the *New Text* field at the end of the current text. Make necessary changes. To insert a format symbol, press **F4, F4** to display the Format Symbol list. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry.
4. Press **Enter** to complete the modification.
5. At the *Are you sure you want to modify this global* confirmation prompt, press **Enter** to confirm the change.
6. To close and save the change(s), press **Ctrl + F4** or click the X in the upper right hand corner of the Global Table dialog box.

In edit, the modified global applies throughout the entire caption file to the matching steno/text of the existing global.

In realtime, the modified global applies only to the existing globals in the caption file. Once the file is saved, the modified global text is saved in the destination dictionary if appropriate. If you want to change a global during realtime captioning session and have it apply, you will need to redefine it or re-global it to have it apply.

At Manage Jobs, the modified global text is changed in the Global Table and has no effect on the text in the caption file. If you use the global table with the modified global for future captioning sessions or applying globals, the modified global is active.

## Search Global Table

Search allows you to locate a entry in the Global Table you want to view or modify. You can search forward or backward for steno or text, including whole word, part of a word, or multiple words. Once a searched entry displays, you can repeat Search for the same text and search parameters by using *Repeat Search*.

Use the [Filter](#) feature to display Global Table entries in a specified category or with specific criteria.

Access the Global Table:

- in CATalyst BCS. Position your cursor in the History window and press **Ctrl + y (Global/Global Table)**. The Global Table dialog box for the History window displays.
- in CATalyst BCS. Position your cursor in the Script dialog pane and press **Ctrl + y (Global/Global Table)**. The Global Table dialog box for the Script dialog pane displays.
- in Manage Jobs. Press **Alt + f, o, i, t (File, Open, List/Table, Global Table)**. In the Open Existing Document dialog box, select a Global Table and press **Enter (Open)**.

Modifying a Global Table entry from Manage Jobs does not change the globalled text already applied to the file. To apply changes to text, it is necessary to modify the globals from within CATalyst BCS. Additionally, Undo Global along with other undo global commands are only available from within CATalyst BCS.

## Search Global Table

1. From the Global Table, press **Ctrl + f (Edit/Search)**. The Search dialog box displays.
2. Make entries as necessary:

### Search For

Select the method by which you want to search the Global Table.

#### Steno

Search by steno. Type the search steno in the field. Separate multiple strokes with a forward slash. When starting with a final stroke, place a – (hyphen) before the first letter.

#### Partial Stroke

Check this box to search for the specified steno regardless of whether or not it is part of a steno outline. For example, searching for –FPLT finds: -FPLT, -FPLTD, -FRPBLGTS, -FRPBLTS, etc. Without the *Partial Stroke* option, searching –FPLT displays entries with –FPLT as a separate outline, such as: -FPLT, -FPLT/-FPLT, etc. This option only displays when you search for Steno.

#### Text

Search by text. Type the search text in the field. The search considers both *Old Text* and *New Text*.

#### FS

Add format symbols to a text search. Select **FS** and double click the format symbol from the list to select it; or use shortcut keys. To use a shortcut key, place the cursor in the *Search For* field, press **F4** and then the appropriate letter or symbol.

#### Case Sensitive

Limit the search based on the upper and lower case letters of text typed in the *Search For* field. Without this option, the search considers all words containing the indicated characters, regardless of the case typed into the field. This option only displays when you search for Text.

3. Press **Enter (OK)** to start the search. The Search dialog box closes and the Global Table window displays the entry. If CATalyst BCS does not find a match for the selected steno or text search, a message displays.
4. To repeat the same search, press **F3 (Edit/Repeat Search)**.

## Filter Global Table

Filter displays only the entries in the Global Table that contain the specified criteria. Entries filtered out are not removed from the file. All the entries redisplay when you select Unfilter or the next time you open the Global Table.

Use the [Search](#) feature in the Global Table to quickly locate an entry you want to view or modify.

Access the Global Table:

- in CATalyst BCS. Position your cursor in the History window and press **Ctrl + y (Global/Global Table)**. The Global Table dialog box for the History window displays.
- in CATalyst BCS. Position your cursor in the Script dialog pane and press **Ctrl + y (Global/Global Table)**. The Global Table dialog box for the Script dialog pane displays.
- in Manage Jobs. Press **Alt + f, o, i, t (File, Open, List/Table, Global Table)**. In the Open Existing Document dialog box, select a Global Table and press **Enter (Open)**.

Modifying a Global Table entry from Manage Jobs does not change the globalled text already applied to the file. To apply changes to text, it is necessary to modify the globals from within CATalyst BCS. Additionally, Undo Global along with other undo global commands are only available from within CATalyst BCS.

## Filter Global Table

1. From the Global Table, press **Alt + v, f (View/Filter)**. The Filter dialog box displays.
2. Make entries as necessary:

### Filter

Click the down arrow to display the filter criteria. Select one of the following:

#### Number

Filter the display by the assigned entry number. Type the entry number in the field.

#### Steno

Filter the display by steno. Type the steno in the field. Separate multiple strokes with a forward slash. When starting with a final stroke, place a – (hyphen) before the first letter.

#### Partial Stroke

Check this box to filter on entries that contain a portion of the steno outlined typed. For example, you filter on –FPLT. The filter includes: -FPLT, -FPLTD, -FRPBLGTS, -FRPBLTS, etc. Filtering on –FPLT without the *Partial Stroke* option, displays entries with –FPLT as a separate outline, such as: -FPLT, -FPLT/-FPLT, etc.

#### Case Sensitive

Filter the display based on the E-Define Case Sensitive attribute. A global created with the Case Sensitive attribute replaces only text with upper and lower case letters as they display in the definition. Select **Y** to filter on entries with the Case Sensitive attribute. Select **N** to filter on entries without it.

#### Type

Filter the display by global define type. Select a define type from the drop down list.

### **Old Text**

Filter the display based on text in the *Old Text* field. Type the text in the field.

Add format symbols and fields to the filter as necessary. Select **FS** and double click the format symbol from the list to select it; or use shortcut keys. To use a shortcut key, place the cursor in the field, press **F4** and then the appropriate letter or symbol. Press **F9** to add [extended characters](#).

### **New Text**

Filter the display based on text in the *New Text* field. Type the text in the field.

Add format symbols and fields to the filter as necessary. Select **FS** and double click the format symbol from the list to select it; or use shortcut keys. To use a shortcut key, place the cursor in the field, press **F4** and then the appropriate letter or symbol. Press **F9** to add [extended characters](#).

### **Selective**

Filter the display based on the Selective attribute. A global created with the Selective attribute moves to each occurrence affected by the global change, allowing you to choose to apply the change, skip the occurrence or apply the change to all occurrences. Select **Y** to filter on entries with the Selective attribute. Select **N** to filter on entries without it.

### **Entry Type**

Filter the display by entry type, such as conflict or Auto Include. Select an entry type from the drop down list. This field is available when *Old Text* or *New Text* is selected in the *Filter* field.

#### **Entry Types**

##### **Conflict**

The first entry that contains a conflict end format symbol.

##### **Scan stop**

The first entry that contains a scan stop begin or end format symbols.

##### **Numbers**

The first entry that contains numbers.

##### **All Capped**

The first entry that contains all capped text.

##### **Contains capped**

The first entry that contains at least one capital letter.

##### **Phrase**

The first entry that contains two or more words separated by a space.

##### **Contains punctuation**

The first entry that contains punctuation.

##### **Contains format symbol**

The first entry that contains a format symbol.

**Contains Field(s)**

The first entry that contains a field.

**Auto Includes**

The first entry that begin with @.

**AccelerWriter**

The first entry that begin with &&.

**Number Conversion**

The first entry that contain the {Number Conversion} translate command.

**Number Trigger**

The first entry that contain the {Number Trigger} translate command.

**Numerical Words**

The first entry that contain a word number including hundred, thousand, million, etc.

**Speaker Entries**

The first entry that contain a <Colloquy> format symbol and a colon.

**Case Sensitive**

Filter on entries based on the upper and lower case letters of text typed in the field. Without this option, the filter considers all words containing the indicated characters, regardless of the case typed into the field. This field is available when *Old Text* or *New Text* is selected in the *Filter* field.

**Whole Word**

Filter only on entries that match the filter text typed in the field. If you do not select *Whole Word*, the filter locates the text as it stands alone and as part of another word. This field is available when *Old Text* or *New Text* is selected in the *Filter* field.

**Location**

Select filter parameters.

**Exact Match**

Filter on entries that exactly match the text entered in the *Filter* field.

**Begins With**

Filter on entries that begin with the text entered in the *Filter* field.

**Ends With**

Filter on entries that end with the text entered in the *Filter* field.

**Contains**

Filter on entries that contain, anywhere in the entry, the text entered in the *Filter* field.

3. Press **Enter (OK)**. If no entries are found for the filter item, a message displays.

## Replace

Replace (Ctrl + r) is a command that replaces text or steno with new text for this single occurrence only. You can also replace text by marking it and typing the new text.

If [Intuitive Replace](#) is active, CATalyst BCS suggests a word in the New Text field based on previous replacements. When you replace a word not previously replaced and you place your cursor in the New Text field, the most recently replaced word displays. You can toggle through the last 10 replacements by pressing **Ctrl + r**.

To replace steno or text:

1. Place the cursor immediately before the word, on the word, or mark the steno or text you want to replace.
2. Press **Ctrl + r (Replace)**. The Global – Replace dialog box displays.
3. Make necessary entries:

### Old Text

The text selected for replacement.

### Steno

The steno, if any, for the text selected.

### Mark/Unmark Left

Press **Alt + [** (left bracket) to expand or **Alt + ]** (right bracket) to deselect the marking to the left.

### Mark/Unmark Right

Press **Alt + Right Arrow** or **Ctrl + g** to expand or **Alt + Left Arrow** to deselect the marking to the right.

### New Text

Type the new text, including any format symbols. To copy the old text to the New Text field, press **F6**.

To add extended characters, place the cursor in the New Text field and press **F9**. The Insert Character dialog box displays. Double click a character to insert. CATalyst BCS inserts the character at the cursor location.

When the option, [Spell Check While Defining](#) is not active, press **Shift + F7** to spell check the word in the New Text field. To look up a definition, press **Ctrl + F7**.

### FS (Alt + f)

Display the list of available format symbols. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry.

You can also use shortcut keys to insert a format symbol. Place your cursor in the New Text field, press **F4** and then press the appropriate letter or symbol.

To always display the format symbol list, check the box, Always Show Format Symbols. When the list always displays, you can access it by pressing **Alt + y**.

### Insert Field

This feature is not applicable to CATalyst BCS.

### Cap

Copy the text in the Old Text field to the New Text field and cycle through three Cap/Uncap options:

- Capitalize the first letter in a word or phrase, except for words in the NoCapWords list
- Capitalize all the letters in a word or phrase
- Uncap the letters in a word or phrase

### Conflict

This option is available when a conflict is part of the Old Text. When you select Conflict, CATalyst BCS copies the text from the Old Text field to the New Text field, automatically choosing the first conflict. If you select Conflict a second time, CATalyst BCS chooses the second conflict. If additional conflict choices exist, select Conflict until the desired choice displays in the New Text field. If more than one conflict exists in the Old Text field, your selection applies to all the conflicts.

### Suggest

Display a list of up to ten possible text definitions for the steno in the Steno field. Click on a selection or press the associated number. CATalyst BCS inserts the entry into the New Text field. If you do not want to select a suggestion, type the correct text, press ESC or press ALT. CATalyst BCS closes the suggestion list and places the cursor focus in the New Text field.

CATalyst BCS determines which definitions display based on current globals, dictionaries used to translate the job, dictionary entry usage count, recently used data, drag/drop and stacking possibilities and spell checked phonetic suggestions based on the current Phonetic Table.

When editing a job on a computer other than the one on which the job was originally taken, you must have all dictionaries and the phonetic table used during translation.

### Endings

The Endings feature is not available when replacing a word or phrase. If you change your action from a replace to a global, the Endings feature may be available. When you type a word in the Text field, CATalyst BCS analyzes the word to see if a " G", " S" or " D" steno outline could be added to the word. If so, then CATalyst BCS activates the Endings button. The Global Endings dialog box displays. Check the box next to any of the suggested definitions and press **Enter (OK)**. To select all the entries, click **Select All**. CATalyst BCS adds them to the designated dictionary and global table.

For example, you have REPT in the Steno field and type "represent" in the Text field. The following suggested entries display when you select Endings:

REPTD = represented

REPTS = represents

The word "representing" is not suggested because the final "g" comes before the final "t" in the original steno outline.

### Spaces

When two or more words display in the Old Text field, the Spaces feature copies the text to the New Text field and places a [<Sticky Space>](#) format symbol between the words. Spaces is also available when you type two or more words in the New Text field.

### Stitch

Copy the text in the Old Text field to the New Text field and place hyphens between each letter. Stitch is also available when you type words in the New Text field. If there is one word, the letters are hyphenated. If there are two or more words, the words are hyphenated. For example step-by-step. To undo a stitch, select this feature again.

### Open with Suggestions

Not available for Replace.

### Global Type

The type of define originally selected displays. To select a different type of define choose from the drop down box, or press **one** of the following key combinations. When you D-Define, K-Define, or J-Define the entry, the correct steno must display in the Steno field.

- **Alt + d** (D-Define)
- **Alt + k** (K-Define)—if the file is in a case.
- **Alt + j** (J-Define)
- **Alt + e** (E-Define)—does not place the global definition into a dictionary.
- **Ctrl + Shift + o** (Other Dictionary)—send job dictionary defines to an alternative dictionary.

### Entire File

Not available for Replace.

### Case Sensitive

Not available for Replace.

### Selective

Not available for Replace.

### Generate All Possible Misstrokes

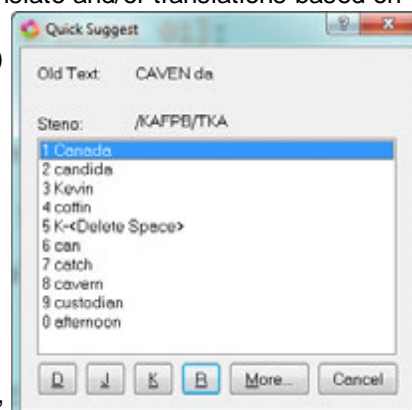

Not available for Replace.

4. When finished replacing press **Enter (OK)** to replace the text.

## Quick Suggest in Caption Edit

Quick Suggest is an editing command that will display a list of suggestions when your cursor is positioned on an untranslate, Drag/Drop or Suffix Drag translation or on any words. If multiple words are highlighted before invoking Quick Suggest, the Quick Suggest command will only offer suggestions for what is highlighted. This is the editing version of the realtime [Live Suggestions](#) feature. The Quick

Suggest feature may offer suggestions based on the individual untranslate and/or translations based on steno outlines before and/or after the untranslate. Once the Quick Suggest dialog box displays, you will see the Old Text (if applicable) and the steno for the entry in the list. Based on the suggestion that is highlighted, the steno/text will also be selected in the transcript. When you move your cursor up and down by the arrow keys or select a list entry by the assigned number, the Old Text and Steno field contents may adjust and the transcript selection may also adjust based on the suggestion.

Quick Suggest is available when your cursor is positioned on an untranslate, Drag/Drop or Suffix Drag translation. In the [Scan For options](#), the *Automatically open Quick Suggestion for* option has been added and once you select any or all of the items (Untranslate, Drag/Drop or Suffix Drag), when [Scan](#) stops on an item, the Quick Suggest dialog box automatically opens displaying possible suggestions. In the Scan For options, if you have selected to have Quick Suggest automatically open for an untranslate, Drag/Drop and/or Suffix Drag, those items must also be selected in the options above the Quick Suggest items. In other words, if you want Quick Suggest to automatically open for an untranslate, Untranslate must also be selected in the Scan For options.

Quick Suggest can manually be invoked on an untranslate, Drag/Drop or Suffix Drag translate regardless of your Scan For option selection by pressing **Alt + g, q** or assigning a key combination to the Quick Suggest function in a keyboard map.

A *No suggestions available* message displays if Quick Suggest cannot offer any suggestions. If Quick Suggest has no suggestions to offer, you can have CATalyst automatically open the Global dialog box by selecting Yes for the Open Global dialog when no Quick Suggest Available option in the [Global Options](#) dialog box.

A *There is too much steno selected* message displays if too many steno outlines are highlighted. Press Enter to close the message box, then highlight fewer words/steno outlines and try again.

A *There is no steno at the cursor location* message displays when highlighted text does not have underlying steno outlines. Press Enter to close the message box.

### Quick Suggest:

1. Scan or position your cursor on an untranslate, Drag/Drop or Suffix Drag translation and do any of the following
  - a. If the Quick Suggest dialog box automatically opened, go to Step 2.
  - b. Press **Alt + g, q**.
  - c. Press the key combination you assigned to the Quick Suggest feature in your [keyboard map](#).
2. To select a suggestion, do one of the following:
 

When a suggestion is highlighted, if the steno for the suggestion changes (based on number of steno outlines), the Steno field updates appropriately and the highlighted text in the transcript adjusts accordingly.

  - a. Press the number associated with the suggestion.
  - b. Use your up/down arrow keys to highlight the selection.
3. To take action, do one of the following
  - a. To Replace the current steno and/or text with the selected suggestion, press **Enter**.

- b. To [D-define](#) (Personal dictionary) the current steno and/or text, press **d** and then **Enter**.
- c. To [J-define](#) (job dictionary) the current steno and/or text, press **j** and then **Enter**.
- d. To [K-define](#) (case dictionary) the current steno and/or text, press **k** and then **Enter**.
- e. To do one of the above actions along with additional actions or to type a different text, press **m** (or **Alt + m**) to open the Global J-define dialog box.
- f. To take no action and scan to the next item, press **F8**.
- g. To take no action and close the Quick Suggest dialog box, press **Esc** or click Cancel.

## Selective Globals

When defining, use the Selective option in the Global dialog box to have CATalyst BCS stop on each occurrence affected by the global change. When a global is Selective, you choose how to apply the change for each occurrence, this occurrence only, all occurrences moving forward in the file, all occurrences in the current section only, skip the occurrence or exit the Selective dialog box not apply the global. When you choose Selective and press Enter (OK) in the Global dialog box, the Confirm dialog box displays for you to select the action for each occurrence. The Entire File option is ignored when using the Selective option but if you select Entire Section, then the global applies to all occurrences in the current section. Selective globals do not apply to previous text, except when selecting Entire Section. The selective global starts at the current cursor location, moves forward in the file until CATalyst is finished applying the selective global. Click OK in finished dialog box and the cursor returns to the location where the global was started.

Globals marked as Selective are added to the Global table and identified as "Selective." A Selective global does not apply automatically when other globals apply. For example, if you select to [apply globals backward](#), a selective global does not automatically apply. A selective global does not apply during captioning to new text.

If you choose to apply a Selective global change to all occurrences or use the Add Other Globals command to apply a Selective global, CATalyst BCS no longer considers the global Selective. If you cut or copy and paste Selective globals from one Global table to another, the globals are no longer considered selective. Globals no longer considered selective apply automatically when other globals apply. To prevent selective globals from being added or pasted when using the [Add Other Globals](#) command or when marking and copying globals from one table to another, check the Global Table [option](#), *Exclude Selective Global*.

To apply globals by occurrence:

1. In the Global define dialog box, enter the text in the New Text field.
2. Check the box, **Selective**.
3. Press **Enter (OK)**, the Confirm dialog box displays. Use the following options as necessary:

### Original

The existing text or steno you are replacing.

### Steno

The marked steno if making a D-Define, J-Define or K-Define.

### Replacement

The new text replacing the original text or steno.

### Type of Define

The type of define selected for this global displays below the *Steno* field.

**Yes**

Change the occurrence and move to the next occurrence.

**Yes To All**

Change all the occurrences from the cursor position forward in the file. Once you select Yes To All, the global is no longer considered selective.

**Entire Section**

Applies the selective global to all occurrences in the current section. The global remains selective in the Global Table.

**Goto Next**

Do not change this occurrence and move to the next occurrence.

**Done**

Do not make any more changes and cancel the command. The cursor remains in the current position.

4. The dialog box closes once all the occurrences are encountered. The cursor remains at the position of the last occurrence.

## Apply Globals to Section

The Apply Global to Current Section allows you to apply a global to only current section of a file. For example, let's say you captioned several shows all related to the same subject but different speakers. You put all the caption sessions in one file to turn into your firm. When those different captioned sessions are in different sections, you can define the different speaker identifications or terminology and have it apply only to the appropriate section.

Sections are created by using the [Set Page/Paragraph Number](#) feature available on the Format menu in caption edit.

**To apply a global to a section only:**

1. In the Global define dialog box, type the text in the New Text field.

2. Check the box, **Selective**.

3. Press **Enter (OK)**, the Confirm dialog box displays. Select **Entire Section** to apply the selective global to all occurrences in the current section. The global remains selective in the Global Table.

4. The dialog box closes once all the occurrences are encountered. The cursor remains at the current position.

## Suggest a Brief

Suggest a Brief is a [Brief It](#) feature that allows you to force Brief It to suggest a brief while writing realtime or while editing. This may be helpful when preparing for a particular type of job with unfamiliar terminology or subject matter.

You can [assign](#) Suggest a Brief command to a [keyboard map](#) function. This works well in a macro to force briefs on previously written text. For example, you create a macro that selects the two previous words and invokes the Suggest a Brief command and then create an AccelerWriter definition. In a realtime file, you write "fibromyalgia syndrome." You then write the stroke to invoke the Suggest a Brief AccelerWriter. Brief It displays the suggested brief in the Brief It dialog pane.

To force a Suggested brief, press **Alt + g, s (Global/Suggest a Brief)**.

[Keyboard Map](#) Function: Suggest a Brief

## Text to Dict Define

Text to Dict Define allows you to create a dictionary definition from text that has no underlying steno. For example, let's say you get script file from another captioner or television station. The script file was typed so there isn't steno associated with the file. You are reviewing the script and come across a few words and phrases that you want to define. You can highlight the word or phrase and select the Text to Dict Define from the Global menu. The Add Dictionary Definition - Job Dictionary dialog box displays where you can type the steno you want to use for that word or phrase. You can select the destination dictionary for the definition also.

### Create a Text To Dict Definition

1. Position the cursor before a word or highlight multiple words in the CATalyst BCS window.
2. Press **Alt + g, n (Global, Text to Dict Define)**. The Add Dictionary Definition –Job Dictionary dialog box displays.
3. Make necessary entries:

#### Steno

Type the steno to associate with the text in the *Text* field. Separate multiple strokes with a forward slash (/).

#### Text (Alt + t)

The text selected for definition. Do any of the following:

- Select **FS** to add format symbols.
- Press **F9** to add [extended characters](#).
- Use the [Cap/Uncap](#) command, **Ctrl + F5**, to quickly cycle through the capping options for all the words in the Text field.

#### FS (Alt + f)

Display the list of available [format symbols](#). Double click the format symbol to insert into the text portion of the definition. You can insert a format symbol at any point in the text entry.

#### Insert Field (Alt + i)

This feature is most likely not applicable in CATalyst BCS. Display the [Insert Field](#) dialog box from which you can select a field to insert into the text portion of the definition.

#### Endings (Alt + n)

CATalyst BCS analyzes word in the *Text* field to see if a " G", " S" or " D" steno outline can be added to the word and additional dictionary entries created. If so, then CATalyst BCS activates the Endings button. The Global Endings dialog box displays. Select any of the suggested definitions to add to your dictionary.

For example, you have REPT in the *Steno* field and "represent" in the *Text* field. The following suggested entries display when you select Endings:

REPTD = represented

REPTS = represents

The word "representing" is not suggested because the final "g" comes before the final "t" in the original steno outline.

### Global Type (Alt + g)

The type of definition you are creating. The default is a J-Define. Make a selection from the drop down box to select a different global type.

### Pick Other Dictionary (Alt + p)

This field is available if you select Other Dictionary in the Global Type field. You can send job dictionary defines to an alternative dictionary when making an O-Define. Select a current dictionary from the drop down list or use **Browse** to choose another dictionary. Depending on your [Global options](#) settings, CATalyst BCS remembers your selection for the current session or for every job. This field displays when you select Other Dictionary in the Global Type field.

### Generate All Possible Misstrokes (Alt + m)

Check this box to have CATalyst BCS generate definitions based on all the possible misstrokes of the original steno outline. CATalyst BCS generates a definition provided one does not already exist in the Personal Dictionary for any of the identified misstrokes. For example, you define /SROEUS as "voice" with Generate All Possible Misstrokes selected. CATalyst BCS also creates a dictionary definition for the following steno outlines as "voice": /SROUS, SROES, and /SROS. The steno outline, /SRAOEUS already exists in your Personal Dictionary as "vice", so CATalyst BCS does not generate /SRAOEUS as a misstroke.

### Add 2 Cat Scratch (Alt + 2)

Send the definition to the [Cat Scratch](#) dialog pane in addition to the Global Table and selected dictionary. Depending on the Cat Scratch scope, the entries are sent to the job, case or user Cat Scratch pane.

4. Press **Enter (OK)** to save the definition.

[Keyboard Map](#) Function: Text to Dict Define

## Text List Brief It

Text List Brief It analyzes text (.txt) files and creates [briefs](#) based on your [Brief It options](#). You may want to use Text List Brief It to suggest briefs from a list of words or phrases you anticipate writing in a future job or case. For example, you are doing a series of depositions on landscaping. You search the internet and download a landscaping wordlist and then use Text List Brief It to analyze the word list and create a list of briefs for a specific captioning session. You could also use a core list from another reporter's job dictionary or transcript. To maximize results, it is best if each word or phrase is on a separate line. There is a 48 character limit per line. For example, you are captioning a new sports team and are unfamiliar with the names of the team members. You download the team roster to a text (.txt) file and then use Text List Brief It to create briefs for the names.

When you select the Text List Brief It feature, the process begins immediately. Once Brief It begins the analysis, the process cannot be canceled. The Brief It dialog pane is visible during the analysis as Brief It populates the list. The number of characters on a line in the text file should not exceed 48. If the number of characters exceed 48, the line is not analyzed and the process continues. Alpha, numeric, punctuation and a white space are considered valid characters. If an invalid character is encountered during the analysis, such as a Unicode character, the processing stops and a message displays. When the analysis completes, a message displays indicating the number of lines for which Brief It attempted to suggest briefs along with the total number of lines processed. Blank lines are counted in the total number of lines processed but do not count towards the attempted number of briefs suggested.

When the Brief It option, Personal Briefs/Reminders Only is active, only Personal and Reminder briefs display in the Brief It dialog pane. No Suggested briefs are created when using Text List Brief It.

To create Suggested briefs from a text list:

1. In CATalyst BCS, press **Alt +g, x (Global/Text List Brief It)**. The Open dialog box displays.
2. Navigate to the location of the text file to analyze, select it and click **Open**.
3. Brief It analyzes the selected text file and displays any briefs in the Brief It dialog pane.
4. At the confirmation message, press **Enter (OK)**.
5. Review the briefs.

[Keyboard Map](#) Function: Text List Brief It

## Request a Live Suggestion

*Request a Live Suggestion* feature is available from the Global menu while writing a captioning session. You can highlight X number of words and use the Request a Live Suggestion feature for the highlighted words. If a Live Suggestion or multiple Live Suggestions are found, they are displayed in the [Brief It](#) pane just like [Live Suggestions](#) currently display. If you like a suggestion, you can then use your [Define](#) or [Replace](#) Live Suggestion commands to take the Live Suggestion. For example, let's say you write four steno outlines, all steno outlines translate but one or more is a mistran. The Live Suggestion feature would not automatically generate suggestions since all the words translated and there isn't an untranslate. You highlight the previous four strokes and select Request a Live Suggestion. The four stroke suggestions displays in the Brief It pane. One of the suggestions is exactly what you want, so you write the Define or Replace Live Suggestion command to take it.

Another example for this feature is that you write five steno outlines, the first one being an untranslate and the rest of the steno outlines translate. Live Suggestion offers you suggestions in the Brief It pane for the five strokes since one of the strokes is an untranslate. You realize you want a suggestion only for the last four strokes so you highlight the last four strokes and use Request a Live Suggestion, the new suggestions replace the original suggestions in the Brief It pane. You then write your Define or Replace Live Suggestion command to select the one you want.

If no suggestion can be found, the No Suggestions Found dialog box displays and automatically closes after a few seconds. If you continue to write realtime, the realtime text displays behind the message box until it closes.

You can easily record macros to accommodate highlighting as few or as many words you want and then select the Request a Live Suggestion feature. Stop recording the macro, name and save it. From the Save Macro dialog box, create a dictionary entry to invoke the macro from your writer. It is recommended that you are in a practice realtime captioning session when recording macros that are invoked from your writing machine to make sure the recorded macros work correctly based on the cursor position.

The Request a Live Suggestion feature is not available (grayed out) when you are in caption edit. The Quick Suggest (Alt + g, q) feature is available while editing and is a better solution.

The Request a Live Suggestion feature is available in realtime even if you do not have the Live Suggestions option selected on Translate's Realtime tab.

[Keyboard Map](#) function: Request Live Suggestion

### Transcript Brief It

Transcript Brief It analyzes the text in the History window and creates [briefs](#) based on your [Brief It options](#) in the Realtime Aids Option dialog box. The captioning file must have underlying steno. When you select the Transcript Brief It feature, a confirmation message prompts you to continue. Once Brief It begins the analysis, the process cannot be canceled. The Brief It dialog pane is visible during the analysis as Brief It populates the list. For example, a few weeks ago, you captioned a topic similar to today's show. You open that previous captioning file and use Transcript Brief It to determine if there any briefs you can use in today's session.

When the Brief It option, Personal Briefs/Reminders Only is active, only Personal and Reminder briefs display in the Brief It dialog pane. No Suggested briefs are created when using Transcript Brief It.

To create Suggested briefs from the current transcript:

1. In CATalyst BCS, press **Alt + g, b (Global/Transcript Brief It)**.
2. At the confirmation message, press **Enter (OK)**. Brief It analyzes the file and displays the briefs in the Brief It dialog pane.
3. Review the briefs.

[Keyboard Map](#) Function: Transcript Brief It

### Undo Globals

CATalyst BCS contains three undo global commands that allow you to reverse the action of a global in the History file and remove the definition from the designated dictionary. In most cases, if you are trying to *fix* globalized text, one of the Undo Global commands is the correct action.

When writing realtime using CATalyst BCS V13 or higher and the Luminex or Diamante V2.0 or higher, Luminex or Diamante J-Defines and all CATalyst BCS dictionary definitions are [automatically exchanged](#). The Delete, Undo Global, Undo Last Global or Undo Global Once commands do not remove the definition from the Luminex or Diamante. Refer to the Luminex or Diamante User Guide for information on removing J-Defines from the Luminex or Diamante.

## Undo Last Global

Undo Last Global reverses the last global action throughout the current realtime or editing session of the file. CATalyst BCS returns the last globalled items to their original state, removes the global from the global table and removes the global from the dictionary, if appropriate. Undo Last Global does not apply to a globalled word or phrase modified after the global took affect. To undo the last global, press **Ctrl + Shift, u** (**Global/Undo Last Global**).

## Undo Global

The Undo Global command reverses the action of the global in the job, removes the global from the Global Table and removes the global from the dictionary, if appropriate. Undo Global does not apply to a globalled word or phrase modified after the global took affect. It is only possible to Undo a global from within Edit. You cannot undo a global when opening the Global Table from Manage Jobs.

To use Undo Global, position the cursor immediately before the globalled word or phrase in the transcript. Right click the mouse to select **Undo Global** or press the [assigned](#) keyboard command for Undo Global. You can also open the [Global Table](#) while editing to undo a global. Undo Global and Undo Global Once commands check the Global Table to verify if the replacement text has a paragraph style that automatically generated punctuation before the globalled text. If so, CATalyst checks to confirm the punctuation is ending punctuation and the ending punctuation will be replaced by a space when the global undo command is used.

## Undo Global Once

The Undo Global Once command reverses the global action for a single word. Position the cursor immediately before the globalled word or phrase in the transcript. Right click the mouse to select **Undo Global** or press the [assigned](#) keyboard command for Undo Global Once. Undo Global and Undo Global Once commands check the Global Table to verify if the replacement text has a paragraph style that automatically generated punctuation before the globalled text. If so, CATalyst checks to confirm the punctuation is ending punctuation and the ending punctuation will be replaced by a space when the global undo command is used.

[Keyboard Map](#) Function: Undo Last Global

Undo Global

Undo Global Once

## CATalyst BCS Format Commands

CATalyst BCS format commands allow you to add and modify transcript text using [format symbols](#) and apply a new or save the current [Layout](#) from the History Window.

## About Layout

A Layout allows you to set formatting values for how the text displays in the History window. It also affects how text displays on a printed page. For example, if you create a transcript of the History text. A layout includes parameters set in inches, such as, paper size, margins, transcript lines per page and header and footers. The default text display in the History window is 32 characters per inch. New

Layouts created in CATalyst BCS version 11 and higher display the Layout name on the Status Bar. If necessary, you can apply a [different](#) layout to the text in the History window.

When you open the Layout function a dialog box displays on the right side of the screen with transcript or sample text to the left. Sample text contains each type of paragraph style with a brief description. The dialog box contains three panes used to setup layout values. Use the Left and Right arrows or the drop down box at the top of the dialog box to display the desired pane:

### Paragraph Setup

The [Paragraph Setup](#) dialog pane contains margin, font, tab and punctuation settings for paragraph styles. It also contains font and margin settings for each paragraph style.

### Page Setup

The [Page Setup](#) dialog pane contains position settings for top and bottom margins and line numbers.

### Headers & Footers

The [Header & Footers](#) dialog pane contains position and font settings for header and footer text and page number information.

## Apply New Layout

Apply New Layout allows you to apply a different [layout](#) to text in the History window. You may want to use this feature if you need to create a transcript of the History text. CATalyst BCS remembers your selection.

1. Press **(Alt + o, a) Format/Apply New Layout**. The Select Layout to Apply dialog box displays with all the available layouts for the current user.
2. Highlight the Layout you want to apply.
3. Press **Enter (Open)**. The Apply this change to: dialog box displays.
4. Click the button next to **one** of the following options to choose how you want to apply the layout changes.

### Entire Document

Changes apply to the entire file. If you made Header or Footer changes, they apply to the entire file.

### Only this page

Changes only apply to the page of your cursor location.

### From this Page to the Next Layout Change

Changes apply from the page of your cursor location to the next layout change.

### From this Page to the End of this Section

Changes apply from the page of your cursor location to the end of the current section.

### From this Page to the End of the Document

Changes apply from the page of your cursor location to the end of the file.

5. Press **Enter (OK)**.

## Save Layout As

The Save Layout As allows you to save the current [layout](#) under a new name. You may want to use this feature if you modify the layout for the text in the History window and want to create a new layout based the current changes.

To save the current layout under a new name:

1. Select **Format/Save Layout As**. The Save Layout File dialog box displays.
2. Type a new name in the File name field or select an existing layout name.

When you select an existing layout name, CATalyst BCS prompts you with a message to replace the existing layout with the current values.

3. Press **Enter (Open)**.

## Captioning Format Symbols

Format symbols are codes that help you format text in the History window or invoke commands during captioning. For example, you can define a steno outline to force text to the encoder, switch from Block mode to Pass mode or insert Story Slug On/Off format symbols to create a script file from the captions you have already written. Depending on the format symbol, you can insert it:

- into the text during a captioning session.
- include it as part of a definition while defining during a captioning session.
- include it as part of a definition when inserting or modifying entries in Manage Dictionary.

The Insert Format Symbol dialog box contains a default list of format symbols along with their associated shortcut key, if assigned. Format symbols display surrounded by < > brackets. Some format symbols have an associated default shortcut key command. Shortcut keys allow you to insert a format symbol by invoking a key combination. To use a shortcut key, press F4 and then press the key associated with the command, such as the default key "t" to insert a Tab. Default paired format symbols that turn a feature On and Off, use capital letters to turn the feature On and lower case letters to turn the feature Off. For example, the default "F4 B" turns bold On and "F4 b" turns bold Off. You can modify the shortcut key assignments in the [Format Symbols Options](#) table to suit your writing style. The Format symbols Options table also allows you to select which format symbols display in the Format Symbol list.

You can change the sort order of the Format Symbol list. When the Insert Format Symbol dialog box is open, click on the Format Symbol column heading to select ascending or descending order by format symbol name or click on the Shortcut column heading to select ascending or descending order by shortcut key.

To learn about additional available format symbols not listed in CATalyst BCS, search the CATalyst BCS Help index using the keyword: **format symbols**. You can add these format symbols to the CATalyst BCS Insert Format Symbol list by modifying your [Format Symbols Options table](#).

### Inserting a Format Symbol

To insert a format symbol during a BCS session, do any of the following:

- Press **F4** and the appropriate shortcut key.
- Select a format symbol from the Format Symbol list dialog box. Open the Format Symbol dialog box

by pressing **Shift + F4** or **F4, F4**, clicking the  icon on the toolbar or from the Edit menu selecting [Insert Format Symbol](#). To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the

first letter until the format symbol want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry.

- Insert the format symbol into a dictionary definition while defining. With the cursor in the New Text field, press **F4** and then press the appropriate letter.

## Caption Format Symbols

The text **Caption:** identifies the captioning format symbols in the Insert Format Symbol dialog box, a dictionary definition and the [Format Symbols Options](#) table. When you insert a captioning format symbol in a CATalyst BCS window, only the format symbol name displays. For example, a dictionary definition with the <Caption: Flush> format symbol displays in the History window, when Reveal Codes is active, as <Flush>.

## Caption Format Symbols

### Baseline

Determine the vertical placement of the captions. The Set Caption Baseline dialog box displays where you can select a valid number between **1 and 15**. The Baseline format symbol displays in the History window when Reveal Codes is active.

### Block

Prevent all upstream captions from being sent to the encoder when you write on the writing machine. CATalyst BCS sends the Block command unless you are in Suspend mode. The Block format symbol displays in the History window when Reveal Codes is active.

Translation Delay does not affect Block mode. When Block mode is invoked, CATalyst BCS forces all text immediately and does not wait for the Translation Delay setting to expire.

### Chars

Determine the number of captions allowed on a caption line. The Set Caption Chars Per dialog box displays where you can select a valid number between **8 and 32**. The Chars format symbol displays in the History window when Reveal Codes is active.

### Clear

Remove all the text from the video screen and the Caption Preview window. No punctuation is added to the prior line after a new paragraph definition is written. The Clear format symbol displays in the History window when Reveal Codes is active.

### Color

Determine the text color for the caption word or remaining text until CATalyst BCS encounters another color or EOC format symbol. The Choose Caption Color dialog box displays. Select a color and press **Enter (OK)**. The Color format symbol displays in the History window when Reveal Codes is active.

To use the Color format symbol for a specific word or phrase, insert the Color format symbol with the selected color before the word or phrase. Then insert the Color format symbol after the word or phrase using White selected as the color.

### Column

Determine the horizontal placement of the caption. The Caption Column dialog box displays where you can select a valid number between **1 and 25**. The Column format symbol displays in the History window when Reveal Codes is active.

**EOC**

Indicates the End of Caption (EOC) in the script file. If no EOC command is found, CATalyst BCS sends two lines of pre-scripted text. If you set the NIK file or key assignment to send to EOC, CATalyst BCS send up to four lines to the EOC. The EOC format symbol displays in the History window when Reveal Codes is active.

**Flash**

Not currently available.

**Flush**

Release any pending realtime text held and force it to the encoder and Caption Preview window. When you use the Caption: Flush format symbol, CATalyst BCS stops automatic number conversion and breaks translated numbers, prefix/suffix, glued letters and entries that contain a Delete Space space format symbol to the right of the previous word. For Example, if "semi<Delete Space>{Caption: Flush} truck" was written, the result would be: "semi truck". The Flush format symbol displays in the History window when Reveal Codes is active.

Translation Delay does not affect the Flush command. When the Flush command is invoked, CATalyst BCS forces all text immediately and does not wait for the Translation Delay setting to expire.

**KeepCaseNext**

Use the KeepCaseNext format symbol in a dictionary definition, the History window or the Script window to retain the next character's case. For example, to retain the small "c" in McLaughlin, you type M<Caption: KeepCaseNext>cLaughlin. When outputting in all caps, the "c" remains in lower case while all the other letters are capitalized, McLAUGHLIN. The KeepCaseNext format symbol displays in the History window when Reveal Codes is active.

Use this format symbol in dictionary definitions or in text that will be resent in a script file.

**KeepCaseOff/On**

Use KeepCaseOff/On format symbols in a dictionary definition, the History window or the Script window to retain the case of the typed text. For example, to retain the capitalization of McLaughlin, you type <Caption: KeepCaseOn>McLaughlin<Caption: KeepCaseOff>. When outputting in all caps, the word displays as "McLaughlin". The KeepCase Off/On format symbols display in the History window when Reveal Codes is active.

Use these format symbols in dictionary definitions or in text that will be resent in a script file.

**Musical Note**

Displays one music note on the video screen, the Caption Preview window and the History file to indicate music. To indicate two musical notes, insert two <Caption:Musical Note> format symbols.

**NIK**

Invokes the command assigned to the selected NIK key. NIK format symbols are used in dictionary definitions to invoke a command from the writing machine or from the computer keyboard to send text or change the position of text.

**Pass**

Allow all upstream captions, such as captioned commercials and other information to go to the encoder. The Pass format symbol displays in the History window when Reveal Codes is active.

Translation Delay does not affect Pass mode. When Pass mode is invoked, CATalyst BCS forces all text immediately and does not wait for the Translation Delay setting to expire.

[Keyboard Map](#) Function: Caption: Pass Existing

### **Position**

Determines the justification, row and column setting of the caption. The Set Caption Position dialog box displays where you can select the row, column and justification. The Position format symbol displays in the History window with the row, column and justification selection when Reveal Codes is active.

Make entries as necessary in the Set Caption Position dialog box:

#### **Justification**

Select one:

**Left**

**Right**

**Widest Right**

**Centered**

#### **Row**

Type the row number on which you want to position the first caption. Subsequent caption lines display above this line. For example, if your caption style is Roll-up with 3 lines and a row placement of 15, the first line of captions display on line 15, then roll up to line 14 when you write the second line. When you write the third row of captions, the first line rolls up to line 13.

#### **Column**

Determine the indent of the caption if the column number is other than 1. Type the column number where you want the caption to begin.

### **Rollup Rows**

Determine the maximum number of caption lines that appear when using the Roll-up style. The Set Roll-up Rows dialog box displays where you can select a valid number between **1 and 4**. The Roll-up Rows format symbol displays in the History window when Reveal Codes is active.

### **Scatter**

Use the Scatter format symbol to send one caption to a different position and then return subsequent captions to the current caption setting. The Set Scatter Position dialog box displays where you can set row and column settings. The Scatter format symbol displays in the History window with the selected row and column settings when Reveal Codes is active.

### **Send Line**

Send the next line of pre-scripted text to the encoder.

[Keyboard Map](#) Function: Caption: Send Line

### **Skip Line**

Move the cursor to the next line of pre-scripted text which sets the current send line. Skip line does not send a line of text.

[Keyboard Map](#) Function: Caption: Skip Line

### Story Slug Off/On

Use the Story Slug Off/On format symbols to indicate the title of the story. For example, <Story Slug On>Barns Commercial<Story Slug Off>. Story Slug format symbols display in the History window when Reveal Codes is active and the format symbols are inserted into the History window. Story Slug On/Off format symbols in a script file are not sent to the History window.

### Transparent Space

Allow the video or picture to be seen. The Transparent Space format symbol displays in the History window when Reveal Codes is active.

[Keyboard Map Function:](#) Caption: Transparent Space

### Warning On/Off

Use the Warning On/Off format symbols to add a warning to a story.

### Cap Next

Use the Cap Next format symbol to capitalize the first letter of the following word. This command is most beneficial when used in a dictionary definition where you always want the following word to be initial capitalized. For example, some people use the abbreviation "Ms" without punctuation and want the following surname capitalized. In this example, the text portion of the definition would be, Ms <Cap Next>.

You can also define a steno outline as <Cap Next> to initial cap the next word while in a captioning session. You can also use the [InitialCap On/Off](#) translate commands or the Cap Previous X Words translate commands to initial cap words while in a captioning session.

You do not need to use the Cap Next format symbol in definitions that contain punctuation with embedded capitalization. For example, the dictionary entry "Mr." would not need the Cap Next format symbol because the period would automatically capitalize the following word.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert during captioning

Position the cursor before the word you want to cap next and press **F4 F6**.

### Insert into a definition during captioning

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. At the end of the definition, press **F4 F6**.
4. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

This command does not affect the caption when sending captions in all capital letters using the [Display in all caps](#) option.

## Centered Paragraph

Use the Centered Paragraph (F4 f) format symbol to center a paragraph between the left and right margins. When you use the Centered Paragraph format symbol in a definition, the translated text following the Centered Paragraph information takes the format of the current paragraph style.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert during captioning

1. In the History window, position the cursor immediately before the text you want centered and press **F4 f**.
2. Move the cursor to the end of the text you want centered.
3. Press the appropriate format symbol to change the paragraph style for the text that follows.

### Insert into a definition during captioning

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, press **F4 f** and the text of the centered information.
4. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Conditional Line Break

A Conditional Line Break format symbol may be automatically inserted in a script file at the time it is imported into CATalyst BCS. To understand when a Conditional Line Break is inserted, it is important to understand the four basic rules that are applied when importing a script file. The following rules apply to importing any CAPTivator®/ASCII file type. When applying the rules to the importing file, longest match always applies.

## Conditional Line Break Rules

### Punctuation New Line

The Punctuation New Line rule occurs when CATalyst BCS encounters the symbols, '?', '.', ':', '-', '---' (question mark, period, colon, hyphen or dash). CATalyst BCS then checks for any combination of the symbols, '<Space>', '<StickySpace>', ')', '>', '}', '^', '^"', ']' (closed paren, greater than, closed brace, backslash open quote, backslash closed quote or closed square bracket), followed by a new line. The rule inserts a new line into the file in all cases except when the item after the line feed is a [/S] StorySlug, or [/W] Warning. All adjacent new lines after the first are suppressed.

### Special Character New Line

The Special Character New Line rule occurs when CATalyst BCS encounters a ']' followed by a line feed. The rule inserts a hard line into the file in all cases.

### Caption Format Symbol New Line

The Caption Format Symbol New Line rule occurs when CATalyst BCS encounter a [/M] Musical Note. The rule inserts a new line only if one is found in the imported file. If a new line is not found, then no new line is added to the file.

### Normal New Line

The Normal New Line rule occurs when none of the other new line rules apply. The rule replaces the first new line with a Conditional Line Break if the item immediately preceding it is not one of the following: [/E] EOC, [/R] Rollup, [/P] Pass, [/B] Block Captivator Format Symbol, [/S] StorySlug, [/W] Warning. CATalyst BCS then examines the text right before and after the new line to determine if a space is necessary. This ensures the text does not run together when the Conditional Line Break is suppressed. All adjacent new lines after the first one are suppressed.

### Colloquy

Use the Colloquy format symbol to indicate a Colloquy paragraph starting on a new line. You may want to use this command before a speaker name or speaker identification. You can insert the Colloquy format symbol during a captioning session or make it part of a dictionary definition.

The Colloquy paragraph formatting values, set in the applied Layout, determine how the Colloquy text displays and prints. You can customize these values in the Layout function.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

#### Insert during captioning

Position the cursor to the right of where you want to insert Colloquy and press F4 c.

#### Insert into a definition during captioning

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, press **F4 c**. Type the speaker name followed by a colon (:) and then press **Spacebar**. For example, **F4 c MS. MEYER:Spacebar**
4. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

### Conflict End

Use the Conflict End format symbol when you want to place text or a format symbol after a conflict but do not want it to be associated with the conflict.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

#### Insert during captioning

1. In the History window, position the cursor where you want to insert the conflict and text and press **Ctrl + i (Edit/Insert/Conflict)**. The Insert Conflict/Text dialog box displays.

2. In the Text field, type the conflict. For example:

**^ Spacebar text Spacebar ^ Spacebar text2**

3. At the end of the conflict, press **F4 \** to insert the Conflict End format symbol. No space should exist between the end of the conflict and the Conflict End format symbol. For example:

**^ Spacebar text Spacebar ^ Spacebar text2<Conflict End>**

4. Type the additional text or insert a format symbol and press **Enter (OK)**.

#### **Insert into a definition during captioning**

1. Position the cursor immediately before the steno outline or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the conflict and then press **F4 \**. No space should exist between the end of the conflict and the Conflict End format symbol. Following the Conflict End format symbol, type the text or insert a format symbol.
4. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

### **Continuation Paragraph**

Use the Continuation Paragraph format symbol to indicate where a secondary or continuation paragraph within a specific paragraph type begins.

The formatting values which determine how the Continuation Paragraph text displays in the History window are set the applied captioning [layout](#). Continuation paragraph values are customized separately for all paragraph styles.

### **Insert the Format Symbol**

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

#### **Insert during captioning**

In the History window, position the cursor before the word where you want to create a continuation paragraph and press **Enter**.

#### **Insert into a definition during captioning**

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, press **F4 p**.
4. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

### **Default Paragraph**

Use the Default Paragraph style to create a new paragraph style that may have different indentations and margins.

The formatting values which determine how the Default Paragraph text displays in the History window are determined by the Default Paragraph information set in the applied captioning [layout](#).

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert during captioning

In the History window, position the cursor before the word where you want to create a default paragraph and press **Shift + F4** to display the Format Symbol list. Select **Default Paragraph** and press **Enter**. You must insert the Default Paragraph by selecting it from the Format Symbol list. There is no shortcut key.

### Insert into a definition during captioning

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. Insert the Default Paragraph format symbol at the desired location in the definition: press **Alt + f** to display the Format Symbol list. Highlight **Default Paragraph** and press **Enter**. You must insert the Default Paragraph by selecting it from the Format Symbol list. There is no shortcut key.
4. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Delete Space

Use the Delete Space format symbol to delete computer-inserted spaces which CATalyst BCS automatically inserts between words during translation. For example, use a <Delete Space> after the period in an internet address, www.<Delete Space>, so that there is no space following the period and remaining characters.

You can also use Backspace or Del to remove a space while editing.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert during captioning

In the History window, position the cursor between the two words where you want the Delete Space and press **F4 ~**.

### Insert into a definition during captioning

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, do **one** of the following:
  - Delete the space at the beginning of the definition, press **F4~** and then type the text of the definition.

- Delete the space at the end of the definition, type the text of the definition and then press **F4~**.
4. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

If you are defining a prefix or suffix you may want to use the Prefix and Suffix translate commands and take advantage of the [EZ Link](#) feature.

## Force Next Lower

Use the Force Next Lower format symbol in a dictionary definition where you want the first character of the following word to be lower case. You would likely use this format symbol in dictionary definitions for web address or e-mail addresses. For example, you have "Stenograph" defined in your dictionary along with "www." and ".com". You write the web site address resulting in "[www.Stenograph.com](#)" Using the Force Next Lower format symbol in the "www." define, such as www.<Force Next Lower><Delete Space>, the result is: "[www.stenograph.com](#)"

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert into a definition while editing

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition.
4. At the location you want to force the following word to be lower case, press **Alt + f** to display the Format Symbol list. Select **Force Next Lower**. Add any other text or format symbols that follow.
5. Press **Enter (OK)**. When defining in Edit, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## New Line

Use the New Line format symbol to move text to the left margin of the following line using the left margin information set in the previous paragraph style. The New Line format symbol does not generate ending punctuation.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert during captioning

1. In the History window, position the cursor on the word or format symbol where you want the New Line.
2. Press **Shift + F4** to display the Insert Format Symbol dialog box.
3. Highlight **New Line** and press **Enter**.

**Insert into a definition during captioning**

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. At the location you want to start a new line, press **Alt + f** to display the Format Symbol list. Highlight **New Line** and press **Enter** to insert the format symbol into the definition.
4. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

**New Line Paragraph**

CATalyst BCS automatically uses the New Line Paragraph format symbol (F4 l) when you open a new file or job and do not specify a particular paragraph style. New Line Paragraph initial caps the first letter of the first word. By default, the captioning layout does not have punctuation associated with the New Line paragraph style.

**Insert the Format Symbol**

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

**Insert during captioning**

In the History window, position the cursor on the word or format symbol where you want the New Line Paragraph and press **F4 l**.

**Insert into a definition during captioning**

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. At the position you want the New Line Paragraph, press **F4 l**. If appropriate, type any remaining text to complete the definition.
4. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

**New Page**

Use the New Page format symbol to create a page break in the job. Text following a New Page format symbol takes on the New Line Paragraph style unless other paragraph format information exists. To remove a new page, delete the New Page format symbol using Reveal Codes.

**Insert the Format Symbol**

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

**Insert during captioning**

In the History window, position the cursor where you want the new page to begin and press **F4 n**.

### Insert into a definition during captioning

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. At the position you want the new page, press **F4 n**. If appropriate, type any remaining text to complete the definition.
4. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

### No Auto Convert

Use the No Auto Convert format symbol in a dictionary definition to prevent the Automatic Number Conversion translate option and Display 10 and Under as Words from affecting numbers within the definition. For example, you write the steno for Global 1 Credit Union with Display 10 and Under as Words active. The result is Global one Credit. To prevent the conversion to Global one Credit Union, create the definition, Global<No Auto Convert>1 Credit.

You can also use the No Auto Convert format symbol in a definition by itself. For example, you create a dictionary definition for <No Auto Convert>. When writing a number, you recognize that you do not want it to convert in the current context. You write the stroke for No Auto Convert followed the "keyword" that creates a conversion. No conversion occurs because you wrote the stroke for <No Auto Convert> in between.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert into a definition during captioning

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, press **Alt + f** to display the Format Symbol list. Highlight **No Auto Convert** and press **Enter** to insert the format symbol into the definition. Type the text of the definition.
4. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

### Oops

Use the Oops format symbols to place an invisible mark in the History window on which you can search or scan. For example, let's say while you are captioning the speaker says something and you know you will need to return to that location in the history file while you are on a break to double check the text. You can write steno outline defined as Oops to mark the place in the History file. During the break you can search, scan for or open the Hotspots pane to find the location immediately. The Oops format symbol displays in the History window when Reveal Codes is active.

There are up to 10 possible Oops categories in the [Hotspots Options](#) which you can personalized with a name and color. You can assign categories based on things that are important to you such as "check spelling" to one category, "script potential" to another category, etc." Using the example above, let's say you have the following categories: Oops 0 is assigned to check a spelling and Oops 1 is assigned to script potential. Once you assign a name and a color (optional), when you view the Hotspots pane, you can quickly identify the categories and what to check when needed. The Oops format symbol categories apply to all jobs. Reveal Codes displays the different Oops categories with Oops followed by the number assignment and category name, if applicable. For example, <Oops 0> - check spelling , <Oops 1> - potential script, etc.

There are certain actions such as aborting a Power Define, Scan Define, Create EZ Speakers or Text E-define dialog box or re-translating a steno file where Power Defines or AccelerWriters were use or having the Live Suggestion option *Insert Oops when replacing a live suggestion option* selected where CATalyst BCS will automatically insert an Oops format symbol into the history file. In the above cases, the Oops format symbol will always be inserted as <Oops 10> which is the CATalyst Inserted category.

The dictionary [filter](#) and [search](#) commands include a Contains <Oops> symbols Entry Type option that will filter/search for every entry containing an Oops format symbol regardless of the Oops number/category assignment.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table or if you have remapped your F4 key in your keyboard map.

### Insert during captioning

In the History window, position the cursor before the word where you want to insert the Oops format symbol and press **Shift + F4** to display the Format Symbol list. Highlight **Oops** and press **Enter**. The Oops Category dialog box displays, type a valid number (0 - 9) and press **Enter**.

### Insert into a definition during captioning

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, press **Alt + f** to display the Format Symbol list. Highlight **Oops** and press **Enter** to insert the format symbol into the definition. The Oops Category dialog box displays. Type a valid number (0-9) for the Oops category. If the Oops format symbol is the only entry in this definition, go to Step 4. If there is text with the Oops format symbol, type the text and go to Step 4.
4. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Parenthetical

Use the Parenthetical paragraph style to indicate where a Parenthetical paragraph begins. You might use a Parenthetical paragraph when information is displayed in parenthesis such as designating (Music played). The parenthetical paragraph information set in the applied captioning [layout](#) affects the formatting values that determine how the parenthetical text.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert during captioning

In the History window, position the cursor before the word where you want to create a parenthetical paragraph and press **Shift + F4** to display the Format Symbol list. Select Parenthetical and press **Enter**.

### Insert into a definition during captioning

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, press **Alt + f** to display the Format Symbol list. Highlight **Parenthetical** and press **Enter** to insert the format symbol into the definition. Type the text of the definition.
4. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

### Scanstop Begin/End

Use the Scanstop Begin and End and format symbols to indicate where you want to create a Scanstop and where the Scanstop should end. The text in between the format symbols is part of the Scanstop. Set CATalyst BCS to stop on Scanstops in [Scan For](#) options. The default color for Scanstops is different from the text. You can [change](#) the color.

### Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

#### Insert during captioning

Do one of the following:

- In the History window, position the cursor immediately to the left of where you want the Scanstop to begin and press **F4 O**, then move the cursor to the position where you want to end the Scanstop and press **F4 o**.
- In the History window, mark the text you want as a Scanstop and press **F4 O**. The Scanstop End format symbol automatically inserts at the end of the marked text.

#### Insert into a definition during captioning

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition.
4. At the location you want to begin the Scanstop, press **F4 O**.
5. Type the text you want to contain in the Scanstop. At the location you want to end the Scanstop, press **F4 o**. If appropriate, type any remaining text to complete the definition.
6. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Sticky Space

Use the Sticky Space format symbol to create a space between two words and keep the words together on the same line. CATalyst BCS uses built in rules so it does not create an extra space in definitions such as Mr.<Sticky Space> but keeps the words together on the same line.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert during captioning

In the History window, position the cursor immediately following the first word of the two words you want to keep together and press **F4 k**.

### Insert into a definition during captioning

1. Position the cursor immediately before the word or steno you want to define. Use a Mark command to highlight multiple steno outlines.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text and then press **F4 k**. Type any additional text. When using <Sticky Space>
  - Do not add an additional space between the words. For example, Global<Sticky Space>1
  - Do not place any additional spaces before or after the <Sticky Space> format symbol.
4. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Tab

Use the Tab format symbol to move text to the next tab setting based on the applied captioning [layout](#) for the job.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert during captioning

In the History window, press **Tab** to move the text to the next tab setting.

### Insert into a definition during captioning

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. At the position you want the Tab, press **F4 T**. If appropriate, type any remaining text to complete the definition.
4. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## Uncap Next

Use the Uncap Next format symbol to lower case the first letter of the following word. This command is most useful when capitalization is controlled by an embedded command, such as punctuation.

When the Uncap Next format symbol is used at the end of a definition, it prevents the capitalization of the first letter of the next word. For example, in the Personal Dictionary, there is a definition for "Mr. and Mrs." If the definition does not contain the Uncap Next format symbol after the period of "Mr.", the entry translates as "Mr. And Mrs." Including the Uncap Next format symbol as part of the definition for "Mr." (Mr. F4 F5), the word "and" translates in lowercase to produce "Mr. and Mrs.".

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert during captioning

In the History window, move the cursor to the beginning of the word you want to lower case and press **F4 F5**.

### Insert into a definition during captioning

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. At the position you want to uncap the next word, press **F4 F5**. If appropriate, type any remaining text to complete the definition.
4. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## User Defined Paragraph

Use the User Defined Paragraph format symbol to insert a User Defined Paragraph Style when no other style applies. Insert the User Defined Paragraph format symbol during a captioning session or make it part of a dictionary definition.

The User Defined Paragraph information set in the applied captioning [layout](#) affects the formatting values which determine how the User Defined Paragraph text displays.

## Insert the Format Symbol

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Insert during captioning

1. In the History window, position the cursor before the word where you want to insert User Defined Paragraph Style and press **F4 e**. The Set User Defined dialog box displays.
2. In the Enter Value field, type the number of the User Defined Style you want to apply.
3. Press **Enter (OK)**.

### Insert into a definition during captioning

1. Position the cursor immediately before the steno outline you want to define or use a Mark command to highlight multiple steno strokes.
2. From the Global menu, select a dictionary definition type. The Global Definition dialog box displays.
3. In the New Text field, type the text of the definition. At the location you want to insert the User Defined Paragraph, press **F4 e**. The Set User Defined dialog box displays. Type the number of the User Defined Paragraph style and press **Enter (OK)**. If appropriate, type any remaining text to complete the definition.
4. Press **Enter (OK)**. When defining during captioning, the global applies forward through the rest of the job. If you selected the Entire File option, then the global applies forward and backward in the job.

## CATalyst BCS Tools and Options

The Tools menu in CATalyst BCS provides access to audio playback options, when audio is available; dictionary selection during captioning; keyboard customizations; EZ Speaker creating; recording and managing macros; keyboard customizations; EZ Speakers creation; History Window editing options; and Spell Check.

### Add/Remove Dictionaries

Add/Remove Dictionaries allows you to add or remove dictionaries used for translation and change dictionary priority during this realtime captioning session.

You can open and modify a dictionary that is selected and in use. After you save and close the dictionary, you can quickly reload the dictionary so that the modifications apply to the realtime translation. Open the Add/Remove Dictionary feature and click OK in the dialog box for the modifications take affect.

You can view the definition for a particular steno outline by using the [Query Realtime Translation](#) feature.

### Add or Remove Dictionaries During Realtime Translation

1. From the Tools menu, press **Alt + t, d (Add/Remove Dictionaries)**. The Dictionary Selection and Priority During Translation dialog box displays.
2. Use the options as necessary:

#### Choose Dictionaries

##### Show All Users

Check this box to display all users. You can select a dictionary from any user. Choosing a user after selecting dictionaries will deselect the checked dictionaries. CATalyst BCS prompts you to continue or Cancel.

##### Dictionaries

Do either of the following:

- Check the box next to any dictionary you want to use for translation.  
To select a dictionary from another user, check the Show All Users box to display a list of users. Choosing a user after selecting dictionaries, deselects the checked dictionaries.
- Uncheck the box next to any dictionary you no longer want to use for translation.

#### Set Dictionary Priorities

Dictionaries are used for translation in priority order. The dictionary at the top of the list has first priority; the second dictionary listed has second priority, etc. When you add a dictionary, it becomes the first available priority before the Personal Dictionary and Update Area, if selected for use.

### Count

The total number of dictionaries selected for translation.

### Move Up/Move Down

To change the dictionary order, highlight a dictionary and then use the buttons as necessary.

### Remove

Highlight a dictionary and click **Remove** to remove it from the priority list.

### Move to Top

Highlight a dictionary and click Move to Top to quickly move the dictionary to the top of the priority list.

### Move To Bottom

Select a dictionary and click Move to Bottom to quickly move the dictionary to the bottom of the priority list. If you click Move to Bottom without selecting a dictionary, the dictionary in the highest priority moves to the lowest priority.

3. Do **one** of the following:
  - Press **Enter (OK)** to accept the changes.
  - Press **Esc (Cancel)** to cancel any changes and close the dialog box.

## Change Job Dictionary

Change Job Dictionary allows you to change the job dictionary to which you send J-Defines. The default job dictionary for each job is the job dictionary of the same name as the captioning session. When you select to change the job dictionary, all job dictionary defines for the open captioning session are sent to the chosen dictionary. CATalyst BCS applies your selection to all editing session for this captioning file, until you change your selection again using the Change Job Dictionary feature.

You can place a define into another dictionary without changing the default job dictionary assignment. When defining, select a different dictionary in the Pick Other Dictionary field of the [Global](#) dialog box.

To change the job dictionary:

1. Press **Alt + t, j (Tools/Change Job Dictionary)**. The Change Job Dictionary dialog box displays with current job dictionary name in the File name field.
2. Select a dictionary from the list. The name displays in the File name field.

If you want to select a dictionary from another user, first change to that user in the Look In field.
3. Press **Enter (Open)**.

## Change Keyboard Maps

Change Keyboard Maps allows you to switch to a specific Keyboard Map, permitting you to use different keyboard commands. When you start a captioning session, the Default keyboard map is active unless you [change](#) the setting. The name of the active keyboard map displays on the Status bar at the bottom of the screen.

To change keyboard maps, press **Alt + t, y, y (Tools/Keyboard Customization/Change Keyboard Map)**. The Keyboard Map submenu displays the keyboard maps available in your user name. From the Keyboard Map menu, select a keyboard map. The selection displays on the Status bar.

You can also press \ (backslash) (**Tools/Cycle Keyboard Maps**) to cycle through the available keyboard maps.

## Format Symbols Options Table

The [Format Symbols Options](#) table contains CATalyst BCS translate commands and CATalyst BCS format symbols along with the default shortcut key assignments. You can customize the display of format symbols in the Format Symbols list and modify the shortcut key assignments.

Access the Format Symbol Options table:

- in CATalyst BCS. Press **Alt + t, y, f (Tools/Keyboard Customization/Format Symbol Options)**.
- in Manage Jobs. Press **Alt + f, o, i, e (File/Open/List/Format Symbols Options)**.

## Cycle Keyboard Maps

Cycle Keyboard Maps allows you to switch the Keyboard Map, permitting you to use different keyboard commands. When you start a captioning session, the Default keyboard map is active. The name of the active keyboard map displays on the Status bar at the bottom of the screen.

To change keyboard maps, press \ (**Tools/Cycle Keyboard Maps**). You can continue to press \ and cycle through all the available keyboard maps in your user name.

CATalyst BCS opens with the Default keyboard map unless you [change](#) the setting.

## Create EZ Speakers Entries

Use Create EZ Speakers Entries to quickly identify speaker names. To use EZ Speakers definitions, you must identify the actual speaker names. Depending on the EZ Speakers entry, you may also need to identify the steno outlines. You can specify speaker names from Manage Dictionary or during a captioning session.

When you use EZ Speaker fields as recommended, CATalyst BCS places the EZ Speaker field into the definition of a job or case dictionary, inserts the speaker name into the job when written during captioning and adds the speaker to the [Speaker List](#). If the job is in a case, the default selection places the generated speaker definition into the case dictionary, although you can select any job dictionary.

## Identify EZ Speakers Names

1. Do **one** of the following to display the Create EZ Speakers Entries dialog box:

### Prior to a Captioning Session in Manage Dictionary

Open the selected case or job dictionary or create a new job dictionary. Press **Alt + t, e (Tools/Create EZ Speakers Entries)**.

### During a Captioning Session

Press **Alt + t, z (Tools/Create EZ Speakers Entries)**.

Write the steno outline defined as {EZ Speaker Define}. See instructions below on how to create EZ Speakers from your steno machine.

2. Make entries as necessary:

## Dictionary

### Job Dictionary

Place the generated EZ Speakers definitions into the job dictionary. This is the default unless the job is in a case. This option is available when the job is in a case and you are identifying EZ Speakers during a CATalyst BCS session.

### Case Dictionary

Place the generated EZ Speakers definitions into the case dictionary. This is the default if the job you are creating is currently in a case. This option is available when the job is in a case and you are identifying during a CATalyst BCS session.

### Other Dictionary

Place the generated EZ Speakers definitions into a dictionary other than the case or job dictionary. All dictionaries that are included in the current Profile display in the drop down box. Select a dictionary from the list or use the Browse to select a dictionary from another location.

This option is available during a CATalyst BCS session.

### Always default to Job Dictionary

When you are creating EZ Speakers generated definitions for a file within a case, you can change the dictionary default to the job dictionary. Select *Job Dictionary* and then check this box. If you select *Job Dictionary* and do not check this box, CATalyst BCS uses the job dictionary for this translation and then defaults back to *Case Dictionary* the next time you open the Create EZ Speakers dialog box. Select this feature if you use a case but always want your EZ Speaker IDs placed in a job dictionary.

This option is available during a CATalyst BCS session.

### Currently selected dictionary

Displays the path and dictionary name where the EZ Speakers entries are generated.

## Text Token Number

Type the speaker number, **00 - 99**, for the EZ Speakers entry to which you want to add an actual speaker name.

### Steno

Do **one** of the following:

- If the speaker number you type contains a steno outline in the EZ Speakers dictionary, the Steno field is unavailable but displays steno associated with the token number. Continue to the Text field.
- If the speaker number you type does not contain a steno outline in the EZ Speaker dictionary, type the appropriate steno. The steno outlines you type in this field replace the ! (exclamation mark) in the EZ Speaker dictionary definition. For example, you write RED/RED for >>Redmond. The steno typed in the steno field represents the exclamation symbol. If the EZ Speakers entry contains an !, type RED/RED.

If there are two Exclamation marks in the EZ Speakers dictionary entry, type the steno outline once. Using the previous example, type RED.

## Text

Type the actual speaker name the way you want it to appear in the transcript. Include any format symbols or extended characters as necessary. Do not include format symbols or punctuation which are part of the EZ Speakers dictionary entry. For example, for Mr. Redford, type **Redford**. The <Colloquy> format symbol before the speaker name, <Caption: KeepCaseOn/Off> format symbol, the : (colon), and space following the colon are part of the EZ Speakers dictionary entry.

To add extended characters:

- Place the cursor in the New Text field and press **F9**. The Insert Character dialog box displays. To change the font, press **Alt + t**. The Font dialog box displays where you can modify the font characteristics. Changing the font may change the availability of characters.
- Double click a character in the Insert Character dialog box. CATalyst BCS inserts the character at the cursor location.

## FS

Display the list of available format symbols. Double click the format symbol you want to use in the definition. You can insert a format symbol at any point in the text entry. If you always add a format symbol to the speaker, you may want to add that format symbol to the EZ Speakers entry.

You can also use shortcut keys to insert a format symbol. Place the cursor in the Text field, press **F4** and then press the appropriate letter or symbol.

## Allcap Text

Check this box to display and save the entry in all upper case letters regardless of the case entered in the Text field.

## Include All Possible Misstrokes

Check this box to have CATalyst BCS generate definitions in the dictionary based on all the possible misstrokes for the EZ Speakers entry.

For example, you have the entry ! = <Colloquy>>>#00: in your EZ Speakers dictionary. You identify ! as A\*PBD/A\*PBD and the 00 as Anderson. CATalyst BCS builds the dictionary entry:  
A\*PBD/A\*PBD = Anderson:

When you check this option, CATalyst BCS also creates the following job dictionary entries, **provided a definition does not already exist in the Personal Dictionary for any of the identified misstrokes:**

APBD/A\*PBD = >>Anderson:

A\*BD/A\*PBD = >>Anderson:

A\*BD/A\*BD = >>Anderson:

## Entire File

Check this box to have the newly created EZ Speaker apply to the entire job. Uncheck this box to apply the newly created EZ Speaker only to the steno outlines written after the EZ Speaker is defined. By default, this option is checked.

This option is available during a CATalyst BCS session.

- Repeat entering steno, text and token numbers until you define all your speakers.
- Press **Alt + e (Close)** when finished.

### Create EZ Speakers from the steno machine

1. Write the steno outline defined in one of your dictionaries being used to translate as {EZ Speaker Define}. The default Realtime Commands Dictionary contains the definition for {EZ Speaker Define} using the steno SPEF/SPEF.  
Once the Create EZ Speakers Entries dialog box displays, you will write the steno outlines in your [Power Define dictionary](#) to navigate the dialog box.
2. In the Text Token Number field, write the steno defined as a digit for the speaker you want to created and then write the steno outline defined in your Power Define dictionary as [TAB].  
Depending on your EZ Speaker dictionary entries, the Steno field may be populated with your speaker steno. Go to Step 4.
3. In the Steno field, type the steno outline(s) you will write for the speaker and then write [TAB].
4. In the Text field, type the name of the speaker using dictionary definitions and/or fingerspelling.
5. Do any of the following:
  - To complete the EZ Speaker entry, write the steno outline defined in the Power Define dictionary as [ENTER]. The speaker is created and added to the appropriate dictionary, speaker list and [seating chart](#).
  - To change an option, write [TAB] to put the cursor focus on the option and then write the steno outline defined in the Power Define dictionary as [SPACE] to select or deselect an option.  
If you want to access the Insert Field function, press **Alt + i** on the computer keyboard or click the button with a mouse.
  - If you need to leave the Create EZ Speaker Entries dialog box open and return to writing realtime, write the steno outline defined as [SUSPEND] in the Power Define dictionary. The Create EZ Speaker Entries dialog box flashes, the cursor focus changes to the realtime text and leaves the Create EZ Speaker Entries dialog box open.  
You can write the Suspend command at any time the Create EZ Speaker Entries dialog box is open. To return to the Create EZ Speaker Entries dialog box, write the steno outline you wrote to open the Create EZ Speaker Entries dialog box.
  - To cancel the creation of the current EZ Speaker and close the dialog box, write the steno outline defined in the Power Define dictionary as [ABORT].
  - To close the dialog box, write [TAB] until your cursor focus is on the Close button and write the steno outline defined as [ENTER].

### Spell Check

The Spell Check feature in CATalyst BCS checks the spelling of text in the History window, text in a Global Definition dialog box when the Spell Check while Defining option is active and text in certain dialog boxes. Once Spell Check identifies a misspelled or repeated word, it highlights the word and displays it in the Spell Check dialog box where you can choose to:

- change the word as suggested by Spell Check.
- view alternative words. The original word's actual and phonetic spelling is the basis for the alternative words suggested by Spell Check for the misspelled word.
- define the word and add it to a Personal, case, or job dictionary.
- ignore the word for this occurrence only.
- ignore the word for all occurrences during this Spell Check session.

- add the word to a Personal, Case or Job [Wordlists](#) so that Spell Check ignores the word for all occurrences.
- delete the word.
- look up the definition of the word or a suggested alternate word. The Spell Check Definition feature uses the Merriam Webster Dictionary. You can also access definitions while using [Spelling Lookup](#).

You can invoke Spell Check manually for a word in the *Text* field of certain dialog boxes. With your cursor in the *Text* field, press **Shift + F7**. The Spell Check dialog box displays when a word is misspelled. If there is no misspelling, a message displays indicating no spelling errors were found. When multiple words display, Spell Check considers the cursor location in the *Text* field when looking for misspellings. To check the definition of a word, position the cursor in the *Text* field and press **Ctrl + F7**. The Spell Check - [Lookup] dialog box displays. When [Spell Check While Defining](#) option is active, Spell Check automatically checks the word in the *Text* field when you press Enter in the dialog box. The Spell Check dialog box displays when Spell Check identifies a misspelled or repeated word.

[Wordlists](#) and [Spell Check options](#) allow you to customize Spell Check for your writing style or job. Using wordlists, you can identify words for Spell Check to automatically ignore as a misspelling. Spell Check options allow you to select automatic Spell Check features, choose Wordlists, set the number of Suggestions and choose the language type. For example, you can add a job wordlist, choose the Wintertree Medical Wordlist, activate the option to have Spell Check ignore all capped words and single characters, display notification when Spell Check completes in a text field and set the number of suggested words to display at 10.

Spell Check stops on a space that occurs before a colon, semi-colon, comma, question mark, exclamation mark and a period, except when the period is followed by numbers. Spell Check also stops on incorrect spacing following punctuation, abbreviations, between words or at the beginning of a paragraph when the Spell Check, Check Spacing option is active. Spell Check does not stop on a space at the beginning of the paragraph created by a <Tab> format symbol. [Advanced Spell Check Options](#) affect how spaces after a colon and an abbreviation are handled. An ellipsis is recognized when it is defined as: <Sticky Space>period<Sticky Space>period<Sticky Space>period

[Spell Check in Manage Dictionary](#) allows you to check the spelling of the text portion of dictionary entries or check words when you are inserting and modifying entries. Spell Check options are set separately for Edit and Manage Dictionary.

## Spell Check

Spell Check the text in the History or Script window. Spell checking your text can be performed at any time. Spell Check uses a default wordlist along with any provided wordlists you select. Options and wordlists are selected in the [Transcript Spell Check](#) dialog box. Spell Check will also use the Personal Wordlist and case and/or job wordlist when spell checking. If, in the rare case, there is a word you feel is misspelled in the default wordlists, you can put the word in your [Personal Wordlist](#) with the exclude attribute. To begin spell checking your text, do the following:

1. Start a Spell Check session, press **Shift + F7 (Tools/Spell Check)**. When Spell Check identifies a possible error, the Spell Check dialog box displays. The Title Bar displays the error type such as Misspelled Word, Repeated Word, Incorrect Spacing, or Repeated Paragraph Type.
2. The following information displays in the Spell Check dialog box:

### Steno

The steno, if any, associated with the highlighted text.

### Text

Text identified as misspelled or repeated.

### **Change To**

CATalyst BCS automatically displays an alternative word for the highlighted text when appropriate. You can also type in the field. When words are available in the Suggestions field, CATalyst BCS highlights the closest match to the typed change.

### **Suggestions**

Alternative words or actions to the suggestion in the Change To field. Click a word or action to select it.

3. Use the following options as necessary:

### **Change**

Change the text for this occurrence only. Do **any** of the following:

- Accept the word or action in the Change To field.
- Select a word or an action from the Suggestions list to display in the Change To field.
- Type a different word in the Change To field.

### **Global**

D-define, J-define, K-Define, or E-define the text. The Global dialog box displays.

### **Wordlist P, K, J**

Add the word directly to one of the wordlists. The Add to Wordlist dialog box does not display. Select **one** of the following:

#### **P**

Press **Alt + p** to add the word to your personal wordlist.

#### **K**

Press **Alt + k** to add the word to the case wordlist, when the job is in a case.

#### **J**

Press **Alt + j** to add the word to the job wordlist.

### **Wordlist**

Add the word to your personal, case, or job wordlist. The [Add to Wordlist](#) dialog box displays where you can select to automatically ignore the word, correct the word or suggest a specific word.

### **Suggest**

Suggests an alternative word(s) from the Suggestions field for the word in the Change To field.

### **Resume**

Resume spell checking your transcript. This option displays when you place your cursor outside of the Spell Check dialog box and when you have the Spell Check option, Pause after change, selected.

### **Ignore**

Leave the highlighted text for this occurrence only. If Spell Check encounters this text again in this job, it stops. Ignore is the default. You can [change](#) the default to do any of the following: Change, Global, Ignore All, or Wordlist.

**Ignore All**

Leave the highlighted text as misspelled, repeated, or incorrect punctuation for all occurrences for this captioning session. If you exit or close the captioning session and reopen the file, Spell Check stops on text previously identified as Ignore All.

**Ignore Page**

Skip the current page. This option only applies when Spell Check encounters incorrect spacing. CATalyst BCS ignores spacing issues on the page but still checks for spelling errors.

**Delete**

Delete the text that displays in the Change To field from the History file.

**Definition**

Check the definition of the word in the Change To field. The Merriam-Webster Dictionary dialog box displays. When connected to the Internet, click the Definition Search () icon to connect to the web site specified in the [Definitions Search option](#) where you can view additional definitions and information. Press **Esc** to return to the Spell Check dialog box.

**Undo**

Restores the last spell check action. Not all actions are reversible.

**User Def**

Display the customized definition, if one exists, for the word in the Change To field. This option is available when the word exists in the [User Definitions table](#) and has been added to a Wordlist set to Suggest.

**Options**

Determine how you want Spell Check to look at words. The Transcript Spell Check [Options](#) dialog box displays where you can set spelling options and select wordlists. When you change options from within the Spell Check dialog box, you must close Spell Check and restart it for the option changes to take effect.

4. Spell Check continues until you press **Esc (Cancel)** to exit the Spell Check feature and close the dialog box or Spell Check reaches the end of the transcript and displays the message: *Spell Check has reached the end of the document. Would you like to restart from the beginning?* Do one of the following:

**Continue Spell Check**

Click **Yes** or with the cursor focus on Yes, press Enter. Spell Check continues from the beginning of the document until finished. Upon completion, Spell Check displays the message: *Spell Check complete*. Press **Enter** to select **OK**.

**End Spell Check**

Click **No** or with the cursor focus on No, press Enter. You can change the cursor default to No in [Advanced Spell Check Options](#).

**Spell Check While Defining**

You can set Spell Check to automatically check a word that is typed in the Global Definition dialog box or a hidden text entry. When you type text and press Enter to complete the definition, Spell Check

automatically checks the word or words for correct spelling. If Spell Checks detects a possible error, the Spell Check dialog box displays.

To have Spell Check active while defining:

1. Do **one** of the following to display the Transcript Spell Check Options dialog box:
  - From a captioning session, press **Alt + t, o, s** (**Tools/Options/Spell Check Options**).
  - From Manage Jobs, press **Alt + t, o, s** (**Tools/Options/Settings/Transcript Spell Check Options**).
2. Check the box for the **Spell Check While Defining** option.
3. Press **Enter (OK)**.

## Spelling Lookup

Spelling Lookup (Ctrl + F7) allows you to look up the definitions or correct spelling for words or steno. You can also access word definitions by pressing **Alt +v, w** (**View/Word Definition**) or selecting **Definitions** from the Spell Check dialog box.

- change the word to one of the suggested words.
- view alternative words. The original word's actual and phonetic spelling is the basis for the alternative words suggested the misspelled word.
- define the word and add it to a Personal, case, or job dictionary.
- ignore the word for this occurrence only.
- ignore the word for all occurrences during this Spell Check session.
- add the word to a Personal, Case or Job [Wordlists](#) so that Spell Check ignores the word for all occurrences.
- exclude the word in one of the Wordlists so Spell Check thinks it is misspelled.
- delete the word.
- look up the definition of the word or a suggested alternate word. The Spell Check Definition feature uses the Merriam Webster Dictionary.

Spelling Lookup uses the following wordlists: Personal, Case, Job wordlists along with any selected wordlists such as Wintertree, Stedman's, Blacks, etc. When the Definition feature is selected, Spelling Lookup uses Merriam-Webster dictionary.

## Look up a Word

1. Position your cursor in front of the word you want to look up or use a Mark command to highlight the words or steno.
2. Press **Ctrl + F7 (Spelling Lookup)**. The Spelling Lookup dialog box displays.
3. Use any of the [Spell Check](#) commands to change the word(s), add the words to a wordlist or ignore for the current job or current session.
4. Press **Alt + e (Definition)**. The Merriam-Webster Dictionary dialog box displays. If you receive the "no definition found" message, you can type a new word in the field and click Find Word. If you have an internet connection, in the Merriam-Webster Dictionary dialog box click the [Definition Search](#) () icon to connect to the web site specified in the [Definitions Search option](#) where you can view additional definitions and information.

5. When finished, press **Esc** to return to the Spelling Lookup dialog box.
6. Press **Esc (Cancel)** to exit the Spelling Lookup dialog box.

## Wordlists

A wordlist contains words you decide CATalyst BCS should ignore as a misspelling when using Spell Check. There are three types of wordlists: personal, case, and job. CATalyst BCS uses the personal wordlist every time you invoke Spell Check. Words entered into this wordlist are those entries you want to apply when spell checking every job. You can also [apply](#) a wordlist from another job or user. CATalyst BCS can only use wordlist types that have a .clx or .tlx extension.

CATalyst BCS automatically creates a job wordlist when you spell check a captioning file or use the [Make Wordlist](#) feature in Manage Dictionary. If the job is in a case, CATalyst BCS also creates a case wordlist. Use a case or job wordlist when you encounter words you want Spell Check to ignore as a misspelling just for the current captioning session. For example, Spell Check may stop on a proper name. You can add this word to the case or job wordlist, so that Spell Check recognizes the word for this captioning session or all the session in the case.

You can [add](#) entries to wordlists while using Spell Check during a captioning session and in Manage Dictionary. New entries apply immediately to the current captioning file or dictionary. Entries added to a job wordlist have priority over entries entered in a case or personal wordlist. For example, if you set a word for Suggest in the job wordlist and then put the same word in a personal wordlist as an Auto-Correct, CATalyst BCS does a Suggest and never an Auto-Correct.

You can only add a single word at a time to a Wordlist. If you attempt to add two words at once to a Wordlist, Spell Check continues to stop on both words. For example, if you have a speaker name that Spell Check does not recognize, such as MS. CASHEN, Spell Check sees each word separately, MS. and CASHEN. You cannot add both words together into a Wordlist.

Spell Check corrects multiple punctuation when the entry is in a wordlist. For example, you want to change any occurrence of an ending quoter followed by a period (".") to a period followed by an ending quote ("). You add the incorrect punctuation to a wordlist and have CATalyst BCS Autocorrect the entry with the correct punctuation.

CATalyst BCS comes with Wintertree Medical and Legal, Black's Law, and Stedman's Medical wordlists. WinterTree Medical and Legal is available in the language set selected for Spell Check. Black's Law and Stedman's Medical is only available in English. You cannot add words to these wordlists. You can choose to apply any of these wordlists.

To open a wordlist, from the Menu Bar, select **File/Open/Wordlist**.

## Viewing a Wordlist

When you open a wordlist, the Status Bar located at the bottom of the screen provides information about the current display of entries and certain keyboard options. The column headings on the screen identify the following for each entry:

### Word

The word Spell Check takes an action upon.

### Action

The selected [action](#) you want CATalyst BCS to perform on the word: Ignore, Suggest, AutoCorrect, or Exclude.

### Suggestion/Replacement

The text you want CATalyst BCS to suggest or use to replace the text in the Word column.

You can change the width of a column. Place the cursor on the line dividing the column headings and hold the left mouse button down. The cursor becomes a double headed arrow. Move the line left or right to the desired position. Release the button. When you exit the Wordlist function, the column widths return to the default settings.

Add To Wordlist allows you to highlight a word in the History window and add it to a Wordlist so that Spell Check does not stop on it. You can only add a single word at a time to a Wordlist. If you attempt to add two words at once to a Wordlist, Spell Check continues to stop on both words. For example, if you have a speaker name that Spell Check does not recognize, such as MS. CASHEN, Spell Check sees each word separately, MS. and CASHEN. You cannot add both words together into a Wordlist.

### Add to a Wordlist While Editing

1. Highlight the word you want to add to a Wordlist.
2. Select **Tools/Add To Wordlist** or right click on the highlighted word and select **Add To Wordlist**.
3. From the Add To Wordlist menu, select one of the following actions:

#### Personal Wordlist

Add the word to the Personal Wordlist.

#### Job Wordlist

Add the word to the Job Wordlist.

#### Case Wordlist

Add the word to the Case wordlist. This option is only available when the job is in a Case.

#### Ignore All Wordlist

Add the word to the Ignore All Wordlist so Spell Check does not stop on it.

You can also add words to Wordlists [during](#) Spell Check.

Add a word to your personal, case, or job wordlist while using Spell Check. Spell Check uses the case of a word entered in the wordlist to determine when it recognizes a word for future spell checks. If a word is entered in a wordlist in all lower case, spell check does not stop on it regardless of the case; if a word is entered as initial capped, Spell Check stops on it if it displays in all lower case; if the word is entered in all capital letters, Spell Check stops on it if it displays as initial capped or all lower case.

1. Start a Spell Check session. In the History or Script window of a captioning session or with an open dictionary in Manage Dictionary, press **Shift + F7 (Tools/Spell Check)**.
2. When CATalyst BCS locates a possible error, the Spell Check dialog box displays. The Title Bar displays the error type such as Misspelled Word, Repeated Word, Incorrect Spacing, or Repeated Paragraph Type.

Do one of the following:

- To add the word to the Personal wordlist, press **Alt + p**.
- To add word to the Case wordlist, press **Alt + k**. This option is only available when the captioning session was created in a case.

- To add the word to the Job wordlist, press **Alt + j**.
- To add the word to a wordlist and apply special instructions, press **Alt + w**. The Add to Wordlist dialog box displays. Highlight the wordlist to which you want to add the entry and select **one** of the following actions. When finished, press **Enter (OK)** to redisplay the Spell Check dialog box.

### **Ignore**

Adds the word to the selected wordlist so Spell Check does not stop on it again.

### **Suggest**

Spell Check continues to stop on the word but automatically suggests the word entered in the Autocorrect/Suggestion field as the first suggested word. Erik, for example, may be an alternative for Eric.

### **Autocorrect**

Adds the word to the selected wordlist and has Spell Check automatically change the word to an alternative you specify in the Autocorrect/Suggestion field. For example, you often type "the" for "th". Spell check automatically corrects the misspelling.

### **Autocorrect/Suggestion**

Enter the alternative word you want Spell Check to either Suggest or Autocorrect when it encounters the highlighted word. This option is available if you have selected Suggest or Autocorrect in the Choose Action field.

### 3. Spell Check continues.

The CATalyst BCS applies [wordlists](#) during Spell Check in the following order:

- Ignore All—when selected during Spell Check, it creates a temporary wordlist. You cannot view this wordlist.
- Job Wordlist with the same name as the job.
- Case Wordlist if you are using a case.
- Personal Wordlist.
- Wintertree Medical Wordlist.
- Stedman's Medical Wordlist
- Wintertree Legal Wordlist
- Black's Law Legal Wordlist.

You can deselect any wordlist so that it does not apply during Spell Check. You can also reset the priority order, add and delete wordlists in the Additional Wordlist field. Words can be added to wordlists selected from other jobs and users but not to the Wintertree Medical and Legal, Stedman's Medical and Black's Legal wordlists.

To select or deselect wordlists:

1. Press **Alt + t, o, s (Tools/Options/Spell Check Options)**. The Transcript Spell Check Options dialog box displays.
2. In the Additional Wordlists section, use the following options as necessary:

### **Add**

Add an additional CATalyst BCS wordlist to use during Spell Check. The Open dialog box displays. Browse for and highlight the desired wordlist. Wordlists have a .tlx extension. Press **Enter (Open)**. The wordlist is added to the Additional Wordlists selections. Check the box to apply the wordlist. You can only use CATalyst BCS wordlists. Once you add the wordlist and select to use it, you can put words into it.

### **Remove**

Remove a wordlist from the Additional Wordlists selections. Highlight the wordlist and click **Remove**.

### **Move Up**

Move a wordlist up in priority. Highlight the wordlist and click **Move Up**.

### **Move Down**

Move a wordlist down in priority. Highlight the wordlist and click **Move Down**.

3. Check the box next to any of the following wordlists to apply it during Spell Check. Uncheck the box to not apply the wordlist.
  - Use Wintertree Medical Wordlist
  - Use Stedman's Medical Wordlist
  - Use Wintertree Legal Wordlist
  - Use Black's Legal Wordlist
4. Press **Enter (OK)** when finished.

Use the Copy, Cut, and Paste commands to merge entries from one wordlist to another. Select individual or group entries to cut or copy using the Windows selection conventions. CATalyst BCS also allows you to paste copied entries into other word processing applications.

To quickly [combine](#) the entire contents of two wordlists, drag and drop one file into another in Manage Jobs.

To cut, copy, and paste wordlist entries:

1. Press **Alt + f, o, w (File/Open/Wordlist)**. From the Wordlist menu, select the type of wordlist to open. The Open Existing Document dialog box displays.
2. Select the source wordlist and press **Enter (Open)**. Verify the wordlist name on the Title Bar.
3. Select entries. Do **one** of the following:

#### **Select one entry at a time**

Highlight the entry for selection.

#### **Select specific entries**

Press and hold **Ctrl** while you click the individual entries to highlight.

#### **Select a consecutive group of entries**

Click to highlight the first entry of the group. Locate the last entry you want to select. Press and hold **Shift**, while you click the last entry. CATalyst BCS highlights all the entries in between for selection.

#### **Select all the entries**

Press **Ctrl + a** to highlight all the entries for selection.

4. Do **one** of the following:
  - Cut and remove the entries by pressing **Ctrl + x (Edit/Cut)**.
  - Copy the entries by pressing **Ctrl + c (Edit/Copy)**. The entries remain in the source wordlist.
5. Open the destination wordlist where you want to place the selected entries. Do **one** of the following:
 

**Select an existing wordlist**

Press **Alt + f, o, w (File/Open/Wordlist)**. Select a wordlist and press **Enter (Open)**.

**Create a new wordlist**

Press **Alt + f, n, w (File/New/Wordlist)** and select the type of wordlist to create. When the Create New Document dialog box displays, type a new name in the File name field and press **Enter (Open)**.
6. In the destination wordlist, press **Ctrl + v (Edit/Paste)** to add the entries. Depending on your Options settings, a message may display if CATalyst BCS encounters duplicate entries. Select Yes or No to overwrite the existing entry and press **Enter (OK)**.
7. Press **Ctrl + s** to save the wordlist.
 

To display the source wordlist, press **Alt + w**, and then the associated file number. To save the changes, press **Ctrl + s**.
8. To close the function, press **Ctrl + F4**.

You can create a new Personal, Case, or Job [Wordlist](#) from Manage Jobs; however, you can only have one Personal Wordlist in each user folder. Once a Personal Wordlist exists, the option to create a new one is no longer available. When creating a new Personal Wordlist, CATalyst BCS automatically places the Personal Wordlist in the System Files case when you save it or close the Wordlist function. Once created, you can reopen a Wordlist to make additional entries. You can also add entries while using the Spell Check feature in Edit or Manage Dictionary.

To create a Wordlist:

1. In Manage Jobs, select **Alt + f, n, w (File/Wordlist/)** and then select the type of Wordlist you want to create. When you create a Case or Job Wordlist, the Create New Document dialog box displays.
  2. Type a name in the File name field and press **Enter (Open)**. CATalyst BCS opens the Wordlist function with an empty Wordlist.
  3. Insert new entries using the [Insert/Modify](#), and [Cut/Copy/Paste](#) Wordlist features.
  4. When you are finished, press **Ctrl + s (File/Save)**.
  5. Press **Ctrl + F4 (File/Close)** to close the Wordlist.
1. Press **Alt + f, o, w (File/Open/Wordlist)**. From the Wordlist menu, select the type of wordlist. The Open Existing Document dialog box displays.
  2. Select the wordlist and press **Enter (Open)**. Verify the wordlist name on the Title Bar.
  3. Do **one** of the following to select entries for deletion:

**Select one entry at a time**

Highlight the entry for selection.

**Select specific entries**

Press and hold **Ctrl** while you click the individual entries to highlight.

#### Select a consecutive group of entries

Click to highlight the first entry of the group. Locate the last entry to delete. Press and hold **Shift**, while you click the last entry to highlight all the entries in-between.

#### Select all the entries

Press **Ctrl + a** to highlight all the entries for selection.

4. Press **Delete** to delete the selected entries. A confirmation message with a Yes/No option to continue deleting displays if you checked the *Warn Before Deleting Entries* option in Wordlist Options.
5. Press **Ctrl + s (File/Save)** to save the wordlist when finished deleting entries.
6. Press **Ctrl + F4** to close the wordlist. If another wordlist is open, it displays. If no other wordlist is open, the function closes.

In Manage Jobs, drag and drop one wordlist on top of another wordlist to bring the entire contents of the first file into the second file. Entries merged into the a current job are immediately recognized. Once you combine the wordlists, you cannot undo the change.

1. In Manage Jobs, click and hold the left mouse button on the wordlist you want to include.
2. Move the wordlist over the destination wordlist, highlighting the destination wordlist.
3. Release the mouse button. A confirmation message displays. Select **one** of the following:

#### Yes

Include the entries from the source wordlist into the destination wordlist. You cannot undo the include.

#### No

Cancel the include.

4. A message displays prompting you to delete the source wordlist.
1. Press **Alt + f, o, w (File/Open/Wordlist)**. From the Wordlist menu, select the type of wordlist. The Open Existing Document dialog box displays.
2. Select the wordlist and press **Enter (Open)**. Verify the wordlist name on the Title Bar.
3. Do either of the following:

#### Insert an Entry

Press **Ctrl + i (Edit/Insert)**. The Insert Wordlist Entry dialog box displays. In the *Word* field, type the word you want to add to the wordlist.

#### Modify an Entry

Highlight the entry you want to modify and then press **Ctrl + m (Edit/Modify)**. The Modify Wordlist Entry Dialog box displays with the selected entry in the *Word* field. Type any necessary changes.

4. Make entries in the fields as necessary:

#### Action To Take

Select **one** of the following options:

**Ignore**

Adds the word to the selected wordlist so Spell Check does not stop on it again.

**Suggest**

Spell Check continues to stop on the word and automatically suggests the word entered in the Autocorrect/Suggestion field as the first suggested word. Erik, for example, may be an alternative for Eric.

**Autocorrect**

Adds the word to the selected wordlist and has Spell Check automatically change the word to the alternative you specify in the Autocorrect/Suggestion field. For example, you often type "teh" for "the". Spell check automatically corrects the misspelling.

**Exclude**

Add the word to the wordlist so Spell Check always stops on it. For example, you have a person's name that is also a common word. Spell Check recognizes the word and does not stop on it. You want Spell Check to always stop on the word, so you select Exclude.

**Autocorrect/Suggestion**

Enter the alternative word you want Spell Check to either Suggest or Autocorrect when it encounters the highlighted word. This option is available when you select Suggest or Autocorrect in the Choose Action field.

5. Press **Enter (OK)** to confirm the action. The Modify Wordlist Entry dialog box closes automatically. If you are inserting entries, press **Esc** to exit the Insert Wordlist Entry dialog box.
1. Press **Alt + f, o, w (File/Open/Wordlist)**. From the Wordlist menu, select the type of wordlist. The Open Existing Document dialog box displays.
2. Select the wordlist and press **Enter (Open)**. Verify the name on the Title Bar.
3. Press **Alt + t, o (Tools/Options)**. The Wordlist Options dialog box displays.
4. Make changes as necessary:

**Warn Before Deleting Entries**

Check this box to display a confirmation message when you delete wordlist entries. A Yes/No option to continue deleting displays.

Uncheck this box to disable the confirmation message when you delete entries. You cannot Undo deleted entries unless you exit the file without saving.

**Paste Options**

This option applies when pasting entries from another wordlist and an entry conflicts with an existing entry. Select **one** of the following:

**Keep Old Entries**

Automatically retain the original text in the wordlist and ignore all new entries.

**Keep New Entries**

Automatically delete the original entries and insert the new entries.

**Entry-by-entry decision**

Prompt to Keep Old or Keep New on every entry that conflicts with an entry in the wordlist.

5. Press **Ctrl + s (File/Save)** to save the wordlist when finished.
6. Press **Ctrl + F4** to close the wordlist. If another wordlist is open, it displays. If no other wordlist is open, the function closes.

## Mistran Minder

The Mistran Minder feature allows you to quickly find and fix (if needed) all occurrences of your personal mistranslates. Personal mistranslates are usually words that are valid words but not the word you want. An example of a personal mistranslate might be when you write the steno outline for *generally* but slightly misstroke it and get *gently*. Or when you write the steno outline for *except* but misstroke and get *exempt*. You simply create your unique list (words and/or phrases) of mistranslates (either by typing them in the [MistranMinderList](#) or using the [Send to Mistran Minder List](#) command while editing). For example, let's use the sample words listed before. The words were generally, gently, exempt and except which are all reasonable words you would find in the history or captioning file. In your Mistran Minder List, on a separate line for each word, you type the word *gently*, *generally*, *exempt* and *except*. You save and close the Mistran Minder List file. When you have finished editing the captioning session and are still in the file, select Mistran Minder from the Tools menu to see if any of the words in your Mistran Minder List occur in the history file or captioning file. Mistran Minder results display in the Search Results dialog pane and are underlined for easy identification. The Search Results pane allows you to scroll through the results which scrolls the transcript at the same time. You can double click an entry and immediately move to that location in the file.

The [MistranMinderList](#) applies to every job unless you create a case or job Mistran Minder list. There may be times you'd like to add unique mistranslates that are only occurring in a particular captioning session or series of captioning session and you use a Case to store all the related files. For example, let's say you are captioning a series of speakers on global warming and you created a case. You have captioned four out of the ten speakers presentations. There are a lot of case specific initials and acronyms in the global warming presentation so there is the potential of some misstrokes. You can add the misstroked initials or acronyms to a Case Mistran Minder List rather than adding them to your System Files MistranMinderList which applies to all captioning files. When you run Mistran Minder, the entries in the case Mistran Minder List only apply to the captioning files in the case and it will continue to also look at your user specific Mistran Minder List as well. If you don't use cases but want to have specific words/phrases for a captioning file, you can also send words to a Job Mistran Minder List.

Some users add their common mistran minder entries to their Homophone list. Using the [Cycle Homophones](#) feature, they can quickly switch to the correct word/phrase they desired. Using the examples from above, since "generally" and "gentle" are two common misstrokes this the user, both words are in the user's Mistran Minder list and are also in the Homophone list as homophones of each other. So, when reviewing the Mistran Minder results, if the user comes across an occurrence of "gently" when it should have been "generally," the user invokes the Cycle Homophones command and quickly changes "gently" to "generally" without retyping anything.

If you are searching for a way to double check particular items that fall into a category, such as dates, you might want to use the [Search \(Ctrl + f\)](#) command, select Regular Expression (**Alt + r**), List Results (**Alt + L**) and then select Dates from the Regular Expression list.

If you select Mistran Minder from the Tools menu and you do not have any entries in the Mistran Minder List, the following message displays:

1. Do **one** of the following:
  - a) Press **Enter** or click **Yes** to create a User Mistran Minder List. The following message displays: Go to Step 2.
  - b) Click **No**, to cancel creating a User Mistran Minder List.
2. If you select **Yes**, the following message displays, press **Enter** to continue.

3. Type each word or phrase on a separate line. For more information, see [Create/Add entries to the Mistran Minder List](#).

[Keyboard Map](#) Function: Mistran Minder

## Send to Mistran Minder List

While in a captioning file, the Send to [Mistran Minder](#) List (User, Case, Job) is available from the Edit menu, the right click menu and are available for assignment in a keyboard map. While editing the caption file, you can position your cursor in front of a word or highlight multiple words, right click and select Send to Mistran Minder List and then select User, Case or Job. If you have assigned a key combination to the Send to Mistran Minder, Send to Case Mistran Minder or Send to Job Mistran Minder function in a keyboard map, press the key combination. The word or words are added to the appropriate MistranMinderList. The Mistran Minder List should not be open at the time you are editing and adding words.

1. While editing, position your cursor immediately before a word or highlight a phrase and do any of the following:
  - a) Press **Alt + e, m** (Edit, Send to Mistran Minder) or click the Edit menu, then Send to Mistran minder and do **one** of the following:
    - Press **u** to send the word/phrase to the User Mistran Minder List.
    - Press **c** to send the word/phrase to the Case Mistran Minder List.
    - Press **j** to send the word/phrase to the Job Mistran Minder List.
  - b) If you have assigned a key combination for Send to Mistran Minder List, Send to Case Mistran Minder or Send to Job Mistran Minder, press the appropriate key combination for the action you want.
  - c) Right click, press **m** (Send to Mistran Minder List) and then do **one** of the following:

- Press **u** to send the word/phrase to the User Mistran Minder List.
  - Press **c** to send the word/phrase to the Case Mistran Minder List.
  - Press **j** to send the word/phrase to the Job Mistran Minder List.
2. When appropriate, select press **Alt + t, i** (Tools, Mistran Minder) to check the transcript. Results display in the Search Results dialog pane.
  3. Once you have reviewed the results, you can close the Search Results dialog pane.

[Keyboard Map](#) Function:      Send to Mistran Minder List  
Send to Case Mistran Minder  
Send to Job Mistran Minder  
Mistran Minder

## Create Core List

The Create Core List feature allows you to create a list of unique words from your history window or caption edit file, excluding words that are in the System File's Exclude list. The core list may contain lower case and upper case occurrences of the same word. For example, "mark" and "Mark." Words or phrases with hyphens and no spaces are listed as one word. For example, 25-mile-per-hour or K-u-r-k-o-w-s-k-i. An entry appears only once in the core list, regardless of the number of occurrences in the job.

The core list is a .txt (ASCII) file. CATalyst BCS assigns a default file name using the job name plus the words, "core list". For example, let's say your captioning session or caption edit file is named ABC Special and you create a core list. The core list, by default, is named ABC Special core list.txt. You can change the name before saving the file. If the file name already exists when the core list is generated, CATalyst BCS prompts you to overwrite the existing core list. The core list is viewable in Notepad, WordPad or other ASCII viewers.

## Generate a Core List

1. Open the caption edit file to which you want to create a core list. If you are currently in a BCS captioning session, go to Step 2.
2. Press **Alt + t, c** (**Tools/Create Core List**). The Select Page to Build Core List dialog box displays.
3. Choose one of the following:

### List Initial Cap Words Only

Create a list that includes only initial capped words and phrases.

### Entire Document

Create the core list from all pages in the history window or caption edit file.

### Skip First *nn* Pages and Last *nn* Pages

Exclude a specific number of pages at the beginning and end of the history window or caption edit file from the core list.

You can exclude pages from the beginning of the job only, the end of the job only or both the beginning and the end. In the *Skip First Pages* field, type the number of pages, if any, to skip at the beginning of the job. In the and *Last Pages* field, type the number of pages, if any, to skip at the end of the job.

## Section

Specify a specific section of the file from which to create the core list. This option is only available when there is more than one section in the file.

## Pages

Select specific pages from which to create the core list. Do one of the following:

### Individual Pages

Type the page numbers separated by a comma. For example, to create a core list from page 5 and page 25, type: 5, 25.

### Series of pages

Type the beginning page number, followed by a hyphen, and then followed by the ending page number. For example, to create a core list from pages 5 through 10, type: 5-10.

### Combination of individual and consecutive pages

Type the individual page number separated by a comma, and then beginning page numbers for the consecutive pages, followed by a hyphen, and then the ending page number and all separated by commas. For example, to create a core list from page 5, pages 15 through 20, and page 29, type the following: 5, 15-20, 29.

### Pages within a section

Type the section number followed by the page range. For example, to create a core list from pages 25-40 in section two, type: 2:25-40.

4. Press **Enter (OK)**. The Save Core List as dialog box displays with the default core list name in the File name field. If desired, type a new name for the core list.
5. CATalyst BCS, by default, saves the core list to the same folder as the caption file. Use the Browse button to save the core list to a different folder.
6. Press **Enter (Save)**. The core list is created with the caption file name followed by core list.txt.

## Follow Realtime

Follow Realtime allows you to toggle the position of the cursor between the last realtime stroke and the last editing location in the file. When using the Follow Realtime command, you can continue to write realtime regardless of the position of the cursor. The text is always added to the end of the file. To use this feature, you must also have the Up-to-Date History feature selected to show.

For example, you start to caption and the cursor is following the last steno stroke written in the History window. There is a commercial break. You want to start editing the History text so you press **Alt + t, f** for Follow Realtime. The cursor moves to the beginning of the file. You edit for about 5 minutes when the program resumes. You press **Alt + t, f** and the cursor returns to following the last steno stroke written. There is another commercial break. You return to the editing by pressing **Alt + t, f**. The cursor moves to the last editing position in the History file.

To toggle the Follow Realtime command from the computer keyboard, press **Alt + t, f (Tool/Follow Realtime)**. A check mark in front of Follow Realtime on the Tools menu indicates the option is active.

The CATalyst BCS default is to follow the realtime data. Using a steno stroke, you can invoke the Toggle Follow Realtime command from the writer.

You can assign a key combination to invoke the Follow Realtime mode.

### Audio

Audio recording during captioning is available using the AudioSync option. Your e-Key license needs to include the AudioSync option in order for the Audio feature to record and playback audio files. It is necessary to have a microphone attached to your computer in order to record audio. You can also use a splitter on your headphones that plugs into the microphone jack on your computer.

During audio recording, the audio file is synchronized with the realtime captions you write and is available for playback in the History window. There is no accompanying audio for Script text inserted during captioning. You may want to use the [Auto Pause Audio](#) feature to pause the audio when no new steno is being sent to the encoder. If you do not use the Auto Pause Audio option, audio playback may be available in the History window where script lines were sent but the audio will not be synchronized with the text.

[Play Audio](#) plays the synchronized audio file from the cursor location in the History window. Once you invoke the Play Audio command, the audio file plays until you invoke the [Stop Audio](#) command. Play Audio with Scroll Text allows CATalyst BCS to scroll through the synchronized playback of the audio track and corresponding text.

EZ Sync at Cursor feature synchronizes an associated audio at the current cursor position. Play audio as usual and then, while audio is playing, position your cursor anywhere in the file. When you hear that portion of the file play in the audio, select the EZ Sync at Cursor command.

**IMPORTANT:** Do NOT change the clock time on your computer at any time once starting a captioning session or have any operating system setting that automatically updates your clock. Changing the clock time once you begin a captioning session affects the playback of the recording.

### Play Audio

Play Audio plays the synchronized audio file from the cursor location in the History window. Once you invoke the Play Audio command, the audio file plays until you invoke the Stop Audio command. If the [option](#), *Stop audio when dialog opens*, is active, the audio pauses when a dialog box opens and automatically resumes when the dialog box closes. You can playback the audio during captioning without pausing AudioSync. Playback speed is adjustable on the Audio Playback Speed toolbar. For volume control during audio playback, refer to your Windows documentation.

Dead air may result when there is a pause during captioning. It may be noticeable when a longer silence occurs without the pausing the audio, either automatically or manually. Use the *Skip Quiet Audio* option on the Audio Playback Speed toolbar to adjust the amount of dead air that plays back.

[Keyboard Map](#) Function: Play Audio

Pause Audio

Increase Audio Playback Speed

Decrease Audio Playback Speed

## Play Audio

To start the playback of the synchronized audio file:

1. Move the cursor to the location in the History window where you want to begin the playback.
2. Press **Shift + F9 (Tools/Audio/Play Audio)**. The Audio Playback Speed toolbar displays.

### Horizontal Bar

Use the mouse cursor to adjust the play back speed. Moving the indicator to the left slows the speed; to the right increases the speed. You can also create key commands to increase and decrease the audio playback speed using the Increase Audio Playback Speed and Decrease Audio Playback Speed commands in a [keyboard map](#).

### Skip Quiet Audio

Use the mouse cursor to determine the level of noise that is considered dead air during playback. This does not affect volume level. Move the indicator up to indicate a lot of background noise is considered silence. You might use a higher vertical setting when a lot of background noise occurs during the recording but no one was speaking. Move the indicator down when little background noise occurs during the recording. **If you feel the audio is "skipping" during playback, adjust vertical bar lower.**

Dead air may result if you pause during captioning or script text is inserted into the file. When using Play Audio, the amount of dead air that plays back is adjustable by using the vertical bar.

### Normal Speed

Reset the audio playback speed to the original speed setting. A "Set Normal Audio Speed" keyboard function is available in the keyboard map.

3. When finished press **Ctrl + F9 (Tools/Stop Audio)** to stop the audio playback.

## Play Audio Messages

The following messages may display when you invoke Play Audio:

### "No Audio information available for this text"

This message may display because the playback portion of text is script text; from pausing and never resuming the audio recording during captioning; or deleting the underlying steno for that portion of the text using Steno Delete command.

### "no Audio"

There is no associated Audio subfile for the current job. This is not a captioning file or you did not use AudioSync during captioning.

### Audio File Path dialog box displays

Play Audio will first look for the audio file in the location where the audio was recorded and if found, will automatically play the audio. If the audio file in the transcript file information doesn't match the current transcript name but there is an audio file with the correct name in the same folder as the current job, CATalyst BCS will automatically link the audio and start audio playback. If still not found, CATalyst BCS will look for an audio file with the same name as the job in the same user folder and then automatically link the audio file and start audio playback. If the audio file still cannot be located, the Choose Audio File dialog box displays allowing you to select the audio file and link it to the transcript and begin audio playback.

If prompted, click the Browse button to search for and select the audio file or type the path for the new location or new name of the Audio subfile and press **Enter** to begin the playback.

### Play Audio with Scroll Text

Play Audio with Scroll Text allows CATalyst BCS to scroll through the synchronized playback of the audio track and corresponding text.

To play audio while scrolling text:

1. Press **Alt + t, a, x** (**Tools/Audio/Play Audio with Scroll Text**). The Audio Playback Speed dialog box displays as the audio and scroll text begins.

You can increase or decrease the playback speed by moving the Playback Speed indicator with the mouse pointer or using assigned keyboard commands in a keyboard map.

### Stop Audio

The Stop Audio feature stops the audio playback. To stop the playback, press **Ctrl + F9**

(**Tools/Audio/Stop Audio**) or, if the Edit toolbar is showing, click the Stop Audio  icon.

### Set Audio Delay

Set Audio Delay is a feature used to hear the context of the transcript a few seconds before the actual cursor position. It can also be used to adjust the synchronization between the cursor location in the caption file and the playback of the audio file if the synchronization is off a little bit. When you invoke the Play Audio command, CATalyst BCS checks the Audio Delay value before playing the associated audio. These settings affect both regular CATalyst translation and CATalyst BCS captioning.

Audio capabilities are only available on systems that have the optional AudioSync software.

### Adjust Audio Values

1. In a captioning session or while in caption edit, press **Alt + t, o, u** (**Tools/Options/Set Audio Delay**). The Set Audio Delay dialog box displays.
2. Review the Current delay setting. Make a change to the setting by typing a new setting number in the New delay field. The maximum number of seconds is 99.
3. Press **Enter** (**OK**) to accept the changes.

## Macros

A macro is a recorded series of keystrokes, mouse clicks and associated keyboard commands. A filename assigned to the macro allows for playback. Playing back a macro performs the series of recorded commands which reduces the amount of keystrokes required to perform a task or process.

Macros are recordable in Caption Edit and Manage Dictionary. It is possible to begin the recording or playback of a macro in one of the functions and have it continue in the other function. For example, you can begin a macro in Edit and continue the macro within a dictionary. You may want to use a separate naming convention for macros created for Manage Dictionary that identifies them from other macros. For example, "dict - modify entry."

When recording a macro, you can use the mouse and keyboard commands to select menus or icons, however, within a dialog box, only keyboard commands are recorded, such as Alt + a (Cap) in a Global Define dialog box. Mouse clicks within a dialog box are not recognized and are not recorded as part of the macro. Once a dialog box opens, you can Pause recording the macro to select a file name or option using the mouse. When you close the dialog box, by pressing Enter or an Alt key combination, the macro continues to record and you can return to using mouse clicks. When the macro plays back, it pauses once the dialog box is open, allowing you to select the file or option and then continues once you press Enter. For example, you want to record a macro to Include a file and choose a file while using the macro. When the Include dialog box display, click Pause and select a file. File selection is not recorded as part of the macro. After selecting the file, press Enter in the Include dialog box. The macro continues recording once you press Enter.

You can playback a macro by selecting it from a list, pressing a user assigned keyboard command or writing a steno stroke on your writing machine during realtime. To quickly invoke a macro, you can assign it to a [keyboard command](#) or [AccelerWriter](#) dictionary definition. Keyboard command assignments and AccelerWriter definitions can be made immediately after saving the macro or at a later time. Stenograph recommends you set up a realtime session when creating a macro for an AccelerWriter definition to assure the macro works as intended.

Macro files have a .sgmac extension and are stored in a Macros case within the System Files case. You can quickly view the list of existing macros by pressing, **Alt + f, o, m (File/Open/Macros)**. Recorded commands for an existing macro can be viewed or modified using the [Macro Editor](#). You can add and remove functions, text and key combinations allowing you to make changes without re-recording the entire macro. Manage Dictionary functions end with - Dict." when viewing them in the Macro Editor or a Keyboard Maps.

The Macro feature contains a submenu of features that include Record, Playback and Playback Last Macro. You can [create a macro pull away toolbar](#) from the submenu to float or dock it like any other toolbar. You can also create a [Macro Toolbar](#) that allows you to quickly play a specific macro from a toolbar.

[Keyboard Map](#) Function: Record Macro

Play Macro

Play Last Macro

## Macro Pull Away Toolbar

The Macro submenu contains the commands necessary to record and playback macros. You can create a toolbar which contains the three Macro menu commands: Record, Playback Macro and Playback Last

Macro. The Macros toolbar can be docked at the top or side of the screen like any other tool or function bar. You can also customize the bar, adding or removing icons.

To display the Macro toolbar:

1. Press **Alt + t, m (Tools/Macro)**. The Macro submenu displays.
2. Place the cursor on the dotted line at the top of the submenu.

3. Press and hold the left mouse button. Drag the cursor away from the menu. The submenu displays as a floating toolbar.

4. Place the Macros toolbar anywhere on the screen or position along with other toolbars on the top or side of the screen. Once you create the Macros toolbar, the toolbar displays with a check mark in the Show list (**View/Show**).

5. You can [customize](#) the toolbar if necessary. To close the toolbar, deselect it from the Show list. Once the Macros toolbar closes, it is no longer available in the list. You must drag it from the Macro submenu to redisplay it.

### Record Macro

The Macro Record feature allows you to record a series of commands and save them as a [macro](#). Once the macro is recorded and named, you can assign a [keyboard command](#) or define an [AccelerWriter](#) to the macro as desired. Stenograph recommends creating a macro for an AccelerWriter dictionary definition during setup for the realtime session to ensure the macro works in realtime as intended.

Recorded commands for an existing macro can be viewed or modified using the [Macro Editor](#). This allows you to add and remove functions, text and key combinations without recording the entire macro again.

[Keyboard Map](#) Function: Record Macro

### Create and Assign Macro

1. Place your cursor in the most logical position where you would want the commands of the macro performed.
2. Press **Alt + t, m, r (Tools/Macro/Record)**. The RecordMacro toolbar displays at the top of the screen with Pause and Stop buttons.

3. Record the commands for the macro. Use the mouse and keyboard commands to select menus or icons, however, in a dialog box, only keyboard commands are recorded. Mouse clicks within a dialog box are not recognized and are not recorded as part of the macro.

When in a dialog box, click **Pause** on the RecordMacro toolbar to suspend the macro in order to select a file or type text. For example, you are recording a macro to include a file and want to be able to select any file while using the macro. When the Include dialog box display, click **Pause** and select a file. File selection is not recorded as part of the macro. After selecting the file, press **Enter** in the Include dialog box. The macro continues recording once you press Enter.

4. When finished, click **Stop** on the RecordMacro toolbar. The Save Macro dialog box displays.

If you attempted to record commands that are not recordable functions, the following error message displays: *The actions you took are not recordable. There are no actions that can be saved for a macro.* Press **Enter (OK)** to close the message.

5. In the *File name* field, type a name for the macro. Use the following options as necessary:

#### **Assign to key in keyboard map (Alt + a)**

Check this box to assign a key combination in your keyboard map to the macro after you save the macro. This allows you to invoke the macro from a keyboard command.

#### **Define in dictionary to invoke macro from writer (Alt + f)**

Check this box to create an AccelerWriter definition for the macro after you save the macro. This allows you to invoke the macro from your writing machine while in a captioning session.

6. Press **Enter (Save)**. One of the following occurs:
  - The Save Macro dialog box closes if no additional options are selected.
  - The Open Keyboard Map dialog box displays if you selected to *Assign to key in keyboard map*. If the option, [Keyboard to open when assigning recorded macros](#), is active, the selected default Keyboard map opens. Make necessary entries to [assign a keyboard command](#) to the macro.
  - The Insert AccelerWriter Entry dialog box displays if you selected the option, *Define After Saving*. Make necessary entries to [define the AccelerWriter](#).
7. Test the macro. Do the following:
  - Playback the macro using the Playback Macro feature. Press **Alt + t, m, p (Tools, Macro, Playback Macro)** or click **Playback Macro** on the Macros toolbar. The Choose Macro dialog box displays. Select the macro just recorded and press **Enter (Open)**.
  - If you created an AccelerWriter definition, use the **Add/Remove Dictionaries** command to reload the dictionaries and then write the steno outlines for the AccelerWriter definition.
  - If you assigned the macro to a keyboard command, press the assigned keys.

### **Define in dictionary to invoke macro from writer**

An AccelerWriter is a [macro](#) invoked from the writing machine during realtime writing. For example, you may want to create an AccelerWriter that loads your credit file. When you write the steno outlines assigned to the macro, Case CATalyst performs the actions of the macro. When invoking an AccelerWriter and the cursor focus is in a dialog pane, Case CATalyst automatically sets the cursor focus to the transcript and performs the actions of the macro.

When saving the recorded macro and you select the option, *Define in dictionary to invoke macro from writer* (**Alt + f**) in the Save Macro dialog box, you can immediately create a dictionary definition to invoke the macro. The Insert AccelerWriter Entry dialog box displays after you press Enter (Save) in the Save Macro dialog box.

### Define in dictionary to invoke macro from writer

Make necessary entries in the Insert AccelerWriter Entry dialog box. When finished, press **Enter (OK)** to add the entry to the selected dictionary.

#### Steno

Insert the steno you write to invoke the AccelerWriter. Separate multiple strokes with a forward slash.

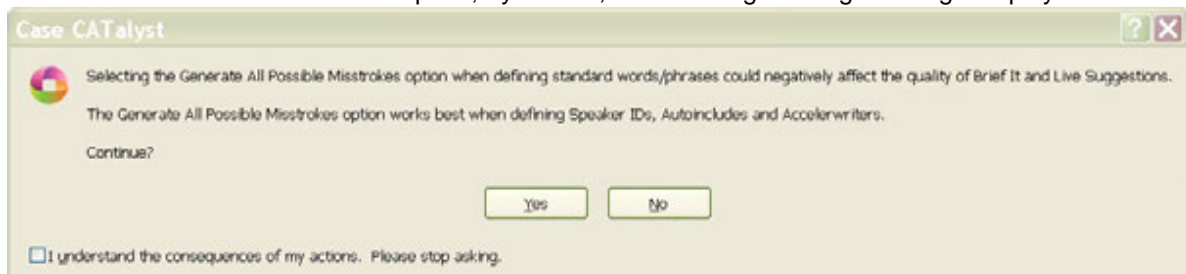

#### Entry Text

The field automatically fills in with the assigned macro name. Two ampersands (&&) precede the name to identify the entry as an AccelerWriter.

#### Generate All Possible Misstrokes

Check this box to generate additional dictionary definitions to invoke the macro based on all the possible misstrokes of the original steno outline. A misstroke definition is generated only if the misstroke does not conflict with an existing entry in the selected dictionary.

When inserting or modifying entries in the Personal Dictionary and/or Update Area, if you select the Generate All Possible Misstrokes option, by default, the following warning message displays:

- Select **Yes** (Alt + y) to generate all possible misstrokes for the current steno outline.
- Select **No** (Alt + n) to return to the previous dialog box with the Generate All Possible Misstrokes option deselected.

To eliminate the General All Possible Misstrokes warning message from displaying, deselect the option in [Dictionary Options](#).

#### Dictionary

Select one of the following dictionaries in which you want to place the AccelerWriter definition. The macro is stored in the Macros case located in the System Files case.

- Personal Dictionary
- Job Dictionary
- Update Area (if selected for use)
- Case Dictionary
- Other Dictionary—use **Browse** to locate a dictionary in a different location.

If the steno you have inserted to invoke the macro has one or more entries that start with that same steno (longer match) in the Personal Dictionary, the following message displays:

If the steno you write for a macro has a longer match in the Personal Dictionary, the macro will be delayed until translation determines the next stroke. This will cause a delayed reaction for the macro and in some cases, depending on what the macro does, can cause an unwanted result. The warning is to let you know that you might want to select different steno for your AccelerWriter definition. For example, you want to create a dictionary entry to run a macro while writing realtime. You have already created the macro so you open your Personal Dictionary, select Edit and then select Insert AccelerWriter. You type the steno /E-P and select your RT-Punctuation macro and press Enter. The above message displays. Immediately you know that there is at least one Personal Dictionary entry that starts with /E-P and if you don't change the steno, then the macro will not run until translate knows you are not writing the longer match steno outline.

- Select **Yes** to return to the Insert AccelerWriters dialog box to change the steno outline.
- Select **No** to insert the entry into the current dictionary knowing that the Personal Dictionary contains at least one entry that starts with the same steno outline and that may delay the execution of the macro.

## Assign to key in keyboard map

When you select the option, *Assign to key in keyboard map (Alt + a)*, in the Save Macro dialog box, you can immediately assign a key combination to invoke the macro. One of the following occurs after you press Enter (Save) in the Save Macro dialog box:

- The Open Keyboard Map dialog box displays. Select a keyboard map to open and press **Enter**. Macros are stored in a Macros case within the System Files case. The Keyboard map displays.
- If the Advanced Edit option, [Keyboard to open when assigning recorded macros](#), is active, the selected default Keyboard map opens with the recorded macro highlighted in the *Functions* list of the Assign Key to Function dialog box.

## Assign to Key in Keyboard Map Macro

Make necessary entries in the Assign Key to Function dialog box. The newly created macro displays highlighted in the Functions field under the MACROS section. When finished, press **Enter (Assign)**. The entry displays in the Keyboard Map list and the keyboard map closes.

### Currently Assigned to

The keyboard function presently assigned to the key or key combination identified in the Key field.

### Key

The Key field contains a list of keyboard keys. The options below the Key field indicate if the key is used alone or in conjunction with Ctrl, Shift, or Ctrl and Shift. The selected radio button designates the active key combination. You can assign a different keyboard function to each of the key combinations. For example, in the Default keyboard map, n alone displays the letter "n". **Ctrl + n** displays the View Vertical Notes feature. **Shift + n** displays a capital letter "N".

Select a key for assignment from the drop down list and then click the radio button next to one of the following: Key Only, Ctrl + Key, Shift + Key, Ctrl + Shift + Key. The keyboard function presently assigned for the selected key combination displays in the Currently Assigned to field. If no keyboard function is assigned, the field is blank.

When you assign a single key to invoke a command, consider assigning Shift plus the same key to the same command. This helps to prevent the possibility of invoking the capped version of a keyboard command when the Caps Lock is on.

### Restore Default Assignment

Restore the default keyboard function assignment for the identified in the Key field. This only restores the default assignment for the current key.

### Filter by Category

Click a category to display only the keyboard functions for the selected category in the Functions list. For example, you want to locate Move to next red squiggle, which is a Spell Check keyboard function. Select the Category, Spell Check to display a list of only the available Spell Check keyboard functions. Select All to display all the keyboard map functions available for assignment.

### Functions

To change the keyboard function for the key in the Key field, highlight the desired keyboard function from the list. Recorded Macros display alphabetically at the end of end of the list in the MACROS section.

When you assign a key combination immediately after creating the macro, the newly created macro displays highlighted in the MACROS section.

### Search

Display the Find dialog box to search for a specific keyboard function.

#### Find Search Functions List

1. Type a keyboard function name or portion of a name in the *Search for* field. To limit the search to a particular category, first select the category in the Filter by Category field and then select Search.
2. Select the direction to search.
3. Press **Enter (OK)**. To repeat the search, press **F3** to search forward or **Shift + F3** to search backward. If you limited the search by category for the desired keyboard function and it does not display in the list, the incorrect category was selected. For example, you select to filter by Punctuation for Move Word Left. This keyboard function is a Cursor action so Search does not locate it in the Punctuation category.

### Use Windows Default

Use the Windows default keyboard assignment if your Windows Regional Language setting is set to a language other than English. For example, if French is selected as your Windows Regional and Language and the key assignment in the Keyboard Map is set to Windows default, the keyboard action follows the Windows default French language keyboard.

## Playback Macro

You can Playback a recorded macro using an assigned keyboard command, writing the steno outlines during realtime that are assigned to an AccelerWriter or by selecting a playback option from the Macro menu.

To playback a macro, do one of the following:

### Use Assigned Keyboard Command

If you [assigned](#) a key command to the macro in the active keyboard map, press the assigned key combination to play the specified macro.

### Use AccelerWriter

If you created an [AccelerWriter](#) definition for the macro, stroke the keys on your writing machine to play the specified macro.

### Use Macro Menu Options

#### Playback Macro

Press **Alt + t, m, p (Tools/Macro/Playback Macro)**. The Open dialog box displays. Select a macro and press **Alt + o (Open)**. The selected macro plays back.

Macro files have a .sgmac extension and are stored in the Macro case within the System Files case.

#### Playback Last Macro

Press **Alt + t, m, L (Tools/Macro/Playback Last Macro)**. The last macro played back using a keystroke plays again. It is recommended to use this command after first using the Playback Macro command.

The last macro remembered is user specific, not job specific.

[Keyboard Map](#) Function: Play Macro

Play Last Macro

## Macros toolbar\_2

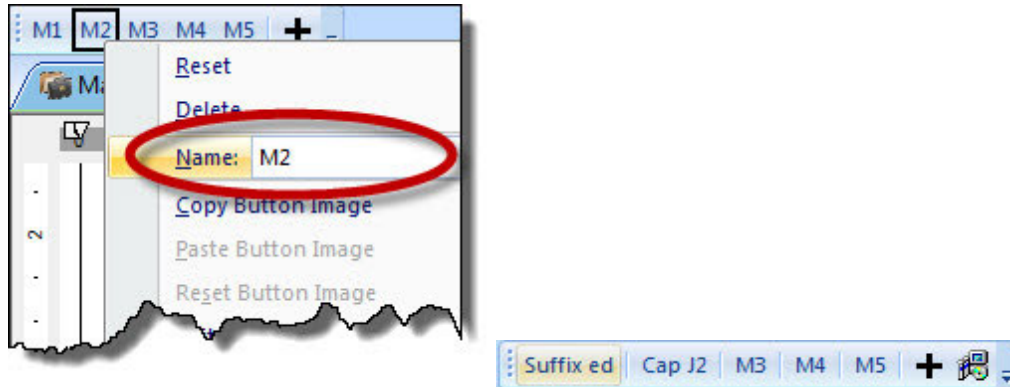

In addition to using the keyboard and AccelerWriters to invoke macros, a Macros toolbar feature is now available to invoke macros via a toolbar. You might want to assign seldom used but important macros to the Macros toolbar and invoke common macros with AccelerWriters while in a captioning session. A separate Macros toolbar is available in caption edit to assign macros specifically used while editing a caption file. By default, the Macros toolbar does not display in a BCS session or caption edit. To display and use the Macros toolbar, select View, Show and then Macros.

The default Macros toolbar includes five icons along with a  and  (Setup) icons.

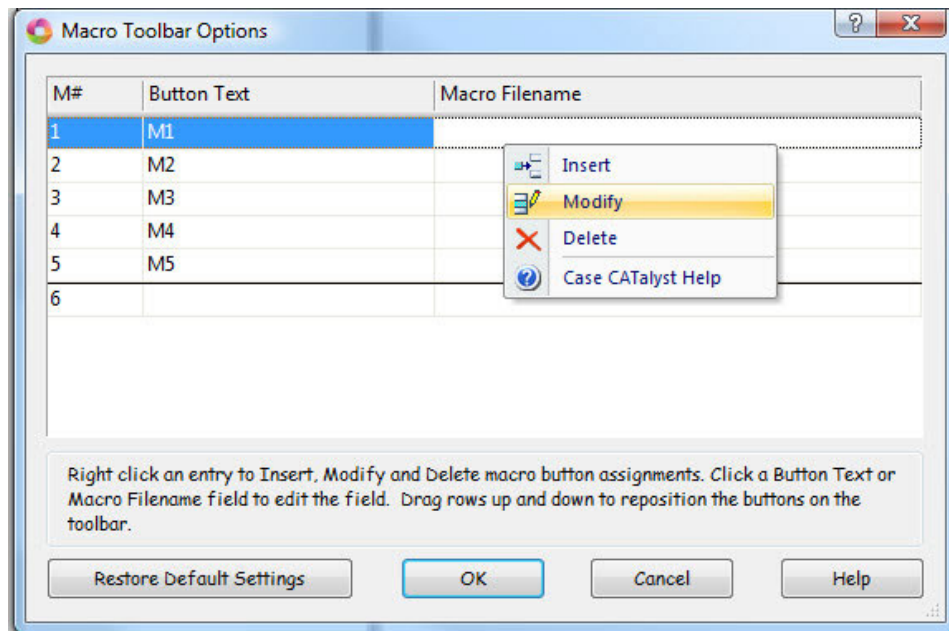

Do any of the following:

- If there is no macro assigned to the macro button on the toolbar, you can click the available M# icon on the Macros toolbar. In the Choose Macro dialog box, locate the macro you want to assign, highlight it and then click Open. The macro is assigned. To add more than the five default macro buttons with macro assignments, click **+**, select the macro and click Open. The next consecutive number is assigned to the macro icon. To personalize the macro button name or add an image, right click anywhere on the Macros toolbar and select Customize. With the Customize dialog box open, right click on the macro icon you want to modify. You can type a name in the Name field or select Change Button Image to select an image for the button. In the example below, both M1 and M2 have been renamed.

- To assign a macro to a toolbar button, modify an existing macro, delete a macro, add more macro buttons to the Macros toolbar or change the order of the macro buttons, click the Setup (  ) icon.

- To add another button to the Macros toolbar and assign a new macro, press Ctrl + i or right click on the M# field and select Insert. The next consecutive numbered macro is created with the cursor focus in the Macro Filename field. Click the down arrow to select from the current user's Macro folder or click the browse button to navigate to another location. Highlight the macro and click Open.
- To modify an existing macro's Button Text or macro assignment, click the field and type the appropriate text.

If you position your cursor on the M# field, you can press Ctrl + m or right click select Modify. Your cursor defaults to the Macro Filename field.

- To delete an existing macro button and assignment, right click either the Button Text or Macro Filename field and select Delete. You are prompted to confirm you want to delete the entry. Select Yes to delete the assignment. The button is removed from the list and the Macros toolbar. The Macros Toolbar Options dialog box displays it as an unassigned entry at the bottom of the list.
- To reset the default settings, click Restore Default Settings. All assignments are removed and the five buttons display on the Macros toolbar.

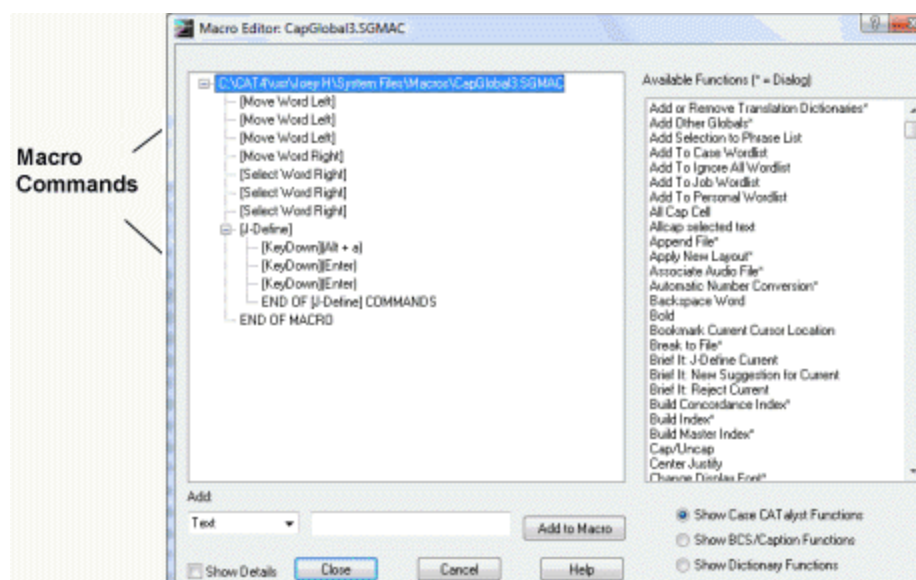

## Editing Macros

You can modify the recorded commands for an existing macro. Using the Macro Editor, add and remove Case CATalyst, CATalyst BCS or Dictionary [functions](#), [text](#) and dialog box [key combinations](#). Macros are stored in the Macros case within the System Files case. Macro files have a .sgmac extension.

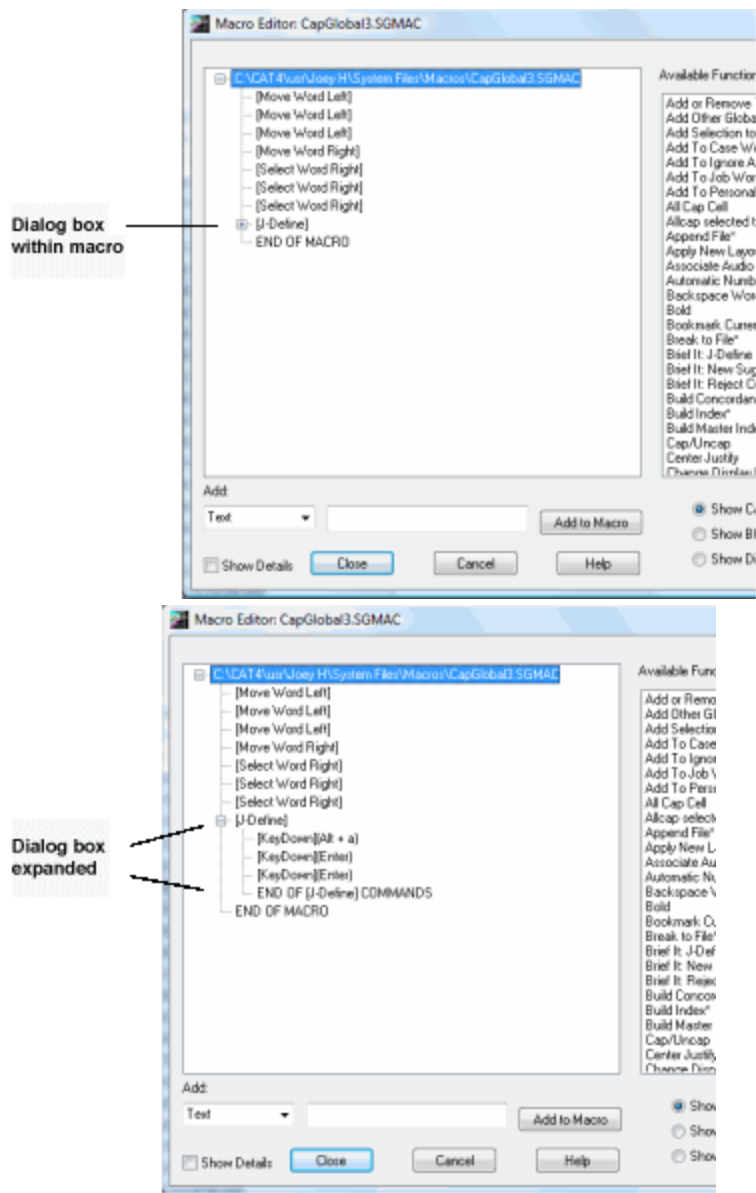

- From anywhere in Case CATalyst or CATalyst BCS, press **Alt + f, o, m (File/Open/Macro)**. The Open Existing Document dialog box displays with the Macros case open. Select the macro and press **Enter (Open)**.
- In Manage Jobs, open the System Files case and then open the Macros case. Double-click a macro to open it.

## Macro Editor

The Macro Editor dialog box opens with the selected macro name in the title bar. The recorded macro commands display in the window.

A command that invokes a dialog box within a macro displays with a plus sign. Click the plus sign to display the commands within the dialog box.

### Available Functions

The Available Functions list displays commands for insertion into the macro. Selecting the option *Show Case CATalyst Functions* below the list displays all the valid editing commands available for insertion into the macro. Selecting *Show CATalyst BCS/Caption Functions* displays all the available CATalyst BCS commands. Selecting *Show Dictionary Functions* display all available Manage Dictionary commands.

Functions in the list marked with an asterisk are commands that invoke a dialog box. You cannot insert these commands into a dialog box within the macro.

## Add

### Text

The Add fields allows you to insert text or key combination into the macro. Selecting *Text* from the drop down list allows you to type the text in the field which you want to add to the macro. Once the text is typed, the *Add to Macro* option inserts the text into the macro following the highlighted line.

### Key Combination

Selecting *Key combination* from the drop down list, allows you to enter a key combination into the field by pressing the appropriate keys on the keyboard. Key combinations can only be added to a dialog box that is part of the macro. The *Add to Macro* option inserts the key combination into the macro following the highlighted line.

## Remove

To remove the function, text or key combination from the macro, highlight the line and press **Delete**.

### Show Details

Display the key stroke details of the macro (KeyUp/KeyDown). This option is typically used to troubleshoot the macro.

### Close/Save/Done

The option that displays depends on the editing state of the macro:

#### Close

Displays when you open the macro and allows you to close the Macro Editor dialog box without making any changes.

#### Save

Displays after you make changes to the macro allowing you to save them.

#### Done

Displays after saving the macro allowing you close the Macro Editor dialog box.

#### Cancel

Close the Macro Editor dialog box without applying any changes since the last save.

To add functions to an existing macro:

1. Do one of the following:
  - From anywhere in Case CATalyst or CATalyst BCS, press **Alt + f, o, m (File/Open/Macro)**. The Open Existing Document dialog box displays with the Macros case open. Select the macro and press **Enter (Open)**.
  - In Manage Jobs, open the System Files case and then open the Macros case. Double-click a macro to open it.
2. In the Macro Editor dialog box, select one of the following to determine the type of functions to display in the Available Functions window:

#### Show Case CATalyst Functions

Display Case CATalyst or CATalyst BCS transcript editing functions.

#### Show BCS/Caption Functions

Display CATalyst BCS and captioning functions.

#### Show Dictionary Functions

Display Manage Dictionary functions.

3. Highlight the line in the macro that precedes the position where you want to insert the command and double click the desired function. The command inserts after the highlighted item. You cannot insert a function at the end of the macro.

To insert more than one function, it is necessary to highlight the position where you want to insert the command each time. The message, *Please select an item in the macro. The item will be inserted after the selection.* indicates the position for inserting the line is deselected. Highlight the line in the macro that precedes the position where you want to insert another function.

Functions in the list marked with an asterisk are commands that invoke a dialog box. You cannot insert a function marked with an asterisk into an active dialog box. If you attempt to insert a function

into an active dialog box, The following message displays; *A function cannot be inserted at this point in the macro, because a dialog is active. Functions can only be inserted when no dialog is active in the macro.* To add commands containing a key combination use the [Add](#) field.

### Example

In the following Stitch macro, you want to add the command, Move Line End, to move the cursor to the end of the line. You highlight the last command line of the macro.

4. In the Available Functions field, double-click the command you want to insert. Functions followed by an asterisk invoke a dialog box. The position you highlight is remembered even though the highlight does not appear once you click in the Available Functions window.

### Example

Continuing with the Stitch macro, The Move Line End command inserts after the [Stitch] line.

5. If necessary, add other functions, [text](#) or [key combinations](#). To remove a command, highlight the line and press **Delete**.
6. Press **Enter (Save)**. A confirmation message may display, depending on your save options. The Macro Editor dialog box remains open.
7. Select **Done** to close the Macro Editor dialog box.

Key combinations can only be added to a dialog box that is part of the macro. Dialog boxes display with a plus sign if the view of the dialog box commands is collapsed or a minus sign if the view is expanded with the commands displayed in an indented list.

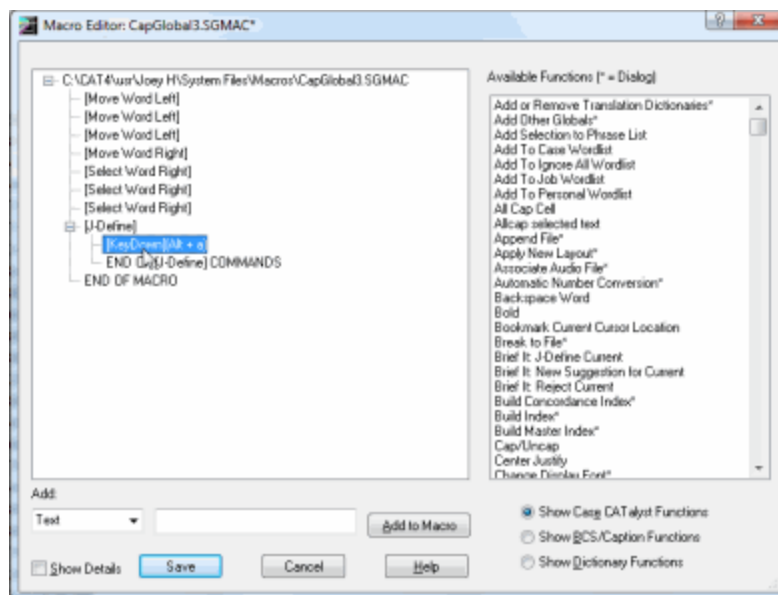

To add commands to a dialog box within an existing macro:

1. Do one of the following:
  - From anywhere in Case CATalyst or CATalyst BCS, press **Alt + f, o, m (File/Open/Macro)**. The Open Existing Dialog Document dialog box displays with the Macros case open. Select the macro and press **Enter (Open)**.
  - In Manage Jobs, open the System Files case and then open the Macros case. Double-click a macro to open it.
2. In the Macro Editor dialog box, highlight the line within a dialog box that precedes the position where you want to insert the key combination. The command inserts after the highlighted item.

Dialog boxes display with a plus sign if the view of the dialog box commands is collapsed or a minus sign if the view is expanded. If there are no commands in the dialog box, highlight the dialog box name.

### Example

In the following CapGlobal3 macro, you want to add Enter to the end of the J Define, so the dialog box closes at the end of the macro. You highlight the last command line in the J Define dialog box.

3. In the Add field:
  - a. Select **Key combination** from the drop down list. The position you highlight is remembered even though the highlight does not appear once you click in the Add field.

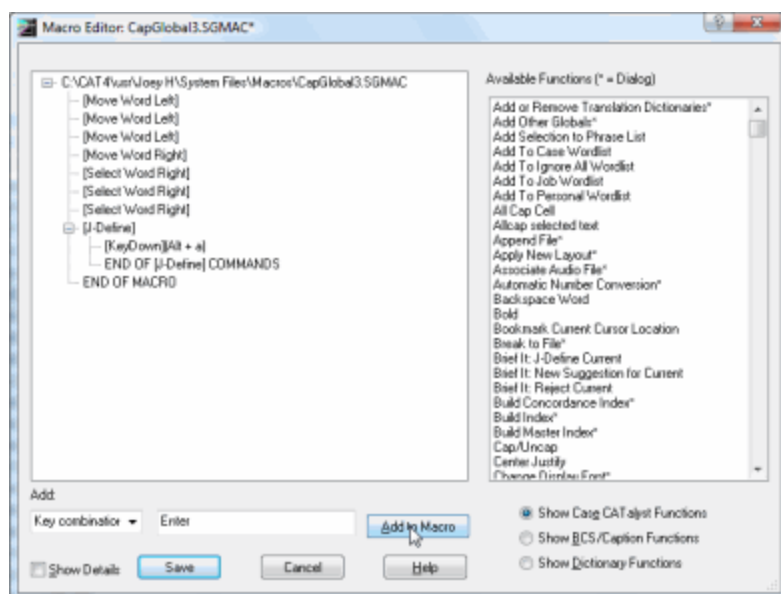

- b. Place the cursor in the command field to the right and press the key combination you want to add. The key combination displays in the field.
- c. Select **Add to Macro**. The key combination inserts after the line you highlighted.

If you did not highlight a line within a dialog, the following message displays; *In order to insert keystrokes onto a dialog in the macro, some part of the dialog needs to be selected.* Select a line within a dialog and select **Add to Macro**.

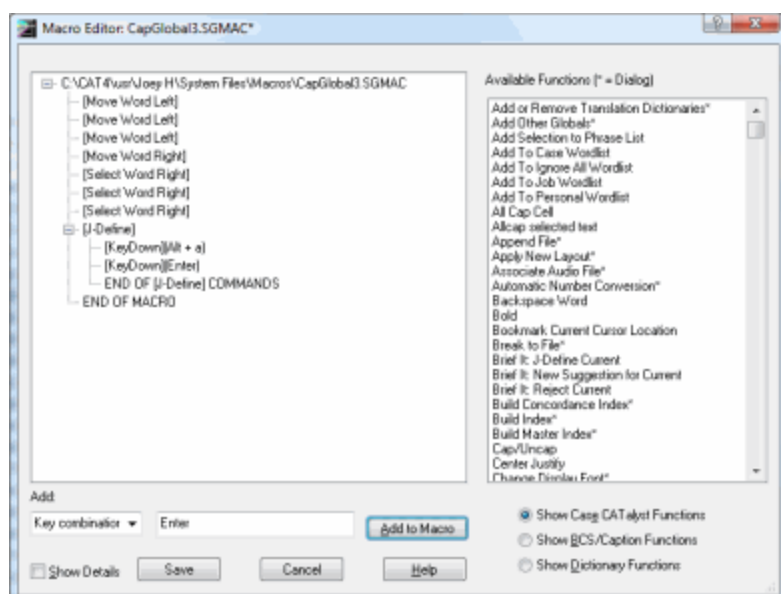

### Example

Continuing with the CapGlobal3 macro, you select **Key combination** from the drop down list.

With your cursor in the command field, you press **Enter** and then select **Add to Macro**.

The Enter command inserts after the line you highlighted, [KeyDown](Alt + a).

4. If necessary, add other key combinations, [text](#) or [functions](#). To remove a command, highlight the line and press **Delete**.
5. Press **Enter (Save)**. A confirmation message may display, depending on your save options. The Macro Editor dialog box remains open.
6. Select **Done** to close the Macro Editor dialog box.

To add text anywhere in an existing macro:

1. Do one of the following:
  - From anywhere in Case CATalyst or CATalyst BCS, press **Alt + f, o, m (File/Open/Macro)**. The Open Existing Document dialog box displays with the Macros case open. Select the macro and press **Enter (Open)**.
  - In Manage Jobs, open the System Files case and then open the Macros case. Double-click a macro to open it.
2. In the Macro Editor dialog box, highlight the line within a dialog box that precedes the position where you want to insert the text. The text inserts after the highlighted item. You can insert text anywhere in the macro. You cannot insert text at the end of the macro.

Dialog boxes display with a plus sign if the view of the dialog box commands is collapsed or a minus sign if the view is expanded with the commands displayed in an indented list.
3. In the Add field:
  - a. Select **Text** from the drop down list. Text is the default. The position you highlight is remembered even though the highlight does not appear once you click in the Add Field.
  - b. Place the cursor in the command field to the right and type the text you want to add.
  - c. Select **Add to Macro**. The text inserts after the line you highlighted.
4. If necessary, add other text, [key combinations](#) or [functions](#). To remove a command, highlight the line and press **Delete**.
5. Press **Enter (Save)**. A confirmation message may display, depending on your save options. The Macro Editor dialog box remains open.
6. Select **Done** to close the Macro Editor dialog box.

## Options

CATalyst BCS contains several options to help you customize certain features available while working in the History Window.

### Pane Options - BCS Session

The Pane Options submenu allows quick access to the following pane options while in a BCS captioning session: Brief It, Cat Scratch and Speaker List. These same options are also available by clicking the Options icon, if available, () on the respective pane's toolbar. When changing the Option settings, the settings affect both regular CATalyst translation and CATalyst BCS captioning respective panes.

1. While captioning in a live session, select Tools, Options, Pane Options (**Alt + t, o, e**). Or anywhere in CATalyst. Click the All Options icon () on the toolbar.
2. Select one of the following:
  - a. [Brief It...](#)
  - b. [Cat Scratch...](#)
  - c. [Speaker List...](#)
  - d. [Search Results](#)
  - e. [Vertical Notes](#)
3. Make any desired changes and click **OK** to save your changes.

## Pane Options - Caption Edit Session

The Pane Options submenu allows quick access to the following pane options while in a caption edit session: Brief It, Cat Scratch, Hotspots and Speaker List. These same options are also available by clicking the Options icon () on the respective pane's toolbar. When changing the Option settings, the settings affect both regular CATalyst translation and CATalyst BCS captioning respective panes.

1. While editing a caption file, select Tools, Options, Pane Options (**Alt + t, o, e**). Or anywhere in CATalyst. Click the All Options icon () on the toolbar.
2. Select one of the following:
  - a. [Brief It...](#)
  - b. [Cat Scratch...](#)
  - c. [Hotspots...](#)
  - d. [Speaker List...](#)
  - e. [Search Results](#)
  - f. [Vertical Notes](#)
3. Make any desired changes and click **OK** to save your changes.

## Themes...

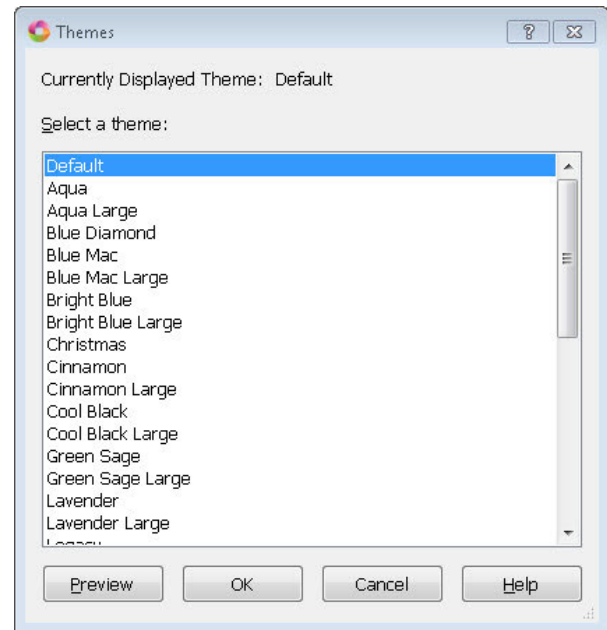

Themes affect the display of the toolbar background color, open file tab colors, dialog pane margins and the format of the open file tabs. There are a variety of pre-made themes available. You can preview a theme by selecting a theme and then clicking the Preview button (**Alt + p**). The current theme name is displayed at the top of the dialog box.

To Access Themes...

- in Manage Jobs, Translate and Edit and Manage Dictionary, press **Alt + t, o, h** (**Tools/Options/Themes...**).
- anywhere in CATalyst, click the All Options icon () on the toolbar.

**To select a theme:**

1. From Manage Jobs or Translate and Edit, press **Alt + t, o, h** (Tools/Options/Themes...).
2. In the Themes dialog box, highlight a theme and do any of the following:
  - a. To preview the theme, press **Alt + p** (Preview).
  - b. To apply the current theme and close the Theme dialog box, press **Enter** (OK).
  - c. To close the theme box and keep your current theme, click **Cancel**.

**Auto Recover/Auto Save**

The [Auto Recover Options](#), Auto Recover automatically saves the open caption edit file and/or dictionary to a temporary file at specified time intervals. If you are editing a dictionary or using the Dictionary Build feature, Auto Recover and Auto Save will save the current dictionary also.

Auto Recover, active by default, saves the changes to a temporary file (caption file or dictionary) at the specific time increment. The default save increment is 30 seconds. The temporary file is used only if you exit the file/dictionary abnormally (such as a crash or power loss).

Auto Save saves the changes directly to the current open file at the specified time interval but does not create a temporary file.

Review the Auto Recover and Auto Save details. Selecting neither option, Auto Recover or Auto Save feature for caption files, means no transcript or dictionary recover file will be created. Stenograph recommends using one of these automatic file saving features. These settings affect both CATalyst BCS captioning and regular translation.

**Auto Recover**

Auto Recover, active by default and set for 30 seconds, automatically saves the text portion of the open captioning job and/or dictionary to a temporary file at specified time intervals. Normally, when you exit the captioning session, you use the Close or Exit command. CATalyst BCS prompts you with a message when any unsaved changes exist. You then choose to save the changes or exit without saving. The Auto Recover file (text and/or dictionary) is available if you exit a job in an abnormal or undesirable way, such as turning off the computer with open files, rebooting the system with open files, Windows running an update unexpectedly or you experience a General Protection Fault (GPF), where the unsaved changes are lost. (Also see AutoArchive option below.)

When editing a caption file or editing a dictionary abnormally terminates, Auto Recover creates a temporary file, using the original file name plus a number. Auto Recover automatically assigns a number using a sequential order. For example, you have the TWC 030408 job open when the electricity fluctuates causing your computer to reboot. You made changes to the file but had not saved your most

recent changes. When you open CATalyst BCS, the Auto Recover file displays in Manage Jobs as TWC 030408 (1).sgnpl.sav. If the same file abnormally closes a second time, the Auto Recover file name is TWC 030408 (2).sgnpl.sav, unless you renamed the first recovered file. Then Auto Recover uses number one.

**To open the file/dictionary with the most recently saved changes, simply double click the original caption file name.** CATalyst opens the most recent recovered file and names it the original file name, renames the original file to filename\_Original#.sgnpl (# in the file name is for a unique name if necessary) and allows you to continue editing in the most recently saved changes file or dictionary with all the associated subfiles. The following message displays when this process is successful:

Transcript successfully recovered. Press Enter to continue editing in your recovered file.

Old file location: *path for the renamed original file*

or

Dictionary successfully recovered. Press Enter to continue editing in your recovered file.

Old file location: *path for the renamed original file*

If for some reason the CATalyst renaming function takes too long or the auto recovered file cannot be renamed, the following message displays:

Your file was successfully recovered but we are unable to complete the renaming process due to an error. (The error description follows).

Press Enter to open your original transcript or dictionary. Click Cancel to correct the issue and try again.

The recovered file location: *path for the renamed recovered file.*

The AutoArchive case is created when the AutoArchive option is selected along with the [Auto Recover](#) feature and the first time Case CATalyst prompts you to save changes upon exiting a Case CATalyst text file (transcript or caption file) or dictionary. CATalyst automatically saves up to four copy of the temporary transcript/caption file (.sgnpl) or dictionary (.sgdct) to the AutoArchive case when you select an action (Yes or No to save the changes) at the Save Changes prompt upon exiting Edit or Manage Dictionary. The Auto Recover option, [Keep Auto Recover Files in Archive](#), must be active to use the AutoArchive case. If you do not use the AutoArchive case, selecting No at the Save Changes prompt results in losing all **unsaved** changes in the transcript. See [AutoArchive Case](#) for more details on recovering a file that is in the AutoArchive case.

## Auto Save

Automatically save changes to the captioning file at the specified interval but does not auto save a dictionary. If editing a dictionary and your option is Auto Save, if there is an abnormal exit, a recovery file is created. From the drop down list, select the frequency at which you want to automatically save the transcript. Changes are saved to the same file at the timed intervals. If you exit the file abnormally, reopen the same file. Since changes are saved to the same captioning file, there may be times when you select to exit a captioning file and you are not prompted to save changes because an automatic save was performed. If a lot of changes were made to the captioning file, you will not be able to exit without saving to "undo" all the changes.

If you select Auto Save and select the Archive File on Close option, when you close a captioning file or dictionary, a copy of the file will be saved in the AutoArchive case whether you selected to save or not save the file upon closing. If you saved the file, a copy of the saved file will also be in the [Recently Saved Files](#) dialog box.

Auto Recover Options determine whether or not CATalyst BCS automatically creates a temporary file every X minutes and saves the [Auto Recover](#) files to the AutoArchive case or if [Auto Save](#) is selected and the file/dictionary is saved every X minutes to the same file (no temporary file is created). By default, the Auto Recover is on and set to 30 seconds. These settings affect both regular CATalyst translation and CATalyst BCS captioning. You can access Auto Recover/Auto Save options:

- from Manage Jobs. Press **Alt + t, o, e, r** (**Tools/Options/Edit/Auto Recover**).
- from a Caption session or Caption Edit. Press **Alt + t, o, r** (**Tools/Options/Auto Recover**).
- anywhere in CATalyst. Click the All Options icon () on the toolbar.

### Auto Recover/Auto Save Options

Make necessary entries. When finished, select **OK**.

#### Use Auto

Check this box to activate the Auto Recover or Auto Save option. You can only select one of the options to be active at a time. Click the option you want to use.

#### Recover

When the captioning session abnormally terminates, Auto Recover creates a temporary file, using the original file name plus a number. Auto Recover automatically assigns a number using a sequential order. For example, you have the TWC 030408 job open when the electricity fluctuates causing your computer to reboot. You made changes to the file but had not saved your most recent changes. When you open CATalyst BCS, the Auto Recover file displays in Manage Jobs as TWC 030408 (1).sgnpl.sav. If the same file abnormally closes a second time, the Auto Recover file name is TWC 030408 (2).sgnpl.sav, unless you renamed the first recovered file. Then Auto Recover uses number one.

To open the file with the most recently saved changes, simply double click the original caption file name. CATalyst opens the most recent recovered file and names it the original file name, renames the original file to filename\_Original#.sgnpl (# in the file name is for a unique name if necessary) and allows you to continue editing in the most recently saved changes file with all the associated subfiles. The following message displays when this process is successful:

Transcript successfully recovered. Press Enter to continue editing in your recovered file.

Old file location: *path for the renamed original file*

or

Dictionary successfully recovered. Press Enter to continue editing in your recovered file.

Old file location: *path for the renamed original file*

If for some reason the CATalyst BCS renaming function takes too long or the auto recovered file cannot be renamed, the following message displays:

Your file was successfully recovered but we are unable to complete the renaming process due to an error. (The error description follows).

Press Enter to open your original transcript. Click Cancel to correct the issue and try again. The recovered file location: *path for the renamed recovered file*.

#### Save

Automatically save changes to the file at the specified interval. From the drop down list, select the frequency at which you want to automatically save the transcript. Changes are saved to the same file at the timed intervals. If you exit the file abnormally, reopen the same file. Since changes are saved to the same file, there may be times when you select to exit a file and you are not prompted to save changes because an automatic save was performed.

### Keep Auto Recover Files in Archive

The AutoArchive case is created when the AutoArchive option is selected along with the [Auto Recover](#) feature and the first time CATalyst BCS prompts you to save changes upon exiting a captioning text file or dictionary. CATalyst BCS automatically saves up to four copy of the temporary caption file (.sgngl) or dictionary (.sgdct) to the AutoArchive case when you select an action (Yes or No to save the changes) at the Save Changes prompt upon exiting Edit or Manage Dictionary. The Auto Recover option, [Keep Auto Recover Files in Archive](#), must be active to use the AutoArchive case. If you do not use the AutoArchive case, selecting No at the Save Changes prompt results in losing all **unsaved** changes in the transcript. See [AutoArchive Case](#) for more details on recovering a file that is in the AutoArchive case.

When *Use Auto Recover* is selected, check this box to automatically save a copy of the temporary file when you select an action at the Save Changes dialog box upon exiting a file. CATalyst BCS automatically stores a copy of the transcript subfile (.sgngl) in the AutoArchive case when you select an action at the Save Changes prompt upon exiting Edit. The AutoArchive case is created the first time you are prompted to save changes as you exit a file. The transcript subfile (.sgngl) is the only file saved.

Uncheck this box to not make a copy of the temporary file when you select an action at the Save Changes prompt. When you select No at the Save Changes prompt, all unsaved changes in the transcript are lost.

The Keep Auto Recover Files in Archive option does not apply to captioning sessions in CATalyst BCS.

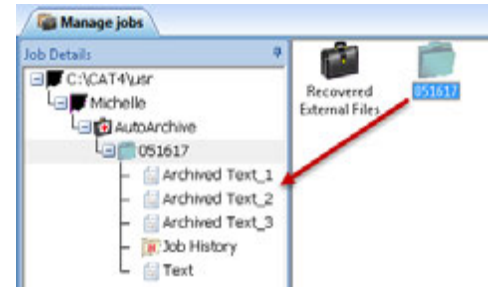

The AutoArchive case is created the first time Case CATalyst prompts you to save changes upon exiting a Case CATalyst text or dictionary file, when the AutoArchive option is active. CATalyst BCS automatically saves a copy of the temporary caption edit file (.sgngl) or dictionary (.sgdct) file to the AutoArchive case when you select an action at the Save Changes prompt upon exiting Edit or Manage Dictionary. The Auto Recover option, [Keep Auto Recover Files in Archive](#), must be active to use the AutoArchive case. If you do not use the AutoArchive case, selecting No at the Save Changes prompt results in losing all unsaved changes in the transcript.

In addition to getting the \*.sgngl file saved in the AutoArchive case when you Save, Close or Save As a file, you could also have up to three additional copies of the file. Every time you open a caption edit file and make changes, up to the last three versions of the file will be saved in the AutoArchive case. You can look at the archived files and select “save” on the version of the file you want to recover. Once you save the recovered file, you are editing the newly recovered file and you can continue editing. No more needing to manually copy or move a file out of the AutoArchive case!

For example, let’s say you just wrote a captioning session and named it 051617 and saved and exited the session.

- In the AutoArchive case, there is a file named 051617 that matches the caption edit file named 051617 in the root of your user as long as there was time for auto recover to save the last changes you made before closing the file.
- You open 051617 and start editing. After a little bit of time, you save and close the 051617 file. In the AutoArchive case, you will find the file named 051617 and an Archived Text\_1 subfile in the Job Details pane.

- The next day, you open 051617 again to finish editing it and you edit for an 30 minutes or so and save and close the file. In the AutoArchive case, you will see the text file named 051617, along with Archived Text\_1, Archived Text \_2 Text subfiles.
- Finally, you open the 051617 file for the last time, make a couple of minor changes and save and close the file. In the AutoArchive case Job Details pane, you will see 051617, along with Archived Text\_1, Archived Text \_2, Archived Text\_3 Text subfiles.  
If you show subfiles, you will see 051617.sgngl\_A1, 051617.sgngl\_A2 and 051617.sgngl\_A3.
- When you double click the text file or any of the additional text subfiles while you are in the AutoArchive case, a message displays with information as to how recent this copy of the file is.

(The “You are opening...” messages are dynamic and automatically adjust the wording whether you are opening the only version of the file that exists, the oldest archived copy or the most recent of two files.)

You can recover any copy of those files by opening the file and selecting **Save**. Once you open a file and select **Save**, the following message displays:

Do one of the following:

- Select **Recover File** to recover the file to its original location in your user and have the original file renamed with the file name followed by underscore Original (051617\_Original). This is the recommended action.
- Select **Save in Archive Dir** to save the file to current location in the AutoArchive case (not recommended).

When you select **Recover File**, the following message displays:

CATalyst goes even further in saving to the AutoArchive case by saving copies of CATalyst files you open or save outside of the current user.

For example, let's say you are helping other captioners who are just getting started and your reviewing their files. You open a file (161108) from another user's name. You are editing the file in your user but the file originated from the Dina user. When you are finished you save and close the file. In **your** AutoArchive case, a Recovered External Files case will be created with the 161108 file in the case. If you have a need to recover the file found in the AutoArchive case, open the 161108 file in the AutoArchive case in the Recovered External Files folder and then select to save the file. The following message displays:

- If you select **Recover File**, a Recovered External Files case is created at the root of your user (Michelle) and the 161108 will be there.
- If you select **Save in Archive Dir** (not recommended), then the file is saved in the current location in the AutoArchive case.

If you selected **Recover File**, a message displays:

- If you selected **Save** in the auto recovered file and click **OK**, the **file is recovered to its original location and you are automatically moved into the newly recovered file so you can start editing the file in the Recovered External Files case in the root of your user. There is no need to exit the AutoArchive case and locate the recovered file.**
- If you selected **Save and Close** in the auto recovered file and click **OK**, the file is recovered to its original location. You need to exit the AutoArchive case and locate the recovered file in the Recovered External Files case in the root of your user and then continue editing.

The Keep Auto Recover Files in Archive option does not apply to captioning sessions in CATalyst BCS.

## BCS Backup Computer

Use the BCS Backup Computer option to setup a second computer as a backup to the first computer in case of system failure. Setting up a backup Catalyst BCS computer requires that you have two computers loaded with CATalyst BCS which are connected to a switch box. The switch box is connected to a single modem.

## Setup

1. Connect your modem and both computers to a switch box.

2. Set the switch box for computer One and start the first computer.
3. Open a CATalyst BCS session and press **Alt + t, o, b (Tools/Options/BCS Backup Computer)**. CATalyst BCS displays, \*\*\*\*BCS BACKUP COMPUTER\*\*\*\*, on the title bar following the captioning session file name.

The BCS Backup Option remains on until it is turned off. A check mark in front of the option indicates the feature is active.
4. Dial the connection number and establish a modem connection.
5. Set the switch box for computer Two and start the second computer. Be sure to enter your PKC (e-Key license) on Computer Two.
6. Open a CATalyst BCS session and press **Alt + t, o, b (Tools/Options/BCS Backup Computer)**. CATalyst BCS displays, \*\*\*\*BCS BACKUP COMPUTER\*\*\*\*, on the title bar following the captioning session file name.

The BCS Backup Option remains on until it is turned off. A check mark in front of the option indicates the feature is active.
7. Dial the same connection number you used for the first computer. When the BCS Backup Computer option is active, CATalyst BCS checks for an active connection on the modem and uses that connection.

If the BCS Backup Computer option is not selected, CATalyst BCS hangs up the active connection on the first computer and then dials the number. The BCS Backup option must be selected on each computer to allow both computers to connect to the modem using the same connection.

## Running the Backup Computer

1. If the first system fails, set the switch box to the second computer. The second computer already has an active modem connection established during setup.
2. Connect your writer to the second system and continue writing.

## Global Options

Global Options determine the selection of certain settings used when making defines. These settings affect both regular CATalyst translation and CATalyst BCS captioning. You can access Global Options:

- in Manage Jobs. Press **Alt + t, o, e, g (Tools/Options/Edit/Global)**.
- in CATalyst BCS. Press **Alt + t, o, g (Tools/Options/Global)**.
- in the Global Define dialog box. Select **Options**.
- anywhere in CATalyst. Click the [All Options](#) icon () on the toolbar.

## Global Options

To make a change, click an option. Depending on the field, select a choice from the drop down box or type an entry. When finished with all your changes, select **OK**. The *Restore Default Settings* option returns all the Global Options to their original CATalyst BCS default selection.

Changes to settings in Global Options for [Intuitive Replace](#) are also reflected in the Intuitive Replace Options dialog box in Edit. This is accessible by selecting Tools/Options/Intuitive Replace.

**Intuitive Replace Active in    Replace and all defines    Only in Replace    Disabled**

Determine when Intuitive Replace suggests a word when you Replace or Define words in Edit. Suggestions are based on previous replacements and defines. Choose one of the following:

**Replace and all Defines**

Suggest a replacement word in the New Text field of the Global Define dialog box for a Replace or any type of define.

**Only in Replace**

Suggest a replacement word in the New Text field of the Global Define dialog box for Replace only.

**Disabled**

Make no suggestions for the text in the Old Text field of the Global Define dialog box.

**Intuitive Replace shows suggestions only if old text was previously replaced Yes No**

Select **Yes** to have CATalyst BCS suggest a replacement word in the New Text field only if the word was previously replaced. Select **No** to not have suggested replacement words. You can toggle through previous replacements by pressing Ctrl + r with the cursor in the New Text field.

**If New Text is empty, show currently selected text Yes No**

If you have text selected (marked) and based on your Intuitive Replace options, the field would be empty, selecting Yes would put the currently selected text in the *New Text* field. If you want the New Text field to remain empty and not be populated by the selected text, select No. The default setting for this option is No.

**Scope of Intuition User/ Case/ Job**

Determine when to apply the replacement for Intuitive Replace. Select one:

**User**

Intuitive Replace is active in all jobs, remembering and suggesting all replacements made in any User job.

**Case**

Intuitive Replace is active across jobs in a case, remembering and suggesting all for jobs in the same case. When Case is selected and you are editing jobs that are not in an existing case, Intuitive Replace treats the scope as a User. CATalyst BCS creates a new case with the User name, *username\_Case.ini*, to store the Intuitive Replace information.

**Job**

Intuitive Replace is active only for the current job, remembering and suggesting replacements for the open job.

**Expiration (in months)**

Designate the number of months that eligible Intuitive Replace entries must remain unused before identified as expired and automatically deleted. The expiration timer for an entry starts from the time the entry was last used.

The scope of an Intuitive Replace entry determines eligibility. All entries with an Intuitive Replace scope of *User* are deleted. Expiration does not apply to entries with a scope of *Job* or with a scope of *Case* when the entry is located in a Case. If an entry with a scope of *Case* is not located in a Case, then expiration applies. For example, the scope for an entry is set to Case. You do not create a Case for the *Anderson040511* job and Edit without one. Since no Case exists, the Intuitive Replace entries are not placed in a Case and the expiration applies.

### **Control + R displays last number of replacements**

When the cursor is in the New Text field of the Global dialog box, by default, you can cycle through the last 10 text replacements by pressing Ctrl + r. To change the default, type a number of replacements.

### **Remember selected options for E-Defines    Yes No**

Select **Yes** to have CATalyst BCS remember the *Entire File*, *Case Sensitive* and *Selective* settings in the Global Define dialog box when making an E-Define. CATalyst BCS opens the Global Define dialog box with the settings used from the previous E-Define. Select **No** to have CATalyst BCS always return the options to the default settings after making an E-Define.

### **Remember selected options for D-Defines    Yes No**

Select **Yes** to have CATalyst BCS remember the *Entire File* and *Selective* settings in the Global Define dialog box when making an D-Define. CATalyst BCS opens the Global Define dialog box with the settings used from the previous D-Define. Select **No** to have CATalyst BCS always return the options to the default settings after making an D-Define.

### **Remember selected options for J-Defines    Yes No**

Select **Yes** to have CATalyst BCS remember the *Entire File* and *Selective* settings in the Global Define dialog box when making an J-Define. CATalyst BCS opens the Global Define dialog box with the settings used from the previous J-Define. Select **No** to have CATalyst BCS always return the options to the default settings after making an J-Define.

### **Remember selected options for K-Defines    Yes No**

Select **Yes** to have CATalyst BCS remember the *Entire File* and *Selective* settings in the Global Define dialog box when making an K-Define. CATalyst BCS opens the Global Define dialog box with the settings used from the previous K-Define. Select **No** to have CATalyst BCS always return the options to the default settings after making an K-Define.

### **Remember selected options for O-Defines    Yes No**

Select **Yes** to have CATalyst BCS remember the *Entire File* and *Selective* settings in the Global Define dialog box when making an O-Define (Other Dictionary). CATalyst BCS opens the Global Define dialog box with the settings used from the previous O-Define. Select **No** to have CATalyst BCS always return the options to the default settings after making an O-Define.

### **Generate Misstrokes for D-Defines    Yes No**

Select **Yes** to have CATalyst BCS remember the *Generate Misstrokes* setting in the Global Define dialog box when making an D-Define. CATalyst BCS opens the Global Define dialog box with the setting used from the previous D-Define. Select **No** to have CATalyst BCS always return the option to the default settings after making an D-Define.

### **Generate Misstrokes for J-Defines    Yes No**

Select **Yes** to have CATalyst BCS remember the *Generate Misstrokes* setting in the Global Define dialog box when making an J-Define. CATalyst BCS opens the Global Define dialog box with the setting used from the previous J-Define. Select **No** to have CATalyst BCS always return the option to the default settings after making an J-Define.

#### **Generate Misstrokes for K-Defines    Yes No**

Select **Yes** to have CATalyst BCS remember the *Generate Misstrokes* setting in the Global Define dialog box when making an K-Define. CATalyst BCS opens the Global Define dialog box with the setting used from the previous K-Define. Select **No** to have CATalyst BCS always return the option to the default settings after making an K-Define.

#### **Generate Misstrokes for O-Defines    Yes No**

Select **Yes** to have CATalyst BCS remember the *Generate Misstrokes* setting in the Global Define dialog box when making an O-Define (Other Dictionary). CATalyst BCS opens the Global Define dialog box with the setting used from the previous O-Define. Select **No** to have CATalyst BCS always return the option to the default settings after making an O-Define.

#### **Remember last O-Define Browse location    Yes No**

Select **Yes** to have CATalyst BCS remember the last *Pick Other Dictionary* path in the Global Define dialog box when making an O-Define (Other Dictionary). CATalyst BCS opens the Global Define dialog box with the setting used from the previous O-Define. Select **No** to have CATalyst BCS always remember the default settings after making an O-Define. You can set a default folder by making an entry in the *O-Define browse location* field.

#### **O-Define browse location**

Select the default folder location for the job dictionary when making an O-Define (Other Dictionary). This option is only available when the option, *Remember last O-Define Browse location*, is set to No.

#### **Add Other Globals go to dictionaries    Yes No**

When using the [Add Other Globals](#) feature, all selected D, J and K-defines are added to the current Global Table and added to the respective dictionary. If you would only like the selected defines to go to the current Global Table, select No. The default setting is Yes.

#### **Open Global Dialog when no Quick Suggest available    Yes No**

When using the [Quick Suggest](#) feature, if a suggestion cannot be generated, a *No Suggestions were found* message displays. If rather than having the message display you want the J-define Global dialog box to display, select Yes. The default setting is No.

### **Display in All Caps**

Display in all caps allows you to display the history file in all capital letters. Display in all caps also affects any [RTF/CRE](#) file exported. When exporting to [ASCII](#), [SCC](#) and [SMPTE-TT](#) you can select an All Caps option regardless of this Display in All Caps option setting.

To enable the Display in all caps option:

1. Press **Alt + t, o (Tools/Options)**.
2. From the Options menu, select **Display in all caps**. A check mark next to the Display in all caps option indicates it is active and history file will display in all capital letters.

To disable the option, select it again.

## Intuitive Replace

Intuitive Replace is an option that, when active, suggests a replacement for the word you are replacing or defining. You can choose to have CATalyst BCS suggest a word:

- when you replace or define highlighted text.
- only when you replace highlighted text.
- only if the word was previously replaced.

When you replace or define a word, Intuitive Replace suggests a word in the New Text field of the Replace or Define dialog box. For example, you replace the word "buy" with the correct word "by". The steno outline is correct for the word "buy" but you need to use the word "by" in this occurrence. The next time you replace the word "buy", the word "by" displays in the New Text field of the Replace dialog box.

If you replace a word not previously replaced, the last word you replaced displays in the New Text field. You can also toggle through the last ten replacement words by pressing **Ctrl + r** with the cursor in the New Text field. Press **Ctrl + Shift + r** to toggle backwards through the selection. The default number of available replacement words when you press Ctrl + r is 10. You can change the number by modifying the setting in your UserSettings.sxml file.

Depending on the option selected, you can have Intuitive Replace active in all jobs, suggesting replacements made in any User job; only suggest replacements for jobs in the same case; or only suggest replacements within an individual job. When you select to have Intuitive Replace active for all jobs in a User, CATalyst BCS stores the replacement words in the System Files\_Case.ini. This file is located in the System Files case. When Intuitive Replace is active in a case, the words are stored in the Case History (*casename\_case.ini*) file. When you select to have Intuitive Replace active only in a job, the words are stored in the Job History (*jobname.sxml*) file. You can view the Intuitive Replace.

## Set Intuitive Replace Options

1. From Edit, press **Alt + t, o, i** (**Tools/Options/Intuitive Replace**). The Intuitive Replace Options dialog box displays.
2. Make changes as necessary:

### Where Active

#### Active in Replace and all Defines

CATalyst BCS suggests a replacement word in the New Text field when you select to Replace or create any type of define for the highlighted steno or text.

#### Active only in Replace

CATalyst BCS suggests a replacement word in the New Text field only when you select to replace the highlighted steno or text.

#### Disabled

Do not have CATalyst BCS suggest a replacement word in the New Text field for the highlighted steno or text.

#### Only show a suggestion if old text was previously replaced

Have CATalyst BCS suggest a replacement word in the New Text field only if the word was previously replaced. You can still toggle through previous replacements by pressing **Ctrl + r**.

### Scope of Intuition

When Intuitive Replace is active, select where you want to apply the feature:

### User

Intuitive Replace is active in all jobs, remembering and suggesting replacements made in any User job.

### Case

Intuitive Replace is active across jobs in a case, remembering and suggesting replacements for all jobs in the same case. When you select Case as the Scope of Intuition, but then do not use cases, CATalyst BCS creates a new case with the User name: *username\_Case.ini* which stores the Intuitive Replace information.

### Job

Intuitive Replace is active only for the current job, remembering and suggesting replacements for the open job.

3. Press **Enter (OK)** to accept the changes.

## Plural Endings Options

Plural Endings Options is a feature that allows you to use the final S, final Z or both for plural endings when the [Suffix Drag](#) translate option is active. Suffix Drag translates steno outlines that would result in an untranslate if a dragged letter, -G, -S or -D is stroked. The Plural Options are also used when selecting the [Endings button](#) in a Global dialog box.

Suffix Drag translates steno outlines that would result in an untranslate if a dragged letter, -G, -S or -D is stroked. For example, you write the word "paper" as PAEUP and "papers" as PAEUP/-S. If you accidentally wrote PAEUPS all in one stroke and had the Suffix Drag option selected, the result would be "papers" even though that stroke is not defined in your dictionary as "papers."

[Brief It](#) will also use this setting for suggesting singular and plural briefs for regular translate and CATalyst BCS captioning.

When creating a global and you type a word in the *New Text* field, Case CATalyst analyzes the word to determine if a " G", " S" or " D" steno outline could be added to the word. If so, then Case CATalyst activates the Endings button. Caption Edit's [Plural Endings](#) Option setting also applies to the Endings feature. The Plural Endings option allows you to set the final S, final Z or both as keys you write to indicate a plural.

The Global Endings dialog box displays when the Endings button is selected. You can choose any of the suggested definitions to add to your dictionary. For example, you have REPT in the Steno field and type "represent" in the Text field. The following suggested entries display when you select Endings and you have the plural endings option set to both final S and final Z:

REPTD = represented

REPTS = represents

REPTZ = represents

## Set Plural Endings Options

1. Press **Alt + t, o, e (Tools/Options/Plural Endings Options)**. The Plural Word Endings Options dialog box displays.
2. Select one of the following:
  - Use /-S

- Use /-Z
- Use both /-S and /-Z

3. Press **Enter (OK)** to accept the changes.

## Retain Script Case

Use Retain Script Case to start CATalyst BCS or switch profiles during a session and retain the current case when sending the Script file to the encoder. For example, you may have sessions with the script file sent in mixed case and other sessions with the script file sent in all capital letters. This option takes priority over the profile option, [Capitalize All](#). To use Capitalize All, turn Retain Script Case off.

When this option is On, CATalyst BCS uses <KeepCaseOn> and <KeepCaseOff> format symbols around each line of the sent script file. If you select this text and load it as a story or save it as a script file, the format symbols are retained. When you send the script file again, the case remains the same regardless of the Retain Script Case setting.

You can also set CATalyst BCS to always automatically start a session or switch profiles with the same Retain Script Case setting using the Retain Script Case [option](#) in Preferences.

To turn Retain Script Case on during a session, press **Alt + t, o, r (Tools/Options/Retain Script Case)**. A check mark displays next to the menu item. To turn Retain Script Case off, select it again.

## Set Audio Delay

Set Audio Delay allows you to adjust the synchronization between the cursor location in the caption file and the playback of the audio file. When you invoke the Play Audio command, CATalyst BCS checks the Audio Delay value before playing the associated audio. These settings affect both regular CATalyst translation and CATalyst BCS captioning.

Audio capabilities are only available on systems that have the optional AudioSync software.

## Adjust Audio Values

1. Press **Alt + t, o, u (Tools/Options/Set Audio Delay)**. The Set Audio Delay dialog box displays.
2. Review the Current delay setting. Make a change to the setting by typing a new setting number in the New delay field. The maximum number of seconds is 99.
3. Press **Enter (OK)** to accept the changes.

## Scan For Options

The Scan For Options allow you to determine the criteria on which the cursor stops when using the [Scan](#) and [Scan Backwards](#) commands. These settings affect both regular CATalyst translation and CATalyst BCS captioning.

## Set the Scan For Options

1. From the Edit menu, press **Alt + t, o, c (Tools/Options/Scan For Options)**. The Scan For Options dialog box displays.
2. Check the box next to **any** of the options you want Scan or Scan Backwards to stop on. Uncheck the box to have Scan and Scan Backwards not stop on that criterion in the job.
  - **Untranslates** - steno outlines in which no dictionary entry was found to translate the steno.

- **Conflicts** - steno outlines that have multiple text definitions.
  - **Scan Stops** - text surrounded by Scan Stop format symbols.
  - **Hidden Text** - text that has been inserted via the Insert Hidden Text command. Hidden text does not print.
  - **Prefix/Suffix Translations** - translations that include a dictionary defined prefix and/or suffix.
  - **Drag/Drop Translations** - translations that have resulted from the Drag/Drop Analysis and/or [TrueStroke Drag/Drop](#) translate options being selected.
  - **Suffix Drag Translations** - translations that have resulted in the [Suffix Drag](#) translate option being selected.
  - **Bench** - occurrences in transcript where the Bench Mode On/Off format symbols were inserted. If you use the Bench Mode commands during captioning sessions, you may want your cursor to stop on Bench Mode On/Off occurrences.
  - **Field (Empty)** - stops on an empty field including those contained in headers. The Insert Fields feature is not available in a captioning session or caption edit session.
  - **Fill in Fields** - this option is only available when you select the Field (Empty) option. The Fill in Field feature is not available in a captioning session or caption edit session.
  - **Indexed Items** - stops the cursor on Index Heading On and/or Index On format symbols. If you use indexing format symbols during captioning session or caption edit sessions, you may want your cursor to stop on Index Heading On/Off and Index On/Off occurrences.
  - **Index Placeholders** - stops the cursor on occurrences of the Index Placeholders Text format symbol. If you use the Index Placeholders format symbol during captioning session or caption edit sessions, you may want your cursor to stop on Index Placeholder occurrences.
  - **Oops** - stops the cursor on occurrences of the [Oops](#) format symbol.
  - **Attachment Points** - stops on Attachment Point format symbols without an attachment. The Attachment Points feature is not available in a captioning session or caption edit session.
  - **Attachments** - stops on attachments. The Attachment Points feature is not available in a captioning session or caption edit session.
  - **Changes** - stops on changes or comments made in the transcript. The Track Changes feature is not available in CATalyst BCS.
  - **Deselect All** - deselect all the options. You may want to use this option when creating a macro to select a specific Scan For Option. To run a macro for a specific Scan For Option you would first need to deselect all the other options. By using Deselect All, you can deselect all the options at once and then select the specific one you want to use.
  - **Automatically open Quick Suggest for** -- automatically opens the [Quick Suggest](#) dialog box with possible suggestions when Scan stops on an untranslate, Drag/Drop and/or Suffix Drag translation. Select the items you want Scan to stop on and automatically open the Quick Suggest dialog box. The scan options selected in this section must also be selected in the section above the Quick Suggest section.
3. To save your changes, press **Enter (OK)**.

## Transcript Spell Check Options

Transcript Spell Check Options determine the Spell Check settings used when spell checking in Edit. You can select automatic Spell Check features, choose Wordlists, set the number of Suggestions and choose the language type. For example, you can add a job wordlist, choose the Wintertree Medical Wordlist, activate the option to have Spell Check ignore all capped words and single characters, display notification when Spell Check completes in a text field and set the number of suggested words to display at 10. Additional Transcript Spell Check options are available by selecting the [Advanced](#) button in the Transcript Spell Check Options dialog box.

Use [Dictionary Spell Check options](#) to set Spell Check parameters for spell checking the text portion of dictionary entries in Manage Dictionary. Dictionary Spell Check options are set independently from CATalyst BCS Transcript Spell Check options.

The priority of the wordlists are as follows: Ignore All (which is in memory only), Job, Case, Personal, Exclude List (if selected), optional "other" wordlists, main language wordlists provided by Wintertree, Wintertree medical (if selected), Stedman's medical (if selected), Wintertree legal (if selected) and Black's legal (if selected).

These settings affect both regular CATalyst translation and CATalyst BCS captioning.

Access Transcript Spell Check Options:

- in Manage Jobs. Press **Alt + t, o, e, t** (**Tools/Options/Edit/Transcript Spell Check**).
- in CATalyst BCS. Press **Alt + t, o, t** (**Tools/Options/Transcript Spell Check**).

## Transcript Spell Check Options

To make a change, click an option. Depending on the field, check or uncheck the box or select a choice from the drop down list. When finished with all your changes, select **OK**.

### Language

Select which language set to use when running Spell Check. Selecting a language set for Spell Check affects the language set for the general WinterTree [Wordlist](#). Black's Law and Stedman's Medical wordlists are only available in English.

- **American English**
- **British English**
- **French** — When using French, Spell Check considers words beginning with a letter followed by an apostrophe, such as "c'est" to be misspelled and suggests a space following the apostrophe, "c' est." Change the [Advanced Spell Check](#) option, *Spell Check contractions as separate words* to prevent Spell Check from stopping on these words.
- **Italian** — When using Italian, Spell Check considers words beginning with a letter followed by an apostrophe, such as "c'est" to be misspelled and suggests a space following the apostrophe, "c' est." Change the [Advanced Spell Check](#) option, *Spell Check contractions as separate words* to prevent Spell Check from stopping on these words.
- **Spanish**
- **Brazilian Portuguese**

### Options

Check the boxes next to the features you want active when Spell Check runs.

**Pause after change**

Suspend Spell Check after an action is taken, such as Change or Ignore. You must press **Resume** to move to the next item. If you do not select this option, CATalyst BCS performs the action and scans to the next item.

**Autocorrect**

Automatically correct a word with the specified alternative contained in a selected [Wordlist](#). For example, Spell Check recognizes "teh" as misspelled and automatically replaces it with "the" because the entry in the selected Wordlist is: "teh" Autocorrect "the".

**Ignore Allcapped Words**

Do not stop on words or abbreviations that are all capitalized and not recognized by Spell Check.

**Ignore Mixed Case**

Do not stop on mixed case words that have more than one initial capped letter and are not recognized by Spell Check. For example, Spell Check does not stop on "CATalyst ", "McNeal", or "OZpc."

**Ignore Mixed Digits**

Do not stop on combinations of digits and numbers not recognized by Spell Check. For example, Spell Check does not stop on 12F, t3sting, or 500th.

**Report Repeated Words**

Stop on repeated words unless the words have been added to your Personal, Case or Job wordlist.

**Strip Possessives**

Spell check only the root word.

**Suggest Split Words**

Offer two separate words as a Suggestion for a single word that can legitimately be two words. For example, Spell Check stops on "someperson" and offers the Suggestion "some person".

**Ignore Single Characters**

Do not stop on individual characters. For example, do not have Spell Check stop on the X in "X marks the spot".

**Add Changes To Wordlist**

This option is not recommended for use in CATalyst BCS.

Add the highlighted word and its replacement to the job Wordlist as a Suggest, when the Change action is used. For example, Spell Check stops on the word "someperson". You select "some person" from the Suggestions list and the Change action. In the job's Wordlist, the following entry is added: "someperson" Suggest "some person".

**Check Punctuation**

Stop on multiple punctuation that is not recognized and suggest correct ending punctuation for Question and Answer paragraph styles. Ending punctuation includes question mark, period or dashes.

**Check Colloquy Punct.**

Not applicable in CATalyst BCS.

### Check Spacing

Stop on incorrect spacing following punctuation, abbreviations or between words. [Advanced Spell Check Options](#) affect how Spell Check handles spaces after a colon and an abbreviation.

### Check Fields

Not applicable in CATalyst BCS.

### Report Repeated Paragraphs

Stop on repeated paragraph styles. Spell Check suggests specific names from the Speaker List when repeated Colloquy is reported.

### Report Empty Pages

Stop on pages with no text. You can select to Ignore the empty page or click in the transcript and delete the New Page format symbol from Reveal Codes.

### Check for missing By Lines

Not applicable in CATalyst BCS.

### Report Empty Q/A/C Paragraph

Depending on your dictionary definitions this option may or may not apply to caption files. If you use Question, Answer and Colloquy paragraphs definitions while captioning and this option is selected, Spell Check will stop on any empty Question, Answer or Colloquy paragraphs. If you select Ignore All, Spell Check will not stop on other occurrences of empty Q/A paragraphs and will not stop on empty Colloquy occurrences with the same name. For example, if Spell Check stops on an empty <Colloquy>>>WILSON: and you select Ignore All, Spell Check will not stop on any remaining empty occurrences of <Colloquy>>>WILSON:

### Deselect All

Deselect all options. By using Deselect All, you can deselect all the options at once and then select the specific one you want to use. For example, you may want to use this feature when creating a macro to select a specific Spell Check Option. To run a macro for a specific Spell Check Option, first deselect all the other options.

### Additional Wordlists

Use the **Add** button to display the Open dialog box where you can locate and include other [Wordlists](#) to apply during Spell Check. Once added to the list, you must check the box next to each Wordlist you want to apply during Spell Check. Uncheck the box to inactivate the Wordlist but keep it in the list for later use. Use **Remove** to delete the Wordlist from the list. You can Add it again if necessary.

Wordlists are applied during Spell Check in a [priority](#) order. Additional Wordlists are applied before all other Wordlists except the Ignore All Wordlist which is a temporary Wordlist that is not viewable. Wordlists contained in the Additional Wordlists field are applied in display order. Use the **Move Up** and **Move Down** buttons to reorder the list.

### Match Common Word Processors

The Match Common Word Processors option uses an exclude list that contains all common words from the Wintertree American wordlist or Wintertree British wordlist that some commonly used spell checkers (i.e. word processor software) report as being misspelled. Although there are words in the Wintertree American wordlist or Wintertree British wordlist that commonly used spell checkers mark as misspelled, many of those same words may be recognized spellings in other spell checkers. By checking this option, you are setting CATalyst's spellchecker to stop on these words even though the built-in wordlist says these words are correct.

When you select the Match Common Word Processors option, the listed legal and medical wordlists are automatically deselected (to give you the most desired results). Deselecting the Match Common Word Processors option does not automatically reselect all the wordlists listed below. You will need to select each wordlist you want to use. All commonly used spell checkers may not have medical and legal terminology as a part of their wordlists. If all the medical and legal wordlist are deselected, you most likely will need to add some medical and legal words to your Personal Wordlist (with the Ignore attribute) so Spell Check doesn't stop on them. For example, if you select the Match Common Word Processors option and deselect the medical and legal words, you may have to add "Voir" (Voir Dire) to your Personal Wordlist so Spell Check doesn't stop on it. There may be medical words you will need to add also. If you select this option and continue to select all medical and legal wordlists, you may still find some words that commonly used spell checkers would consider misspelled. You can select all, some or none of the wordlists, it is your decision.

*This option is grayed out if American English or British English is not selected in the Language field.*

**Use Wintertree Medical Wordlist**

Check this box to use the Wintertree Medical Wordlist.

**Use Stedman's Medical Wordlist**

Check this box to use Stedman's Medical Wordlist.

**Use Wintertree Legal Wordlist**

Check this box to use the Wintertree Legal Wordlist.

**Use Black's Legal Wordlist**

Check this box to use Black's Legal Wordlist.

**Display Red Squiggle Under Misspelled Words**

Check this box to display a red squiggle underline on words that Spell Check considers misspelled. You can add the red squiggle underlined word to the Personal, Job, Case or Ignore All Wordlist. Selecting Ignore All prevents CATalyst BCS from stopping on any occurrence of the word in this job during this Edit session. If you exit or close the session and reopen the file, Spell Check stops on the text previously identified in the Ignore All. By default, this option is turned on.

**Spell Check While Defining**

Check this box to invoke Spell Check automatically when the spelling of text in the Global dialog box and inserting text. When you type in the Text field and then press Enter in the dialog box, Spell Check automatically checks the word or words for correct spelling. If Spell Checks detects a possible error, the Spell Check dialog box displays. The spell check while defining options affects the following dialog boxes: Global/Replace, Filling in a field, Change Header Text, Hidden Text - insert/modify, Insert Conflict/Text, Modify Header/Footer in Layout, Make Exhibit Index Entries, define from Vertical Notes and define from Brief It. This option is active by default. This option is active by default.

**Spell Check While Defining during Realtime**

Spell Check While Defining during Realtime automatically checks the spelling of text in the Global dialog box and inserting text and applies strictly while writing realtime. The Spell Check While Defining during Realtime is selected by default. If you don't want Spell Check to interrupt the define process while writing realtime, deselect the option. If you only want spell check while defining active while editing, select the Spell Check While Defining option and leave the Spell Check While Defining during Realtime option unselected. The spell check while defining options affects the following dialog boxes: Global/Replace, Filling in a field, Change Header Text, Hidden Text - insert/modify, Insert Conflict/Text, Modify Header/Footer in Layout, Make Exhibit Index Entries, define from Vertical Notes and define from Brief It. This option is active by default

### Scan While Spellcheck

Check this box to use the selected Scan options during Spell Check. Use the Scan Options feature to select the options.

### Scan Options

Set [Scan For Options](#) for Spell Check to recognize. Changes made here also reflect in the Scan For options accessed in Edit from Tools/Options/Scan For.

### Notify me when spellcheck completes in a text field

When the Spell Check while Defining option is Off and you manually spell check text in a field of a dialog box using Spell Check (Shift + F7), the No Spelling Errors dialog box displays.

### Maximum Number of Suggestions

Enter a number between 10 and 100 to determine the maximum number of alternative words that display in the Suggestions field. The smaller the number of suggestions, the more accurate the suggestions.

### Advanced

Display the [Advanced Spell Check Options](#) dialog box where you can make additional Spell Check settings.

### Advanced Spell Check Options

Additional Transcript Spell Check options are available by selecting the **Advanced** button in the [Transcript Spell Check Options](#) dialog box. Access Advanced Transcript Spell Check Options:

- in Manage Jobs. Press **Alt + t, o, e, t (Tools/Options/Edit/Transcript Spell Check)**. In the Transcript Spell Check dialog box, select **Advanced**.
- in CATalyst BCS. Press **Alt + t, o, t (Tools/Options/Transcript Spell Check)**. In the Transcript Spell Check dialog box, select **Advanced**.

### Advanced Spell Check Options

To make a change, click an option and select a choice from the drop down box. When finished with all your changes, select **OK**. The *Restore Default Settings* option returns all the Advanced Spell Check Options to their original CATalyst BCS default selection.

#### Expect two spaces after colon

Determine how Spell Check handles spaces after a colon. Select **Yes** to have Spell Check stop when there are less than two spaces following a colon. Select **No** to set Spell Check to not stop when one or two spaces follow a colon. The default is No.

#### Allow one or two spaces after an abbreviation

Determine how Spell Check handles spaces after abbreviations with periods. Select **Yes** to prevent Spell Check from stopping when one or two spaces follow an abbreviation with a period. Select **No** to have Spell Check stop when one space follows an abbreviation with a period. The default is Yes.

### Restart from top defaults to Yes

When Spell Check reaches the end of the file, you are prompted to continue Spell Check from the beginning of the document. Select **Yes** to set the cursor focus default to "Yes." Spell Check continues checking the document from the beginning. Select **No** to set the cursor focus default "No." Spell Check stops and the cursor focus remains at the end of the file. The default selection for this option is Yes.

### Default action in Spell Check dialog box

Set the default action for the cursor focus in the Spell Check dialog box. For example, when spell checking a transcript, you generally select the Ignore All action. Select Ignore All as the default action. When you press Enter in the Spell Check dialog box, CATalyst BCS invokes the Ignore All option. Choose one of the following: **Change**, **Global**, **Ignore**, **Ignore All**, or **Wordlist**. The default is Ignore.

### Spell Check contractions as separate words

Spell Check considers words that start with a letter followed by an apostrophe, such as c', l' or d' misspelled. For example, Spell Check considers "c'est" misspelled and suggests "c' est" with a space following the apostrophe. Select **Yes** to prevent Spell Check from considering these types of words misspelled when writing in languages such as French or Italian with the [Transcript Spell Check](#) Language option set for the respective language. The default is No.

### Personalized Spell Check punctuation characters

Specify nonstandard grammatical punctuation on which you want Spell Check to stop. For example, you may want to Spell Check to stop on a ^ (caret) or \* (asterisk) you use as a placeholder. Type the characters in the field without spaces.

## Warnings

The Warnings option allows you to select to display or hide messages when captioning and/or editing a caption file. These settings affect both regular CATalyst translation and CATalyst BCS captioning. Caption warning messages:

- Warn when ending realtime - an *Are you sure* message displays when selecting to stop realtime.
- Warn before resolving all chosen conflicts - an *Are you sure* message displays when using the Resolve All Chosen Conflicts feature.
- Warn about file deletion before merging files - a message displays advising the difference that the Merge command deletes the selected file.
- Warn when deleting entry from Query Translation dialog - an *Are your sure* message displays when selecting the Delete command in the Lookup Steno dialog box.
- Warn about outputting to the cloud - the Cloud is not available in CATalyst BCS.

## Set Warning Options

1. Press **Alt t, o, w** (**Tools/Options/Warnings**). The Warnings in Edit dialog box displays.
2. Check the box next to each of the warnings you want to display. Uncheck the box to turn the warnings off or when the warning dialog box displays, check the option: *I understand the consequences of my actions. Please stop asking.*
3. Press **Enter** (**OK**).

## Word Definition Settings

Word Definition Dictionary Settings allow you to confirm the version of Merriam-Webster dictionary being used, confirm the location of the Merriam-Webster wordlist and definition files and change the colors for the Word Definition dialog box. These settings affect both regular CATalyst translation and CATalyst BCS captioning.

Access Word Definition Options:

- in Manage Jobs. Press **Alt + t, o, e, w** (**Tools/Options/Edit/Word Definition**).
- in CATalyst BCS. Press **Alt + t, o, n** (**Tools/Options/Word Definition**).
- in CATalyst BCS. In the Word Definition dialog box, click the **Setup** icon.

## Word Definition Options

To make a change, select a choice from the drop down box or navigate to a folder using the Browse button. When finished with your selection, click **Apply**. When finished with all your changes, select **OK**.

### Dictionary Tab

#### Available Word Dictionaries

The default dictionary, Merriam-Webster Dictionary, comes with the CATalyst BCS software. The most current Merriam-Webster dictionary displays. Click the down arrow to display other available versions.

#### Words Path

Displays the current location for the Merriam-Webster wordlist file, MWWords.bin. The default location for this file is the same location where CATalyst BCS was loaded. To change the location, click  and navigate to the new location.

#### Definitions Path

Displays the current location for the Merriam-Webster definitions file, MWDef.bin. The default location for this file is the same location where CATalyst BCS was loaded. To change the location, click  and navigate to the new location.

### Colors tab

Using the options on the Color tab, modify the Background Color, Text Color, and Link Color in the Word Definition Dictionary dialog box. For each option, select a color from the drop down menu or create a customized color. To create your own color, consult your Windows documentation for more information.

## Application/Computer Options

Application/Computer Options allow you to set certain defaults for CATalyst BCS. Access Application/Computer Options in Manage Jobs. Press **Alt + t, o, a** (**Tools/Options/Application Computer Options**).

## Application/Computer Options

To make a change, click an option. Select a choice from the drop down list. When finished with your changes, select **OK**. The *Restore Default Settings* option returns all the Advanced Edit Options to their original Case CATalyst default selection.

## Start-up Settings

### Start-up Size

Start-up size determines the size and location of the Case CATalyst window when Case CATalyst opens. This setting affects all users on this computer. By default, Case CATalyst is set to open maximized.

### Last Known Size

Case CATalyst opens with the last customized size and position of the Case CATalyst window. It is necessary to manually resize and position the window. Do not use Windows Aero to resize the window.

It may be necessary to change the Windows settings for the Case CATalyst shortcut icon in order for the *Last Known Size* option to function properly. Some versions of Case CATalyst install with this setting set to *Maximized*. The shortcut setting must be set to *Normal window*. To modify the Case CATalyst shortcut setting, right click the Case CATalyst icon and select **Properties**. On the Shortcut tab, in the *Run* field, select **Normal window**.

### Maximized

The Case CATalyst window opens to the size of your screen.

### Full Screen

The Case CATalyst window opens with only the Menu bar and Full Screen toolbar displayed. The Function Bar and all other toolbars are not shown.

## Renew expiring e-Key license

Your e-Key, keyless access, requires reauthorization every 90 days. By default, reauthorization is set to automatically renew. Optionally, you can choose to manually reauthorize via renewal notification. This setting affects the current Case CATalyst/CATalyst BCS application.

### Without Asking

By default, this option is active to automatically reauthorize e-Key, keyless access, when the renewal date falls within 29 days. e-Key requires reauthorization every 90 days. When reauthorization successfully completes, a message displays indicating successful reauthorization. Close the message box by pressing **Enter**. The 90 days of reauthorization is added to the amount of authorized days currently remaining. Automatic reauthorization requires an Internet connection.

A reauthorization reminder message displays if automatic reauthorization is unavailable. For example, this may happen if you do not have Internet access at the time of automatic reauthorization.

### At User Direction Only

Display a reauthorization reminder message that requires you to [manually respond](#) to renew keyless access. Internet access is necessary to respond to the notification message for reauthorization. If you do not have an Internet connection, follow the instructions in *e-Key Activation* for [No Internet Access](#).

## Check for Updates

### Check for Updates Enabled

The Check for Updates Help menu item or the Check for Updates button in the About Case CATalyst dialog box allows all users in this application to check for Case CATalyst updates. Select **Yes** to have the Check for Updates menu item and the Check for Updates button in the About Case CATalyst dialog box active and to receive update reminder messages when you haven't checked for updates for three months. There are some situations where Network Administrators or Instructors, for example, control the Case CATalyst version being used and do not want individuals updating. Select **No** to disable automatic update check reminders and gray out the Check for Updates menu item and button in the About Case CATalyst dialog box. The default is Yes.

**Track Changes - this option is not available in captioning sessions or caption edit sessions**

### Editor ID

Designate a name to associate with changes and comments made to a transcript with the [Track Changes](#) feature. When this option is left blank, the current user name is used as the Editor ID. The entry in this field applies to all files for all users on the system. The default is blank. To fill in the Editor ID field, click in the blank field to the right of the option and type the name.

### Always Track Changes in Edit

The Always Track Changes in Edit option, when set to Yes, automatically sets the Track Changes option tab to be active when editing. If you are writing realtime and making editing changes in the file, realtime is active and track changes is not active. Once you stop translation (Ctrl + \ or File, Stop Translation) with this option set to Yes, the Track Changes feature is automatically active. This option may be ideal for a scopist who wants to track their changes in every file. If you manually turn Track Changes off in the file, it will remain off until you turn it back on or until you open the file in Edit again. The Always Track Changes in Edit option setting affects all Case CATalyst users on the current computer.

## Edit

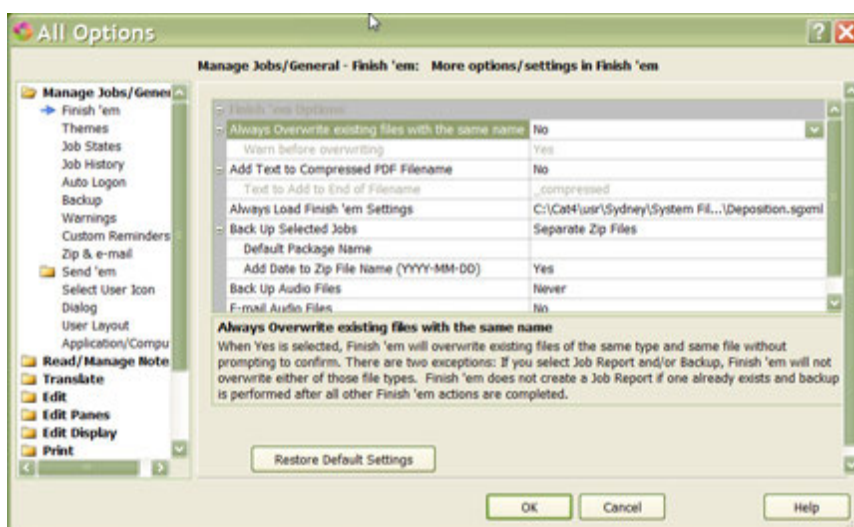

### Fast Save

Save settings works with the widest range of hardware configurations and in most situations the selection for this option should remain Yes. Yes is the default. In a rare situation, Stenograph Technical Support may recommend changing the option to No. The selection in this field works in conjunction with Auto Save and Auto Recover and has no effect on manual saves made with Ctrl + s (File/Save) or File/Save As.

## All Options

For easy access to the majority of CATalyst options in one location, the All Options menu item is available at the bottom of all Tools menus. CATalyst BCS options are available at the bottom of the list. The All Options dialog box displays options starting with Manage Jobs, then Read/Manage Jobs and continues with options for all the different CATalyst functions. There may be additional options available in the actual function. For example, if you select Print in the All Options dialog box, you can set the default printer. When you go to the Print dialog box to print a specific file, additional options are available there because they are specific to a particular print session.

An All Options icon  is available on the Standard toolbar. If you have not modified your Standard toolbar, the icon automatically is added to the Standard toolbar in each area of CATalyst (Manage Jobs, Edit, Dictionary, etc.) when you updated. If you have modified your Standard toolbar, you can add the icon to your Standard toolbar by clicking the down arrow on the right hand side of the Standard toolbar. Select Add or Remove Buttons, Standard and click All Options. You will see the new All Options icon added to the end of the Standard Toolbar.

Keyboard map functions available in Edit, Dictionary and Caption keyboard maps

Open All Options Dialog

## Manage CATalyst BCS Dictionaries

The Manage Dictionary function allows you to create and maintain CATalyst BCS dictionaries. A dictionary is a file that contains steno outlines with text definitions. Dictionaries translate steno outlines into text during a captioning session. The following dictionaries are available in CATalyst BCS:

- [Case](#)
- [EZ Speakers](#)
- [Job](#)
- [Personal](#)
- [Power Define](#)
- [Realtime Commands](#)
- [Update Area](#)

You can insert, modify, delete, spell check, and print entries in a dictionary. [Guidelines](#) for Creating Dictionary Entries provides detailed information about working with dictionary entries.

To open Manage Dictionary, do **one** of the following:

- On the Function Bar, click Manage Dictionary .
- From the Menu Bar, select **Function/Manage Dictionary**.
- Press **Alt + u, d**.
- Press **Alt + f, o, d** (**File/Open/Dictionary**) and select the dictionary type

### Viewing Dictionary Entries

When you open a dictionary, information displays for each dictionary entry. The column headings identify the type of information. They include:

**Steno**

The steno portion of the dictionary entry.

**Text**

The text portion of the dictionary entry.

**Modified Date**

The last modification date for the dictionary entry.

**Usage Count**

The quantity of times the dictionary entry was used for translation in CATalyst BCS.

**Used Date**

The most recent date the dictionary entry was used during translation.

**Status Bar**

Located at the bottom of the Manage Dictionary screen, it provides information about the current display of entries. From left to right, this includes:

- indication the display is Full View, showing all the dictionary entries; or Filtered View, showing only those entries that meet the filtering criteria.
- the total number of entries currently displayed.
- the numeric location of the highlighted entry.
- indication the Num Lock on your keyboard is On or Off. When NUM displays, Num Lock is On.

The default size of the columns depends on the size of the entries. The date columns have first priority so that it expands to fit the complete date. The steno and text columns display based on remaining space. The size of the columns also depends on your Windows settings.

You can modify the column display including column width, sorting order, font size and what columns display. When you resize the columns, CATalyst BCS retains the values until you close the dictionary. Once you close the dictionary, the column sizing returns to the default settings.

## Guidelines for Creating Dictionary Entries

Use the following guidelines when inserting and modifying steno or text entries in the dictionary.

### Inserting and Modifying Steno

If you are inserting or modifying the steno portion of an entry, CATalyst BCS uses the [Steno Shortcut table](#) to help you type steno from the computer keyboard. For example, using the computer keyboard, you type "jan" in the Steno field of a dialog box. CATalyst BCS automatically converts the typed text into steno SKWRAPB unless you modified the Steno Shortcut table.

Use the following guidelines when inserting or modifying steno in the dictionary:

- Use either upper- or lowercase letters. The steno always displays in the Steno field as uppercase.
- Separate multiple steno strokes with a / (slash). For example, TKEUS/KET (diskette). Or select Yes to the [Dictionary Option, Break Steno Outlines Based on Key Order](#) to have CATalyst automatically insert a / (slash) between steno outlines.

- Use a – (hyphen) before the first letter to indicate a final or a right-hand stroke. For example, -RB (shall).
- Use punctuation keys to create the equivalent in a steno outline. For example, when you type "." (period), it displays as –FPLT, unless you modified your Steno Shortcut table.

## Inserting and Modifying Text

Use the following guidelines when inserting or modifying text in the dictionary:

- Type the text exactly how you want it to translate.
- Translation automatically creates a space before every word in the Edit file. Do not add spaces to the beginning or end of words.
- When defining punctuation, in which you need one space following it in the translation, do not add a space to the definition. For example, to define a period that translates with one space following it, define it as just the period (.).  
For more information, see [Creating Punctuation Definitions](#).
- When creating a conflict, a ^ (caret) must precede each conflict choice and a space must follow each caret. For example, to enter a conflict for the steno outline **THR** type:

**^ Spacebar there Spacebar ^ Spacebar their Spacebar ^ Spacebar they're**

Make sure there is not a space after the last word. When you create a dictionary entry for a conflict, CATalyst BCS adds a Conflict End format symbol immediately after the last word of the conflict.

- You can use format symbols in the Text field either by pressing **F4** and typing the shortcut key for the format symbol or selecting a format symbol from the Format Symbol list. Press **Alt + f** or click the FS (FS) icon to display the Format Symbol list. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol you want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry.
- Insert the Conflict End format symbol at the end of a conflict to add text following a conflict which is not part of the conflict. For example:

<By Line>^ Atty1 ^ Atty2<Conflict End>:<Question>

- You can use Format Symbols in the Text field either by typing the shortcut key or selecting from the Format Symbol list.
- Auto Include entries must begin with @  
You may also want to use the Insert [Auto Includes...](#) feature from the Dictionary Edit menu.
- AccelerWriter (dictionary definitions that invoke a macro from the steno machine) must begin with &&  
You may also want to the [Insert AccelerWriters...](#) feature from the Dictionary Edit menu.
- Number Conversion, Number Trigger, Start Timer, and Stitch On translate commands are followed by text in square brackets. For example but not limited to:

{Number Conversion}[NNN-NN-NNNN]

{Start Timer}[1]

{Stitch On}[-]

## Adding Delete Stroke Entries to a Dictionary

CATalyst BCS does not have a preset delete stroke dictionary entry. Many captioners write an asterisk to delete the previous stroke. You can create dictionary entries for your delete stroke. Stenograph recommends adding your delete stroke entries to the Personal Dictionary. If you import a CATalyst BCS 3.x dictionary that contains a delete stroke entry, that delete stroke entry is already in your CATalyst BCS dictionary.

Steno outlines deleted by the delete stroke remain in the steno note file but are not used in translation.

### Define a Delete Stroke

1. At the Manage Jobs screen, highlight the dictionary to which you want to add the delete stroke and press **Enter**.

To add the delete stroke entry to your Personal Dictionary, double click the **System Files** case and then double click **Personal Dictionary**.

2. Once the dictionary opens, press **Ctrl + i (Edit/Insert)** to display the Insert dialog box.
3. Make the following entries:

#### Steno

Type the steno for the delete stroke. For example, typing \* (asterisk) results in a /\* entry.

#### Text

Press **Alt + f** to display the list of format symbols. From the list select **{Delete}**. If you have a separate multiple delete stroke, define that steno outline as {Delete}.

4. Click **OK**. Define any additional {Delete} strokes as necessary. For example, the number bar/asterisk combination.
5. When finished inserting entries, press **Esc (Cancel)** to exit the Insert dialog box.
6. Press **Ctrl + s (File/Save)** to save the new entries.
7. Press **Ctrl + F4 (File/Exit)** to exit the Manage Dictionary function.

## Personal Dictionary

The Personal Dictionary contains steno and text definitions specific to your writing style. CATalyst BCS requires that a dictionary named *Personal Dictionary* exists in the System Files case and automatically uses the Personal Dictionary for translation. You can import a Personal Dictionary into CATalyst BCS or create it from scratch. If you import your dictionary and do not want to name it Personal Dictionary, you can create a Personal Dictionary with one entry.

The Personal Dictionary is one of the most important files in your CATalyst BCS system and Stenograph recommends backing up your dictionary on a regular basis.

### Create a Personal Dictionary

1. Press **Alt + f, n, d (File/New/Dictionary)**. From the dictionary menu, select a dictionary type. You must be in a case to create a case dictionary. If a Personal, EZ Speakers or Power Define dictionary already exists in the user's System Files case, the choice to create the dictionary is not available.
2. In the Create New Document dialog box, type a name for the new dictionary and press **Alt + o (Open)**. The new dictionary displays.

3. Do **any** of the following:
  - Insert new dictionary entries.
  - Cut, copy, and paste dictionary entries from another dictionary.
  - Include a dictionary.
4. Press **Ctrl + s (File/Save)** when finished.
5. Press **Alt + f, c (File/Close)** to close the dictionary. If another dictionary is open, that dictionary displays. If no other dictionary is open, the Manage Dictionary function closes.

## Update Area

Case CATalyst, by default, places all new D-Defines into the Personal Dictionary. The Update Area is an optional holding area to store new [D-Defines](#) for review before moving the entries into the Personal Dictionary. In addition to other dictionaries selected for translation, you can use the Update Area to translate. To use the Update Area, select the [Dictionary Option](#), *D-Defines go to Update Area*. The Update Area is stored in the System Files case.

If you select to have your D-defines go to the Update Area, remember to review the Update Area entries and move desired entries into your Personal Dictionary. It is recommended that you make at least two backup copies of your Personal Dictionary and store in different locations in the event that your computer fails and you can't retrieve files. If you don't regularly review entries in your Update Area and move them to your Personal Dictionary and you don't back up your Update Area, you could lose hundreds of entries (in your Update Area) if your computer fails.

## Job Dictionary

A Job dictionary contains entries that are specific to a captioning session. These entries might include speaker names or technical terms that you do not want to place in your Personal or case dictionary. Each caption file has only one associated job dictionary which has the same name as the caption file. The steno and text definition of a J-Define goes into the associated job dictionary unless you select to define to a different job dictionary. If a caption file does not have an associated job dictionary, CATalyst BCS creates one.

You can use a job dictionary for translation in addition to using any other dictionary. You can also select multiple job dictionaries for translation in the Profile or during captioning. By default, the associated job dictionary has the highest priority during translation. When creating J-Defines during a captioning session, you can send the definitions to a different job dictionary by using the Other dictionary define or the Change Job Dictionary feature.

## Create a Job Dictionary

1. In Manage Jobs, select **Alt + f, n, d, j (File/New/Dictionary/Job)**. The Create New Document dialog box displays.
2. Type a name in the File name field and press **Enter (Open)**. The Manage Dictionary function opens with an empty dictionary.
3. Insert new entries using the following features: [Insert/Modify](#), Cut/Copy/Paste and Include. Dictionary function opens with an empty dictionary. Refer to the [Guidelines](#) for Creating Dictionary Entries.
4. When finished, press **Ctrl + s, (File/Save)**.

## Case Dictionary

A Case dictionary contains entries that are specific to related captioning sessions which are located in a case. These entries can be speaker names or technical terms that apply to the related captioning sessions which you do not want to place into your Personal or individual job dictionaries. Using a case dictionary can eliminate remembering to select multiple dictionaries for translation or the need for copying multiple job dictionaries so that all the entries apply to the next related session. You can use a case dictionary for translation in addition to using your Personal Dictionary.

Each case has only one associated case dictionary which has the same name as the case (casename\_Case.SGDCT). K-Define definitions go into the associated case dictionary. If a case does not have an associated case dictionary, CATalyst BCS creates one when you make the first K-define.

When you create a Case dictionary prior to translation in the Manage Dictionary function, CATalyst BCS automatically uses it when you write a captioning session in the same case. This eliminates the need to select the case dictionary for translation. For example, you create a case named HSN. You have all the guest celebrity names in the HSN case dictionary. Any time you have a captioning session for HSN; you select the case dictionary and do not need to select individual specific dictionaries that include the guest names.

When you create a case dictionary from Manage Jobs, you must be in the case for which you want the case dictionary.

### Create a Case Dictionary from Manage Jobs

1. Do **one** of the following:
  - Open an existing case for which you want to create a case dictionary. Double click the case.
  - Open a new case for which you want to create a case dictionary.
    - a. Press **Alt + f, n, c (File/New/Case)**. CATalyst BCS creates a new case with the default name. For example, if the case name is HSN, the case dictionary name is HSN.
    - b. In highlighted area, type a name for the case and press **Enter**.
    - c. Double click the case.
2. Press **Alt + f, n, d, c (File/New/Dictionary/Case)**. The Create New Document dialog box displays.
3. In the File name field, type a name for the dictionary and press **Enter (Open)**. The Manage Dictionary function opens with an empty dictionary.
4. Insert new entries using the following features: [Insert/Modify](#), Cut/Copy/Paste and [Include](#). Refer to the [Guidelines](#) for Creating Dictionary Entries.
5. When finished, press **Ctrl + s, (File/Save)**.

## Power Define Dictionary

The Power Define dictionary contains special definitions for use with the [Define](#) and [Scan Define](#) features, allowing you to make any global dictionary or replace definition from your writing machine during a captioning session. Stroking the steno outline for the translate command, Define or Scan Define, invokes the Power Define feature. This loads the Power Define dictionary and opens the Power Define dialog box where you can create dictionary definitions from your writing machine.

Command definitions contained in the Power Define dictionary provide the ability to move from field to field, select dictionaries, insert format symbols and set options in the Power Define dialog box. For example, to move from the *Steno* field to *Text* field in the Power Define dialog box, you stroke the steno outline for the [TAB] entry.

The Power Define dictionary becomes the highest priority in the dictionary list for captioning translation when the Power Define dialog box is open. When you stroke a steno outline with the cursor positioned in the *Text* field, CATalyst BCS searches the Power Define dictionary first. If no definition is found, it searches for a definition in other dictionaries according to dictionary priority. When CATalyst BCS finds a definition, the text of the definition displays in the *New Text* field. When you complete or abort the Power Define, the Power Define dictionary is removed from the dictionary priority.

The Power Define Dictionary is located in the System Files case. Stenograph recommends you review the entries in the Power Define dictionary and modify entries to match your writing style. You can add, modify, and delete entries in the Power Define dictionary the same as any other dictionary. You can also [Create EZ Speakers](#) from your writing machine and use the Power Define Dictionary commands to navigate the dialog box.

## Power Define Dictionary Definition Parameters

- If you add the alphabet to the Power Define dictionary, the letters automatically translate with no spaces between the letters when you finger spell a word. All letters in the *Text* portion of the definition must be surrounded by brackets, [ ] to translate without spaces. For example [a] or [N].
- If you add [DELETE] to the Power Define dictionary, the command moves the cursor back one space in the *Text* field, removing a single character at a time. Place the Delete command in another dictionary, such as your Personal Dictionary, to have it delete a stroke at a time. (This command is a part of the default Power Define dictionary.)
- Adding the [PASTE] command to your Power Define dictionary allows you use the copy, cut and paste features to enter steno and text. When you use the [Paste] command in the *Steno* field, the underlying steno for the text you are copying or cutting is pasted if the *Include Steno Copying/Cutting* option is On. This is the default. If this option is not set to include underlying steno, then no steno displays in this field when you paste the copy or cut text. You can change the default in [Advanced Edit Options](#)
- When you perform a command or make a typed entry from the keyboard in the Power Define dialog box, CATalyst BCS resets translation, removing the automatically inserted space before the next item translated.

## Power Define Dictionary Default Commands

Power Define	Steno Equivalent	Explanation
[F4]	TPO-RPLT	Displays the <i>enter a format symbol message</i> . You must stroke the steno outline for the format symbol shortcut key
[F4 LIST]	TPO-UR/HR-EUS	Displays the Format Symbol list. Use the Up/Down Arrows to move to the format symbol. Write the steno outline defined as [ENTER] to insert the format symbol into the <i>New Text</i> field.
[ABORT]	/PWO-RT	Cancels the Power Define dialog box and returns to the captioning screen. No steno or text is inserted.

[DOWN ARROW]	TKO-UPB	Moves the cursor down one name at a time in the dictionary and format symbol list. When using this command in the dictionary list, the dictionary number associated with the dictionary dynamically adjusts in the dictionary field. Functions the same as ↓ on the computer keyboard.
[UP ARROW]	-UP	Moves the cursor down one name at a time in the dictionary and format symbol list. When using this command in the dictionary list, the dictionary number associated with the dictionary dynamically adjusts in the dictionary field. Functions the same as ↑ on the computer keyboard.
[ENTER]	TPH-T	Same as pressing Enter on the computer keyboard, completes the action.
[SPACE]	SPA-EUS	Creates a space when you are defining more than one word.
[TAB]	TK-EF	Moves the cursor forward to the next field.
[SHIFT + TAB]	STK-EF	Moves the cursor back to the previous field.
[ACCEPTCONTINUE]	TPH-RT	Apply the definition and keep the Power Define dialog box open to continue defining.
[CAT SCRATCH]	K*S	Send the definition to the Cat Scratch dialog pane.
[PASTE]	PAEUS/PAEUS	If the cursor is in the Steno field and your Advanced Edit options are set to include steno when copying/cutting text, the underlying steno of the copied/cut text is pasted in the Steno field. If the cursor is in the Text field, the last copied or cut text is pasted into the Text field.
[DELETE]	*	If the cursor is in the Steno field, deletes the previous steno outline. If the cursor is in the Text field, deletes the previous character.
[SUSPEND]	SP*PB	Leaves the Power Define dialog box open and moves the cursor to the captioning session to allow you to continue writing. When you have time to return to the Power Define dialog box and continue with the Power Define, write the stroke to invoke the Power Define command.

## Realtime Commands Dictionary

CATalyst BCS software includes the realtime job dictionary, [Realtime Commands Dictionary](#), which contains predefined realtime and translation commands. The predefined commands consist of common number conversion, conflict resolution, mode control, translate commands and define strokes. You can add to, modify, and delete entries in the Realtime Commands Dictionary or copy the entries to the Personal, case, or job dictionary. If you choose to use the Realtime Commands Dictionary, Stenograph recommends that you review the entries and modify the steno outlines to reflect your writing style and theory. If you do not want to use the Realtime Commands Dictionary, you can delete it from the System Files case in your User.

CATalyst BCS automatically copies the Realtime Commands Dictionary when creating a new user if you selected the Copy Default Files option in the Create New User dialog box.

## EZ Speakers Dictionary

The EZ Speakers dictionary contains predefined speaker identification formatting entries with steno that can be used to quickly and easily create speaker identification definitions for a session. EZ Speakers dictionary entries use placeholders for speaker names and depending on the type of entry, for steno. The placeholder text is designated with an EZ Speaker field, such as [!EZ SPEAKER 00]. Using the [Create EZ Speakers](#) feature during a captioning session, you identify the speaker names and steno for each placeholder. CATalyst BCS then generates the speaker definitions in either a job or case dictionary. The actual EZ Speakers dictionary is not used during translation.

Although there are two types of EZ Speakers dictionary entries: Standard ID and Super ID, a Super ID is most often used when captioning. A Super ID allows you to put a placeholder in the Steno field and the Text field of the EZ Speaker dictionary entry. This allows you to create the steno for the speaker quickly during a captioning session.

For example, you have Mr. Redford and Ms. Wilson in the session. You write RED/RED to identify Mr. Redford and WEUL/WEUL to identify Ms. Wilson. A Super ID entry has a placeholder for the steno and a placeholder for the speaker name. When you create an EZ Speakers entry, you include all format symbols, punctuations, and font characteristics. This allows you to type only the name when using the Create EZ Speakers feature. For example, your Super ID entry might be one of the following:

!<Colloquy>>>[!EZ SPEAKER 00]:space

CATalyst BCS comes with two EZ Speakers dictionaries that focus on court and deposition work. If you primarily caption, delete the EZ Speaker dictionary named "EZ Speaker Dictionary." The dictionary, "EZ Speakers Dictionary Fields", contains speaker field entries. Modify this dictionary as necessary for captioning.

When you [create](#) EZ Speaker dictionary definitions that contain EZ Speaker fields and you use the Create EZ Speaker feature, CATalyst BCS generates the speaker definition in a job or case dictionary and inserts the field value, actual speaker name, into the job during translation. For example, the dictionary entry !>>[!EZ SPEAKER 00]: is placed in a job or case dictionary. When you identify SKWROEPBS/SKWROEPBS as the name Jones, it displays as >>Jones: in the job. CATalyst BCS also add the speaker name and number to the list on the [EZ Speakers tab](#) in the active Profile.

## CATalyst BCS Dictionary Edit

Once you have a dictionary open, the Manage Dictionary Edit menu allows you [insert new entries and/or modify existing entries](#) and [delete entries](#). You can [create Auto Include](#) and [AccelerWriter entries](#) using a simple dialog box. You can cut, copy and paste entries, [copy and move entries](#) to a specific dictionary, [search for entries](#) and [search and replace text](#) in dictionary entries.

## Insert and Modify Dictionary Entries

You can create or modify dictionary entries for a job, case, Power Define, EZ Speakers or your Personal Dictionary.

1. Press **Alt + f, o, d (File/Open/Dictionary)**.
2. From the dictionary menu, select the dictionary type. When you choose Case or Job, the Open Existing Document dialog box displays. Select the dictionary and press **Enter**.
3. Do **either** of the following:

### Insert an Entry

Press **Ctrl + i (Edit/Insert)** to create a new dictionary definition. The Insert Dictionary Entry dialog box displays with empty Steno and Text fields.

### Modify an Entry

Use Search (**Ctrl + f**) or cursor movements to find the entry you want to modify and then press **Ctrl + m (Edit/Modify)**. The Modify Dictionary Entry Dialog box displays with the current Steno and Text for the definition.

4. Make entries as necessary:

### Steno

Type new or modify existing steno outlines. Refer to the [Guidelines](#) for Creating Dictionary Entries as necessary.

### Text

Type new or modify existing text for the steno outlines, including any format symbols. When the option, Press F9 to add [extended characters](#).

Use the [Cap/Uncap](#) command, **Ctrl + F5**, to quickly cycle through the capping options for all the words in the Text field.

When [Spell Check While Defining](#) is not active, press **Shift + F7** to spell check the word in the Text Field.

### Insert Field

Display the Insert Field dialog box from which you can select a field to insert into the text portion of the definition. Typically fields are not used for captioning dictionary definitions.

### FS

Display the list of available format symbols. Double click the format symbol you want to use in the definition. You can insert a format symbol at any point in the text entry.

You can also use shortcut keys to insert a format symbol in the Text field. Place the cursor in the Text field, press **F4** and then press the appropriate letter or symbol.

### Endings

When you type a word in the Text field, CATalyst BCS analyzes word to see if a " G", " S" or " D" steno outline could be added to the word. If so, then CATalyst BCS activates the Endings button. The Global Endings dialog box displays. You can select any of the suggested definitions to add to your dictionary.

For example, you have REPT in the Steno field and type "represent" in the Text field. The following suggested entries display when you select Endings:

REPTD = represented

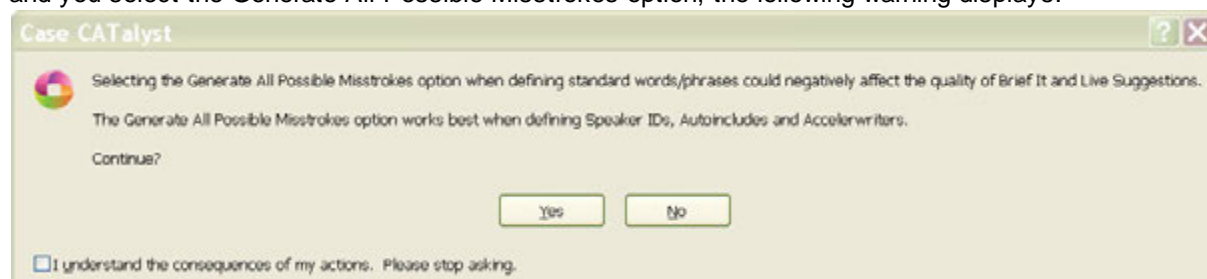

REPTS = represents

The word "representing" is not suggested because the final "g" comes before the final "t" in the original steno outline.

### Generate All Possible Misstrokes

Check this box to have CATalyst BCS generate definitions based on all the possible misstrokes of the original steno outline. CATalyst BCS generates a definition provided one does not already exist in the Personal Dictionary for any of the identified misstrokes. For example, you define /SROEUS as "voice" with Generate All Possible Misstrokes selected. CATalyst BCS also creates a dictionary definition for the following steno outlines as "voice": /SROUS, SROES, and /SROS. The steno outline, /SRAOEUS already exists in your Personal Dictionary as "vice", so CATalyst BCS does not generate /SRAOEUS as a misstroke.

If defining to the Personal Dictionary and/or inserting/modifying an entry in the Personal Dictionary and you select the Generate All Possible Misstrokes option, the following warning displays:

- Select **Yes** (Alt + y) to generate all possible misstrokes for the current steno outline.
- Select **No** (Alt + n) to return to the previous dialog box with the Generate All Possible Misstrokes option deselected.
- Select the *I understand the consequences of my actions. Please stop asking.* option to set the warning option to **No**. This displays because the [Dictionary Option Warn when inserting/modifying an entry and selecting All Possible Misstrokes](#) option is set to Yes, by default.

This option is not available when modifying dictionary entries from the Query Realtime Translations feature.

5. Press **Enter (OK)**. If an existing dictionary entry contains the exact steno outline as the new or modified entry, the Duplicate Entry dialog box displays. Review the steno and text, select an action and then press **Enter (OK)**.
6. Press **Ctrl + s (File/Save)** to save the dictionary when finished.
7. Press **Ctrl + F4** to close the dictionary. If another dictionary is open, that dictionary displays. If no other dictionary is open, the Manage Dictionary function closes.

## Deleting Dictionary Entries

1. Press **Alt + f, o, d (File/Open/Dictionary)**.
2. From the dictionary menu, select the dictionary type. When you choose Case or Job, the Open Existing Document dialog box displays. Select the dictionary and press **Enter**.
3. Use Search (**Ctrl + f**) or cursor movements to find the entry you want to delete or use Filter (**Ctrl + y**) to view specific types of entries.

4. Do **one** of the following to select entries for deletion:

**Select one entry at a time**

Highlight the entry for selection.

**Select specific entries**

Press and hold **Ctrl** while you click the individual entries to highlight.

**Select a consecutive group of entries**

Click to highlight the first entry of the group. Locate the last entry to delete. Press and hold **Shift**, while you click the last entry to highlight all the entries in-between.

**Select all the entries**

Press **Ctrl + a** to highlight all the entries for selection.

5. Press **Delete** or click the Delete  icon to delete the selected entries. You can undo the delete by pressing **Ctrl + z (Undo)**. To undo multiple deletes, repeat Undo or use the Undo arrow key to display a list of most recent actions; highlight the actions to delete and click the left mouse button.
6. A confirmation message displays, if the Dictionary Option *Warn before deleting entries* is active. Press **Alt + y (Yes)** to continue or **Alt + n (No)** to cancel and retain the entries.  
  
To turn this option Off, check the box: *I understand the consequences of my actions. Please stop asking.*
7. Press **Ctrl + s (File/Save)** to save the dictionary when finished deleting entries.
8. Press **Alt + f, c** to close the dictionary. If another dictionary is open, that dictionary displays. If no other dictionary is open, the Manage Dictionary function closes.

## Insert Auto Include Entries

Auto Include definitions in your Personal, case or job dictionaries automatically bring [include](#) files into the job during translation. The text portion of an Auto Include dictionary entry begins with the "at" symbol, @, followed by the Include name. The @ symbol designates the entry as an Auto Include.

The Insert Auto Includes feature in Manage Dictionary is a wizard that allows you to quickly create an Auto Include definition. Browse to select the Include file. Case CATalyst creates the text portion of the Auto Include definition with the appropriate delineating character. You can also easily choose to bring in the page layout for the Include file.

## Create Auto Include Entry using the Wizard

1. Open the appropriate dictionary.
2. Press **Alt + e, n (Edit/Insert Auto Includes)**. The Insert Auto Include Entry dialog displays.
3. Make the following entries:

**Steno**

Insert the steno you write to bring in the include file during translation. Separate multiple strokes with a forward slash.

**Entry Text**

The text portion of the dictionary definition that identifies the include file. CATalyst BCS automatically fills in this field with the specified include file name. Select **Browse** to choose the include file you want to associate with the steno identified in the *Steno* field. You cannot type directly into this field.

### Browse

Display the Choose Include File dialog box where you can choose the include file you want to associate with the steno identified in the *Steno* field. Choose the file and then select **Open**. CATalyst BCS inserts the name of the file along with the @ symbol in the *Entry Text* field. The @ symbol precedes the entry to identify it as an Auto Include.

If the include file you want is in another user, first select that user and then choose the file name. If the include file is in a case, double click the case name and then choose the file name.

### Bring Page Layout

Check this box to bring in the associated layout for the file you are including. CATalyst BCS adds [Y] to the text portion of the definition to indicate the layout is brought in with the include file.

### Generate All Possible Misstrokes

Check this box to have CATalyst BCS generate additional auto include definitions based on all the possible misstrokes of the original steno outline. CATalyst BCS generates a definition provided the generated misstroke does not conflict with an existing entry in the Personal Dictionary.

If defining to the Personal Dictionary and/or inserting/modifying an entry in the Personal Dictionary and you select the Generate All Possible Misstrokes option, the following warning displays:

- Select **Yes** (Alt + y) to generate all possible misstrokes for the current steno outline.
  - Select **No** (Alt + n) to return to the previous dialog box with the Generate All Possible Misstrokes option deselected.
  - Select the *I understand the consequences of my actions. Please stop asking.* option to set the warning option to **No**. The is displays because the [Dictionary Option Warn when inserting/modifying an entry and selecting All Possible Misstrokes](#) option is set to Yes, by default.
4. Press **Enter** (OK).
  5. When finished creating Auto Includes, press **Esc** (Cancel).
  6. Press **Ctrl + s** (File/Save) to save the dictionary.

## Create Auto Include Entry Manually

1. Open the appropriate dictionary.
2. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
3. Make the following entries:

### **Steno**

Insert the steno you write to bring in the include file during translation. Separate multiple strokes with a forward slash.

### **Text**

Type **@** followed by the Include file name. Do not put a space between any characters in the definition. If, however, the file name contains spaces, you must type the name exactly the same, including any spaces.

If you also want to bring in the page layout for the Include file, type **[Y]** after the *file name*. For example: **@title[Y]**.

Use **one** of the following formats:

#### **@title**

The Include file is the current user name.

#### **@includes\title**

The Include file is in a case in the current user name. In this example, the case name is "includes".

#### **@<Kirsten>title**

The Include file is in another user name. In this example, the user name is "Kirsten".

#### **@<Kirsten>includes\title**

The Include file is in a case in another user name. In this example "Kirsten" is the other user and "includes" is the case name.

### **Generate All Possible Misstrokes**

Check this box to have CATalyst BCS generate additional auto include definitions based on all the possible misstrokes of the original steno outline. CATalyst BCS generates a definition provided the generated misstroke does not conflict with an existing entry in the Personal Dictionary.

4. Press **Enter (OK)**.
5. When finished creating Auto Includes, press **Ctrl + s (File/Save)** to save the dictionary.

## **Insert AccelerWriters**

An AccelerWriter is a [macro](#) invoked from the writing machine during realtime writing. For example, you may want to create an AccelerWriter that deletes to the last Question because of a false start or strike that response. When you write the steno outlines assigned to the macro, Case CATalyst performs the actions of the macro. When invoking an AccelerWriter and the cursor focus is in a dialog pane, Case CATalyst automatically sets the cursor focus to the transcript and performs the actions of the macro.

Creating an AccelerWriter is a two step process. In the first step, you create the [macro](#) that contains the commands you want to invoke. You can use an existing macro or create a new one. When creating new macros to be invoked from the writer, Stenograph recommends you create the macro while in a captioning session to see what actually takes place on the screen. In the second step, you create the dictionary definition to invoke the AccelerWriter. The text portion of an AccelerWriter dictionary entry begins with two ampersands (&&) followed by the macro name. The ampersands designate the entry as an AccelerWriter.

The Insert AccelerWriters feature in Manage Dictionary is a wizard that allows you to quickly create an AccelerWriter definition. Browse to select the macro and CATalyst automatically creates the text portion of the definition. Alternatively, you can manually type the entire definition using the Manage Dictionary, [Insert](#) feature. Case CATalyst also provides the option to [create the AccelerWriter definition](#) while in a captioning session immediately after creating the macro, eliminating the need to open the dictionary and create it.

Stenograph allows provides pre-made macros and possible dictionary definitions. Select the Help menu, Exceptional Extras and then Using Extras AccelerWriters.

## Create an AccelerWriter Definition using the Wizard

1. Open the appropriate dictionary.
2. Press **Alt + e, w** (**Edit/Insert AccelerWriters**). The Insert AccelerWriter Entry dialog displays.
3. Make the following entries:

### **Steno**

Insert the steno you write to invoke the AccelerWriter. You can type either a forward slash (/) or press the Spacebar to separate steno outlines. For example, to use a two stroke outline, such as "end end", you could type -EPBD -- then type / or press the Spacebar to finish with the second stroke, EPBD. When typing steno that starts with a final stroke, place a – (hyphen) before the first letter. It is recommended to use a one stroke entry to invoke an Accelerwriter.

### **Entry Text**

The text portion of the dictionary definition that calls the macro to run when you write the steno entered in the *Steno* field. CATalyst automatically fills in this field with the specified macro file name. Select **Browse** to choose the macro you want to associate with the steno identified in the *Steno* field. You cannot type directly into this field.

### **Browse**

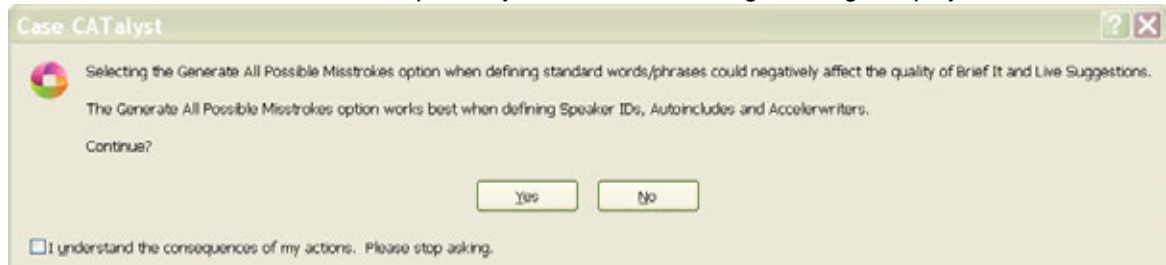

Display the Choose Macro File dialog box where the contents of the Macros case display. Choose the macro to run when you write the steno identified in the *Steno* field and then select **Open**. Case CATalyst inserts the name of the file in the *Entry Text* field. Two ampersands (&&) precede the entry to identify it as an AccelerWriter.

Macros are stored in the Macros case located in the System Files case. You cannot use a macro from another user.

### **Generate All Possible Misstrokes**

Check this box to generate additional AccelerWriter definitions based on all the possible misstrokes of the original steno outline. Case CATalyst generates a definition provided the generated misstroke does not conflict with an existing entry in the Personal Dictionary.

When inserting or modifying entries in the Personal Dictionary and/or Update Area, if you select the Generate All Possible Misstrokes option, by default, the following message displays:

- Select **Yes** (Alt + y) to generate all possible misstrokes for the current steno outline.
- Select **No** (Alt + n) to return to the previous dialog box with the Generate All Possible Misstrokes option deselected.

To eliminate the General All Possible Misstrokes warning message from displaying, deselect the option in [Dictionary Options](#).

4. Press **Enter (OK)**.

If the steno you have inserted to invoke the macro has one or more entries that start with that same steno (longer match) in the Personal Dictionary, the following message displays:

If the steno you write for a macro has a longer match in the Personal Dictionary, the macro will be delayed until translation determines the next stroke. This will cause a delayed reaction for the macro and in some cases, depending on what the macro does, can cause an unwanted result. The warning is to let you know that you might want to select different steno for your AccelerWriter definition. For example, you want to create a dictionary entry to run a macro while writing realtime. You have already created the macro so you open your Personal Dictionary, select Edit and then select Insert AccelerWriter. You type the steno /E-P and select your RT-Punctuation macro and press Enter. The above message displays. Immediately you know that there is at least one Personal Dictionary entry that starts with /E-P and if you don't change the steno, then the macro will not run until translate knows you are not writing the longer match steno outline.

- Select **Yes** to return to the Insert AccelerWriters dialog box to change the steno outline.
- Select **No** to insert the entry into the current dictionary knowing that the Personal Dictionary contains at least one entry that starts with the same steno outline and that may delay the execution of the macro.

5. When finished creating AccelerWriters, press **Esc (Cancel)**.

6. Press **Ctrl + s (File/Save)** to save the dictionary. If you are in a captioning session, you can test the AccelerWriters by returning to the realtime file and writing the steno outline for the selected AccelerWriter.

## Resolve Conflict

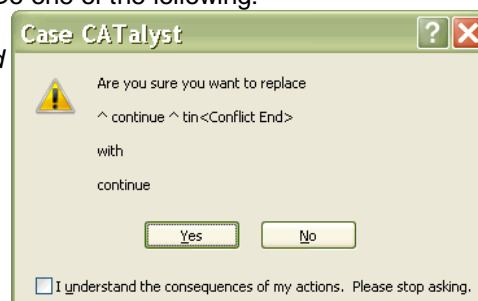

When reviewing and/or modifying a dictionary, you can eliminate a conflict in a dictionary entry by using one of the Resolve Conflict with Choice # - Dict. [Dictionary keyboard map](#) assignments. This feature can be useful if you are working to resolve conflicts and you want to eliminate the conflict in the entry by selecting one of the choices. For example, let's say you are starting with someone else's dictionary instead of building your own or you have imported an RTF/CRE dictionary from another CAT vendor, and that CAT vendor allows multiple exact steno entries with different text definitions in their dictionary. In that situation, CATalyst automatically creates a conflict when the dictionary is imported. Using the Resolve Conflict With Choice # - Dict. keyboard map assignment you can quickly resolve the conflict entries. You can [filter your dictionary](#) to display only Conflicts.

For another example, let's say a dictionary contains the following entry: TEUPB ^continue ^tin. TEUPB is the way you write 'continue' but not the word 'tin'. You position your cursor on the entry and press Ctrl + 1 (default keyboard assignment for Resolve Conflict with Choice 1 - Dict.) to select the first choice of the conflict.

To select a conflict choice in a dictionary entry, simply position your cursor on the dictionary entry and press the key assignment for the number of the conflict choice you want. No

To resolve a conflict in a dictionary entry:

1. Open the dictionary you want to modify.
2. Position your cursor on the dictionary entry that contains a conflict you want to resolve.
3. Press the keyboard assignment for the number of the conflict choice you want.  
The default dictionary keyboard map has the following assignments (unless there was another command already assigned to the following keyboard commands):  
Resolve Conflict with Choice 1 - Dict  
Resolve Conflict with Choice 2 - Dict  
Resolve Conflict with Choice 3 - Dict  
Resolve Conflict with Choice 4 - Dict  
Resolve Conflict with Choice 5 - Dict  
Resolve Conflict with Choice 6 - Dict  
Resolve Conflict with Choice 7 - Dict  
Resolve Conflict with Choice 8 - Dict  
Resolve Conflict with Choice 9 - Dict
4. The "Are you sure you want to replace message displays. Do one of the following:  
If you do not want to see the confirmation message each time you resolve a conflict, you can select the *I understand the consequences of my actions. Please stop asking.* option.
  - Select Yes to select the conflict choice to replace the conflict.
  - Select No to leave the conflict as is.

## Copy and Cut Dictionary Entries to Other Dictionaries

Use the Copy to Dictionary and Move to Dictionary features to select dictionary entries from one dictionary and add them to another dictionary without opening the destination dictionary. You can the select entries from the source dictionary, such as the job dictionary and place them into multiple dictionaries. For example, you want to put a few captioning session dictionary entries into multiple

dictionaries that are used for specific profiles or jobs. You open the source (dictionary that contains the entries you want to copy), select the dictionary entries you want to copy and then you can select several dictionaries (one at a time) to copy the entries. The destination dictionary must be closed when copying or moving dictionary entries via this method.

To merge the entire contents of one dictionary with another, use the [Include](#) feature.

## Copy or Move Entries

1. From anywhere in CATalyst BCS, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the source dictionary, which contains the entries you want to copy or move, and press **Enter**. Verify the dictionary name on the Title Bar.
3. Select entries to copy or move. Do **one** of the following:

### Select all the entries in the dictionary or Update Area

Press **Ctrl + a** to highlight all the entries in the update area or dictionary.

### Select a consecutive group of entries

Click to highlight the first entry of the group. Locate the last entry to select. Press and hold **Shift**, while you click the last entry. All the entries in-between are highlighted.

### Select specific entries

Press and hold **Ctrl** while you click to highlight the individual entries to add.

4. Do **one** of the following:

### Copy the entries

Press **Alt + e, d (Edit/Copy to Dictionary)** to keep the entries in the source dictionary and copy them to the destination dictionary.

Or **right click** and select **Copy to Dictionary** to keep the entries in the source dictionary and copy them to the destination dictionary you select from the submenu.

### Cut and remove the entries.

Press **Alt + e, m (Edit/Move to Dictionary)** to remove the entries from the source dictionary and move them to the destination dictionary. Stenograph recommends removing (deleting) the entries if you are working with the Update Area.

Or **right click** and select **Move to Dictionary** and select the destination dictionary from the submenu.

5. Select one of the following dictionaries to place the entries. Depending on the dictionary you are copying or moving entries from, all destination dictionaries may not be available.

### Personal Dictionary

### Update Area

### Case Dictionary

### Other Dictionary

When selecting Other Dictionary, the Send To Other Dictionary dialog box displays. Select a dictionary and press **Enter (Open)**.

Depending on the Dictionary Options setting for the *How to treat entries with duplicate steno when Pasting* option, you may be prompted to take action if an entry conflicts.

- Keep Old Text (**Alt + o**) - the definition in the destination dictionary will be retained.
  - Keep New Text (**Alt + n**) - the definition in the source dictionary will overwrite the destination dictionary definition.
  - Create Conflict (**Alt + c**) - a conflict will be created between the source and destination dictionary definitions.
  - Keep Neither (**Alt + e**) - neither definition will be retained and the destination dictionary entry will be deleted.
6. CATalyst BCS automatically saves the new entries in the destination dictionary. Press **Ctrl + s**, (**File/Save**) to save the changes in the open (source) dictionary.

## Search

The Manage Dictionary Search feature allows you to look for a dictionary entry by steno, text, or entry type, such as a conflict, phrase, number of strokes, number, etc. When searching for steno or text, you can limit the search by specifying an exact match, begins with, ends with or contains.

Once a searched entry displays, you can repeat the Search for the same text/steno and search parameters without reentering the information by using Repeat Search Forward (F3) or Repeat Search Backward (Shift +F3).

## Search for a Dictionary Entry

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + f (Edit/Search)**. The Search dialog box displays.
4. Make entries as necessary:

### Search For

Select the method by which you want to search the dictionary.

#### Steno

Search by steno. In the field, type the steno for which you want to search. You can type either a forward slash (/) or press the Spacebar to separate steno outlines. For example, to search for a two stroke steno outline, such as "end end", you could type EPBD -- then type / or press the Spacebar to finish with the second stroke, EPBD. When typing steno that starts with a final stroke, place a – (hyphen) before the first letter.

#### Partial Stroke

Check this box to search for the specified steno regardless of whether or not it is part of a steno outline. For example, when Partial Stroke is selected, searching for –FPLT finds: -FPLT, FPLTD, FRPBLGTS, FRPBLTS, etc. Searching for –FPLT without the Partial Stroke option selected, displays entries with –FPLT as a separate outline, such as: -FPLT, -FPLT/-FPLT, etc. Case CATalyst searches all steno strokes for the letters indicated in the Steno field regardless of your selection in the Location field.

#### Text

Search by text. In the field, type the text for which you want to search. Include any format symbols or [extended characters](#) as necessary.

### **FS**

To add format symbols to your text search, select **FS** and double click the symbol from the list to select it.

You can also use shortcut keys to insert a format symbol. Place the cursor in the Search For field, press **F4** and then press the appropriate letter or symbol.

### **Insert Field**

Display the [Insert Field](#) dialog box from which you can select a field to add to a text search.

### **Case Sensitive**

Search for the text in the Search For field as it is typed in upper and lower case. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field.

### **Whole Word**

Search only for the whole words that match the text typed in the Search For field.

If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. For example, searching for "of" would result in Search finding "of", "officer", "coffee", "soft", etc.

### **Entry Type**

Search by entry type. Selecting an entry type filters the search so that only entries with the entry type selected display. Click the arrow to display a list of available entry types.

Select **one** Search For type:

#### **Conflict**

The first entry that contains a conflict end format symbol.

#### **Scan stop**

The first entry that contains a scan stop begin or end format symbols.

#### **Numbers**

The first entry that contains numbers.

#### **All Capped**

The first entry that contains all capped text.

#### **Contains capped**

The first entry that contains at least one capital letter.

#### **Phrase**

The first entry that contains two or more words separated by a space.

#### **Contains punctuation**

The first entry that contains punctuation.

#### **Contains format symbol**

The first entry that contains a format symbol.

**Used Entries**

The first entry used during translation.

**Unused Entries**

The first entry not used during translation. A "0" (zero) displays the Usage count column for an unused entry.

**Contains Field(s)**

The first entry that contains a field.

**Repeated Stroke Entries**

The first entry that contain repeated steno outlines, such as STPHAO/STPHAO and STPHAO/STPHAO/STKPWHR.

**Auto Includes**

The first entry that begin with @.

**AccelerWriter**

The first entry that begin with &&.

**Number Conversion**

The first entry that contain the {Number Conversion} translate command.

**Number Trigger**

The first entry that contain the {Number Trigger} translate command.

**Numerical Words**

The first entry that contain a word number including hundred, thousand, million, etc.

**Speaker Entries**

The first entry that contain a <Colloquy> format symbol and a colon.

**One Stroke**

All entries that contain only one steno outline.

**Two Strokes**

All entries that contain two steno outlines.

**Three Strokes**

All entries that contain three steno outlines.

**Four Strokes**

All entries that contain four steno outlines.

**Five Strokes**

All entries that contain five steno outlines.

**Six or more steno strokes**

All entries that contain at least six steno outlines.

**2 or more steno strokes**

All entries that contain at least two steno outlines.

**3 or more steno outlines**

The first entry that contain three or more steno outlines.

**Live Suggestions**

Entries created by using a Define With LS1 - LS5 command on a Live Suggestion.

The invisible identification on the entries stay with the entries unless the entries are copied or moved to another dictionary, you export and import a dictionary back into Case CATalyst or you modify an entry or entries with the invisible identification and then modify entry or entries back to what the entry or entries were before modification.

**Used Briefs**

Entries created by using a suggested brief in the Brief It pane.

The invisible identification on the entries stay with the entries unless the entries are copied or moved to another dictionary, you export and import a dictionary back into Case CATalyst or you modify an entry or entries with the invisible identification and then modify entry or entries back to what the entry or entries were before modification.

**Live Suggestions and Briefs**

Entries created by using a Define With LS1 - LS5 command on a Live Suggestion and entries created by using a suggested brief in the Brief It pane.

The invisible identification on the entries stay with the entries unless the entries are copied or moved to another dictionary, you export and import a dictionary back into Case CATalyst or you modify an entry or entries with the invisible identification and then modify entry or entries back to what the entry or entries were before modification.

**Contains <Oops> symbols**

Entries that contain an [Oops](#) format symbol regardless of the category assignment. The Oops format symbol allows for 10 category (0 - 9) assignments. This filter will show all dictionary entries that contain the Oops format symbol.

**Location**

Select search parameters.

**Exact Match**

Search for entries that exactly match the steno or text entered in the Search For field.

**Begins With**

Search for entries that begin with the steno or text entered in the Search For field.

**Ends With**

Search for entries that end with the steno or text entered in the Search For field.

**Contains**

Search for entries that contain, anywhere in the entry, the steno or text entered in the Search For field.

**Direction**

Select where in the dictionary you want to search for the entries.

**Forward**

Search forward, from the cursor position to the end of the dictionary.

**Backward**

Search backward, from the cursor position to the beginning of the dictionary.

5. Press **Enter (OK)** to start the search. The Search dialog box closes and the dictionary window displays the entry. If Case CATalyst does not find a match for the selected steno or text search, a message displays.
6. To repeat the same search, press **F3 (Repeat Search Forward)** or **Shift + F3 (Repeat Search Backward)**.

**Search and Replace Text**

Search and Replace is a Manage Dictionary feature that allows you to search for and replace the text portion of a dictionary entry. For example, let's say you just attended a captioning boot camp and realized that your suffix definitions should use the Suffix format symbol instead of the Delete Space format symbol. So you want to find all the entries that begin with <Delete Space>, review the entry and either leave the <Delete Space> format symbol for that entry or replace it with the <Suffix> format symbol.

1. Press **Alt + f, o, d (File/Open/Dictionary)**.
2. From the dictionary menu, select the dictionary type. When you choose Case or Job, the Open Existing Document dialog box display. Select the dictionary and press **Enter**.
3. Press **Ctrl + r (Edit/Search and Replace)**. The Search and Replace dialog box displays.
4. Make entries as necessary.

**Search For**

Type the text for the search, including any format symbols.

You can add extended characters to the search. Place the cursor in the Search For field and press **F9**. The Insert Character dialog box displays. Double click a character to insert. CATalyst BCS inserts the character at the cursor location.

**FS**

You can add format symbols to your search. Select **FS** and double click the format symbol from the list to select it.

You can also use shortcut keys to insert a format symbol. Place the cursor in the Search For field, press **F4** and then press the appropriate letter or symbol.

**Insert Field**

Display the Insert Field dialog box from which you can select a field to add to the search.

**Case Sensitive**

Limit the search based on the upper and lower case letters of text typed in the Search For field. If you do not select Case Sensitive, the search replaces all words containing the indicated characters, regardless of the case typed into the field.

### Whole Word

Search only for the whole words that match the text typed in the Search For field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. **This is most likely to result in undesirable effects.** For example, replacing "of" would affect "of", "officer", "coffee", "soft", etc.

### Location

#### Exact Match

Search for entries that exactly match the text entered in the Search For field.

#### Begins With

Search for entries that begin with the text entered in the Search For field.

#### Ends With

Search for entries that end with the text entered in the Search For field.

#### Contains

Search for entries that contain, anywhere in the entry, the text entered in the *Search For* field.

### Direction

Select where in the dictionary you want to search and replace entries.

#### Forward

Search and replace forward, from the cursor position to the end of the dictionary. A confirmation message displays for each possible replacement.

#### Backward

Search and replace backward, from the cursor position to the beginning of the dictionary. A confirmation message displays for each possible replacement.

#### Replace All

Search and replace the entire dictionary without stopping to confirm each replacement. To display a confirmation message, select the Dictionary Option, *Warn Before Search and Replace*.

### Replace With

Type the replacement text for the entry in the *Search For* field. Add format symbols or fields if appropriate.

5. Press **Enter (OK)** to start the search and replace. A message displays if the search item has not match.
6. Press **Ctrl + s (File/Save)** to save the dictionary when finished.
7. Press **Ctrl + F4** to close the dictionary. If another dictionary is open, that dictionary displays. If no other dictionary is open, the Manage Dictionary function closes.

## Search Dictionary Entries

Search in Manage Dictionary allows you to look for a dictionary entry by steno, text, or entry type, such as a conflict or phrase. You can limit the search by specifying an exact, initial, or ending character match.

Once a searched entry displays, you can repeat the Search for the same text and search parameters without reentering the information by using Repeat Search Forward (F3) or Repeat Search Backward (Shift +F3).

## Search for an Entry

1. Press **Alt + f, o, d (File/Open/Dictionary)**.
2. From the dictionary menu, select the dictionary type. When you choose Case or Job, the Open Existing Document dialog box display. Select the dictionary and press **Enter**.
3. Press **Ctrl + f (Edit/Search)**. The Search dialog box displays.
4. Make entries as necessary:

### Search For

Select the method by which you want to search the dictionary.

#### Steno

Search by steno. In the field, type the steno for which you want to search. Separate multiple strokes with a forward slash. When starting with a final stroke, place a – (hyphen) before the first letter.

#### Partial Stroke

Check this box to search for the specified steno regardless of whether or not it is part of a steno outline. For example, when Partial Stroke is selected, searching for –FPLT finds: -FPLT, -FPLTD, -FRPBLGTS, -FRPBLTS, etc. Searching for –FPLT without the Partial Stroke option selected, displays entries with –FPLT as a separate outline, such as: -FPLT, -FPLT/-FPLT, etc. CATalyst BCS searches all steno strokes for the letters indicated in the Steno field regardless of your selection in the Location field.

#### Text

Search by text. In the field, type the text for which you want to search.

You can add extended characters to the text. Place the cursor in the Text field and press **F9**. The Insert Character dialog box displays. Double click a character to insert. CATalyst BCS inserts the character at the cursor location.

#### FS

To add format symbols to your text search, select **FS** and double click the symbol from the list to select it.

You can also use shortcut keys to insert a format symbol in your text search. Place the cursor in the Search For field, press **F4** and then press the appropriate letter or symbol.

#### Case Sensitive

Search for the text in the Search For field as it occurs in upper and lower case. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field.

#### Whole Word

Search only for the whole words that match the text typed in the Search For field.

If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. For example, searching for "of" would result in Search finding "of", "officer", "coffee", "soft", etc.

### **Entry Type**

Search by entry type. Selecting an entry type filters the search so that only entries with the entry type selected display. Click the arrow to display a list of available entry types.

Select **one** Search For type:

#### **Conflict**

The first entry that contains a conflict end format symbol.

#### **Scan stop**

The first entry that contains a scan stop begin or end format symbols.

#### **Numbers**

The first entry that contains numbers.

#### **All Capped**

The first entry that contains all capped text.

#### **Contains capped**

The first entry that contains at least one capital letter.

#### **Phrase**

The first entry that contains two or more words separated by a space.

#### **Contains punctuation**

The first entry that contains punctuation.

#### **Contains format symbol**

The first entry that contains a format symbol.

#### **Unused Entries**

The first entry not used during translation. A "0" (zero) displays the Usage count column for an unused entry.

#### **Contains Fields**

The first entry that contains a field.

#### **Repeated Stroke Entries**

All entries that contain repeated steno outlines, such as STPHAO/STPHAO and STPHAO/STPHAO/STKPWHR.

#### **Auto Includes**

All entries that begin with @.

#### **AccelerWriter**

All entries that begin with &&.

**Number Conversion**

All entries that contain the {Number Conversion} translate command.

**Number Trigger**

All entries that contain the {Number Trigger} translate command.

**Numeral Words**

All entries that contain a word number including hundred, thousand, million, etc.

**Speaker Entries**

All entries that contain a <Colloquy> format symbol and a colon and all entries defined with the <By-line> format symbol.

**One stroke**

All one stroke entries.

**Two strokes**

All two stroke entries.

**Three strokes**

All three stroke entries.

**Four strokes**

All four stroke entries.

**Five strokes**

All five stroke entries.

**6 or more steno strokes**

All entries that contain six or more steno outlines.

**2 or more steno strokes**

All entries that contain two or more steno outlines.

**3 or more steno outlines**

All entries that contain three or more steno outlines.

**Live Suggestions**

Entries created by using a Define With LS1 - LS5 command on a Live Suggestion.

The invisible identification on the entries stay with the entries unless the entries are copied or moved to another dictionary, you export and import a dictionary back into Case CATalyst or you modify an entry or entries with the invisible identification.

**Used Briefs**

Entries created by using a suggested brief in the Brief It pane.

The invisible identification on the entries stay with the entries unless the entries are copied or moved to another dictionary, you export and import a dictionary back into Case CATalyst or you modify an entry or entries with the invisible identification.

### Live Suggestions and Briefs

Entries created by using a Define With LS1 - LS5 command on a Live Suggestion and entries created by using a suggested brief in the Brief It pane.

The invisible identification on the entries stay with the entries unless the entries are copied or moved to another dictionary, you export and import a dictionary back into Case CATalyst or you modify an entry or entries with the invisible identification.

### Contains <Oops> symbols

Entries that contain an [Oops format symbol](#) regardless of the category assignment. The Oops format symbol allows for 10 category (0 - 9) assignments. Oops Category 10 is reserved for CATalyst inserted Oops format symbols. This filter will show all dictionary entries that contain the Oops format symbol.

### Location

Select search parameters.

#### Exact Match

Search for entries that exactly match the steno or text entered in the Search For field.

#### Begins With

Search for entries that begin with the steno or text entered in the Search For field.

#### Ends With

Search for entries that end with the steno or text entered in the Search For field.

#### Contains

Search for entries that contain, anywhere in the entry, the steno or text entered in the Search For field.

### Direction

Select where in the dictionary you want to search for the entries.

#### Forward

Search forward, from the cursor position to the end of the dictionary.

#### Backward

Search backward, from the cursor position to the beginning of the dictionary.

5. Press **Enter (OK)** to start the search. The Search dialog box closes and the dictionary window displays the entry. If CATalyst BCS does not find a match for the selected steno or text search, a message displays.
6. To repeat the same search, press **F3 (Repeat Search Forward)** or **Shift + F3 (Repeat Search Backward)**.

## CATalyst BCS Dictionary Tools

CATalyst BCS Dictionary Tools are features that allow you to create and modify different types of dictionary entries. For example, you can [create](#) a new dictionary entry, [modify](#) the text or steno portion of an entry, create an [Auto Include](#) or [AccelerWriter](#) entry, [spell check](#), create [Wordlists](#) and [include](#) other dictionaries.

## Keyboard Customization

While navigating in a dictionary, you can [customize your keyboard map](#) to assign specific commands to specific key combinations. Similar to your Edit keyboard map, you can have a [Dictionary keyboard map](#) that contains commands related to the dictionary. For example, when editing a dictionary the default command to insert an entry is **Ctrl + i**. You just want to press the letter **i** to insert an entry in a dictionary. You can modify your dictionary keyboard map and assign Insert Entry - Dict. function to the letter **i**. The dictionary keyboard map has no effect on your editing keyboard map.

You can also [change keyboard](#) maps while in the dictionary. Let's say you use the default dictionary keyboard map most of the time but when you want to review your dictionary to make it more efficient, you have a different dictionary keyboard map that makes navigation quicker. So you can easily switch between those two keyboard maps.

You can also customize the commands to invoke a format symbol. For example, let's say that you provide CART for a science class you are inserting the Subscript On/Off and Superscript On/Off format symbols in definitions all the time. It is hard for you to remember that F4Y/y is for Subscript and F4W/w is for Superscript. You can [modify the Format Symbol list](#) and make the commands easier for your to recognize. **Modifying and saving the Format Symbol list applies the changes to the Format Symbol in all CATalyst functions, not just the dictionary.**

## Change Keyboard Map

Change Keyboard Maps is a Dictionary feature that allows you to switch the [Keyboard Map](#), permitting you to use different keyboard commands while working in a dictionary. When you open a dictionary, the Dictionary Default keyboard map is active. The name of the active keyboard map displays on the Status bar at the bottom of the screen. You can [change](#) the default dictionary keyboard map to have a different keyboard map active when opening the Dictionary function.

To switch keyboard maps while working in the Dictionary function, press **Alt + t, y (Tools/Change Keyboard Map)**. The Keyboard Map submenu displays the keyboard maps available in your user name. From the Keyboard Map menu, select a keyboard map. The selection displays on the Status bar.

## Modify Format Symbols

The Format Symbols Options table contains Case CATalyst and CATalyst BCS translate commands and format symbols with default shortcut key assignments. The Display in BCS FS List column only displays if your e-Key license includes the optional Broadcast Captioning Suite. You can customize the shortcut assignments to meet your needs.

## Modify Entries

1. In a dictionary, press **Alt + t, y, o (Tools, Keyboard Customization, Format Symbol Options)**. The Format Symbols Options table displays.
2. Highlight the entry you want to modify and press **Ctrl + m (Edit/Modify)**. You can use the [Search](#) feature to quickly locate an entry in the table.
3. In the Modify dialog box, make necessary entries:

### F4 Shortcut

When a shortcut key assignment exists for the selected format symbol or translate command, it displays in the field. To change or assign a shortcut key assignment, click the down arrow and select a character from the list. If you select a shortcut key that is already assigned to another format symbol, Case CATalyst prompts you to reassign the key. Select Yes or No at the prompt.

To remove an assignment, select the "blank" option at the top of the drop down list.

### Reset to Default Value

Click this button to reset the selected format symbol shortcut key assignment to the default value. If the default is a capital letter, Case CATalyst restores it as a capital letter. The value in the table changes once you click OK.

### Display this format symbol when showing the Format Symbols list

Check this box to display the selected format symbol in the Case CATalyst Insert Format Symbol dialog box. Yes displays in the *Display in FS List* column when this option is active. This option affects the display of the format symbol in the list only. The shortcut key assignment works regardless of the display status.

### Display this format symbol when showing the Format Symbols list in BCS

Check this box to display the selected format symbol in the CATalyst BCS Insert Format Symbol dialog box. CATalyst BCS is optional captioning software. Yes displays in the Format Symbol Options, *Display in BCS FS List* column when this option is active. This option affects the display of the format symbol in the list only. The shortcut key assignment works regardless of the display status.

When the *Hide Caption-specific format symbols* option in [Advanced Edit Options](#) is set to Yes, it overrides the individual settings made for captioning format symbols in the Format Symbols Options table.

4. Press **Enter (OK)** to apply the changes and close the dialog box.
5. Press **Ctrl + s (File/Save)** to save the changes to the Format Symbols Options table. Changes are active in the Insert Format Symbol dialog box once you save the changes.

## Cycle Keyboard Maps

The Manage Dictionary Cycle Keyboard Maps feature allows you to switch the active [Keyboard Map](#), permitting you to use different keyboard commands. When you open Manage Dictionary, the Default keyboard map is active. You can modify the [Dictionary Options](#) to change which keyboard map is active when you open Manage Dictionary. The name of the active keyboard map displays on the Status bar at the bottom of the screen.

To change the active keyboard map while working in Manage Dictionary, press **Alt + t, k (Tools/Cycle Keyboard Maps)**. You can continue to press **Alt + t, k** to cycle through all the available keyboard maps in the Dictionary case located in your System Files case. The default assignment for \ (backslash) is Cycle Keyboard Maps - Dict. If you have not modified the keyboard map, pressing \ (backslash) also cycles through all the available Dictionary keyboard maps. Some users modify the keyboard maps to change the default assign for the \ (backslash) because the user may accidentally press the \ (backslash) and change their keyboard map without noticing right away.

## Create EZ Speakers Entries

Use Create EZ Speakers Entries to quickly identify speaker names. To use EZ Speakers definitions, you must identify the actual speaker names. Depending on the EZ Speakers entry, you may also need to identify the steno outlines. You can specify speaker names from Manage Dictionary or during a captioning session.

When you use EZ Speaker fields as recommended, CATalyst BCS places the EZ Speaker field into the definition of a job or case dictionary, inserts the speaker name into the job when written during captioning and adds the speaker to the [Speaker List](#). If the job is in a case, the default selection places the generated speaker definition into the case dictionary, although you can select any job dictionary.

## Identify EZ Speakers Names

1. Do **one** of the following to display the Create EZ Speakers Entries dialog box:

### Prior to a Captioning Session in Manage Dictionary

Open the selected case or job dictionary or create a new job dictionary. Press **Alt + t, e** (**Tools/Create EZ Speakers Entries**).

### During a Captioning Session

Press **Alt + t, z** (**Tools/Create EZ Speakers Entries**).

Write the steno outline defined as {EZ Speaker Define}. See instructions below on how to create EZ Speakers from your steno machine.

2. Make entries as necessary:

### Dictionary

#### Job Dictionary

Place the generated EZ Speakers definitions into the job dictionary. This is the default unless the job is in a case. This option is available when the job is in a case and you are identifying EZ Speakers during a CATalyst BCS session.

#### Case Dictionary

Place the generated EZ Speakers definitions into the case dictionary. This is the default if the job you are creating is currently in a case. This option is available when the job is in a case and you are identifying during a CATalyst BCS session.

#### Other Dictionary

Place the generated EZ Speakers definitions into a dictionary other than the case or job dictionary. All dictionaries that are included in the current Profile display in the drop down box. Select a dictionary from the list or use the Browse to select a dictionary from another location.

This option is available during a CATalyst BCS session.

#### Always default to Job Dictionary

When you are creating EZ Speakers generated definitions for a file within a case, you can change the dictionary default to the job dictionary. Select *Job Dictionary* and then check this box. If you select *Job Dictionary* and do not check this box, CATalyst BCS uses the job dictionary for this translation and then defaults back to *Case Dictionary* the next time you open the Create EZ Speakers dialog box. Select this feature if you use a case but always want your EZ Speaker IDs placed in a job dictionary.

This option is available during a CATalyst BCS session.

#### Currently selected dictionary

Displays the path and dictionary name where the EZ Speakers entries are generated.

### Text Token Number

Type the speaker number, **00 - 99**, for the EZ Speakers entry to which you want to add an actual speaker name.

### Steno

Do **one** of the following:

- If the speaker number you type contains a steno outline in the EZ Speakers dictionary, the Steno field is unavailable but displays steno associated with the token number. Continue to the Text field.
- If the speaker number you type does not contain a steno outline in the EZ Speaker dictionary, type the appropriate steno. The steno outlines you type in this field replace the ! (exclamation mark) in the EZ Speaker dictionary definition. For example, you write RED/RED for >>Redmond. The steno typed in the steno field represents the exclamation symbol. If the EZ Speakers entry contains an !, type RED/RED.

If there are two Exclamation marks in the EZ Speakers dictionary entry, type the steno outline once. Using the previous example, type RED.

### Text

Type the actual speaker name the way you want it to appear in the transcript. Include any format symbols or extended characters as necessary. Do not include format symbols or punctuation which are part of the EZ Speakers dictionary entry. For example, for Mr. Redford, type **Redford**. The <Colloquy> format symbol before the speaker name, <Caption: KeepCaseOn/Off> format symbol, the : (colon), and space following the colon are part of the EZ Speakers dictionary entry.

To add extended characters:

- a. Place the cursor in the New Text field and press **F9**. The Insert Character dialog box displays. To change the font, press **Alt + t**. The Font dialog box displays where you can modify the font characteristics. Changing the font may change the availability of characters.
- b. Double click a character in the Insert Character dialog box. CATalyst BCS inserts the character at the cursor location.

### FS

Display the list of available format symbols. Double click the format symbol you want to use in the definition. You can insert a format symbol at any point in the text entry. If you always add a format symbol to the speaker, you may want to add that format symbol to the EZ Speakers entry.

You can also use shortcut keys to insert a format symbol. Place the cursor in the Text field, press **F4** and then press the appropriate letter or symbol.

### Allcap Text

Check this box to display and save the entry in all upper case letters regardless of the case entered in the Text field.

### Include All Possible Misstrokes

Check this box to have CATalyst BCS generate definitions in the dictionary based on all the possible misstrokes for the EZ Speakers entry.

For example, you have the entry != <Colloquy>>>#00: in your EZ Speakers dictionary. You identify ! as A\*PBD/A\*PBD and the 00 as Anderson. CATalyst BCS builds the dictionary entry:  
A\*PBD/A\*PBD = Anderson:

When you check this option, CATalyst BCS also creates the following job dictionary entries, **provided a definition does not already exist in the Personal Dictionary for any of the identified misspelled words:**

APBD/A\*PBD = >>Anderson:

A\*BD/A\*PBD = >>Anderson:

A\*BD/A\*BD = >>Anderson:

### Entire File

Check this box to have the newly created EZ Speaker apply to the entire job. Uncheck this box to apply the newly created EZ Speaker only to the steno outlines written after the EZ Speaker is defined. By default, this option is checked.

This option is available during a CATalyst BCS session.

3. Repeat entering steno, text and token numbers until you define all your speakers.
4. Press **Alt + e (Close)** when finished.

### Create EZ Speakers from the steno machine

1. Write the steno outline defined in one of your dictionaries being used to translate as {EZ Speaker Define}. The default Realtime Commands Dictionary contains the definition for {EZ Speaker Define} using the steno SPEF/SPEF.  
Once the Create EZ Speakers Entries dialog box displays, you will write the steno outlines in your [Power Define dictionary](#) to navigate the dialog box.
2. In the Text Token Number field, write the steno defined as a digit for the speaker you want to created and then write the steno outline defined in your Power Define dictionary as [TAB].  
Depending on your EZ Speaker dictionary entries, the Steno field may be populated with your speaker steno. Go to Step 4.
3. In the Steno field, type the steno outline(s) you will write for the speaker and then write [TAB].
4. In the Text field, type the name of the speaker using dictionary definitions and/or fingerspelling.
5. Do any of the following:
  - To complete the EZ Speaker entry, write the steno outline defined in the Power Define dictionary as [ENTER]. The speaker is created and added to the appropriate dictionary, speaker list and [seating chart](#).
  - To change an option, write [TAB] to put the cursor focus on the option and then write the steno outline defined in the Power Define dictionary as [SPACE] to select or deselect an option.  
If you want to access the Insert Field function, press **Alt + i** on the computer keyboard or click the button with a mouse.
  - If you need to leave the Create EZ Speaker Entries dialog box open and return to writing realtime, write the steno outline defined as [SUSPEND] in the Power Define dictionary. The Create EZ Speaker Entries dialog box flashes, the cursor focus changes to the realtime text and leaves the Create EZ Speaker Entries dialog box open.  
You can write the Suspend command at any time the Create EZ Speaker Entries dialog box is open. To return to the Create EZ Speaker Entries dialog box, write the steno outline you wrote to open the Create EZ Speaker Entries dialog box.

- To cancel the creation of the current EZ Speaker and close the dialog box, write the steno outline defined in the Power Define dictionary as [ABORT].
- To close the dialog box, write [TAB] until your cursor focus is on the Close button and write the steno outline defined as [ENTER].

## Spell Check Dictionary

Enter topic text here.

## Create Dictionary Core List

Core List in Manage Dictionary allows you to create a list of unique case or job dictionary entries for the purpose of exchanging the terminology with another captioner. This is a way to share the terminology without sharing your steno outlines. CATalyst BCS searches the case or job dictionary for entries. An entry appears only once in the Core List, regardless of the number of occurrences in the dictionary.

CATalyst BCS names the core list using the file name followed by the text "Dict core list." For example, for the Captioning file HSN 012510, the core list created in Manage Dictionary is named, HSN 012510 Dict core list. The Core List is a .txt file and opens in Notepad or WordPad. If you filter the dictionary, CATalyst BCS creates a core list of only the filtered entries. You can save and print the file.

### Create a Core List

1. Press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select Case or Job. The Open Existing Document dialog box displays.
2. Select the case or job dictionary from which you want to create a core list and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Alt + t, c (Tools/Create Core List)**. Depending on the size of the file, the Core List displays in Notepad or WordPad.
4. Review the entries. You can cut, copy, paste, delete, and print the entries. Refer to your Windows documentation for additional information on using Notepad or WordPad.
5. To save the file, do **one** of the following:

#### Save

Press **Alt + f, s** to save the core list under the current user with the current file name as displayed in the Title bar. The core list is a text file and uses the file extension .txt

#### Save As

Press **Alt + f, a** to save the core list under a different name or in a different folder. The Save As dialog box displays. Make necessary entries.

## Make a Wordlist

Make Wordlist is a Manage Dictionary feature that automatically copies all the words in the open dictionary that Spell Check considers misspelled to the wordlist and assigns *Ignore* to them. If no wordlist exists, CATalyst BCS automatically creates a job or case wordlist. Make Wordlist only applies to case and job dictionaries.

For example, you may want to use Make Wordlist if you created a job dictionary with the Create EZ Speakers feature which did not Spell Check the speaker names during creation. Spell Check would not recognize the EZ Speakers names. Using Make Wordlist, CATalyst BCS copies those names to the job

wordlist with *Ignore* assigned to them. When you run Spell Check, CATalyst BCS does not stop on the speaker names which are already in the job or case wordlist.

## Macros - Dictionary

Enter topic text here.

### Record dictionary macro

The Macro Record feature allows you to record a series of commands in a dictionary and save them as a [macro](#). Macros are used to save time and effort for results that may take more than one keystroke to perform. For example, if you have some dictionary editing to do that requires the same commands each time, you might want to record a macro to save time and get the same results each time. Once the macro is recorded and named, you can assign a [keyboard command](#) to it so it can be invoked from your computer keyboard. Dictionary keyboard maps are different from an editing keyboard map and are stored in a case named Dictionary in your System Files case.

Recorded commands for an existing macro can be viewed or modified using the [Macro Editor](#). All macros are stored in the Macros case in your System Files folder. If you want to modify a key command in a keyboard map to invoke a dictionary macro, be sure to go to the Dictionary case in your Systems Files folder. The Macro Editor allows you to add and remove functions, text and key combinations without recording the entire macro again.

[Keyboard Map](#) Function: Record Macro

### Create and Assign Macro

1. Open a dictionary.
2. Position your cursor on a dictionary entry.
3. Press **Alt + t, m, r (Tools/Macro/Record)**. The RecordMacro toolbar displays at the top of the screen with Pause and Stop buttons.
4. Record the commands for the macro. Use the mouse and keyboard commands to select menus or icons, however, **in a dialog box, only keyboard commands are recorded**. Mouse clicks within a dialog box are not recognized and are not recorded as part of the macro.

When in a dialog box, click **Pause** on the RecordMacro toolbar to suspend the macro in order to type text, select a format symbol or other action. For example, you are recording a macro to modify the text of several dictionary entries. When the Modify Entry dialog box opens, click **Pause** and type the text. The typed text is not recorded as part of the macro. After you are finished typing the text, press **Enter** in the Include dialog box. The macro continues recording once you press Enter.

5. When finished, click **Stop** on the RecordMacro toolbar. The Save Macro dialog box displays.

If you attempted to record commands that are not recordable functions, the following error message displays: *The actions you took are not recordable. There are no actions that can be saved for a macro.* Press **Enter (OK)** to close the message.

6. In the *File name* field, type a name for the macro. Use the following options as necessary:

**Assign to key in keyboard map (Alt + a)**

Check this box to assign a key combination in your keyboard map to the macro after you save the macro. This allows you to invoke the macro from a keyboard command.

### **Define in dictionary to invoke macro from writer (Alt + f)**

Do not select this option, macros cannot be invoked from the writing machine while in a dictionary.

7. Press **Enter (Save)**. One of the following occurs:
  - The Save Macro dialog box closes if no additional options are selected.
  - The Open Keyboard Map dialog box displays if you selected to *Assign to key in keyboard map*. If the option, [Keyboard to open when assigning recorded macros](#), is active, the selected default Keyboard map opens. Make necessary entries to [assign a keyboard command](#) to the macro.
8. Test the macro. Do the following:
  - Playback the macro using the Playback Macro feature. Press **Alt + t, m, p (Tools, Macro, Playback Macro)** or click **Playback Macro** on the Macros toolbar. The Choose Macro dialog box displays. Select the macro just recorded and press **Enter (Open)**.
  - If you assigned the macro to a keyboard command, press the assigned keys.

### **Playback dictionary macro**

Enter topic text here.

### **Playback last dictionary macro**

Enter topic text here.

## **Dictionary Builder**

The Dictionary Builder feature is a Manage Dictionary feature that allows you to build dictionary entries using a writing machine or your computer (QWERTY) keyboard. Dictionary Builder displays a word or phrase from an ASCII (.txt) wordlist or a dictionary builder list created by Case Prep. You can define one or more steno outlines for each word or phrase. The ASCII file must have a .txt extension and each word or phrase in the wordlist must occur on a separate line. A Speak Word command/button is available so as you are building your dictionary with a Case Prep wordlist or a downloaded wordlist, you can hear the word's pronunciation and write what you hear. In addition to the Speak Word command/button, there is an Auto-Speak option that will automatically pronounce each word/phrase as you move through the list.

CATalyst BCS uses the [Dictionary Options](#) settings when encountering a conflict with steno that already exists in the same dictionary. If you are building a case or job dictionary and you enter steno that already exists in your Personal Dictionary, a *Personal Dictionary contains this steno* message displays in the Dictionary Builder dialog box. There is a *Replace spaces following titles* option located in Dictionary Options that will automatically replace a space following a title (i.e. Mr., Mrs., Dr., etc.) with a <Sticky Space> format symbol. For example, the text in the Word: field displays Dr. Kay. With the *Replace spaces following titles* option set to Yes, the space following Dr. is removed and replaced with a <Sticky Space> format symbol. Dr.<Sticky Space>Kay.

A Dictionary Builder case is located in the System Files case and is the default location for the lists of words created by [Case Prep](#). You can store lists of words in the Dictionary Builder case or use the Browse button to select your list from another location.

### **Use the Dictionary Builder**

1. From anywhere in CATalyst BCS, press **Alt + f, o, d (File/Open/Dictionary)**.

2. From the dictionary menu, select the type of dictionary. When you choose Case or Job, the Open Existing Document dialog box displays. Select the dictionary or type a new dictionary name and press **Enter**.
3. Press **Alt + t, b (Tools, Dictionary Builder)**. The Dictionary Builder Setup dialog box displays.
4. Make entries as necessary:

#### Writer

- **Stenograph Writer Serial/Bluetooth**  
This option includes Stenograph's Luminex, Diamante, Wave, élan Mira, élan Cybra, Stentura Fusion, Stentura Protégé, Stentura LX, Stentura, 200/400 SRT and SmartWriter. Bluetooth is a wireless serial connection and may not be available for all writers listed.
- **Stenograph Writer USB**  
This option includes Stenograph's Luminex, Diamante, Wave, élan Mira, élan Cybra, Stentura Fusion and Stentura Protégé.
- **Stenograph Writer WiFi**  
This option includes Stenograph's Luminex, Diamante and élan Mira A3.
- **StenoRam III, III+, Ultra**  
This option includes Xscribe's StenoRam III, III+ and Ultra with a serial connection.
- **FlashWriter**  
This includes ProCAT's Flash steno machine and any other steno writer that uses the Flash serial connection protocol.
- **Baron TX**  
This includes Baron Transcriptor X (TX) steno machine and any other steno writer that uses the BOLT serial connection protocol.
- **Keyboard input (no writer)** allows you to use your computer (QWERTY) keyboard to input steno and does not require a connected writer.

#### Comm Port

If you are connected to your writing machine via USB, no entry is required in this field. If you are not connecting your writer via USB, select the correct COM port to which your writing machine is attached to the computer. If you selected Keyboard input (no writer) option in the Writer field, this option is grayed out.

#### Wordlist

Do one of the following:

##### Start with a new wordlist

Select **Browse** to display the Open Dictionary Builder wordlist dialog box. Select a wordlist and press **Enter (Open)**.

##### Start at the beginning of a file

Select this option to start at the beginning of the wordlist last used.

##### Continue where I left off

Select this option to continue with a wordlist you already started, beginning at the point where you previously stopped.

5. Press **Enter. (OK)**.

6. Write a stroke on your writing machine to establish a connection. If you selected Keyboard input (no writer) no action is needed.
7. The Dictionary Builder dialog box displays. The word for which you are defining displays in the *Word* field. Do **one** of the following:
  - a. From your writing machine, stroke the steno outline for the word/phrase displayed. This option is only available if you selected a writer connection in the Setup dialog box. If you want to hear the word/phrase the default steno outline for the Speak Word command is **SPAO\*EBG**. You can customize the steno outlines used to invoke commands by clicking the Modify Steno Command button.
  - b. From your computer keyboard, type the steno outline for the word/phrase displayed. This option is only available if you selected Keyboard input (no writer) in the Setup dialog box. If you want to hear the word or phrase, press **Alt + k** which will speak the word/phrase only on demand and **Alt + u** will toggle the state of the Auto-Speak Word feature. When the Auto-Speak Word option is selected, each time you move to a new word/phrase the word/phrase will automatically be spoken.
  - c. Press **Alt + c** to toggle the capitalization of the word or phrase in the Word field.
  - d. Press **Alt + g** (if active) to define additional steno outlines with a suffix.

The Endings button is active when Case CATalyst analyzes the word and steno outline to determine if one or more suffixes (" -G", " -S" or " -D" steno) could be added to the word. Edit's [Plural Endings](#) Option setting also applies to the Endings feature. The Plural Endings option allows you to set the final S, final Z or both as keys you write to indicate a plural. You can choose any of the suggested definitions to add to your dictionary. For example, you have 'represent' in the Word field and REPT in the Steno field. The following suggested entries may display when you select Endings: REPTD = represented and REPTS = represents. The word "representing" is not suggested because the final "g" comes before the final "t" in the original steno outline.
  - e. You can press **Alt + w** to move your cursor to the Word: field and edit the text word or phrase if needed. For example, the word or phrase in the Word field is misspelled. Once you correct the spelling, you use the New Outline command to keep the modified word or phrase in the Word field to create additional steno outlines.

If you were modifying the entry in the Word field to add a <Sticky Space> format symbol following a title, there is a *Replace spaces following titles* option located in Dictionary Options. When this option is set to Yes and you are using Dictionary Builder, CATalyst BCS will automatically replace a space following a title (i.e. Dr., Mr., Mrs., etc.) with a <Sticky Space> format symbol. For example, the text in the Word: field displays Dr. Kay. With the *Replace spaces following titles* option set to Yes, the space following Dr. is removed and replaced with a <Sticky Space> format symbol. Dr.<Sticky Space>Kay.

The default setting for the *Replaces spaces following titles* option is No. If you want CATalyst BCS to replace spaces following titles with the <Sticky Space> format symbol, change the option to Yes. Dictionary Options can be accessed while in a dictionary by pressing **Alt + t, o, t** (Tools, Options, Dictionary Options) or from Manage Jobs by pressing **Alt + t, o, d, o** (Tools, Options, Dictionary Options, Options).

If there is an entry in your Personal Dictionary with the same steno outline, the *Personal Dictionary contains this steno* message displays. You can enter a different steno outline or if this dictionary has a [higher priority](#) than your Personal Dictionary when translating, this entry will take priority.

8. Use the following commands as necessary. Click the option or stroke the steno outline associated with the command. The associated steno for each command can be changed using the Modify Steno Commands option.

**Next Word**

Displays the next word in wordlist.

**Previous Word**

Displays the previous word in the wordlist.

**New Outline**

Allows you to stroke another steno outline for the same word.

**Delete**

Delete the previous stroke.

**Modify Steno Commands**

Display the Dictionary Builder Steno Command dialog box where you can change steno for any of the five Dictionary Builder commands. When finished making changes, press **Enter (OK)**. This button is not available if Keyboard input (no writer) was selected in the Setup dialog box.

9. When finished, select **Done**. The Dictionary Builder dialog box closes.

**Brief My Dictionary (BCS)**

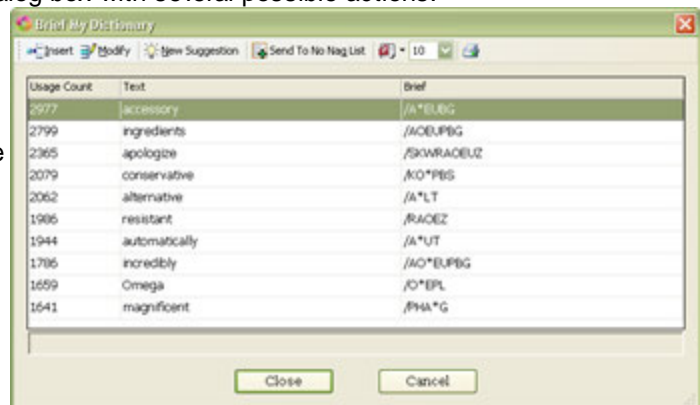

Many captioners love [Brief It](#) and how it helps them write shorter and faster. Brief It is a great productivity tool. When you think about it, you most likely still have multi-stroke words you are writing over and over again. How can you find them and get briefs for them without waiting for Brief It? For example, let's say that you want to see the top ten multi-stroke words/phrases that you have used in the last six months and then get one stroke briefs for them. You simply open your Personal Dictionary, open the Brief My dictionary dialog box, select a few options and press Enter. CATalyst does the work for you. You will be presented with a list of words/phrases that meet the selected criteria and a list of brief suggestions.

**To Use Brief My Dictionary:**

1. Open your Personal Dictionary.
2. Select Tools, Brief My Dictionary (**Alt + t, f**). The Brief My Dictionary dialog box displays.
3. In the *Find entries with* section, select one of the following:
  - a) 2 or more strokes will display the most recently used multi-stroke steno outlines starting with two stroke entries.
  - b) 3 or more strokes will display the most recently used multi-stroke steno outlines starting with three stroke entries. Two stroke entries will not be analyzed or displayed.
4. In the *That do not have matching text with a* section, select one of the following:
  - a) Shorter outline means CATalyst will only analyze and display dictionary entries that do not have another identical entry in the same dictionary (and also looking at the Personal dictionary) defined with less strokes.
  - b) Single stroke outline means CATalyst will only analyze and display dictionary entries that do not have another identical entry in the same dictionary (and also looking at the Personal dictionary) defined with a single/one stroke.
5. In the *Used most frequently in the past* section, type the number of months to limit the search.
6. In the *Show* section, type the number of most recently used multi-stroke entries you would like to see at this time.
7. Press Enter or click **OK** to continue.
8. The results display in a three column dialog box with several possible actions:

- Usage Count column displays the number of times the multi-stroke entry has been used.
  - Text column shows the word/phrase that meets the criteria specified.
  - Brief column displays a suggested brief.
9. Do **any** of the following:
  - a) Insert (  ) - adds the highlighted text and brief entry in the current dictionary. (**Alt + I** or **Ctrl + I**).  
**Note:** the entry or entries are added to the dictionary when you click Close which also closes the dialog box.
  - b) Modify (  ) - positions the cursor in the Brief column and makes it editable so you can create your own brief (**Alt + m** or **Ctrl + m**).  
**Note:** the modified entry or entries are added to the dictionary when you click Close which also closes the dialog box.

- c) New Suggestion () - removes the current brief and suggests a different brief for the highlighted entry. (**Alt + n** or **Ctrl + n**).

If Brief My Dictionary cannot suggest a brief for the selected word/phrase the following dialog box displays prompting if you want to remove the word/phrase from the list. Click **Yes** to remove the word/phrase or **No** to keep the word/phrase in the list.

- d) Send To No Nag List () - sends the word/phrase in the Text field to the No Nag List and both Brief My Dictionary and Brief It will no longer offer suggestions (or "nag" you) for briefs for that text. (**Alt + d** or **Ctrl + d**).

- e) To adjust the font style and size, use the font/size icon  14 .

- f) To print() the list of words/phrases and the suggested briefs, click the Print icon in the dialog box.

10. If you have inserted an entry or multiple entries, press **Enter** or click Close to **add them to your dictionary**. If you select Cancel, no changes have been saved.

### Things to know:

- If you select to insert some of the suggestions into your dictionary, **you must click Close** (or press Enter) in order for the entries to be added to your dictionary.
- If you highlight a few entries and select Insert and then review the rest of the entries and click Cancel, no entries have been added to your dictionary.
- If you select the 2 or more strokes options and a two stroke word/phrase is found, Brief My Dictionary will try to find and display a one stroke suggestion. If you select New Suggestion, a two stroke suggestion may display if no one-stroke brief can be found.
- When analyzing a dictionary, Brief My Dictionary will analyze the current dictionary you are in and compare it to your Personal Dictionary (and Update Area if you use one) to look for matching text.

## Options - Dict

Selecting Options from the Dictionary Tools menu give you access to [Themes...](#), [Dictionary Spell Check Options...](#), [Dictionary Options...](#) and [Application/Computer Options...](#)

### Dictionary Spell Check Options

Dictionary Spell Check Options determine the spell check parameters applied when spell checking dictionary entries. You can select automatic Spell Check features, choose Wordlists, set the number of Suggestions and choose the language type. For example, you can add a job wordlist, choose the Wintertree Medical Wordlist, activate the option to have Spell Check ignore all capped words and single characters, display notification when Spell Check completes in a text field and set the number of suggested words to display at 10.

Use CATalyst BCS [Transcript Spell Check options](#) to set Spell Check parameters for spell checking during a captioning session. Transcript Spell Check options are set independently from Dictionary Spell Check options.

The priority of the wordlists are as follows: Ignore All (which is in memory only), Job, Case, Personal, Exclude List (if selected), optional "other" wordlists, main language wordlists provided by Wintertree, Wintertree medical (if selected), Stedman's medical (if selected), Wintertree legal (if selected) and Black's legal (if selected).

Access Dictionary Spell Check Options:

- from Manage Jobs, press **Alt + t, o, d, s** (**Tools/Options/Dictionary/Dictionary Spell Check**).
- from Manage Dictionary, press **Alt + t, o, d** (**Tools/Options/Dictionary Spell Check**).

### Dictionary Spell Check Options

To make a change, click an option. Depending on the field, check or uncheck the box or select a choice from the drop down list. When finished with all your changes, select **OK**.

#### Language

Select which language set to use when running Spell Check. Selecting a language set for Spell Check affects the language set for the WinterTree Medical and Legal [Wordlists](#). Black's Law and Stedman's Medical wordlists are only available in English.

- **American English**
- **British English**
- **French** — When using French, Spell Check considers words beginning with a letter followed by an apostrophe, such as "c'est" to be misspelled and suggests a space following the apostrophe, "c' est." Change the [Advanced Spell Check](#) option, *Spell Check contractions as separate words* to prevent Spell Check from stopping on these words.
- **Italian** — When using Italian, Spell Check considers words beginning with a letter followed by an apostrophe, such as "c'est" to be misspelled and suggests a space following the apostrophe, "c' est." Change the [Advanced Spell Check](#) option, *Spell Check contractions as separate words* to prevent Spell Check from stopping on these words.
- **Spanish**
- **Brazilian Portuguese**

#### Options

Check the features you want active when Spell Check runs.

##### Autocorrect

Automatically correct a word with the specified alternative contained in an applied [wordlist](#). For example, Spell Check recognizes "teh" as misspelled and automatically replaces it with "the" because the entry in the applied wordlist is: "teh" Autocorrect "the".

##### Ignore Allcapped Words

Do not stop on words or abbreviations that are all capitalized and not recognized by Spell Check.

##### Ignore Mixed Case

Do not stop on mixed case words that have more than one initial capped letter and are not recognized by Spell Check. For example, Spell Check does not stop on "CATalyst ", "McNeal", or "OZpc."

**Ignore Mixed Digits**

Do not stop on combinations of digits and numbers not recognized by Spell Check. For example, Spell Check does not stop on 12F, t3sting, or 500th.

**Report Repeated Words**

Stop on repeated words unless the words have been added to your Personal, Case or Job wordlist.

**Split Hyphenated Words**

Spell check each hyphenated word as a separate word. For example, in "seff-employed" (self-employed), Spell Check stops only on "seff".

**Strip Possessives**

Spell check only the root word.

**Suggest Split Words**

Offer two separate words as a Suggestion for a single word that can legitimately be two words. For example, Spell Check stops on "someperson" and offers the Suggestion "some person".

**Ignore Single Characters**

Do not stop on individual characters. For example, do not have Spell Check stop on the X in "X marks the spot".

**Add Changes to Wordlist**

Add the highlighted word and its replacement to the Job wordlist as a Suggest, when using the Change option. For example, Spell Check stops on the word "someperson". You select "some person" from the Suggestions list. In the wordlist, the following entry occurs: "someperson" Suggest "some person". Spell Check continues to stop on every occurrence of the word in the dictionary.

**Deselect All**

Deselect all options. You may want to use this feature when creating a macro to select a specific Spell Check option. To run a macro for a specific Spell Check option you would first need to deselect all the other options. By using Deselect All, you can deselect all the options at once and then select the specific one you want to use.

**Additional Wordlists**

Use the **Add** button to display the Open dialog box where you can locate and include other [wordlists](#) to apply during Spell Check. Once added to the list, you must check the box next to each wordlist you want to apply during Spell Check. Uncheck the box to inactivate the wordlist but keep it in the list for later use. Use **Remove** to delete the wordlist from the list. You can Add it again if necessary.

Wordlists are applied during Spell Check in a [priority order](#). Additional wordlists are applied before all other wordlists except the Ignore All Wordlist which is a temporary wordlist that is not viewable. Wordlists contained in the Additional Wordlists field are applied in the order they occur. Use the **Move Up** and **Move Down** buttons to reorder the list.

**Match Common Word Processors**

The Match Common Word Processors option uses an exclude list that contains all common words from the Wintertree American wordlist or Wintertree British wordlist that some commonly used spell checkers (i.e. word processor software) report as being misspelled. Although there are words in the Wintertree American wordlist or Wintertree British wordlist that commonly used spell checkers mark as misspelled, many of those same words may be recognized spellings in other spell checkers. By checking this option, you are setting CATalyst's spellchecker to stop on these words even though the built-in wordlist says these words are correct.

When you select the Match Common Word Processors option, the listed legal and medical wordlists are automatically deselected (to give you the most desired results). Deselecting the Match Common Word Processors option does not automatically reselect all the wordlists listed below. You will need to select each wordlist you want to use. All commonly used spell checkers may not have medical and legal terminology as a part of their wordlists. If all the medical and legal wordlist are deselected, you most likely will need to add some medical and legal words to your Personal Wordlist (with the Ignore attribute) so Spell Check doesn't stop on them. For example, if you select the Match Common Word Processors option and deselect the medical and legal words, you may have to add "Voir" (Voir Dire) to your Personal Wordlist so Spell Check doesn't stop on it. There may be medical words you will need to add also. If you select this option and continue to select all medical and legal wordlists, you may still find some words that commonly used spell checkers would consider misspelled. You can select all, some or none of the wordlists, it is your decision.

*This option is grayed out if American English or British English is not selected in the Language field.*

### **Use Wintertree Medical Wordlist**

Check this box to use the Wintertree Medical Wordlist.

### **Use Stedman's Medical Wordlist**

Check this box to use Stedman's Medical Wordlist.

### **Use Wintertree Legal Wordlist**

Check this box to use the Wintertree Legal Wordlist.

### **Use Black's Legal Wordlist**

Check this box to use Black's Legal Wordlist.

### **Display Red Squiggle Under Misspelled Words**

This option does not apply to dictionary Spell Check.

### **Spell Check While Defining**

Check this box to invoke Spell Check when inserting and modifying entries.

### **Scan While Spell Check**

This option does not apply to dictionary Spell Check.

### **Scan Options**

This option does not apply to dictionary Spell Check.

### **Notify me when spellcheck completes in a text field**

When the Spell Check while Defining option is Off and you spell check a field using Spell Check (Shift + F7), the No Spelling Errors dialog box displays.

### **Maximum Number of Suggestions**

Enter a number between 10 and 100 to determine the maximum number of alternative words that display in the Suggestions field. The recommended setting is 10. This is the default.

## Dictionary Options

Dictionary Options allows you to customize whether your D-defines go directly to your Personal Dictionary or to the Update Area, what happens to conflicting entries when combining dictionaries, decide what warning messages you see and more. Settings in Dictionary Options affect all dictionaries in the user folder.

Access Dictionary Options:

- At Manage Jobs, press **Alt + t, o, d, o** (Tools, Options, Dictionary, Options).
- At Manage Jobs, press **Alt + t** and then select All Options. Navigate to the Dictionary section and select Options.
- In Manage Dictionary, press **Alt + t, o, t** (Tools, Options, Dictionary, Options).
- At Manage Dictionary, press **Alt + t** and then select **All Options**. Navigate to the Dictionary section and select **Options**.
- Click the All Options icon () on the toolbar and then navigate to the Dictionary section and select **Options**.

## Dictionary Options

Select your choice from the drop-down list on the right side of the option. When finished, to save and close the Dictionary Options dialog box, select **OK**.

### D-Defines go to the Update Area Yes/No

When making D-defines (entries defined to the Personal Dictionary), entries are placed in the Personal Dictionary and the newest entry is always used during translation. When you open your Personal Dictionary, based on your Dictionary Options (see below) you may be prompted to take action on any conflicting (entries with identical steno outline(s) and different text definition) entries. To have your D-defines go directly to the Personal Dictionary, select **No**. By default, D-defines made while editing go to the Personal Dictionary.

When D-defines go to the Update Area, the entries go to a holding dictionary that allows you to review, revise, delete entries before moving them to your Personal Dictionary. If you work with a scopist that creates dictionary definitions or you edit on multiple computers, you may want to select the D-Defines go to Update Area option. The scopist can send the Update Area along with the edited file or you can backup and restore the Update Area on your main computer. You can then review the entries and add the ones you want to your Personal Dictionary. To have your D-defines go to the Update Area, select **Yes**.

### How to treat entries with duplicate steno from D-defines Stop for Decision / Keep New Text / Keep Old Text / Create Conflict

When the *D-Defines go to the Update Area* option is set to No, select one of the options as the default action when D-defines conflict with entries in your Personal Dictionary. When a D-define is made while writing realtime or editing that is different than the existing Personal Dictionary entry, the entry goes into your Personal Dictionary and is automatically used until you open your dictionary. Once you open your dictionary, depending on your dictionary options, either the action that you selected is performed or you need to decide how to resolve the conflict. Select from the following options: Stop for Decision which allows you to select the action for each conflicting entry, or automatically have one of the following actions performed: Keep New Text, Keep Old Text or Create Conflict. If undecided, select Stop for Decision.

If *D-defines go to the Update Area* is set to Yes, this option is not available.

### Stop for Decision

Displays the Duplicate Entry dialog box for each conflicting steno outline along with the text definitions. Review the steno. and text and then select an action: **Keep New Text**, **Keep Old Text**, **Create Conflict** or **Keep Neither**. Keep Neither removes the original dictionary entry from the destination dictionary and does not include the new dictionary entry.

Selecting an action applies only to the duplicate entry displayed. If you want to apply the same action to all duplicate entries, check the box, *Apply this choice to the rest of the duplicate entries for this include*. When finished selecting your action, choose **OK**.

If you choose Cancel, Case CATalyst prompts you with a Yes/No option to confirm the cancellation. Selecting Yes cancels any action taken with the Include and closes the Duplicate Entry dialog box. Selecting No displays the Duplicate Entry dialog box.

### Keep New Text

Keep the text definition from the newest D-define and remove the old entry.

### Keep Old Text

Keep the text definition from the current Personal Dictionary entry and disregard the newest dictionary entry.

### Create Conflict

Keep both the original and new text to create a conflict in the entry.

## How to treat entries with duplicate steno when Including Stop for Decision / Keep New Text / Keep Old Text / Create Conflict

When using Manage Dictionary's Include feature to combine dictionaries, you need to decide how you want Case CATalyst to handle the included entries if some entries conflict (entries with identical steno outline(s) and different text definition) with entries in the destination dictionary. Select **one** of the following:

### Stop for Decision

Displays the Duplicate Entry dialog box for each conflicting steno outline along with the text definitions. Review the steno. and text and then select an action: **Keep New Text**, **Keep Old Text**, **Create Conflict** or **Keep Neither**. Keep Neither removes the original dictionary entry from the destination dictionary and does not include the new dictionary entry.

Selecting an action applies only to the duplicate entry displayed. If you want to apply the same action to all duplicate entries, check the box, *Apply this choice to the rest of the duplicate entries for this include*. When finished selecting your action, choose **OK**.

If you choose Cancel, Case CATalyst prompts you with a Yes/No option to confirm the cancellation. Selecting Yes cancels any action taken with the Include and closes the Duplicate Entry dialog box. Selecting No displays the Duplicate Entry dialog box.

### **Keep New Text**

Keep the text definition from the source and remove the old entry from the destination dictionary.

### **Keep Old Text**

Keep the text definition from the destination dictionary entry and disregard the source dictionary entry.

### **Create Conflict**

Keep both the original and new text to create a conflict in the entry.

## **What to do with source dictionary after Include   Stop for Decision / Delete Source Dictionary / Leave Source Dictionary**

The Source dictionary is the dictionary you select to bring entries into the current (destination) dictionary. You open the destination dictionary, select Include and then select the dictionary (source) you want to include into the currently opened dictionary. The default action is to Stop for Decision.

Depending on your dictionary options, if the *Warn before voiding undo ability when using Include* option (see below) is active, you will be prompted that if you continue you will not be able to undo changes that were done before the include. If you need to "undo changes" you can exit the dictionary without saving it. By default, this prompt is active.

Select **one** of the following:

### **Stop For Decision**

Displays the following message prompting you for a decision after including the entries: "Do you want to delete the source dictionary?" Select **Yes** to delete the source dictionary or **No** to retain the source dictionary after including. Stop For Decision is the default.

### **Delete Source Dictionary**

Automatically delete the source dictionary after including the entries in the destination dictionary.

### **Leave Source Dictionary**

Automatically retain the source dictionary after including the entries in the destination dictionary.

## **How to treat entries with duplicate steno when Pasting   Stop for Decision / Keep New Text / Keep Old Text / Create Conflict**

When using the cut, copy and paste commands in the Manage Dictionary function, you need to decide how you want Case CATalyst to handle the pasted entries if some entries conflict (entries with identical steno outline(s) and different text definition) with entries in the destination dictionary. Select **one** of the following:

### **Stop for Decision**

Displays the Duplicate Entry dialog box for each conflicting steno outline along with the text definitions. Review the text and select an action **Keep New Text**, **Keep Old Text**, **Create Conflict** or **Keep Neither**. When finished selecting your action, choose **OK**. No action occurs if you choose Cancel. Stop for Decision is the default. Keep Neither is an action available when you use Stop for Decision. Keep Neither removes the original dictionary entry from the destination dictionary and does not paste the new dictionary entry.

### **Keep New Text**

Keep the copied/cut text definition and remove the old entry from the destination dictionary.

### **Keep Old Text**

Retain the destination dictionary entry and disregard the copied/cut entry.

### **Create Conflict**

Keep both the original and new text to create a conflict in the entry.

### **Break steno outlines based on key order Yes/No**

Case CATalyst allows you to type text characters in the Steno field of a dialog box to generate steno characters. For example, you type JAIMS and Case CATalyst generates SKWRAEUPLS.

Select **Yes** to have Case CATalyst automatically add a / (forward slash) between steno strokes based on steno key order. For example, you type PATRIK. The result is /PAT/REUBG. You do not need to type the /. Select **No** to manually insert the slash between steno strokes to indicate multiple strokes.

### **Swap steno entered out of key order Yes/No**

Select **Yes** to have Case CATalyst automatically corrects typed steno in the Steno field of a dialog box. For example, you type READ. The steno order corrects to /RAED; TOAD corrects to TAOD.

Select **No** to not have Case CATalyst automatically correct incorrectly ordered steno keys. Case CATalyst does not generate the correct steno character or may generate the steno character as a "final" character instead of the intended "initial" character. Case CATalyst inserts / to separate strokes when it is clear a second stroke is written.

This field is only available if you select No in the *Break steno outlines based on key order* field.

### **Default Keyboard map**

Select the active [keyboard map](#) when using Manage Dictionary. Click the down arrow to display the list of available dictionaries. All dictionary keyboard maps located in the Dictionary case within your System Files case, are available for selection from the list. The Default keyboard map will be used until it is changed to another keyboard map. Only dictionary commands can be used in the dictionary keyboard map.

### **Warn before deleting entries**

Check this box to display a confirmation message when deleting dictionary entries. Each time you delete an entry, the message prompts you with a Yes/No option to continue the deletion. This is the default.

Uncheck this box to disable the confirmation message when deleting entries. You can also deselect this message by checking the option, *I understand the consequences of my actions. Please stop asking.* in the message box.

### **Warn before Search and Replace Yes/No**

Search and Replace allows you to search for and replace the text portion of a dictionary entry. You can search and replace all entries forward, backward or all matching entries at one time.

Check this box to display a confirmation message when selecting the Replace All option. The message prompts you with a Yes/No choice option to continue the replace without stopping for a decision. This is the default.

Uncheck this box to disable the confirmation message when replacing. You can also deselect this message by checking the option, *I understand the consequences of my actions. Please stop asking.* in the message box. The confirmation message displays only when you select Replace All. It does not display when you select Forward or Backward. Forward and Backward stop on every occurrence.

#### **Warn before voiding undo ability when using Include Yes/No**

The Include feature allows you to include the entire contents of another dictionary into the displayed dictionary. You cannot Undo the Include unless you exit the dictionary without saving. All unsaved changes made prior to the Include are lost.

Check this box to display a warning message when including a dictionary. The message prompts you with a Yes/No choice option to continue the Include. This is the default.

Uncheck this box to disable the warning message when you Include a dictionary. You can also deselect this message by checking the option, *I understand the consequences of my actions. Please stop asking.* in the message box.

#### **Warn when inserting or modifying an entry in a filtered display Yes/No**

When you display dictionary entries in a filtered view, and then modify a filtered entry so that it no longer meets the filter criteria, the modified entry no longer displays in the filtered view.

Check this box to display a warning message when the modified entry does not meet the filter criteria. The message prompts you that the entry will not be displayed and press Enter to continue.

Uncheck this box to disable the warning message when modifying an entry in filtered view. You can also deselect this message by checking the option, *I understand the consequences of my actions. Please stop asking.* in the message box.

#### **Warn when overwriting EZ Speakers Entries Yes/No**

Check this box to display a confirmation message when you create a duplicate speaker identification with an existing token number in the Create EZ Speaker Entries feature. The message prompts you with a Yes/No choice option to overwrite the existing entry.

Uncheck this box to disable the confirmation message when identifying speaker names. You can also deselect this message by checking the option, *I understand the consequences of my actions. Please stop asking.* in the message box.

#### **Warn twice before exiting without saving changes Yes/No**

If you have unsaved changes and you select to exit the dictionary, select Yes to have an Are you sure message display. Select No, if you do not want the extra warning dialog box. The default setting is Yes.

#### **Confirm Conflict Resolution Yes/No**

If a dictionary entry is a conflict and you eliminate the conflict by using one of the Resolve Conflict with Choice # - Dict commands, a confirmation message displays prompting you to confirm you want to replace the conflict (conflict displays) with the conflict choice (the conflict choice displays). To disable the confirmation message from displaying when you resolve a conflict, set this option to No. To change the setting, double click the Confirm Conflict Resolution option to toggle between Yes and No. The default setting is Yes.

**Print Steno in Crowded Format Yes/No**

Check this box to print the dictionary entries in crowded line format and reduce the number of pages needed to print the dictionary entries. Crowded line format prints the steno outlines using a forward slash to separate the strokes. The steno for the entry prints on a line. For example, /KA\*P /O\*PB.

Uncheck this box to print the dictionary entries so that the steno prints in paper tape format. For example:

K A \* P  
O\* PB

**Display steno in "paper tape" format Yes/No**

Select **Yes**, the default, to display the steno outlines for dictionary entries in paper tape format. Paper format displays steno outlines for a dictionary entry in a vertical display as it appears written on paper tape. For example, you have the dictionary entry "arrhythmia" which contains multiple steno outlines for the dictionary entry.

arrhythmia      A R  
                    R EU PBLG  
                    PH AO E  
                    K W RA

Select **No** to display the steno outlines in crowded format. This setting also affects the display of printed dictionary entries. Crowded format reduces the amount of space it takes to display the dictionary entry. In crowded steno format, multiple steno outlines for entries are separated by a slash on one or more lines. The same entry displays as:

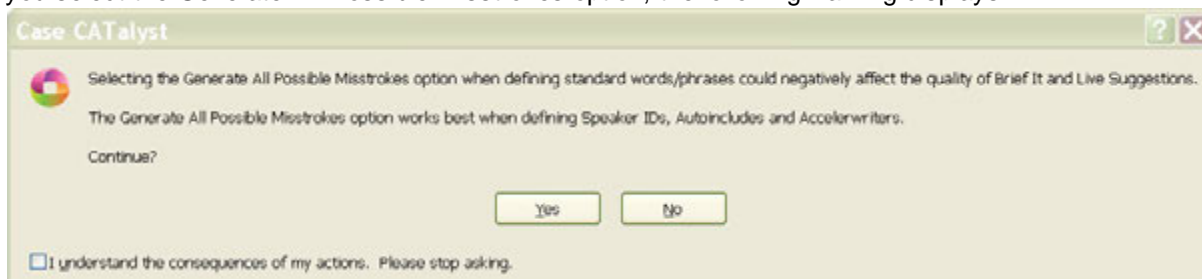

arrhythmia      AR/REUPBLG/PHAOE/KWRA

**Warn when inserting/modifying an entry and selecting All Possible Misstrokes Yes/No**

This option will display a warning message when inserting or modifying dictionary entries in your Personal Dictionary or Update Area (if used) when you have selected the Generate All Possible misstrokes option in the Insert/Modify dialog box. The Generate All Possible Misstrokes option can be a good option when creating additional definitions for speaker identifications, realtime commands, format symbols, Auto Includes, AccelerWriters and punctuation. The option can also be helpful for case-specific or job-specific terminology (names, briefs). However, for average words and phrases, especially when a dictionary is not mature enough, using the Generate All Possible Misstrokes option is much more likely to generate defines that will either never be used in translation; mistranslates that need to be re-defined or it will prevent Brief It from working as well as it could/should. This option is set to Yes as the default action. Change the option to No if you do not want to see this warning when inserting/modifying entries in the Personal Dictionary and Update Area.

If defining to the Personal Dictionary and/or inserting/modifying an entry in the Personal Dictionary and you select the Generate All Possible Misstrokes option, the following warning displays:

- Selecting **Yes** (Alt + y) will generate all possible misstrokes for the current steno outline.
- Selecting **No** (Alt + n) will return to the Insert or Modify dialog box with the Generate All Possible Misstrokes option deselected.
- Select the *I understand the consequences of my actions. Please stop asking.* option to set the warning option to **No**.

## Column Display Order

Customize the order in which you want the columns to display on the Manage Dictionary screen. Click in the Column Display Order: option and then click the Browse (...) button to display the Confirm Column Order dialog box. In the Choose column order section, highlight a column name and then use the arrow icons (↑ ↓) to position the order of the columns. When finished, click **OK** to save the changes.

To customize which columns display, double click the column name to toggle between Visible and Not Visible. The Text and Steno columns are inactive as those two columns will always display in a dictionary.

## Dictionary Verify Options

The [Dictionary Verify](#) feature, checks your dictionary for potential issues. In the Dictionary Verify reporter, you may see invalid modification date or invalid used date. There is nothing wrong with the dictionary entry, it is just the date information for specific entries is not correct. You can select to correct the issue by selecting the appropriate option listed below.

### Fix Invalid Modification Date

Double click the Fix Invalid Modification Date option to toggle between Yes and No. If set to Yes, Dictionary Verify will reset the dictionary entry date to today's date based on your computer's date.

### Fix Invalid Used Date

Double click the Fix Invalid Used Date option to toggle between Yes and No. If set to Yes, the *How to fix used date:* option is active.

### How to fix used date:

To select an option to fix the used date, click the down arrow. Select one of the following:

#### Set entry as unused

Reset the Usage Count flag to reflect the dictionary entry has never been used.

#### Set to Modification Date

Reset the Used date to match the modification date.

### Set to today's date

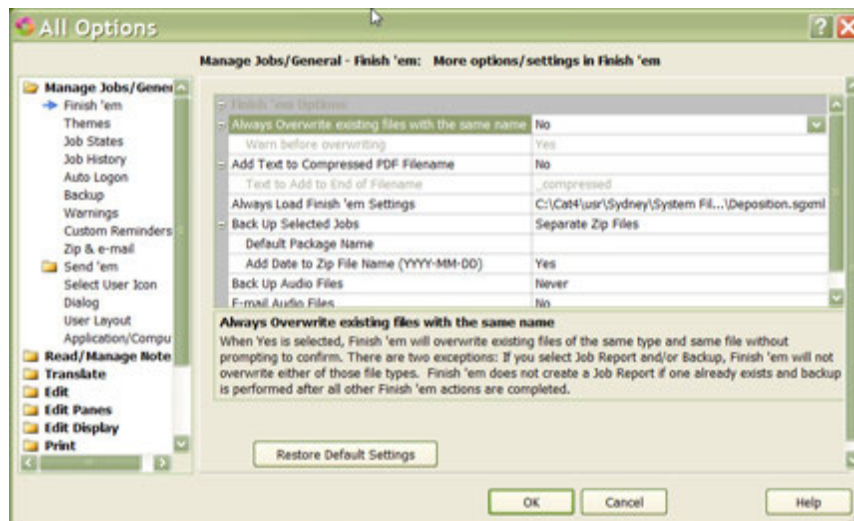

Reset the Used date to today's date based on your computer's date..

## All Options

For easy access to the majority of CATalyst BCS and CATalyst options in one location, the All Options menu item is available at the bottom of all Tools menus. The All Options dialog box displays options starting with Manage Jobs, then continues with options for all the different CATalyst functions with Captioning (BCS) listed last. There may be additional options available in the actual function. For example, if you select Print in the All Options dialog box, you can set the default printer. When you go to the Print dialog box to print a specific file, additional options are available there because they are specific to a particular print session.

The CATalyst BCS options include Realtime, Options, Preferences, Auto Recover and Set Cursor Context. While in a captioning session, there are additional options when selecting the Tools menu. The Realtime, Options and Preferences options are available while in a captioning session by selecting them from the Setup Menu.

An All Options icon  is available on the Standard toolbar. If you have not modified your Standard toolbar, the icon automatically is added to the Standard toolbar in each area of CATalyst (Manage Jobs, Edit, Dictionary, etc.) when you updated. If you have modified your Standard toolbar, you can add the icon to your Standard toolbar by clicking the down arrow on the right hand side of the Standard toolbar. Select Add or Remove Buttons, Standard and click All Options. You will see the new All Options icon added to the end of the Standard Toolbar.

Keyboard map functions available in Edit, Dictionary and Caption keyboard maps

Open All Options Dialog

## Create AccelerWriters

An AccelerWriter is a [macro](#) invoked from the writing machine during realtime writing. For example, you may want to create an AccelerWriter that loads your credit file. When you write the steno outlines assigned to the macro, Case CATalyst performs the actions of the macro. When invoking an AccelerWriter and the cursor focus is in a dialog pane, Case CATalyst automatically sets the cursor focus to the transcript and performs the actions of the macro.

Creating an AccelerWriter involves recording the commands for the [macro](#) and then defining the steno outline in a dictionary to invoke the AccelerWriter. When creating new macros, Stenograph recommends you create the macro while in a practice BCS captioning session to make sure of your cursor position and to see what actually takes place on the screen. Once you record the commands for the macro, when you save the macro, you can also define the macro. If you already have recorded macros, you can open a dictionary and [manually create AccelerWriter](#) definitions to invoke the macro from your writing machine. The text portion of an AccelerWriter dictionary entry begins with two ampersands (&&) followed by the macro name. The ampersands designate the entry as an AccelerWriter.

The Insert AccelerWriters feature in Manage Dictionary is a wizard that allows you to quickly create an AccelerWriter definition. Browse to select the macro and Case CATalyst automatically creates the text portion of the definition. Alternatively, you can manually type the entire definition using the Manage Dictionary, Insert and typing the steno and the name of the macro file. Case CATalyst also provides the option to create the AccelerWriter definition from Edit immediately after creating the macro, eliminating the need to open the dictionary and create it.

## Record, save and define macro

1. In a practice BCS captioning session, position your cursor in the most logical position where you would want the commands of the macro performed. While in a captioning session, the cursor is usually at the end of the most recently written text.
2. Press **Alt + t, m, r (Tools/Macro/Record)**. The RecordMacro toolbar displays at the top of the screen with Pause and Stop buttons.
3. Record the commands for the macro. Use the mouse and keyboard commands to select menus or icons, however, in a dialog box, only keyboard commands are recorded. Mouse clicks within a dialog box are not recognized and are not recorded as part of the macro.

When in a dialog box, click **Pause** on the RecordMacro toolbar to suspend the macro in order to select a file or type text. For example, you are recording a macro to include a file and want to be able to select any file while using the macro. When the Include dialog box display, click **Pause** and select a file. File selection is not recorded as part of the macro. After selecting the file, press **Enter** in the Include dialog box. The macro continues recording once you press Enter.

4. When finished, click **Stop** on the RecordMacro toolbar. The Save Macro dialog box displays.

If you attempted to record commands that are not recordable functions, the following error message displays: *The actions you took are not recordable. There are no actions that can be saved for a macro.* Press **Enter (OK)** to close the message.

5. In the *File name* field, type a name for the macro. To create an AccelerWriter (macro invoked from the steno machine), place a check mark in front of the **Define in dictionary to invoke macro from writer** option.
6. Press **Enter (Save)**. The Insert AccelerWriter Entry dialog box displays if you selected the option, *Define in dictionary to invoke macro from writer* option. Fill in the following fields:

**Steno**

Insert the steno you write to invoke the AccelerWriter. Separate multiple strokes with a forward slash.

### Entry Text

The field automatically fills in with the assigned macro name. Two ampersands (&&) precede the name to identify the entry as an AccelerWriter.

### Generate All Possible Misstrokes

Check this box to generate additional dictionary definitions to invoke the macro based on all the possible misstrokes of the original steno outline. A misstroke definition is generated only if the misstroke does not conflict with an existing entry in the Personal Dictionary.

### Dictionary

Select one of the following dictionaries in which you want to place the AccelerWriter definition. The macro is stored in the Macros case located in the System Files case.

- Personal Dictionary
- Job Dictionary
- Update Area (if selected for use)
- Case Dictionary
- Other Dictionary—use Browse to locate a dictionary in a different location.

**Press Enter (OK)** to complete the definition.

If the steno you have inserted to invoke the macro has one or more entries that start with that same steno (longer match) in the Personal Dictionary, the following message display:

If the steno you write for a macro has a longer match in the Personal Dictionary, the macro will be delayed until translation determines the next stroke. This will cause a delayed reaction for the macro and in some cases, depending on what the macro does, can cause an unwanted result. The warning is to let you know that you might want to select different steno for your AccelerWriter definition.

Do **one** of the following:

- Select Yes to return to the Insert AccelerWriters dialog box to change the steno outline.
- Select No to insert the entry into the current dictionary knowing that the Personal Dictionary contains at least one entry that starts with the same steno outline and that may delay the execution of the macro. You receive the following message:

7. Test the macro. Do the following:

- Playback the macro using the Playback Macro feature. Press **Alt + t, m, p (Tools, Macro, Playback Macro)** or click **Playback Macro** on the Macros toolbar. The Choose Macro dialog box displays. Select the macro just recorded and press **Enter (Open)**.

- If you created an AccelerWriter definition, use the **Add/Remove Dictionaries** command to reload the dictionaries and then write the steno outlines for the AccelerWriter definition.
- If you assigned the macro to a keyboard command, press the assigned keys.

## Create an AccelerWriter Definition using the Wizard

1. Open the appropriate dictionary.
2. Press **Alt + e, w** (**Edit/Insert AccelerWriters**). The Insert AccelerWriter Entry dialog displays.
3. Make the following entries:

### Steno

Insert the steno you write to invoke the AccelerWriter. You can type either a forward slash (/) or press the Spacebar to separate steno outlines. For example, to use a two stroke outline, such as "KR-T KR-T", you could type KR-T -- then type / or press the Spacebar to finish with the second stroke, KR-T. When typing steno that starts with a final stroke, place a – (hyphen) before the first letter. It is recommended to use a one stroke entry to invoke an AccelerWriter.

### Entry Text

The text portion of the dictionary definition that calls the macro to run when you write the steno entered in the *Steno* field. Case CATalyst automatically fills in this field with the specified macro file name. Select **Browse** to choose the macro you want to associate with the steno identified in the *Steno* field. You cannot type directly into this field.

### Browse

Display the Choose Macro File dialog box where the contents of the Macros case display. Choose the macro to run when you write the steno identified in the *Steno* field and then select **Open**. Case CATalyst inserts the name of the file in the *Entry Text* field. Two ampersands (&&) precede the entry to identify it as an AccelerWriter.

Macros are stored in the Macros case located in the System Files case. You cannot use a macro from another user.

### Generate All Possible Misstrokes

Check this box to generate additional AccelerWriter definitions based on all the possible misstrokes of the original steno outline. Case CATalyst generates a definition provided the generated misstroke does not conflict with an existing entry in the Personal Dictionary.

4. Press **Enter (OK)**.  
If you opened your Personal Dictionary and there is a definition that has a longer match for the steno you typed, the following message displays:

Do **one** of the following:

Click Yes to return to the Insert AccelerWriter dialog box to change the steno outline.

Click No to insert the entry into your Personal Dictionary knowing that because there is an existing entry in the dictionary with a longer match to the steno, the macro will not take action until translate waits to see if the longest match is written.

5. When finished creating AccelerWriters, press **Esc (Cancel)**.
6. Press **Ctrl + s (File/Save)** to save the dictionary. If you are writing realtime, you can test the AccelerWriters by returning to the realtime file and writing the steno outline for the selected AccelerWriter.

## Create AccelerWriters manually

The [Insert AccelerWriters](#) feature in Manage Dictionary is a wizard that allows you to quickly Browse for the macro and automatically create the text portion of the AccelerWriter definition with the appropriate delineating characters. Alternatively, you can manually type the entire definition using the Manage Dictionary, Insert feature.

## Manually Create an AccelerWriter Definition

1. Open the appropriate dictionary.
2. Press **Alt + e, i (Edit/Insert)**. The Insert Dictionary Entry dialog displays.
3. Make the following entries:

### Steno

Insert the steno you write to invoke the AccelerWriter. You can type either a forward slash (/) or press the Spacebar to separate steno outlines. For example, to insert a two stroke outline, such as KR-T KR-T, you could type KR-T -- then type / or press the Spacebar to finish with the second stroke, KR-T. When typing steno that starts with a final stroke, place a – (hyphen) before the first letter. You may have the best results when using one steno outline to invoke an AccelerWriter. For more information about typing steno outlines in the Steno field, see the [Steno Shortcut Table](#).

### Text

Type two ampersands (&&) to indicate an AccelerWriter and then type the name of the macro.

The text portion of the dictionary entry must begin with two ampersands (&&). The name must be the same name as the macro; however, the name is not case sensitive. For example, you created a macro that inserts your credit file. You name the macro: *Insert My Credit File*. The dictionary entry can be any the following for the AccelerWriter:

&&insert my credit file

&&INSERT MY CREDIT FILE

&&Insert My Credit File

### Generate All Possible Misstrokes

Check this box to have Case CATalyst generate additional AccelerWriter definitions based on all the possible misstrokes of the original steno outline. Case CATalyst generates a definition provided the generated misstroke does not conflict with an existing entry in the Personal Dictionary.

4. Press **Enter (OK)**.
5. When finished creating AccelerWriters, press **Ctrl + s (File/Save)** to save the dictionary.

## Include Dictionaries

CATalyst BCS allows you to take all the entries from one dictionary and copy them into another dictionary. You can include a dictionary from Manage Dictionary or Manage Jobs. Manage Dictionary lets you open and view dictionary entries before including them. Using the Include feature, you bring in

the entire contents of a different dictionary into the displayed dictionary. You cannot Undo an included dictionary unless you exit the file without saving. Any other changes in the file not previously saved, are lost. Stenograph recommends that you save dictionary changes before using the Include feature.

Manage Jobs allows you to quickly move the all the entries from one dictionary into another by dragging and dropping the source dictionary file into the destination file. You cannot undo the move.

Certain Dictionary options affect included dictionaries:

- The option, *What to do with source dictionary after Include*, determines how CATalyst BCS handles the included (source) dictionary, deleting it, retaining it or displaying a decision box at the time of the include.
- The option, *How to treat entries with duplicate steno when Pasting*, determines how CATalyst BCS handles any steno outlines that may conflict with the entries in the destination dictionary.

## Include a Dictionary from Manage Dictionary

In Manage Dictionary, use the Include (**F9**) feature to bring in the entire contents of another dictionary into the currently open dictionary. You might use the Include feature to add your Update Area entries to your Personal Dictionary or to combine two caption session dictionaries. Once you have selected to include a dictionary, you cannot Undo an included dictionary, except to exit the file without saving. Stenograph recommends you save changes to the destination dictionary before using the Include command.

There are two [Dictionary Options](#) settings that affect including a dictionary into another dictionary. The first option is a setting as to how to treat entries with duplicate steno. In other words, the same steno outline exists in both the source and destination dictionary but with a different text definition. The second option determines what happens after the source dictionary is included into the destination dictionary. You may want to review these settings before including a dictionary.

### To include a dictionary from Manage Dictionary:

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary you want to open. Depending on your selection, the Open Existing Document dialog box displays.
2. If appropriate, the Open Existing Document dialog box displays. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **F9 (File/Include)**. The Include Dictionary dialog box displays.
4. Select a dictionary to include. The file highlighted for selection displays in the File name field. To select a dictionary from another user, first select the user from the Look in field of the Include Dictionary dialog box and then select the dictionary.
5. Press **Enter (OK)**. A warning message displays if the option, "Warn before voiding undo ability when using Include", is selected in Dictionary Options. Press **Alt + y (Yes)** to continue with the Include.
6. The entries are inserted into the dictionary. Depending on your Dictionary Options selections, you may be prompted that duplicated entries exist and your action is required.
  - Keep Old Text (**Alt + o**) - the definition in the destination dictionary will be retained.
  - Keep New Text (**Alt + n**) - the definition in the source dictionary will overwrite the destination dictionary definition.
  - Create Conflict (**Alt + c**) - a conflict will be created between the source and destination dictionary definitions.

- Keep Neither (**Alt + e**) - neither definition will be retained and the destination dictionary entry will be deleted.
- *Apply this choice to the rest of the duplicate entries for this include* - allows to select an above action and have all remaining duplicate entries be handled by the selected action. For example, let's say that you select Create Conflict as a duplicate entry action and then select the *Apply this choice to the rest of the duplicate entries for this include* option, all duplicate entries will be included as conflicts with the destination entries and you will no longer be prompted during this include.

Depending on your Dictionary Options, you may also be prompted to delete the source dictionary.

**Yes** - deletes the source dictionary.

**No** - retains the source dictionary with all entries retained.

7. Press **Ctrl + s (File/Save)** to save the dictionary when finished.
8. Press **Ctrl + F4 (File/Close)** to close the dictionary. If another dictionary is open, that dictionary displays. If no other dictionary is open, the Manage Dictionary function closes.

### Include Dictionary in Manage Jobs

In Manage Jobs, drag and drop one dictionary on top of another dictionary to bring the entire contents of the first file into the second file. For example, you might drag your Update Area onto your Personal Dictionary or drag one job dictionary unto another job dictionary to combine them. Entries merged into the dictionary for a current job are immediately recognized for translation once the dictionary is saved. Once you combine the dictionaries in this manner, you cannot undo the change.

There are two [Dictionary Options](#) settings that affect including a dictionary into another dictionary. The first option is a setting as to how to treat entries with duplicate steno. In other words, the same steno outline exists in both the source and destination dictionary but with a different text definition. The second option determines what happens after the source dictionary is included into the destination dictionary. You may want to review these settings before including a dictionary.

1. In Manage Jobs, click and hold the left mouse button on the dictionary name (source) you want to include into another dictionary (destination).
2. Move the source dictionary over the destination dictionary, highlighting the destination dictionary.
3. Release the mouse button. A confirmation message displays prompting you that you want to include the source dictionary with the destination dictionary. Select **one** of the following:

#### **Yes**

Include the entries from the source dictionary into the destination dictionary. You cannot undo the include.

#### **No**

Cancel the include.

4. The entries are inserted into the dictionary. Depending on your Dictionary Options selections, you may be prompted that duplicated entries exist and your action is required.
  - Keep Old Text (**Alt + o**) - the definition in the destination dictionary will be retained.
  - Keep New Text (**Alt + n**) - the definition in the source dictionary will overwrite the destination dictionary definition.

- Create Conflict (**Alt + c**) - a conflict will be created between the source and destination dictionary definitions.
- Keep Neither (**Alt + e**) - neither definition will be retained and the destination dictionary entry will be deleted.
- *Apply this choice to the rest of the duplicate entries for this include* - allows to select an above action and have all remaining duplicate entries be handled by the selected action. For example, let's say that you select Create Conflict as a duplicate entry action and then select the *Apply this choice to the rest of the duplicate entries for this include* option, all duplicate entries will be included as conflicts with the destination entries and you will no longer be prompted during this include.

Depending on your Dictionary Options, you may also be prompted to delete the source dictionary.

**Yes** - deletes the source dictionary.

**No** - retains the source dictionary with all entries retained.

## Insert and Modify EZ Speaker Entries

EZ Speakers dictionary entries use placeholders for speaker names and, depending on the type of entry, for steno. The placeholder text is designated with an EZ Speaker field, such as [!EZ SPEAKER 00]. Using the [Create EZ Speakers](#) feature during a captioning session, you identify the speaker names and steno for each placeholder. CATalyst BCS then generates the speaker definitions in either a job or case dictionary. The actual EZ Speakers dictionary is not used during translation.

### Create, Modify or Delete Entries

1. Press **Alt + f, o, d, e** (**File/Open/Dictionary/EZ Speakers**).
2. The Open dialog box displays. Select the EZ Speakers dictionary you want to open and press **Enter** (**Open**).
3. In the EZ Speakers dictionary, do **any** of the following:

#### Insert a new Entry

Press **Ctrl + i** (**Edit/Insert**). The Insert Dictionary Entry dialog box displays with empty Steno and Text fields.

#### Modify an Entry

Use Search (**Ctrl + f**) or cursor movements to find the entry you want to modify and then press **Ctrl + m** (**Edit/Modify**). The Modify Dictionary Entry Dialog box displays with the current Steno and Text for the definition.

#### Delete an Entry

Move your cursor to the entry you want to delete and press **Del** or **Delete**. A warning message displays. Select **Yes** to confirm the deletion. No further steps are necessary.

4. Make entries as necessary:

#### Steno

Type new or modify existing steno outlines.

### Standard ID

Use a Standard ID entry when you write the same steno outline for a speaker identification on every job and then define the steno with the appropriate speaker's name for each job. Type the steno outline you always write to indicate the speaker. For example, you always write EUFPLT/EUFPLT to indicate the first speaker or the Plaintiff's attorney. Type EUFPLT/EUFPLT in the *Steno* field. You must create a separate definition for each speaker.

### Super ID

Use a Super ID when you write different steno outlines to identify each speaker for every session. For example, you have Mr. Redford and Ms. Wilson in the session. You write RED/RED to identify Mr. Redford and WEUL/WEUL to identify Ms. Wilson. A Super ID uses the exclamation mark as a placeholder, to represent the variable steno outline entry. Type an ! (exclamation mark) in the *Steno* field.

### Text

Type new or modify existing text for the steno outline. Include all format symbols, punctuations, and font characteristics as necessary. To add extended characters to the definition, place the cursor in the Text field and press **F9**. The Insert Character dialog box displays. Double click a character to insert. CATalyst BCS inserts the character at the cursor location. Use the Insert Field button to insert an EZ Speaker field if appropriate.

#### Example

If you are creating a Standard ID, your text entry may look like the following:

<Colloquy>>>[!EZ SPEAKER 01]:space

If you are creating a Super ID, your text entry may look like the following:

<Colloquy>>>[!EZ SPEAKER 00]:space

### Insert Field

Display the Insert Field dialog box. Select an EZ Speaker field to insert into the text portion of the definition and click **OK**. If the [EZ SPEAKER 01], [EZ SPEAKER 02], etc. fields do not exist, select **New Field** to create the necessary field.

### FS

Display the list of available format symbols. To always display the format symbol list, check the box, Always Show Format Symbols. Double click the format symbol you want to use in the definition. You can insert a format symbol at any point in the text entry.

You can also use shortcut keys to insert a format symbol in the Text field. Place the cursor in the Text field, press **F4** and then press the appropriate letter or symbol.

### Endings

This option is not applicable when inserting or modifying EZ Speaker entries in the EZ Speakers dictionary.

### Generate All Possible Misstrokes

This option is not usually applicable when inserting or modifying EZ Speaker entries in the EZ Speakers dictionary. This option is available when creating EZ Speakers using the [Create EZ Speakers](#) feature.

5. Press **Enter (OK)**. If an exact entry exists, CATalyst BCS prompts you with a message that the entry already exists.
6. Press **Ctrl + s (File/Save)** to save the dictionary when finished.
7. Press **Ctrl + F4** to close the dictionary.

## Modify Dictionary Columns

To modify the way columns display information in Manage Dictionary, do any of the following:

### Change the column display order

From the Tools menu, select Dictionary Options. The Dictionary Options dialog box displays. In the Column Display Order section, check the box next to the columns you want to display.

To move a column to a different position, highlight the column name. Use the arrow button to the right to position the column into the desired location. Moving the position up in the list moves the column to the left in the display. Moving the position down in the list moves the column to the right in the display.

### Change the sorting column and sorting order

Click the column heading by which you want to sort dictionary information. A triangle to the right of the column heading identifies the column used for sorting. Click the column heading until the triangle points up for ascending order or down for descending order.

For example, if you want dictionary entries sorted by Modified Date in descending order, click the Modified Date column heading. Click again, if necessary, to have the triangle point down.

Text	Steno	Modified Date	Usage Count	Used Date
elbow	EW E L	10-12-04	0	
elevate	S RA EU T	10-19-04	0	
elm	E L P L	10-19-04	0	
Elmer	P H E R	10-14-04	0	
elects	HR E B QTS	10-20-04	0	

### Change the column width

Place the cursor on the line dividing the column headings and hold the left mouse button down. The cursor becomes a double headed arrow. Move the line left or right to the desired position. Release the button.

When you exit the Manage Dictionary function, the column widths return to the default settings.

### Change the font in the columns

Press **Alt + v, f (View/Font)** to display the Font menu and select an area to change. When the Font dialog box displays, make changes as necessary and press **Enter (OK)**. You can modify the following areas as indicated:

#### Column Headers

Affects the font for all the column headings.

### Steno

Affects the font in the Steno column for all dictionary entries.

### Text

Affects the font in the Text column for all dictionary entries.

### Other

Affects the font in the Modified Date, Used Date, and Usage columns.

## Print Dictionary Entries

You can print the entries in your dictionary. The current sorting order displayed on the Manage Dictionary screen determines the print output. Set the [sorting order](#) before printing.

To print the dictionary entries in crowded line format and save the number of pages needed to print the dictionary, select the [dictionary option](#), Print Steno in Crowded Format.

## Print Entries

1. Press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the dictionary type. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Do one of the following:

### Print Selected Entries

Mark the entries you want to print and press **Ctrl + p**. In the Print dialog box, choose **Selection** for the Print range.

### Print All Entries

Press **Ctrl + p (File/Print)**. The [Print](#) dialog box displays.

4. Confirm the printer settings and press **Enter (OK)**.

## Select All

Select All is a feature in Manage Dictionary that allows you to highlight all the entries in the dictionary or Wordlist for a subsequent action.

## Spell Check Dictionary Entries

The Manage Dictionary Spell Check feature checks the spelling of the text portion of entries in an open dictionary and an entry when you are inserting or modifying dictionary entries. Several dictionary Spell Check [options](#) allow you to customize Spell Check to your writing style. For example, you can select to automatically check for errors such as punctuation, spacing, hyphenation and identify [wordlists](#) which contain words CATalyst BCS should ignore during Spell Check. To use Spell Check when inserting or modifying dictionary entries, you must select the dictionary Spell Check option, Spell Check While Defining. Dictionary Spell Check options apply only to spell checking in Manage Dictionary.

Complete the following steps to [Spell Check](#) the text portion of all the entries in the open dictionary. Some features, specific to spell checking in a transcript, are unavailable while using Spell Check in Manage Dictionary.

1. From anywhere in Case CATalyst or CATalyst BCS, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Do one of the following:

### **Spell Check the Dictionary**

Press **Shift + F7 (Tools/Spell Check)**. The Spell Check dialog box displays when an entry contains a word or words that Spell Check identifies as misspelled. The Spell Check feature begins checking from the cursor location forward.

### **Spell Check While Inserting/Modifying Dictionary Entries**

- a. Verify that the Dictionary Spell Check [option](#), Spell Check While Defining is selected. If the option is not active, you can press Shift + F7 with your cursor in the Text Field to check the word.
  - b. Press **Ctrl + i (Edit/Insert)** or **Ctrl + m (Edit/Modify)** to open the Insert/Modify dialog box and make entries. If you misspell the text portion of any entries you add or modify, the Spell Check dialog box displays.
4. The following information displays in the Spell Check dialog box:

#### **Steno**

The steno associated with the text identified as misspelled.

#### **Text**

The word identified as misspelled.

#### **Change To**

CATalyst BCS automatically displays an alternative word. You can select a word from the Suggestions list or type a different word in the Change To field and click Suggest. When words display in the Suggestions field, CATalyst BCS highlights the closest match to the typed change.

#### **Suggestions**

Alternative words to the suggestion in the Change To field. Click a word to select it.

5. Use the following actions as necessary:

#### **Change**

Change the Text to the word in the Change To field for this occurrence only. Do **any** of the following:

- Accept the suggestion in the Change To field.
- Select a word from the Suggestions list to display in the Change To field.
- Type a word in the Change To field.

#### **Ignore**

Leave the word Spell Check suggested as misspelled for this entry. If Spell Check encounters this word again in this session, Spell Check stops.

#### **Global**

Not available in Manage Dictionary. Use the Manage Dictionary [Search and Replace](#) feature to make a changes to a dictionary entry.

### Ignore All

Leave the word Spell Check suggested as misspelled or repeated for all occurrences during this session. If you exit the dictionary and run Spell Check again in this dictionary, Spell Check stops on words for which you selected Ignore All.

### Wordlist P, K, J

Add the word directly to one of the wordlists. Although the Add to Wordlist dialog box does not display, the word is added to the designated wordlist. Select **one** of the following:

#### P

Press **Alt + p** to add the word to your Personal Wordlist.

#### K

Press **Alt + k** to add the word to the case wordlist. This option is not available when spell checking the Personal Dictionary or the current dictionary is not in a case.

#### J

Press **Alt + j** to add the word to the job wordlist. This option is not available when spell checking the Personal Dictionary.

### Delete

Delete the repeated word in this dictionary entry.

### Wordlist

Add the word to your Personal, case or job Wordlist. Select an action for the word and select a wordlist. If necessary, the [Add to Wordlist](#) dialog box displays where you can select to automatically ignore the word, correct the word or suggest a specific word.

Only the Personal Wordlist is available when spell checking a Personal Dictionary.

### Definition

Check the definition of the word in the Change To field. The Merriam-Webster Dictionary dialog box displays. When connected to the Internet, click the Definition Search  icon to connect to [www.onelook.com](http://www.onelook.com) where you can view additional definitions and information. Press **Esc** to return to the Spell Check dialog box.

### Suggest

Type a different word in the Change To field and click Suggest to show other suggestions.

### Options

Determine how you want Spell Check to look at words. The Spell Check Options dialog box displays where you can set Dictionary Spell Check [options](#) such as setting the number of suggested words to display or selecting additional Wordlists.

6. Do one of the following:
  - When spell checking the dictionary, do one of the following:
    - Spell Check finishes and displays a completion message. Press **Enter (OK)**.
    - Spell Check is still running and you want to stop it. Press **Esc (Cancel)**.

- Spell Check reaches the end of the file and a message displays indicating that Spell Check has reached the end of the dictionary. Select **Yes** to move to the beginning of the dictionary and continue spell checking the beginning of the job. Select **No** to end Spell Check.

This message displays at the end of the file when you start Spell Check at any point in the job besides the beginning.

- When inserting and modifying dictionary entries, do one of the following:
  - The Insert or Modify Dictionary Entry dialog box displays. Continue inserting or modifying dictionary entries or press **Esc (Cancel)** to close the dialog box.
  - If an existing dictionary entry contains the exact steno outline as the new or modified entry, the Duplicate Entry dialog box displays. Review the steno and text, select an action and then press **Enter (OK)**.

## CATalyst BCS Dict View Menu

The CATalyst BCS Dictionary View menu allows access to the [Dictionary Filter](#), [Dictionary Unfilter](#), [Dictionary Show](#) and [Dictionary Font](#) features. The View menu can be displayed in a dictionary by pressing **Alt + v** while the dictionary is open.

### Dictionary Filter

The Manage Dictionary Filter feature allows you to display only dictionary entries based on a specific criteria such as specific text, specific steno outline(s) or a specific type of dictionary entry. For example, let's say you have been captioning for over a year now and you would like to look at all the unused entries in your dictionary. You want to make your dictionary as efficient as possible. You can [filter your dictionary](#) to display all the entries that have not been used since starting CATalyst BCS. You can then decide whether you want to keep them in your dictionary, move them to another dictionary or delete them.

You can also filter a filtered display of the dictionary. There may be times when you filter the display of a dictionary that you want to narrow the display even further. You can now filter within a filtered dictionary. For example, let's say you filter your dictionary for "All Capped" entry type. You select Filter, Entry Type and then All Capped. Some of the results are KRAO\*EU= CIA, KR-FPLT = C, EUFPLT = I, A-FPLT = A, TP-FPLT = F, PW-FPLT = B, AO\*EUFPLT = I, TPWAO\*EU = FBI, etc.

Now, you want to filter the "All Capped" display to only show entries that contain -FPLT so you can see only the entries that are used when fingerspelling. Since you are in a filtered display, you select Filter again. The Filter dialog box is the same except for the addition of a Filter Within Filter button. You select Steno and type -FPLT, select the *Ends With* option and then click the *Filter Within Filter* button (Alt + w). The filtered dictionary display only shows dictionary entries that are defined in all caps and end with the steno -FPLT. In other words, the reporter sees entries such as KR-FPLT = C, EUFPLT = I, A-FPLT = A, TP-FPLT = F, PW-FPLT = B, AO\*EUFPLT = I.

**Filtering a dictionary's view is only a display only function.** Once you select the Unfilter (**Alt + v, u**) command or click the Unfilter icon () , the display returns to the full view of the dictionary. Filter does not remove entries from the dictionary. To filter the dictionary display, press **Ctrl + y** or select View, Filter. You can also click the Filter () icon.

### Filter Entries

1. Press **Alt + f, o, d (File/Open/Dictionary)**.

2. From the dictionary menu, select the dictionary type. When you choose Case or Job, the Open Existing Document dialog box display. Select the dictionary and press **Enter**.
3. Press **Ctrl + y** (**View/Filter** or **Alt + v, u**). The Filter dialog box displays.
4. Make entries as necessary:

### Filter On

Select the method by which you want to filter the dictionary.

#### Steno

Filter by steno. In the field, type the steno for which you want to filter. Separate multiple strokes with a forward slash. When starting with a final stroke, place a – (hyphen) before the first letter.

#### Partial Stroke

Check this box to filter on the specified steno regardless of whether or not it is part of a steno outline. For example, when Partial Stroke is selected to filter on –FPLT, CATalyst BCS finds: -FPLT, FPLTD, FRPBLGTS, FRPBLTS, etc. Filtering on –FPLT without the Partial Stroke option selected, displays entries with –FPLT as a separate outline, such as: -FPLT, -FPLT/-FPLT, etc. CATalyst BCS searches all steno strokes for the letters indicated in the Steno field regardless of your selection in the Location field.

#### Text

Filter by text. In the field, type the text on which you want to filter. Use any of the following options to narrow the scope of the filter. To include [extended characters](#), press **F9**.

#### FS (Alt + f)

To Filter with a format symbol, press F4 and the format symbol shortcut key or display the format symbol list by clicking the FS () icon or pressing **Alt + f**. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry.

#### Case Sensitive

Limit the Filter based on the upper and lower case letters of text typed in the field. If you do not select Case Sensitive, the filter finds all words containing the indicated characters, regardless of the case typed into the Filter On field.

#### Whole Word

Filter only the whole words that match the text typed in the Filter On field. If you do not select Whole Word, the Filter finds the word both as it stands alone and as part of another word. For example, filtering on the word "of" without selecting Whole Word, would include the words "of", "officer", "coffee", "soft", etc. in the filter.

#### Entry Type

Filter on an entry type. Click the arrow to display a list of available entry types.

Select **one** Filter type:

#### Conflict

All entries that contain a conflict end format symbol.

**Scan stop**

All entries that contain scan stop begin or end format symbol.

**Numbers**

All entries that contain numbers.

**All Capped**

All entries that contain all capped text.

**Contains capped**

All entries that contain at least one capital letter.

**Phrase**

All entries that contain two or more words separated by a space.

**Contains punctuation**

All entries that contain punctuation.

**Contains format symbol**

All entries that contain a format symbol.

**Used Entries**

All entries used for translation since loading the dictionary on CATalyst BCS.

**Unused Entries**

All entries that have not been used for translation since loading the dictionary on CATalyst BCS.

**Contains Fields**

All entries that contain fields.

**Repeated Stroke Entries**

All entries that contain repeated steno outlines, such as STPHAO/STPHAO and STPHAO/STPHAO/STKPWHR.

**Auto Includes**

All entries that begin with @.

**AccelerWriter**

All entries that begin with &&.

**Number Conversion**

All entries that contain the {Number Conversion} translate command.

**Number Trigger**

All entries that contain the {Number Trigger} translate command.

**Numeral Words**

All entries that contain a word number including hundred, thousand, million, etc.

**Speaker Entries**

All entries that contain a <Colloquy> format symbol and a colon and all entries defined with the <By-line> format symbol.

**One stroke**

All one stroke entries.

**Two strokes**

All two stroke entries.

**Three strokes**

All three stroke entries.

**Four strokes**

All four stroke entries.

**Five strokes**

All five stroke entries.

**6 or more steno strokes**

All entries that contain six or more steno outlines.

**2 or more steno strokes**

All entries that contain two or more steno outlines.

**3 or more steno outlines**

All entries that contain three or more steno outlines.

**Live Suggestions**

Entries created by using a Define With LS1 - LS5 command on a Live Suggestion.

The invisible identification on these entries stay with the entries unless the entries are copied or moved to another dictionary, you export and import a dictionary back into Case CATalyst or you modify an entry or entries with this invisible identification.

**Used Briefs**

Entries created by using a suggested brief in the Brief It pane.

The invisible identification on the entries stay with the entries unless the entries are copied or moved to another dictionary, you export and import a dictionary back into Case CATalyst or you modify an entry or entries with the invisible identification .

**Live Suggestions and Briefs**

Entries created by using a Define With LS1 - LS5 command on a Live Suggestion and entries created by using a suggested brief in the Brief It pane.

The invisible identification on the entries stay with the entries unless the entries are copied or moved to another dictionary, you export and import a dictionary back into Case CATalyst or you modify an entry or entries with the invisible identification.

**Contains <Oops> symbols**

Entries that contain an [Oops](#) format symbol regardless of the category assignment. The Oops format symbol allows for 10 category (0 - 9) assignments. This filter will show all dictionary entries that contain the Oops format symbol.

### Location

Select the Filter On parameters.

#### Exact Match

Entries that exactly match the steno or text entered in the Filter On field.

#### Begins With

Entries that begin with the steno or text entered in the Filter On field.

#### Ends With

Entries that end with the steno or text entered in the Filter On field.

#### Contains

Entries that contain, anywhere in the entry, the steno or text entered in the Filter On field.

#### Range

Text entries that fall within the specified range. Enter the beginning text you want to display in the From field. Enter the ending text in the Thru field. All entries between this range display. For example, to Filter all the words that begin with the letter "a", select Text and then select Range. In the From field type **a** and in the Thru field type **az**.

5. Press **Enter (OK)** to filter the dictionary. The Filter dialog box closes and the dictionary window displays the filtered entries. If Show Status Bar is active, the number of entries matching the Filter criteria displays in the lower left corner (X filtered entries of X dictionary entries). When there is no match for the selected steno or text filter, a message displays.

If you insert or modify a dictionary entry that does not match the current Filter criteria, the following message displays:

Press **Enter** to dismiss the message or press **Alt + u** to select the I understand the consequences of my actions. Please stop asking. This option disables the 'doesn't fit filter criteria' message box until the [Dictionary Option](#) *Warn before inserting or modifying an entry in a filtered display* is set to Yes.

6. Do **any** of the following:
  - To return the dictionary display to Full View, press **Alt + v, u** (**View/Unfilter** or click the Unfilter (🔍) icon ).
  - To filter the current filtered entries, press **Ctrl + y** or press **Alt + v, i** (**View, Filter**). Follow the instructions in Step 5. Click the **Filter Within Filter** button or press **Alt + w** to filter for entries only in the filtered display.  
**Note:** If you select the Filter button, instead of Filter Within Filter button, you are starting a new filter.

- To close the dictionary and return the display to all dictionary entries, press **Alt + f, x** or **Ctrl + F4**. You will be prompted if there are unsaved changes. Select whether to save the changes or not.

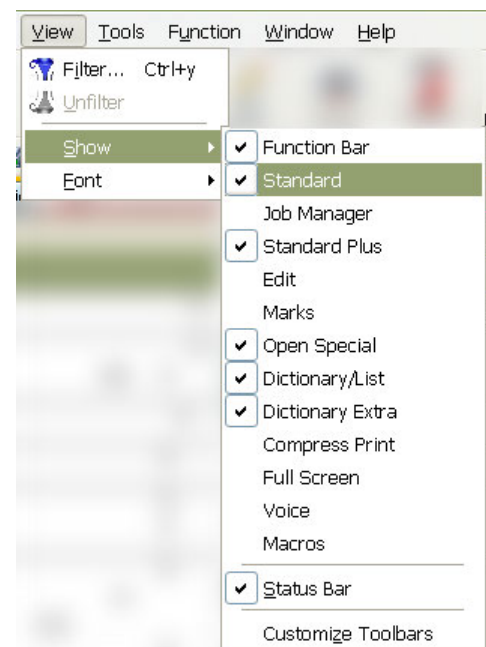

## Dictionary Unfilter

When you [filter](#) your dictionary, it is only filtering the dictionary to show the items you requested. Once you have filtered the display of your dictionary, you can return to the full view of your dictionary by pressing **Alt + v, u** or by clicking the Unfilter (🗑️) icon. Also, if you close your dictionary the next time you open it, all dictionary entries display.

## Dictionary Show

The Show option displays all the available toolbars and allows you to customize what toolbars display in the Manage

Dictionary feature. To show a specific toolbar, press **Alt + v, s** and confirm there is a check mark in front of the menu item. To hide a specific toolbar, press **Alt + v, s** and remove the check mark in front of the menu item.

## Dictionary Font

You can change the display font for the dictionary column headers, text portion of the definition, steno portion of the definition and modified date, used date and usage column text information. Press **Alt + v, f** (**View/Font**) to display the Font menu and select an area to change. When the Font dialog box displays, make changes as necessary and press **Enter (OK)**. Changing the font assignments in one dictionary changes them for all dictionaries in the current user. You can modify the following areas as indicated:

### Column Headers

Affects the font for all the column headings.

### Steno

Affects the font in the Steno column for all dictionary entries.

### Text

Affects the font in the Text column for all dictionary entries.

**Other**

Affects the font in the Modified Date, Used Date, and Usage columns.

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select Personal, Case, Job, EZ Speakers, Power Define or Update Area, if selected for use. The Open Existing Document dialog box displays.
2. Select the dictionary for which you want to set font attributes and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Alt + v, f (View/Font)**.
4. From the submenu, select one of the following for which to set the font attributes.
  - **Column Headers** - change the font style for all the column headers.
  - **Steno** - change the font style for the steno in the Steno column.
  - **Text** - change the font style for the text in the Text column.
  - **Other** - change the font style for the text in the Modified Date, Usage Count and Used Date columns.
5. In the Font dialog box, make necessary entries:

**Font**

Select a font type.

**Font Style**

Select a font style:

- **Regular**—no style attributes
- **Italics**—applies italics to the selected font
- **Bold**—applies bold to the selected font
- **Bold Italic**—applies italics and bold to the selected font.

**Font Size**

Select a font size. Size is in points.

**Sample**

A sample of how text displays in the job with the selected font settings.

**Script**

Select the language in which the characters display. Although a variety of languages are displayed, Western is the only supported language.

6. Press **Enter (OK)** to save the settings.

## CATalyst BCS Lists & Tables

Several lists and tables provide integrated functionality of various CATalyst BCS features. Keyboard Maps, for example, allow customization of key combinations used to invoke captioning sessions/edit commands. For example, in the default captioning keyboard map (System Files\Captioning\Default), pressing F7 suspends the captions and pressing Ctrl + 1 will send one line at a time.

## CATalyst BCS Lists & Tables

- [Format Symbols Options Table](#)
- [Global Table](#)
- [Keyboard Maps](#)
- [NumberConversion.ini File](#)
- [Phonetic Table](#)
- [Prefixsuffixrules File](#)
- [User Definitions Table](#)

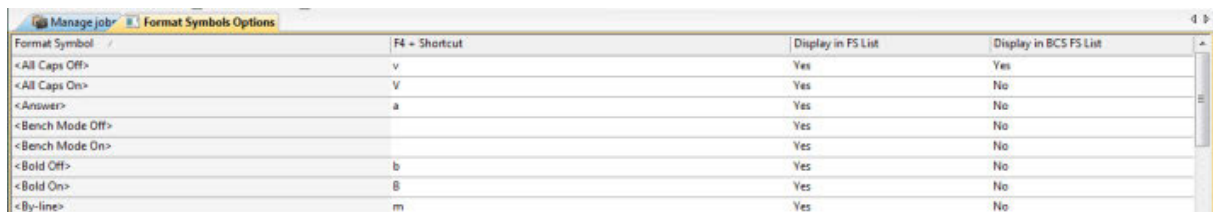

### Format Symbols Options Table

The Format Symbols Options table contains CATalyst BCS translate commands and [CATalyst BCS format symbols](#) along with the default shortcut key assignments. Shortcut keys allow you to insert a format symbol or translate command by invoking a key combination of F4 plus the key associated with the command. For example the default "F4 t" inserts a Tab or the default "F4 X" inserts a {Suffix} translate command in a definition. Not all format symbols and translate commands have a default shortcut key assignment.

You can customize the shortcut key assignments, add new assignments and manage the display of format symbols in the Format Symbols list to suit your writing style. For example, you may want to assign shortcut keys to the commonly used <Caption:> format symbols. The *Display in BCS FS List* column only displays if your e-Key includes the optional Broadcast Captioning Suite option.

The Format Symbol Options table is sortable by column in ascending or descending order. To sort, click on a column heading. The arrow in the column heading indicates when the sort in the selected column is in ascending or descending order. You can also [search](#), [print](#) the entire table and [print a reference sheet](#).

To open the Format Symbols Options table, press **Alt + f, o, i, o** (**File/Open/List/Table/Format Symbols Options**).

Format Symbol	F4 + Shortcut	Display in FS List	Display in BCS FS List
<All Caps Off>	v	Yes	Yes
<All Caps On>	V	Yes	No
<Answer>	a	Yes	No
<Bench Mode Off>		Yes	No
<Bench Mode On>		Yes	No
<Bold Off>	b	Yes	No
<Bold On>	B	Yes	No
<By-line>	m	Yes	No

### Modify Format Symbol Options Table Entries

The Format Symbols Options table contains CATalyst BCS translate commands and format symbols with default shortcut key assignments. You can customize the shortcut assignments to meet your needs.

#### Modify Entries

1. Press **Alt + f, o, i, o** (**File/Open/List/Table/Format Symbols Options**). The Format Symbols Options table displays.
2. Highlight the entry you want to modify and press **Ctrl + m** (**Edit/Modify**). You can use the [Search](#) feature to quickly locate an entry in the table.

3. In the Modify dialog box, make necessary entries:

#### F4 Shortcut

When a shortcut key assignment exists for the selected format symbol or translate command, it displays in the field. To change or assign a shortcut key assignment, click the down arrow and select a character from the list. If you select a shortcut key that is already assigned to another format symbol, CATalyst BCS prompts you to reassign the key. Select Yes or No at the prompt. To remove an assignment, select the "blank" option at the top of the drop down list.

#### Reset to Default Value

Reset the selected format symbol shortcut key assignment to the default value. If the default is a capital letter, CATalyst BCS restores it as a capital letter. The value in the table changes once you click OK.

#### Display this format symbol when showing the Format Symbols list

Display the format symbol in the Case CATalyst Insert Format Symbol dialog box. The shortcut key assignment for the format symbol works regardless of the display status. The word "Yes" displays in the Format Symbol Options table indicating the format symbol is selected to display.

#### Display this format symbol when showing the Format Symbols list in BCS

Display the format symbol in the CATalyst BCS Insert Format Symbol dialog box. The shortcut key assignment for the format symbol works regardless of the display status. The word "Yes" displays in the Format Symbol Options table indicating the format symbol is selected to display.

If the *Hide Caption-specific format symbols* option in [Advanced Edit Options](#) is set to Yes, it overrides the individual settings made for captioning format symbols in the Format Symbols Options table.

4. Press **Enter (OK)** to apply the changes and close the dialog box.
5. Press **Ctrl + s (File/Save)** to save the changes to the Format Symbols Options table. Changes are active in the Insert Format Symbol dialog box once you save the changes.

## Change Format Symbols Options Table Fonts

The font type and size for the body and heading text in the Format Symbol Options table are customizable. The font type and size applies equally to the body and heading text.

### Modify the Font:

1. Press **Alt + f, o, i, u (File, Open, List/Table, Format Symbols Options)**.
2. Do either of the following:
  - If the Dictionary/List Toolbar (  ) is displaying, go to Step 3.
  - If the Dictionary/List Toolbar is not displaying, right click a toolbar and select Dictionary/List Toolbar.
3. Do any of the following:
  - Click the Font style icon (  ) to change the font type.
  - Click the Font size icon (  ) to change the font size.

4. Closing the Format Symbols Options table saves the font change information. If you have made other changes, you will be prompted to save your changes.

## Search Format Symbol Options Table

Search allows you to locate a format symbol or translate command in the Format Symbol Options table. You can search forward or backward for a whole word, part of a word, or multiple words. Once a searched entry displays, you can repeat the search for the same text and search parameters by using Repeat Search Forward or Repeat Search Backward.

### Search the Table

1. Press **Alt + f, o, i, o** (**File/Open/List/Table/Format Symbols Option**). The Format Symbols Options displays.
2. Press **Ctrl + f** (**Edit/Search**). The Search dialog box displays.
3. Select the method by which you want to search the Personal Globals table.

#### Specific Text

Search by specific text. In the *Search* field, type the text you want to find.

#### Entry Type

Customize the search by entry type. CATalyst BCS searches all the columns for entries that contain the selected entry type. Click the down arrow to select an entry type from the list:

##### Numbers

The first entry that contains numbers.

##### All Capped

The first entry that contains all capped text.

##### Contains capped

The first entry that contains at least one capital letter.

##### Phrase

The first entry that contains two or more words separated by a space.

##### Contains punctuation

The first entry that contains punctuation.

##### Numerical Words

The first entry that contain a word number including hundred, thousand, million, etc.

4. Use the remaining fields as necessary:

#### Case Sensitive

Check this box to limit the search based on the upper and lower case letters of text typed in the *Search* field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field. This option is unavailable when searching by *Entry Type*.

#### Whole Word

Search only for the words that match the text typed in the *Search* field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. This option is unavailable when searching by *Entry Type*.

### Location

Select search parameters. This option is unavailable when searching by *Entry Type*.

#### Exact Match

Search for entries that exactly match the text entered in the *Search* field.

#### Begins With

Search for entries that begin with the text entered in the *Search* field.

#### Ends With

Search for entries that end with the text entered in the *Search* field.

#### Contains

Search for entries that contain, anywhere in the entry, the text entered in the *Search* field.

### Direction

Select **one**:

#### Forward

Search forward, from the cursor position to the end of the file.

#### Backward

Search backward, from the cursor position to the beginning of the file.

5. Press **Enter (OK)** to start the search. If no match is found for the search item, a message displays.
6. To repeat the same search, press **F3 (Edit/Repeat Search Forward)** or **Shift + F3 (Edit/Repeat Search Backward)**.

## Print Format Symbol Reference Sheet

The format symbols and shortcut keys in the Format Symbol Options table are printable as a reference sheet. You can print the reference sheet in format symbol or shortcut key sort order.

### Print a Reference Sheet

1. Press **Alt + f, o, i, o (File/Open/List/Table/Format Symbols Options)**. The Format Symbols Options table displays.
2. Select File/Print Reference Sheet and choose a sort order from the submenu.

## Keyboard Maps

A keyboard map (.sgkbd) contains keyboard commands with associated History window or Dictionary functions, respectively. The keyboard map entries determine the action or function that occurs as a result of pressing a key or combination of keys on the keyboard. For example, when the Default keyboard map is active in the History window, pressing the right arrow moves the cursor to the right one word at a time; Ctrl + right arrow moves the cursor to the right one character at a time; pressing F5 clears the caption video.

The History window and Manage Dictionary have independent customizable keyboard maps. You can create new keyboard maps and/or modify existing ones by [modifying](#) the keyboard map entries. Keyboard functions available for assignment differ in the History window and Manage Dictionary. Certain keys and key combinations are unavailable for assignment to a keyboard function because they are used by CATalyst BCS. For example, the F4 key, used to insert format symbols and F10 key, used to place the cursor focus on the menu bar, are not available. Although the F4 key is not available for reassignment, you can assign any key to act as the F4 key by assigning the key to the F4-Key function. Certain key combinations for the following keys are also unavailable: F1, F6, Esc, and Tab. These keys are available to use in the following key combination assignments: F1 + Ctrl, F1 + Shift and F1 + Ctrl+Shift; F6 + Shift, Esc + Shift and Tab + Shift. In addition to assigning a keyboard function, you can create and assign a [macro](#) to a keyboard command. Only one keyboard function or macro can be assigned to a key or key combination.

The History window opens, by default, with the [Default](#) keyboard map active. You can create and use multiple keyboard maps but only one is active at a time. By default, Keyboard maps for the History window are stored in the Captioning case. The [Default Keyboard Map](#) option allows you to specify the active keyboard map for the History window and for a caption file while editing. The Default keyboard map and other customized maps for the History window are located in the Captioning case. The Default keyboard map is not initially visible. It becomes visible in the System Files case once you open and save it with the name, **Default**. You can open the Default keyboard map by double clicking the name at the bottom of the History Window. Other keyboard maps can reside in any other location on the computer.

The Personal Command Summary Card feature is available from the View menu when in a keyboard map and also available from the Help menu in any function where you may select any keyboard map. The Personal Command Summary Card always displays the current keyboard map assignments. In other words, if you make changes to your keyboard map at a later date, you simply select Personal Command Summary Card to see the latest version of your keyboard map. If your e-Key license includes the BCS option, in addition to Basic, Intermediate and Advanced command summary card versions, the BCS Basic and BCS Advanced versions are available.

Manage Dictionary opens, by default, with the Manage Dictionary [Default](#) keyboard map active. Keyboard maps for Manage Dictionary must be stored in the Dictionary case located in the System Files case. The Dictionary case is created once you open and save a keyboard map while in a dictionary. Opening the Dictionary keyboard map for the first time and saving it automatically creates the Default keyboard map in the Dictionary Case. To change the opening active keyboard map in Manage Dictionary, change the setting in [Dictionary Options](#).

The name of the active keyboard map displays on the Status bar at the bottom the screen. Click the name to display a list of available keyboards. You can easily switch the active keyboard map by selecting another keyboard from the list. The [Cycle Keyboard Map](#), also allows you to easily switch the active keyboard map.

A keyboard map displays the following information:

**Key**

The key or key combination available for assignment.

**Function**

The action that occurs when the associated key or key combination is pressed.

**Macro Filename**

The macro location and name assigned to the Play Macro function and associated key.

## Change Keyboard Map Fonts

The font type and size for the body and heading text in the Keyboard Maps are customizable. The font type and size applies equally to the body and heading text.

### Modify the Font:

1. Press **Alt + f, o, i, u** (**File, Open, List/Table, Keyboard Maps**). In the Open Existing Document dialog box, select a Keyboard Map.
2. When the keyboard map displays, do either of the following:
  - If the Dictionary/List Toolbar (  ) is displaying, go to Step 3.
  - If the Dictionary/List Toolbar is not displaying, right click a toolbar and select Dictionary/List Toolbar.
3. Do any of the following:
  - Click the Font style icon (  ) to change the font type.
  - Click the Font size icon (  ) to change the font size.
4. Closing the Keyboard Map saves the font change information. If you have made other changes, you will be prompted to save your changes.

## Create and Modify Keyboard Maps

Create new or customize an existing [keyboard maps](#) in the History window and Manage Dictionary to better fit your writing and captioning style. You may want to create or modify keyboard map entries to perform keyboard functions not currently assigned to a key or key combination, modify a keyboard assignment to a key combination that is easier to remember or to invoke a [macro](#).

### Keyboard Maps in the History Window

Refer to [History Window Keyboard Map Functions](#) for a list of default available keyboard functions available for assignment, including, Upper ANSI and extended ASCII characters available for assignment in any keyboard map. The list identifies the default keyboard assignments for the History window. By default, Keyboard maps for the History window are stored in the Captioning case.

### Keyboard Maps in Manage Dictionary

The Dictionary Default keyboard map is accessible to view and modify after you open it for the first time and save it. The Dictionary case, that stores Dictionary keyboard maps, is created the first time you save the Dictionary Default keyboard map. To access the Dictionary Default keyboard map for the first time and create the Dictionary Case, open a dictionary. Double click **Default** on the Status bar at the bottom of the screen. After the keyboard map opens, close it. When prompted to save the file, select **Yes** to automatically save the keyboard map with the filename, "Default." Keyboard maps for Manage Dictionary must be stored in the Dictionary case located in the System Files case.

Refer to [Dictionary Keyboard Map Functions](#) for a list of default Dictionary keyboard functions available for assignment.

The Insert key does not have a command assigned to it. The Insert key normally is assigned to toggle between Insert and Overstrike. If you want the Insert key to toggle between Insert and Overstrike, assign the Insert Overstrike Toggle command to the Insert key.

You may notice that some keys have the capability for four assignments. You can assign an action to the key itself, the key plus Shift, the key plus Ctrl and the key plus Ctrl + Shift. In other cases, you may only be able to assign an action to the key and possibly the key plus shift. Windows reserves some key combinations that are not to be reassigned.

## Manage Keyboard Maps

1. Open the desired keyboard map type:

### History Window Keyboard Maps

#### Open an Active Keyboard Map

Double click the keyboard name in the Status bar at the bottom of the History window.

#### Open Existing Keyboard Map

Press **Alt + f, o, i, k** (**File/Open/List-Table/Keyboard Map**). The Open Existing Document dialog box displays. Select an existing keyboard map and press **Enter (Open)**.

To open the History window default keyboard map, type the name **Default** in the *File name* field. Once initially accessed, it is available for selection in the Manage Jobs, Systems Files case.

#### Create New Keyboard Map

Press **Alt + f, n, i, k** (**File/New/List-Table/Keyboard Map**). The Create New Document dialog box displays. Type a name in the *File name* field and press **Enter (Open)**.

### Dictionary Keyboard Maps

#### Open the Active Keyboard Map

Double click the keyboard name in the Status bar at the bottom of the Dictionary screen.

#### Open Existing Keyboard Map

Press **Alt + f, o, i, k** (**File/Open/List-Table/Keyboard Map**). The Open Existing Document dialog box displays. Double click the Dictionary case, located in the System Files case. Type an existing name in the File name field and press **Enter (Open)**.

To access the Dictionary Default keyboard map, it is necessary to initially open and save the Dictionary Default keyboard map from an open dictionary. Open a dictionary and double click **Default** on the Status bar at the bottom of the screen. Save the keyboard map as "Default" or rename it.

#### Create New Keyboard Map

Press **Alt + f, n, i, k** (**File/New/List-Table/Keyboard Map**). The Create New Document dialog box displays. Double click the Dictionary case, located in the System Files case. Type a name in the File name field and press **Enter (Open)**.

New Dictionary keyboard maps display with default keyboard command assignments. Dictionary keyboard maps must be stored in the Dictionary case located in the System Files case. If the Dictionary case is not available, create it by opening a dictionary and double clicking **Default** on the Status bar at the bottom of the screen. When the Default keyboard map opens, save or rename it. The Dictionary case is created when you save the keyboard map.

2. Do one of the following:

- Press **Ctrl + i (Edit/Insert)** to add a new key assignment.
  - Double click the key or key combination to modify.
  - Highlight the key or key combination to modify and press **Enter** or **Ctrl + m (Alt + Edit/Modify)**.
3. The Assign Key to Function dialog box displays. Make necessary entries:

### Currently Assigned to

The keyboard function presently assigned to the key or key combination identified in the *Key* field.

### Key

The Key field contains a list of keyboard keys. The options below the Key field indicate if the key is used alone or in conjunction with Ctrl, Shift, or Ctrl and Shift. The selected radio button designates the active key combination. You can assign a different keyboard function to each of the key combinations. For example, in the Default keyboard map, n alone displays the letter "n". **Ctrl + n** displays the View Vertical Notes feature. **Shift + n** displays a capital letter "N".

Select a key for assignment from the drop down list and then click the radio button next to **one** of the following: **Key Only**, **Ctrl + Key**, **Shift + Key**, **Ctrl + Shift + Key**. The keyboard function presently assigned for the selected key combination displays in the Currently Assigned to field. If no keyboard function is assigned, the field is blank.

When you assign a single key to invoke a command, consider assigning Shift plus the same key to the same command. This helps to prevent the possibility of invoking the capped version of a keyboard command when the Caps Lock is on.

### Restore Default Assignment

Restore the default keyboard function assignment for the identified in the *Key* field. This only restores the default assignment for the current key.

### Filter by Category

Click a category to display only the keyboard functions for the selected category in the Functions list. For example, you want to locate *Move to next red squiggle*, which is a Spell Check keyboard function. Select the *Category*, Spell Check to display a list of only the available Spell Check keyboard functions. Select **All** to display all the keyboard map functions available for assignment.

### Functions

To change the keyboard function for the key in the *Key* field, highlight the desired keyboard function from the list. Recorded Macros display alphabetically at the end of end of the list in the Macros section.

### Search

Display the Find dialog box to search for a specific keyboard function.

### Search Functions List

1. Type a keyboard function name or portion of a name in the *Search for* field. To limit the search to a particular category, first select the category in the *Filter by Category* field and then select **Search**.
2. Select the direction to search.
3. Press **Enter (OK)**. To repeat the search, press **F3** to search forward or **Shift + F3** to search backward. If you limited the search by category for the desired keyboard function

and it does not display in the list, the incorrect category was selected. For example, you select to filter by Punctuation for *Move Word Left*. This keyboard function is a Cursor action so Search does not locate it in the Punctuation category.

### Use Windows Default

Use the Windows default keyboard assignment if your Windows Regional Language setting is set to a language other than English. For example, if French is selected as your Windows Regional and Language and the key assignment in the keyboard map is set to Windows default, the keyboard action follows the Windows default French language keyboard.

4. Press **Enter (Assign)**. The entry displays in the keyboard map list.

If you modify an entry with an existing assignment, a message prompts you to continue. Choose **Yes** to replace the existing assignment with the new keyboard function. Choose **No** to retain the existing assignment.

5. Press **Ctrl + s (File/Save)** to save the change to the keyboard map.
6. Press **Ctrl + F4**, to close the keyboard map when finished.

## Delete Keyboard Map Assignment

To delete a keyboard map assignment:

1. Open the keyboard map which contains the key assignment you want to delete. Do either of the following:
  - Press **Alt + f, o, i, k (File/Open/List/Table/Keyboard Map)**. The Open Existing Document dialog box displays. If you are opening a Dictionary keyboard map, double click the Dictionary Case. Type the keyboard map name in the *File name* field and press **Enter (Open)**. The selected keyboard map displays.
  - Open the active keyboard map from the History window for an History window keyboard map or Manage Dictionary for a Manage Dictionary keyboard map. Double click the keyboard name in the Status bar at the bottom of the History window. The keyboard map displays.
2. Highlight the assignment you want to delete and press **Delete (Edit/Delete)**. The following message displays: "Are you sure you want to delete this assignment?" Press **Yes** to delete the entry.
3. Press **Ctrl + s (File/Save)** to save the change to the keyboard map.
4. Press **Ctrl + F4**, to close the keyboard map. If you opened the active keyboard map from the History window, the History window displays. If you opened the active keyboard map from Manage Dictionary, the dictionary displays.

## Filter Keyboard Map Entries

The Filter feature allows you to limit the display of the keyboard map entries to specific keys, keyboard function or macro filename. You can further customize the filtered display using additional criteria. Filter does not remove entries from the keyboard map. All entries display when you apply the Unfilter feature. A filtered display is [searchable](#).

## Filter Keyboard Functions

1. Press **Ctrl + y (View/Filter)**. The Filter dialog box displays.
2. Make necessary entries:

## Filter

### Key

Filter on a specific key. Type the key in the field. To filter on a specific type of key, check the option, **Entry Type**, and select a type from the drop down list.

### Macro Filename

Filter on a specific macro. Type all or part of the macro name in the field.

### Function

Filter on a specific keyboard function. Type all or part of the keyboard function name in the field. To filter on a specific keyboard function category, check the option, **Entry Type**, and select a type from the drop down list.

### Entry Type

Filter on keys or keyboard functions by entry type. Select an entry type from the drop down list. This option is available when filtering by *Key* or by *Function*.

### Case Sensitive

Filter on keyboard functions identified in the field, as it is typed in upper and lower case. If you do not select Case Sensitive, the filter includes all words containing the indicated characters, regardless of the case typed into the field.

### Whole Word

Filter only on whole words that match the text typed in the *Search* field. When Whole Word is not selected, the search finds the word both as it stands alone and as part of another word.

## Location

Select the filter parameter:

### Exact Match

Filter on keyboard functions that match the text in the field exactly as it is entered.

### Begins With

Filter on keyboard functions that begin with the text entered in the field.

### Ends With

Filter on keyboard functions that end with the text entered in the field.

### Contains

Filter on keyboard functions that contain, anywhere in the entry, the text entered in the field.

3. Press **Enter (OK)**. The Filter dialog box closes and the screen displays the filtered entries. If no entry matches the filter criteria, a message displays.

If you search within a filtered display, the search is limited to the filtered entries. If your search cannot locate the entry, unfilter the display or filter by different criteria.

4. Press **Alt + v, u (View/Unfilter)** to redisplay all the entries. If you close the keyboard map in a filtered display, all entries display when you open it.

## Personal Command Summary Cards

The Personal Command Summary Card feature displays your selected keyboard map assignments in a basic, intermediate or advanced command card version. For example, let's say that you have made many changes to the Default keyboard map. You can create a Command Summary Card (reference sheet) based on your own keyboard map assignments. You open your keyboard map, select View, then Personal Command Summary Card. Select the command summary version you want to view. The keyboard command summary card opens in your default browser. You can view the command summary card on the screen and/or select to Print Preview in your browser and then print it (landscape format is best).

The Personal Command Summary Card feature is available from the View menu when in a keyboard map and also available from the Help menu in any function where you may select any keyboard map. The Personal Command Summary Card always displays the current keyboard map assignments. In other words, if you make changes to your keyboard map at a later date, you simply select Personal Command Summary Card to see the latest version of your keyboard map.

If your e-Key license includes the BCS option, in addition to Basic, Intermediate and Advanced command summary card versions, the BCS Basic and BCS Advanced versions are available.

1. To view or print a personalized command summary card, do one of the following:
  - Open your keyboard map, select View and then Personal Command Summary Card.
  - From anywhere in Case CATalyst, select Help, Personal Command Summary Card.
2. Select Basic, Intermediate or Advanced.

If you selected Personal Command Summary Card from the help menu and you are not in a keyboard map, the Choose Keyboard Table dialog box displays. Select any keyboard map.
3. Your Personal Command Summary Card displays in your Internet browser.
  - You can display your Personal Command Summary Card while editing.
  - You can print your Personal Command Summary Card by selecting the Print Preview feature in your browser, confirm Landscape orientation and then click Print.
  - You can save your Personal Command Summary Card to an html file type which will always open in your default internet browser or a specific browser when using the Windows' Open With feature.
4. To close the Personal Command Summary Card display, press Ctrl + F4 or click the X in the upper right hand corner.

## Keyboard Map Functions - Dictionary

You can create a new keyboard map or [modify](#) the entries of an existing Manage Dictionary keyboard map to change the functionality of the keyboard commands while managing dictionary entries. The following table lists all the keyboard functions available for assignment in a Manage Dictionary keyboard map.

Case CATalyst contains a Manage Dictionary Default keyboard map with default keyboard command assignments. The Dictionary Default keyboard map is accessible to view and modify after you open it for the first time and save it. The Dictionary case is created the first time you save the Dictionary Default keyboard map. To access the Dictionary Default keyboard map for the first time and create the Dictionary Case, open a dictionary. Double click **Default** on the Status bar at the bottom of the screen. After the keyboard map opens, close it. When prompted to save the file, select **Yes** to automatically save the keyboard map with the filename, "Default." Keyboard maps for Manage Dictionary must be stored in the Dictionary case located in the System Files case. A keyboard map has the .sgkbd extension.

The Ctrl + Shift + 0 (zero) key combination is reserved for Windows and if assigned to a function or macro in a CATalyst keyboard, nothing will happen when trying to use it.

## Available Keyboard Assignments

Function	Default Keyboard Command	Action
Change Column Header Font - Dict.	F12	Display the Font dialog box to change the font style for the column headings.
Change Other Font - Dict.		Display the Font dialog box to change the font style for the text in the Modified Date, Usage Count and Used Date columns.
Change Steno Font - Dict.		Display the Font dialog box to change the font style for the steno in the Steno column.
Change Text Font - Dict.		Display the Font dialog box to change the font style for the text in the Text column.
Close File - Dict.		Close the current file and display a Save Changes dialog box if there are unsaved changes to the file.
Copy - Dict.	c + Ctrl Insert + Ctrl	Copy the selected entries from the current dictionary and place them on the clipboard.
Copy to Case Dictionary - Dict.		Copy the selected dictionary entries and paste into a selected Case Dictionary without opening the dictionary.

<b>Function</b>	<b>Default Keyboard Command</b>	<b>Action</b>
Copy to Other Dictionary - Dict.		Copy the selected dictionary entries and paste into a selected dictionary without opening the dictionary.
Copy to Personal Dictionary - Dict.		Copy the selected dictionary entries and paste into your Personal Dictionary without opening the dictionary.
Copy to Update Area - Dict.		Copy the selected dictionary entries and paste into Update Area without opening the Update Area.
Create Core List - Dict.		Create a list of unique case or job dictionary entries.
Create EZ Speakers Entries - Dict.		Display the Create EZ Speakers dialog box to identify names for EZ Speaker definitions in a job or case dictionary.
Cut - Dict.	x + Ctrl Delete + Ctrl Delete + Shift	Remove the selected dictionary entries from current dictionary and place them on the clipboard.
Cycle Keyboard Maps - Dict.	\	Change the current keyboard map to the next available keyboard map.
Delete Entry - Dict.	Delete	Delete the highlighted entries.
Dictionary Builder - Dict.		Display the Dictionary Builder Setup dialog box.
Dictionary Options - Dict.		Display the Dictionary Options dialog box.
Dictionary Spellcheck Options - Dict.		Display the Dictionary Spell Check Options dialog box.
Document End - Dict.	End + Ctrl	Move the cursor to the end of the file.

Function	Default Keyboard Command	Action
Document Home - Dict.	Home + Ctrl	Move the cursor to the beginning of the file.
Export to Stenograph Writer		Opens the Export to Stenograph Writer dialog box with the current dictionary selected.
Export to RTF-CRE - Dict.		Display the Save As dialog box with File Type set to RTF.
Filter - Dict.	y + Ctrl	Display the Filter dialog box.
Include Dictionary - Dict.	F9	Display the Include dialog box.
Insert AccelerWriters - Dict.		Display the Insert AccelerWriter Entry dialog box.
Insert Auto Includes - Dict.		Display the Auto Include Entry dialog box.
Insert Entry - Dict.	Insert i + Ctrl	Display the Insert Dictionary Entry dialog box.
Line Down - Dict.	Down	Move the cursor and highlight the next dictionary entry.
Line End - Dict.	End	Move the cursor to the end of the field when a dialog box is open
Line Home - Dict.	Home	Move the cursor to the beginning of the field when a dialog box is open.
Line Up - Dict.	Up	Move the cursor and highlight the previous dictionary entry.
Make Wordlist - Dict.		Automatically copy all the words in the current dictionary, that Spell Check thinks are misspelled, to the wordlist and assign <i>Ignore</i> to them.

<b>Function</b>	<b>Default Keyboard Command</b>	<b>Action</b>
Modify Entry - Dict.	Enter Enter + Shift m + Ctrl	Display the Modify Dictionary Entry dialog box.
Move to Case Dictionary - Dict.		Remove the selected dictionary entries from the current dictionary and place them into a selected Case Dictionary without opening the dictionary.
Move to Other Dictionary - Dict.		Remove the selected dictionary entries from the current dictionary and place them into another dictionary without opening the dictionary.
Move to Personal Dictionary - Dict.		Remove the selected dictionary entries from the current dictionary and place them into your Personal Dictionary without opening the dictionary.
Move to Update Area - Dict.		Remove the selected dictionary entries from the current dictionary and place them into the Update Area without opening the Update Area.
New Caption File		Display the Create New File dialog box with the default file type set to "Caption Files (*.sgcap)."
New Case Dictionary		Display the Create New File dialog box with the default file type set to "Dictionary Files (*.sgdct)."
New Case Wordlist		Display the Create New File dialog box with the default file type set to "Wordlist Files (*.tlx)."
New EZ Speakers		Open a new EZ Speakers dictionary if one does not exist or open an existing EZ Speakers dictionary.
New EZ Text Table		Open a blank EZ Text table if one does not exist or open the existing EZ Text table.

Function	Default Keyboard Command	Action
New File	n + Ctrl	Display the Create New File dialog box with the default file type set to "Transcript Files (*.sgnfl)."
New Fill In Field List		Open a blank Fill-In-Field List if one does not exist or open the existing Fill-In-Field List.
New Job Dictionary		Open the Create New File dialog box with the default file type set to "Dictionary Files (*.sgdct)."
New Job Wordlist		Display the Create New File dialog box with the default file type set to "Wordlist Files (*.tlx)."
New Keyboard Map		Display the Create New File dialog box with the default file type set to "keyboard Table (*.sgkbd)."
New Layout		Display the Create New File dialog box with the default file type set to "Layout Files (*.sgpgl)."
New Notes File		Display the Create New File dialog box with the default file type set to "Notes Files (*.sgstn)."
New Personal Dictionary		Open a blank Personal Dictionary if one does not exist or open the existing Personal Dictionary.
New Personal Wordlist		Open a blank Personal Wordlist if one does not exist or open the existing Personal Wordlist.
New Phonetic Table		Open a blank Phonetic Table if one does not exist or open the existing Phonetic Table.
New Power Define		Open a blank Power Define Dictionary if one does not exist or open the existing Power Define Dictionary.

<b>Function</b>	<b>Default Keyboard Command</b>	<b>Action</b>
New Read Notes		Display the Read Setup dialog box to read steno notes, unless the Read option to not display the Read Setup dialog box is active.
New Steno Shortcut Table		Open a blank Steno Shortcut Table if one does not exist or open the existing Steno Shortcut Table.
New Text File		Display the Create New File dialog box with the default file type set to Transcript Files (*.sgnfl)."
Open BCS Number Conversion File		Display the BCS Number Conversion file.
Open Caption File		Display the Open Existing Document dialog box with the file type set to "Caption Files (*.sgdct)."
Open Case Dictionary	k + Ctrl	Display the Open Existing Document dialog box with the file type set to "Dictionary Files (*.sgdct)."
Open Case Wordlist		Display the Open Existing Document dialog box with the file type set to "Wordlist Files (*.tlx)."
Open EZ Speakers	e + EZ Speakers	Display the Open Existing dialog box with the default file type set to "EZ Speakers Dictionaries."
Open EZ Text Table		Display the Open Existing dialog box with the default file type set to EZ Text Files (*.sgezt)."
Open EZKeys File		Display the Open Existing dialog box with the default file type set to "EZKeys (*.ezk)."
Open File	o + Ctrl	Display the Open Existing Document dialog box with the default file type set to "Transcript Files (*.sgnfl)."

Function	Default Keyboard Command	Action
Open Fill In Field List		Open the existing Fill-In-Field List for the current user or create a new one if no Fill-In-Field List exists.
Open Job Dictionary	o + j	Display the Open Existing Document dialog box with the default file type set to "Dictionary Files (*.sgngl)."
Open Job Voice Dictionary		Display the Open Existing Document dialog box with the default file type set to "Voice Command Files (*.sgvcd)."
Open Job Wordlist		Display the Open Existing Document dialog box with the default file type set to "Wordlist Files (*.tlx)."
Open Keyboard Map		Display the Open Existing Document dialog box with the default file type set to "Keyboard Table (*.sgkbd)."
Open Layout		Display the Open Existing Document dialog box with the default file type set to "Layout Files (*.sgpgl)."
Open Macro		Display the Open Existing Document dialog box with the default file type set to "Macro Files (*.sgmac)."
Open Notes File		Display the Open Existing Document dialog box with the default file type set to Notes.
Open Number Conversion File		Open the Number Conversion file stored in the System Files case.
Open Personal Dictionary	d + Ctrl	Open the Personal Dictionary for the current user or create a new one if no Personal Dictionary exists.

<b>Function</b>	<b>Default Keyboard Command</b>	<b>Action</b>
Open Personal Voice Dictionary		Open the Personal Voice Dictionary for the current user or create a blank one if no Personal Voice Dictionary exists.
Open Personal Wordlist		Open the Personal Wordlist for the current user or create a blank one if no Personal Wordlist exists.
Open Phonetic Table		Open the Phonetic Table for the current user or create a blank one if no Phonetic Table exists.
Open Power Define	w + Ctrl	Open the Power Define Dictionary for the current user or create a blank one if no Power Define Dictionary exists.
Open Steno Shortcut Table		Open the Steno Shortcut Table for the current user or create a blank one if no Steno Shortcut Table exists.
Open Text File		Display the Open Existing Document dialog box with the default file type set to "Transcript Files (*.sgnfl)."
Open Update Area	u + Ctrl	Open the Update Area for the current user or create a new one if no Update Area exists.
Page Down - Dict.	Page Down	Move one screen page down in the dictionary.
Page Up - Dict.	Page Up	Move one screen page up in the dictionary.
Paste - Dict.	v + Ctrl Insert + Shift	Paste the text most recently copied or cut into the available field in the dictionary dialog box.
Play Last Macro - Dict.		Invoke the last played macro.
Play Macro - Dict.		Display the Choose Macro dialog box in the keyboard map file to select a macro to assign to the current key combination.

Function	Default Keyboard Command	Action
Print File - Dict.	p + Ctrl	Displays the Print dialog box.
Print Setup - Dict.		Display the Print Setup dialog box.
Record Macro - Dict.		Display the RecordMacro toolbar to record all subsequent keyboard commands and mouse clicks until Stop is selected.
Redo - Dict.	z + Ctrl + Shift	Restore the most recent consecutive changes or actions in the current dictionary.
Repeat Search Backward	F3 + Shift	Search backward in the dictionary for the last searched text, steno or entry type.
Repeat Search Forward	F3	Search forward in the dictionary for the last searched text, steno or entry type.
Resolve Conflict with Choice 1	Ctrl + 1	Select the first choice of the conflict in a dictionary entry.
Resolve Conflict with Choice 2	Ctrl + 2	Select the second choice of the conflict in a dictionary entry.
Resolve Conflict with Choice 3	Ctrl + 3	Select the third choice of the conflict in a dictionary entry.
Resolve Conflict with Choice 4	Ctrl + 4	Select the fourth choice of the conflict in a dictionary entry.
Resolve Conflict with Choice 5	Ctrl + 5	Select the fifth choice of the conflict in a dictionary entry.
Resolve Conflict with Choice 6	Ctrl + 6	Select the sixth choice of the conflict in a dictionary entry.
Resolve Conflict with Choice 7	Ctrl + 7	Select the seventh choice of the conflict in a dictionary entry.

<b>Function</b>	<b>Default Keyboard Command</b>	<b>Action</b>
Resolve Conflict with Choice 8	Ctrl + 8	Select the eighth choice of the conflict in a dictionary entry.
Resolve Conflict with Choice 9	Ctrl + 9	Select the ninth choice of the conflict in a dictionary entry.
Save File - Dict	s + Ctrl	Save the dictionary.
Save File As - Dict.		Display the Save As dialog box to save the dictionary using a different name.
Scroll left - Dict.	Left	Moves the display to the left when the entire dictionary is not displayed.
Scroll right - Dict.	Right	Moves the display to the right when the entire dictionary is not displayed.
Search - Dict.	f + Ctrl	Display the Search dialog box to search for text, steno or timestamps in the dictionary.
Search and Replace - Dict.	r + Ctrl	Display the Search and Replace dialog box to search for and replace the specified text and replace it with new text either selectively or for all the occurrences in the dictionary.
Select All - Dict.	a + Ctrl	Highlight all the entries in the dictionary.
Select Document End - Dict.	End + Ctrl + Shift	Highlight the entries from the current location to the end of the dictionary.
Select Document Home - Dict.	Home + Ctrl	Highlight the entries from the current location to the beginning of the dictionary.
Select Line Down - Dict.	Down + Shift	Highlight the entry from the current location forward in the dictionary, one entry at a time.
Select Line Up - Dict.	Up + Shift	Highlight the entry from the current location backward in the dictionary, one entry at a time.

Function	Default Keyboard Command	Action
Select Page Down - Dict.	Page Down + Shift Page Down + Ctrl	Highlight entries from the current location forward in the dictionary one screen at a time.
Select Page Up - Dict.	Page Up + Shift Page Up + Ctrl	Highlight entries from the current location backward in the dictionary one screen at a time.
Send to Cat Scratch Pane - Dict.		Send the current dictionary entries' steno and text to the Cat Scratch pane's steno & text section.
Spellcheck - Dict.	F7 F7 + Ctrl F7 + Shift	Spell check the text portion of the dictionary entries.
Undo	z + Ctrl	Reverse the most recent consecutive changes or actions in the current dictionary.
Unfilter		Removes the currently applied filter and displays the entire dictionary.
Windows Default		Apply the current Windows Default setting to the key combination based on the selected Windows language set.

## Keyboard Map Functions - History Window

You can [create](#) a new keyboard map or modify the entries of an existing keyboard map to change the functionality of the keyboard commands during a captioning session. The following table lists all the functions available for assignment in a CATalyst BCS keyboard map. It includes available keyboard, Upper ANSI and extended ASCII characters.

CATalyst BCS contains a Default keyboard map with default keyboard command assignments. Keyboard assignments for functions listed in the Functions list are indicated in the following table. The words "Windows Default" appear where the default assignment is affected by the selected Windows language set. For example, default Windows keyboard commands appropriate for the English language are only active when the English language setting is selected in Windows Region and Language options. When French is selected the keyboard commands appropriate for French are active.

Function	Default Keyboard Command	Action
[none]		Remove the key assignment with nothing assigned to the key.
' Apostrophe or ' Smart Single Quote	'	Type an apostrophe.  You can cycle the single quote between applying it to the current word, the previous punctuation or before the previous punctuation. Simply press the same key to cycle through the punctuation positions.

@ At-sign/Commercial At	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
\ Backslash	Change Keyboard Mode	Change to the next keyboard map if one is available. No character is typed.
] Right square bracket	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
^ Circumflex/Caret	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
_ Underscore	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
` Grave accent	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
{ Left curly bracket	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
Pipe/More/Vertical line	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
} Right curly bracket	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
~ Tilde	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
+ Plus/addition sign	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
< Less than sign	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
= Equals sign	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
> Greater than sign	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
0	Windows Default	Type the character assigned to the currently selected Windows keyboard map.

Function	Default Keyboard Command	Action
1	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
2	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
3	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
4	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
5	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
6	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
7	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
8	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
9	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
a	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
A	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
Add Last Brief to No Nag		Send the last brief in the Brief It pane to the No Nag List located in the System Files case.
Add or Remove Translation Dictionaries	a + Ctrl	Display the Add or Remove Translation Dictionaries dialog box during captioning.
Add Other Globals		Display the Add Other Globals dialog box.
Add Selection to Phrase List		Add the highlighted phrase to the Concordance Index Phrase list.
Add To Case Wordlist		Add the word to the Case Wordlist for use with Spell Check.
Add To Ignore All Wordlist		Add the word to the Ignore All Wordlist for use with Spell Check.
Add To Job Wordlist		Add the word to the Job Wordlist for use with Spell Check.
Add To Personal Wordlist		Add the word to the Personal Wordlist for use with Spell Check.
Allcap select text		Change the selected text to all capital letters.

Function	Default Keyboard Command	Action
Append File		Display the Append dialog box for selection of a text file to add to the end of the current file.
Apply All Globals Backward		Apply all globals in the Global Table backward in the History file.
Apply New Layout		Display the Select Layout to Apply dialog box to apply a new layout to the current file.
Apply All Globals Backward		Applies all globals in the Global Table from the current location in the transcript to the beginning of the transcript.
Apply Personal Globals		Apply Personal Globals table entries to the current transcript.
Automatic Number Conversion		Apply an automatic number conversion rule based on the Number Conversion file entries.
b	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
B	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
Backspace Word	Backspace + Ctrl	Delete the previous word.
Break to File	b + Ctrl	Display the Break dialog box to type a new name for a file that will contain the text from the current cursor location to the end of the file or the selected text.
Brief It - Filter Live Suggestions		Applies a filter to the Brief It pane to show <a href="#">Live Suggestions</a> only.
Brief It - Filter Personal Only		Applies a filter to the Brief It pane to show Personal Briefs only.
Brief it - Filter Reminders Only		Applies a filter to the Brief It pane to show Reminders only.
Brief It - Filter Suggestions Only		Applies a filter to the Brief It pane to show Suggestions only.
Brief It - Filter Used Only		Applies a filter to the Brief It pane to show Used briefs only.
Brief It - Unfilter		Removes any filter on the Brief It pane to show all briefs in the pane.
Brief It: J-Define Current		Make a job dictionary entry on the last suggested global when using the Brief It feature.
Brief It: New Suggestion for Current		Reject the current brief and suggest a new one when using the Brief It feature.

Function	Default Keyboard Command	Action
Brief It: Reject Current		Reject the current brief when using the Brief It feature.
c	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
C	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
Cap/Uncap	F5 + Ctrl	Cycle the case of an individual or highlighted word between initial cap, all caps and lower case.
Caption: Add Stories		Display the Import Captions dialog box to add stories to the Story Queue.
Caption: AutoFeed: Decrease Speed		Reduce the words per minute setting at which the script file is being sent.
Caption: AutoFeed: Increase Speed		Increase the words per minute setting at which the script file is being sent.
Caption: AutoFeed: Start/Stop		Toggle the start and stop of AutoFeed when the script is sent automatically.
Caption: Auto Feed: Toggle Repeat		Alternate between sending the script file once and sending the script file again from the beginning once the file is sent.
Caption: Block Existing F3		Activate the Block Mode.
Caption: Clear Stories		Remove all the stories from the story queue.
Caption: Clear Video	F5	Remove the captions from the Caption Preview window and the output screen.
Caption: Insert Baseline		Insert Baseline format symbol.
Caption: Insert Block		Insert Block format symbol.
Caption: Insert Chars Per Line		Insert Chars format symbol.
Caption: Insert Clear		Insert Clear format symbol.
Caption: Insert Color		Insert Color format symbol.
Caption: Insert column		Insert a number for the left column indent.
Caption: Insert EOC		Insert EOC (end of caption) format symbol.
Caption: Insert Flash		Insert Flash format symbol.
Caption: Insert KeepCaseNext		Insert KeepCaseNext format symbol.

Function	Default Keyboard Command	Action
Caption: Insert KeepCaseOff		Insert KeepCaseOff format symbol.
Caption: Insert KeepCaseOn		Insert KeepCaseOn format symbol.
Caption: Insert Musical Note		Insert Musical Note format symbol.
Caption: Insert Pass		Insert Pass format symbol.
Caption: Insert Position		Insert Position format symbol.
Caption: Insert Roll up Rows		Insert Roll up Rows format symbol.
Caption: Insert Scatter		Insert Scatter format symbol.
Caption: Insert Story Slug Off		Insert Story Slug Off format symbol.
Caption: Insert Story Slug On		Insert Story Slug On format symbol.
Caption: Insert Transparent Space		Insert Transparent Space format symbol.
Caption: Insert Warning Off		Insert Warning Off format symbol.
Caption: Insert Warning On		Insert Warning On format symbol.
Caption: Load Selection I (L) + Ctrl + Shift As Story		Save the selected text as a story and place it in the story queue of the current captioning session.
Caption: Move To Next Story	Keypad + m + Ctrl	Move to the next story in the story queue.
Caption: Move To Previous Story	Keypad - m + Ctrl + Shift	Move to the previous story in the story queue.
Caption: NIK 0	Keypad 0	Invoke the action assigned to the NIK 0 file.
Caption: NIK 1	Keypad 1	Invoke the action assigned to the NIK 1 file.
Caption: NIK 2	Keypad 2	Invoke the action assigned to the NIK 2 file.
Caption: NIK 3	Keypad 3	Invoke the action assigned to the NIK 3 file.
Caption: NIK 4	Keypad 4	Invoke the action assigned to the NIK 4 file.
Caption: NIK 5	Keypad 5	Invoke the action assigned to the NIK 5 file.
Caption: NIK 6	Keypad 6	Invoke the action assigned to the NIK 6 file.

Function	Default Keyboard Command	Action
Caption: NIK 7	Keypad 7	Invoke the action assigned to the NIK 7 file.
Caption: NIK 8	Keypad 8	Invoke the action assigned to the NIK 8 file.
Caption: NIK 9	Keypad 9	Invoke the action assigned to the NIK 9 file.
Caption: Pass Existing	F2	Activate Pass Mode.
Caption: Reset Encoder		Reset the encoder.
Caption: Retain Script Case		Retain the current case when sending the Script file to the encoder.
Caption: Save Script Window As		Save the text in the Script window as a caption file (.sgcap).
Caption: Send 1 Line	1 + Ctrl	Send the next line of pre-scripted text to the encoder.
Caption: Send 2 Lines	2 + Ctrl	Send the next two lines of pre-scripted text to the encoder.
Caption: Send 3 Lines		Send the next three lines of pre-scripted text to the encoder.
Caption: Send 4 Lines		Send the next four lines of pre-scripted text to the encoder.
Caption: Send Line From Cursor	c + Ctrl + Shift	Send the next line of pre-scripted text that follows the cursor to the encoder.
Caption: Send to End of Caption	e + Ctrl + Shift	Send the pre-scripted text to the end of the caption to the encoder.
Caption: Setup Colors		Display the Captions Color dialog box to change the color for specific elements in the History window.
Caption: Setup Connections		Display the Modem dialog box to dial a specific modem, hang up the current modem or modify modem information in the current Profile.
Caption: Setup Contacts		Display the Contacts Profile tab to temporarily or permanently modify the Contact information for the current Profile and apply the changes to the current captioning session.
Caption: Setup Dictionaries		Display the Dictionaries Profile tab to temporarily or permanently modify the Dictionary settings for the current Profile and apply the changes to the current captioning session.

Function	Default Keyboard Command	Action
Caption: Setup EZ Speakers		Display the EZ Speaker Profile tab to temporarily or permanently modify the EZ Speakers for the current Profile and apply the changes to the current captioning session.
Caption: Setup EZ Text		Display the EZ Text Profile tab to temporarily or permanently modify the EZ Text settings for the current Profile and apply the changes to the current captioning session.
Caption: Setup Multiple Outputs		Display the Multiple Outputs Profile tab to temporarily or permanently modify the Multiple Output settings for the current Profile and apply the changes to the current captioning session.
Caption: Setup Numeric Island Keys		Display the Numeric Island Keys dialog box to create or modify NIK files.
Caption: Setup Options		Display the Caption Translate Options dialog box to temporarily or permanently modify captioning options for the current Profile and apply the changes to the current captioning session.
Caption: Setup Preferences		Display the Preferences Profile tab to make changes to certain CATalyst BCS captioning options.
Caption: Setup Profiles		Display the Manage Profiles dialog box to create, modify or switch a profile.
Caption: Setup Realtime		Display the Realtime Profile tab to temporarily or permanently modify Realtime settings for the current Profile and apply the changes to the current captioning session.
Caption: Setup Story Queue		Display the Arrange Stories dialog box to rearrange the stories in the Story Queue
Caption: Show Terminal Window		Display the terminal window to use advanced feature to configure the modem and encoder.
Caption: Simultaneous ASCII Output		Display the Create Simultaneous ASCII dialog box to create an ASCII file of the text from current CATalyst BCS session being sent to the encoder.
Caption: Simultaneous SCC Output		Display the Create Simultaneous SCC dialog box to create an SCC file of the text from current CATalyst BCS session being sent to the encoder.

Function	Default Keyboard Command	Action
Caption: Simultaneous SMPTE-TT		Display the Create Simultaneous SMPTE-TT dialog box to create an SMPTE-TT file of the text from current CATalyst BCS session being sent to the encoder.
Caption: Skip Line	F12 + Shift	Move the cursor to the next line of pre-scripted text identifying the current send line.
Caption: Style		Display the Caption Styles dialog box to temporarily or permanently change the caption style for the current Profile and apply the changes to the current captioning session.
Caption: Suspend	F7	Activate the Suspend Mode.
Caption: Toggle display all caps		Toggle the display of all capital letters in the History window. Also affects the output of RTF and ASCII.
Caption: Set YouTube Delay		Set the delay of text for the YouTube Live session. Based on the YouTube live streaming partner it may be necessary to adjust this setting.
Change Job Dictionary		Display the Change Job Dictionary dialog box.
Change Keyboard Mode	\	Change the current keyboard map to the next available keyboard map.
Choose Conflict 1		Select the first choice of the conflict.
Choose Conflict 2		Select the second choice of the conflict.
Choose Conflict 3		Select the third choice of the conflict.
Choose Conflict 4		Select the fourth choice of the conflict.
Choose Conflict 5		Select the fifth choice of the conflict.
Choose Conflict 6		Select the sixth choice of the conflict.
Choose Conflict 7		Select the seventh choice of the conflict.
Choose Conflict 8		Select the eighth choice of the conflict.
Choose Conflict 9		Select the ninth choice of the conflict.
Choose Selected Conflict		Confirm the EZ Choice selected conflict.
Close File		Close the current file and display a Save Changes dialog box if there are unsaved changes to the file.
Connect Realtime Writer		Establish connection with the writing machine.

Function	Default Keyboard Command	Action
Continue Spellcheck		Start Spell Check from the current cursor location.

Insert Conflict End		Insert the Conflict End format symbol to indicate the end of a conflict.
Insert Continuation Paragraph	Enter	Insert the Continuation Paragraph format symbol to indent the text based on the values set for the current paragraph style.
Insert Default Paragraph		Insert the Default Paragraph format symbol to format the text based on the Default Paragraph style.
Insert Delete Space		Insert a Delete Space format symbol to remove a computer generated space.
Insert Extended Character		Display the Insert Character dialog box.
Insert Format Symbol Dialog		Display the Insert Format Symbol dialog box.
Insert Hidden Text		Display the Hidden Text dialog box.
Insert Hyphen	-	Type a hyphen.
Insert New Line	Enter + Shift	Insert the New Line format symbol moving the following text to the left margin of the current paragraph style.
Insert New Line Paragraph		Insert the New Line Paragraph format symbol to format the text based on the New Line Paragraph style.
Insert New Page		Insert the New Page format symbol to force the following text to a new page.
Insert Oops		Insert an <a href="#">Oops</a> format symbol (invisible format symbol in the history file or caption file) with an Oops category designation (0 - 9).
Insert Parenthetical		Insert the Parenthetical format symbol to format the following text based on the Parenthetical paragraph style.
Insert Reporter's Dash		Insert a double dash at the end of the current word.
Insert Right Margin Release		Insert the Right Margin Release format symbol allowing text to exceed the right margin setting.
Insert Scanstop Begin		Insert the Scanstop Begin format symbol.
Insert Scanstop End		Insert the Scanstop End format symbol.
Insert Single Space Paragraph		Insert the Single Space Paragraph format symbol to format the text based on the Single Space Paragraph style.

Function	Default Keyboard Command	Action
Insert Speaker		Display the Insert Speaker dialog box.
Insert Sticky Space		Insert a Sticky Space format symbol to keep the following text with the previous text.
Insert Tab	Tab	Insert the Tab format symbol.
Insert Uncap Next		Insert the Uncap Next format symbol to remove the initial capitalization of the following word.
Insert User-Defined Paragraph		Display the Set User Defined dialog box.
Internet Search		Place the highlighted word or phrase into the Search field of the selected search engine site when connected to the Internet.
j	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
J	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
J-Define	j + Ctrl	Display the Global – J-Define dialog box.
Join current paragraph to previous		Join the current paragraph where your cursor is positioned to the previous paragraph and remove the current paragraph's format symbol (if appropriate).
k	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
K	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
K-Define	k + Ctrl	Display the Global – K-Define dialog box.
l	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
L	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
Load Window Positions		Display the Load Window Positions dialog box to select a saved window positions file to load.
Lock Window Positions		Prevent the CATalyst BCS dialog panes from being rearranged.
m	Windows Default	Types the character assigned to the currently selected Windows keyboard map.
M	Windows Default	Type the character assigned to the currently selected Windows keyboard map.

Function	Default Keyboard Command	Action
Mark Start		Invoke the Mark Start command to highlight the following text by moving the cursor, using Search or using the Go To command.
Mark Stop		Invoke the Mark Stop command to stop highlighting text.
Merge File	m + Ctrl	Display the Merge dialog box to remove the contents of one file and place the contents in the current file.
Mistran Minder		Invoke the Mistran Minder feature. Mistran Minder searches the entire document for words/phrases in the Mistran Minder List and displays the results in the Search Results pane.
Move Document Bottom	End + Ctrl	Move the cursor to the end of the file.
Move Document Top	Home + Ctrl	Move the cursor to the beginning of the file.
Move Down	Down Arrow	Move the cursor down one line.
Move Down Word Begin		Move the cursor down one line and position it at the beginning of the closest word.
Move Left	Left Arrow + Ctrl	Move the cursor to the left one character at a time.
Move Left Word Begin		Move the cursor to the beginning of the word that is left of the cursor.
Move Line Begin	Home	Move the cursor to the beginning of the current line.
Move Line End	End	Move the cursor to the end of the current line.
Move Page Down	Page Down + Ctrl	Move the cursor to the first line of the next page.
Move Page Up	Page Up + Ctrl	Move the cursor to the first line of the previous page.
Move Right	Right Arrow + Ctrl	Moves the cursor to the right one character at a time.
Move Screen Bottom	Down + Ctrl	Move the cursor to third line from the bottom of the screen.
Move Screen Page Down	Down Arrow + Ctrl; Page Down	Move the cursor down in the file approximately a screen page.
Move Screen Page Up	Up Arrow + Ctrl; Page Up	Move the cursor up in the file approximately a screen page.

Function	Default Keyboard Command	Action
Move Screen Top	Up + Ctrl	Move the cursor to the first line displayed at the top of the screen.
Move to Beginning of Current Word		Move the cursor to the beginning of the current word.
Move to End of Current Word		Move the cursor to the end of the current word.
Move Up	Up Arrow	Move the cursor up to the previous line.
Move Up Word Begin		Move the cursor up to the previous line and position the cursor at the beginning of the closest word.
Move Word End		Move the cursor to the end of each word to the right.
Move Word Left	Left Arrow	Move the cursor to the end of each word to the left.
Move Word Right	Right Arrow	Move the cursor to the beginning of each word to the right.
n	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
N	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
New Caption File		Display the Create New File dialog box with the default file type set to a "Caption Files (*.sgcap)."
New Case Dictionary		Display the Create New File dialog box with the default file type set to "Dictionary Files (*.sgdct)."
New Case Fill In Field List		Create a Case Fill in Field List for the current case.
New Case Wordlist		Display the Create New File dialog box with the default file type set to "Wordlist Files (*.tlx)."
New EZ Speakers		Open a new EZ Speakers dictionary if one does not exist or open an existing EZ Speakers dictionary.
New EZ Text Table		Open a blank EZ Text table if one does not exist or open the existing EZ Text table.
New File		Display the Create New File dialog box with the default file type set to "Transcript Files (*.sgnfl)."

Function	Default Keyboard Command	Action
New Job Dictionary		Opens the Create New File dialog box with the default file type set to "Dictionary Files (*.sgdct)."
New Job Wordlist		Display the Create New File dialog box with the default file type set to "Wordlist Files (*.tlx)."
New Keyboard Map		Display the Create New File dialog box with the default file type set to "Keyboard Table (*.sgkbd)."
New Layout		Display the Create New File dialog box with the default file type set to "Layout Files (*.sgpgl)."
New Personal Dictionary		Open a blank Personal Dictionary if one does not exist or open the existing Personal Dictionary.
New Personal Wordlist		Open a blank Personal Wordlist if one does not exist or open the existing Personal Wordlist.
New Phonetic Table		Open a blank Phonetic Table if one does not exist or open the existing Phonetic Table.
New Power Define		Open a blank Power Define Dictionary if one does not exist or open the existing Power Define Dictionary.
New Steno Shortcut Table		Open a blank Steno Shortcut Table if one does not exist or open the existing Steno Shortcut Table.
New Text File		Display the Create New File dialog box with the default file type set to "Transcript Files (*.sgnfl)."
Next Search	F3	Repeat the current search pattern forward in the file.
Next Search Result		Moves the cursor to the next search result.
Number Conversion	u + Ctrl	Display the Number Conversion dialog box when the cursor is immediately before numbers or highlighted (marked) numbers.
o	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
O	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
Open BCS Number Conversion File		Display the BCS Number Conversion file.

Function	Default Keyboard Command	Action
Open Caption File		Display the Open Existing Document dialog box with the file type set to "Caption Files (*.sgcap)."
Open Case Dictionary		Display the Open Existing Document dialog box with the file type set to "Dictionary Files (*.sgdct)."
Open Case Fill In Field List		Open the Case Fill In Field List.
Open Case Wordlist		Display the Open Existing Document dialog box with the file type set to "Wordlist Files (*.tlx)."
Open Current Case Dictionary		Open the current Case dictionary.
Open Current Job Dictionary		Open the job dictionary of the same name as the current transcript.
Open EZ Speakers		Display the Open dialog box with the default file type set to "EZ Speaker Dictionaries."
Open EZ Text Table		Display the Open dialog box with the default file type set to "EZ Text Files (*.sgezt)."
Open EZKeys		Open the last EZKeys file used.
Open EZKeys File		Display the Open dialog box with the default file type set to "EZKeys (*.ezk)."
Open File	o + Ctrl	Display the Open Existing Document dialog box with the default file type set to "Transcript Files (*.sgnpl)."
Open Job Dictionary		Display the Open Existing Document dialog box with the file type set to "Dictionary Files (*.sgdct)."
Open Job Voice Dictionary		Display the Open Existing Document dialog box with the default file type set to "Voice Command Files (*.sgvcd)."
Open Job Wordlist		Display the Open Existing Document dialog box with the default file type set to "Wordlist Files (*.tlx)."
Open Keyboard Map		Display the Open Existing Document dialog box with the default file type set to "Keyboard Table (*.sgkbd)."
Open Layout		Display the Open Existing Document dialog box with the default file type set to "Layout Files (*.sgpgl)."

Function	Default Keyboard Command	Action
Open Macro		Display the Open Existing Document dialog box with the default file type set to "Macro Files (*.sgmac)."
Open Mistran Minder List		Opens the Mistran Minder List located in the System Files case.
Open Number Conversion File		Open the Number Conversion file.
Open Personal Dictionary		Open the Personal Dictionary for the current user or create a new one if no Personal Dictionary exists.
Open Personal Globals File		Open the Personal Globals file located in the System Files case.
Open Personal Voice Dictionary		Open the Personal Voice dictionary for the current user or create a new one if no Personal Voice Dictionary exists.
Open Personal Wordlist		Open the Personal Wordlist for the current user or create a new one if no Personal Wordlist exists.
Open Phonetic Table		Open the Phonetic Table for the current user or create a new one if no Phonetic Table exists.
Open Power Define		Open the Power Define Dictionary for the current user or create a new one if no Power Define Dictionary exists.
Open Steno Shortcut Table		Open the Steno Shortcut Table for the current user or create a new one if no Steno Shortcut Table exists.
Open System Files Case		Display the Open Existing Document dialog box with the default file type set to "All."
Open Text File		Display the Open Existing Document dialog box with the default file type set to "Transcript Files (*.sgngl)."
Open Update Area		Open the Update Area for the current user.
Other Dictionary Define	o + Ctrl + Shift	Display the Global – Other Dictionary dialog box.
p	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
P	Windows Default	Type the character assigned to the currently selected Windows keyboard map.

Function	Default Keyboard Command	Action
Paste	v + Ctrl	Paste the most recently copied or cut text into the transcript at the current cursor location.
Pause Audio		Pause the recording of audio during captioning.
Play Audio	F9 + Shift	Play the audio associated with the cursor location.
Play Last Macro		Invoke the last played macro.
Play Macro		Display the Choose Macro dialog box in the keyboard map to select a macro for assignment to the current key combination.
Plural Word Endings Option		Display the Plural Word Ending Options dialog box to designate how to use the final S, Z or both when writing plural endings in steno.
Previous Search Results		Moves the cursor to the previous search result.
Print Current Page	p + Ctrl + Shift	Send the current page to the printer with the last used print options.
Print File	p + Ctrl	Display the Print dialog box.
Print Preview		Change the display to print preview.
q	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
Q	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
Query Realtime Translations	q + Ctrl + Shift	Display the Lookup dialog box with the dictionary name and definition for the current steno outline or outlines.
QuickFix Prefix		Display the QuickFix dialog box to select a prefix.
QuickFix Suffix		Display the QuickFix dialog box to select a suffix.
Quick Suggest		The <a href="#">Quick Suggest</a> dialog box displays when the cursor is positioned on an untranslate, Drag/Drop or Suffix Drag translation or word(s).
r	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
R	Windows Default	Type the character assigned to the currently selected Windows keyboard map.

Function	Default Keyboard Command	Action
Record Macro		Display the RecordMacro toolbar to record all subsequent keyboard commands and mouse clicks until Stop is selected.
Redo	z + Ctrl + Shift	Restore the most recent consecutive changes or actions in the current file.
Replace	r + Ctrl	Display the Replace dialog box to replace the text for this single occurrence.
Replace with Live Suggestion 1		Replace the current untranslate and possibly surrounding steno/text with the first Live Suggestion displays in the Brief It pane.
Replace with Live Suggestion 2		Replace the current untranslate and possibly surrounding steno/text with the second Live Suggestion displays in the Brief It pane.
Replace with Live Suggestion 3		Replace the current untranslate and possibly surrounding steno/text with the three Live Suggestion displays in the Brief It pane.
Replace with Live Suggestion 4		Replace the current untranslate and possibly surrounding steno/text with the fourth Live Suggestion displays in the Brief It pane.
Replace with Live Suggestion 5		Replace the current untranslate and possibly surrounding steno/text with the fifth Live Suggestion displays in the Brief It pane.
Remove Suffix		Removes the <a href="#">shortest suffix</a> from the current word.
Reset Window Positions		Reset the CATalyst BCS dialog panes to the default display and positions.
Resolve All Chosen Conflicts		Confirm the selected conflict for all EZ Choice and AutoChoice conflicts.
Restore Steno	F2 + Shift; F2 + Ctrl	Revert the translated text to the original steno outline.
Resume Audio		Resume recording of audio during captioning.
Resume Spellcheck	F7 + Ctrl + Shift	Resume spell check when the cursor focus is not in the Spell Check dialog box.
Reveal Codes	r + Ctrl + Shift	Toggle the display of the Reveal Codes dialog pane.
s	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
S	Windows Default	Type the character assigned to the currently selected Windows keyboard map.

Function	Default Keyboard Command	Action
Save File	s + Ctrl	Save the file.
Save File As		Display the Save As dialog box to allow you to save the text file as another name.
Save Selected Text As		Display the Save Copy As dialog box to allow you to type a file name for the selected (highlighted) text.
Save Window Positions		Save the positions of the CATalyst BCS dialog panes.
Scan Backward	F8 + Shift	Scan backward through the file using the current Scan For options.
Scan Backward for Conflicts		Scan backward in the file for a previous Conflict.
Scan Backward for Drag/Drop		Scan backward in the file for a previous Drag/Drop Begin format symbol.
Scan Backward for Hidden Text		Scan backward in the file for a previous Hidden Text.
Scan Backward for Oops		Scan backward in the file for a previous Oops format symbol.
Scan Backward for Prefix/Suffix		Scan backward in the file for a previous Prefix or Suffix Begin format symbol.
Scan Backward for Scan Stops		Scan backward in the file for a previous Scan Stop Begin format symbol.
Scan Backward for Suffix Drag		Scan backward in the file for a previous Suffix Drag Begin format symbol.
Scan Backward for Untranslates		Scan backward in the file for a previous Untranslate.
Scan for Conflicts		Scan forward in the file for the next Conflict.
Scan for Drag/Drop		Scan forward in the file for the next Drag/Drop Begin format symbol.
Scan for Hidden Text		Scan forward in the file for the next Hidden Text.
Scan for Oops		Scan forward in the file for the next Oops format symbol.
Scan For Options		Display the Scan For Options dialog box to specify the items on which to scan.
Scan for Prefix/Suffix		Scan forward in the file for the next Prefix or Suffix Begin format symbol.
Scan for Scan Stops		Scan forward in the file for the next Scan Stop Begin format symbol.

Function	Default Keyboard Command	Action
Scan For Suffix Drag		Scan forward in the file for the next Suffix Drag Begin format symbol.
Scan for Untranslates		Scan forward in the file for the next untranslate.
Scan Forward	F8	Scan forward through the file using the current Scan For options.
Scroll Text Backwards	a + Ctrl + Shift	Automatically move the cursor backward in the file line by line using the designated time increment.
Scroll Text Forward	a + Ctrl	Automatically move the cursor forward in the file line by line at the designated time increment.
Scroll Text With Audio	F9 + Ctrl + Shift	Automatically move the cursor line to line and play the associated audio, if available, at the designated time increment.
Search	f + Ctrl	Display the Search dialog box to search for text, steno or timestamps.
Search and Replace		Display the Search and Replace dialog box to search for the specified text and replace it either selectively or replace it all with new text.
Search Next Hidden Text		Search forward in the transcript for the previous Hidden Text entry and displays the Hidden Text dialog box with entries when found.
Search Next Paragraph		Search forward in the file for the next paragraph style.
Search Next Punctuation		Search forward in the file for the next punctuation.
Search Next Sentence Ending Punctuation		Search forward in the file for the next sentence ending punctuation.
Search Prev Sentence Ending Punctuation		Search backward in the file the previous sentence ending punctuation.
Search Previous	F3 + Shift	Search backward in the file for the last searched text, steno or timestamps.
Search Previous Hidden Text		Search backward in the transcript for the previous Hidden Text entry and displays the Hidden Text dialog box with entries when found.
Search Previous Paragraph		Search backward in the file for the previous paragraph style.
Search Previous Punctuation		Search backward in the file for the previous punctuation.

Function	Default Keyboard Command	Action
Select Document Bottom	End + Ctrl + Shift	Highlight (mark) text from the cursor location forward in the file through the end of the transcript.
Select Document Top	Home + Ctrl + Shift	Highlight (mark) text from the cursor location backward in the file to the beginning of the transcript.
Select Down	Down Arrow + Shift	Highlight (mark) text from the cursor location forward line by line.
Select Down Word Begin		Highlight (mark) text from the cursor location forward through the file line by line the cursor positioned before a word.
Select Left	Left Arrow + Ctrl + Shift	Highlight (mark) the character to the left of the cursor location.
Select Line End	End + Shift	Highlight (mark) text from the cursor location to the end of the line.
Select Line Home	Home + Shift	Highlight (mark) text from the cursor location to the beginning of the line.
Select Macro to Play		Display the Choose Macro dialog box to select a macro to play.
Select Page Down	Page Down + Ctrl + Shift	Highlight (mark) text from the cursor location forward through the end of the current page.
Select Page Up	Page Up + Ctrl + Shift	Highlight (mark) text from the cursor location backward to the beginning of the current page.
Select Right	Right Arrow + Ctrl + Shift	Highlight (mark) the character to the right of the cursor location.
Select Screen Bottom	Down Arrow + Ctrl + Shift	Highlight (mark) text from the cursor location forward to the end of the screen display.
Select Screen Page Down	Page Down + Shift	Highlight (mark) text from the cursor location forward to end of screen display that represents a page.
Select Screen Page Up	Page Up + Shift	Highlight (mark) text from the cursor location backward to the beginning of the screen display that represents a page.
Select Screen Top	Up Arrow + Ctrl + Shift	Highlight (mark) text from the cursor location backward to the beginning of the screen display.
Select Up	Up Arrow + Shift	Highlight (mark) text from the cursor location backward to the beginning of the file.

Function	Default Keyboard Command	Action
Select Up Word Begin		Highlight (mark) text from the cursor location backward to the beginning of the file with the cursor positioned before a word.
Select Whole Transcript		Highlight (mark) all the text in the entire transcript.
Select Word Left	] + Ctrl; Left Arrow + Shift	Highlight (mark) one word at a time to the left of the cursor.
Select Word Right	[ + Ctrl; Right Arrow + Shift	Highlight (mark) one word at a time to the right of the cursor.
Send Last Brief to Cat Scratch		Send the last brief in the Brief It pane to the Cat Scratch pane.
Send Selected Brief to Cat Scratch		Send the selected brief in the Brief It pane to the Steno/Text section of the Cat Scratch pane.
Send Steno & Text to Cat Scratch Pane		Send the highlighted steno/text in the transcript to the Steno/Text section of the Cat Scratch pane.
Send To Cat Scratch Pane		Send the highlighted text in the transcript to the Text section of the Cat Scratch pane.
Send to Mistran Minder List		Send the word or highlighted text to the Mistran Minder List located in the System Files case.
Send to Case Mistran Minder List		Send the word or highlighted text to the Case Mistran Minder List. The caption file must be in a case.
Send to Job Mistran Minder List		Send the word or highlighted text to the Job Mistran Minder List.
Set Active Window		Display the Set Active Window dialog box to select the dialog pane for the cursor focus.
Set Audio Delay		Display the Set Audio Delay dialog box to adjust the synchronization between the cursor location in the job and the playback of the audio file.
Set Cursor Context		Display the Set Cursor Context dialog box to select a resting cursor position for arrowing and scrolling through the file.
Set Cursor Size		Display the Set Cursor Size dialog box to change the size of the cursor on the screen.
Set Focus To Edit		Place the cursor focus in the transcript.

Function	Default Keyboard Command	Action
Set Normal Audio Speed		Reset the audio playback speed to the default setting when the Audio Playback Speed dialog box is displayed.
Smart Colon	; + Shift	Attach a colon to the end of the previous word, add two spaces, and caps the next word.
Smart Comma	,	Attach a comma to the end of the previous word and add a space.
Smart Exclamation	1 + Shift	Attach an exclamation mark to the end of the previous word, add two spaces and cap the next word.
Smart Period	.	Attach a period to the end of the previous word, add two spaces and cap the next word.
Smart Question	/ + Shift	Attach a question mark to the end of the previous word, add two spaces and cap the next word.
Smart Remove Punctuation		Remove the punctuation at the end of the previous word, remove a space and uncap the next word. Applies to colon, period, exclamation mark, question mark, and semi-colon.
Smart Semicolon	;	Attach a semi-colon (;) to the end of the previous word and add a space.
Space	Space; Space + Shift	Insert a space into the transcript.
Spellcheck	F7 + Shift	Begin spellchecking the file based on the selected wordlists and spell check options.
Spelling Lookup	F7 + Ctrl	Display the Spelling Lookup dialog box with the selected word in the Text field.
Split Compound Word		Invoke the Split Compound Word command to separate a compound word into two words.
Split Compound Word - Exclude		Sends the split words to the Compound Wordlist with the exclude attribute.
Split Compound Word - Set Preferred		Sends the split words to the Compound Wordlist with the suggest attribute.
Stitch	- + Ctrl	Cycle through the stitch options for the current word or highlighted (marked) words.
Stop Audio	F9 + Ctrl	Stop the playback of the associated audio.
Stop Translation	\ + Ctrl	Stop realtime translation and stop the connection from the writing machine.
Suggest a Brief		Brief It suggests a conflict-free brief for the highlighted or typed words.

Function	Default Keyboard Command	Action
Surround With Comma		Insert a comma before and after the word or highlighted (marked) words.
Surround With Dash	= + Ctrl	Insert a dash before and after the word or highlighted (marked) words.
Surround With Double Quote		Insert a double quote before and after the word or highlighted (marked) words.
Surround With Parentheses		Insert an open parenthesis before and a closed parenthesis after the word or highlighted (marked) words.
Surround With Single Quote		Insert a single quote before and after the word or highlighted (marked) words.
t	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
T	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
Text List Brief it		Open the Open dialog box to select a text file in order to generate briefs from the selected text file.
Text to Dict Define		Open the Add Dictionary Definition define dialog box.
Toggle All Punctuation	, + Ctrl	Cycle through a series of punctuation symbols for the first punctuation on the same transcript line as the cursor: period, question mark, comma, colon, semi colon, exclamation mark, dashes and no punctuation
Toggle Apply E-Define To Typed Text		Toggle the state of the Advanced Global option, Apply E-define to Typed Text.
Toggle Follow Realtime		Toggle Follow Realtime between the cursor following realtime and the last editing location.
Toggle in-line reveal codes		Toggle the display of Reveal Codes.
Toggle Insert/Overstrike Insert		Toggle between the Insert and Overstrike modes.
Toggle Paragraph Ending Punctuation	. + Ctrl + Shift	Cycle through ending paragraph options for the current paragraph: period, question mark, exclamation mark, dashes, and no punctuation.
Toggle Reporter's Area		Toggle the display of the Reporter's Area during captioning.

Function	Default Keyboard Command	Action
Toggle Sentence Ending Punctuation	. + Ctrl	Cycle through a series of punctuation symbols for the sentence ending punctuation on the same transcript line as the cursor: period, question mark, dash and exclamation mark,
Transcript Brief It		Invoke the Transcript Brief It feature which creates briefs for the current transcript.
Transcript Spellcheck Options		Open the Transcript Spell Check Options dialog box.
u	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
U	Windows Default	Type the character assigned to the currently selected Windows keyboard map.
Uncap selected text		Remove the capitalization for all words of the selected text.
Undo	z + Ctrl	Reverse the most recent consecutive changes or actions in the current file.
Undo Global	u + Ctrl + Shift	Reverse the global action throughout the History file of current editing session and remove the definition from the designated dictionary.
Undo Global Once		Reverse the global action for the current word only.
Undo Last Global	u + Ctrl + Shift	Reverse the last global action throughout the current editing session of the file.
Unmark		Remove the highlighting (marking) from text.
V		
View/Edit Homophones		Opens the Homophones Editor dialog box where you can easily add new homophones and/or edit/delete existing homophones.

## Modify Keyboard Map Columns

You can resize the column widths and reorder the columns in the keyboard map.

### Resize a Column

Place the cursor on the line dividing the column headings and hold the mouse button down. The cursor becomes a double headed arrow. Move the line left or right to the desired position and release the button.

### Reorder Columns

Place the cursor on a column heading and hold the mouse button down. Move the cursor to a new location. Red arrows indicate the new position. Release the mouse button.

## Search Keyboard Map

The Search feature in a keyboard map allows you to locate keyboard functions by text or entry type, such as Cursor movement, Global or Edit. You can limit the search by specifying an exact, initial, or ending character match. Once a search result displays, repeat the Search with the same search parameters without reentering the information by using Repeat Search Forward (F3) or Repeat Search Backward (Shift +F3). You can use the [Filter](#) feature to limit the display of the keyboard map to a specific key, macro or keyboard function. A filtered display is searchable.

## Search for Keyboard Functions

1. From within a keyboard map, press **Ctrl + f (Edit/Search)**. The Search dialog box displays.
2. Make necessary entries:

### Search

#### Text

Type the text for the keyboard command or function on which you are searching.

#### Entry Type

Search by entry type. Select an entry type from the drop down list to search entries categorized by the selected entry type.

#### Case Sensitive

Search for the text in the *Search* field as it is typed in upper and lower case. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field. Depending on your search criteria, this option may not be available.

**Whole Word**

Search only for whole words that match the text typed in the *Search* field. When Whole Word is not selected, the search finds the word both as it stands alone and as part of another word. Depending on your search criteria, this option may not be available.

**Location**

Select the search parameter. Depending on your search criteria, this option may not be available.

**Exact Match**

Search for entries that match the text, exactly as it is entered, in the *Search* field.

**Begins With**

Search for entries that begin with the text entered in the *Search* field.

**Ends With**

Search for entries that end with the text entered in the *Search* field.

**Contains**

Search for entries that contain, anywhere in the entry, the text entered in the *Search* field.

**Direction**

Select the direction of the search:

**Forward**

Search forward, from the cursor position to the end of the keyboard map.

**Backward**

Search backward, from the cursor position to the beginning of the keyboard map.

3. Press **Enter (OK)** to search the keyboard functions. The Search dialog box closes and the Search highlights the first entry that meets the search criteria. If no entry matches the search criteria, a message displays. To repeat the search using the same criteria, press **F3** to search forward or **Shift + F3** to search backward.

If you search for a keyboard function within a filtered display, the search is limited to the filtered keyboard functions. If your search cannot locate the desired keyboard function, try [unfiltering](#) the display or filter by different criteria.

## Set Keyboard Map Options

To set Keyboard Map options:

1. From the Keyboard Map table, press **Alt + t, o (Tools/Options)**. The Options dialog box displays.
2. Make an entry as necessary:

**Warn before restoring default key assignment.**

Check this box to display a warning message when you restore a default key assignment in the Assign Key to Function dialog box.

Uncheck this box to disable the warning message. You can also turn this warning off from the confirmation dialog box by checking the option: *I understand the consequences of my actions. Please stop asking.*

3. Press **Enter (OK)**.

## NumberConversion.ini File

The NumberConversion.ini file contains formatting rules based on "keyword" word and number combinations that are used by the [Automatic Number Conversion](#) feature to convert numbers and words into specific formats. There is one NumberConversion.ini file per user that affects a captioning session. It is located in the Captioning case which is in the System Files case. If you also use regular translation for jobs other than captioning, there is a Numberconversion file located in the System Files case that affect regular translate jobs. If you need number conversion formats specifically to a case, you can create a [Case Numberconversion file](#).

Depending on the keyword, there may be multiple rules available depending on how you want the numbers converted. When you select a keyword, select a rule, then the comment section displays information as to how the number will convert. For example, each of the months of the year are keywords and there are four rule options available. Let's say the person says, "I participated in a protest march one day during that week." You most likely would not want "march one" to change to March 1st in a situation like that so you would apply the {Match\_Case} rule to the month of March and probably May. A number conversion will only occur when CATalyst encounters numbers following "March" and "May" and not when "may" and "march" are followed by numbers.

### Example

The keyword "dollars" is associated with the number conversion rule for {MONEY}. This rule looks to the left of the keyword and inserts the dollar symbol when preceded by numbers and removes the word "dollars." When Automatic Number Conversion is active and you write "50 dollars," the result is "\$50."

### Example

The keyword "avenue" is associated with the number conversion rule for {ADDRESS}. This rule looks to the left of the keyword and caps up to two words when preceded by numbers. When Automatic Number Conversion is active and you write "1234 red pine avenue", the result is "1234 Red Pine Avenue."

### Example

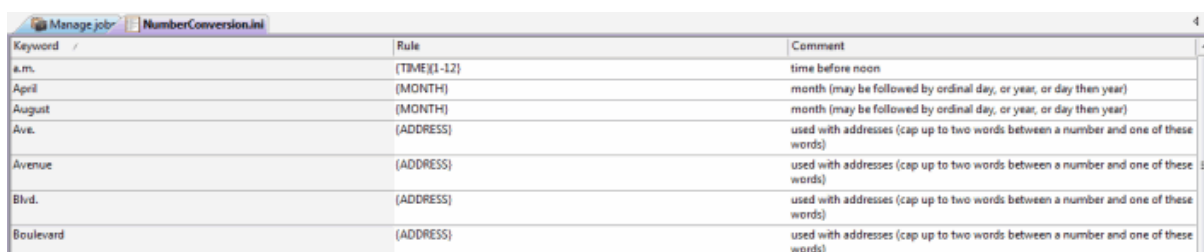

The keywords "a.m." and "p.m." are associated with the number conversion rule for {TIME}. This rule dictates that a 3 or 4 digit number appears with a colon before the last two digits. When Automatic Number Conversion is active and you write eleven forty-five a.m., the rule for a.m. applies after translation, resulting in 11:45 a.m. If you write "315 a.m.," it converts to "3:15 a.m."

To open the NumberConversion.ini file, do one of the following:

- Press **Alt + f, o, i, n (File, Open. List/Table, Number Conversion)**.
- On the Caption Option, Options tab, click **numberconversion...** you will be prompted with the following message: *To view this file, the Translate dialog box needs to close. Apply changes and continue?* The default is set to Yes. If you press **Enter** or click Yes, any changes will be saved and the Broadcast Captioning Translate dialog box will automatically close and the numberconversion file will open.

## BCS NumberConversion.ini File Overview

When you open the NumberConversion.ini file, the contents display in three columns: Keyword, Rule and Comment. The Keyword column indicates the keyword that you write; the rule column indicates the type of automatic number conversion instruction; and the Comment column briefly describes the function of the rule. You can sort the entries in ascending or descending order by clicking the desired column heading.

Keyword	Rule	Comment
a.m.	(TIME){1-12}	time before noon
April	(MONTH)	month (may be followed by ordinal day, or year, or day then year)
August	(MONTH)	month (may be followed by ordinal day, or year, or day then year)
Ave.	(ADDRESS)	used with addresses (cap up to two words between a number and one of these words)
Avenue	(ADDRESS)	used with addresses (cap up to two words between a number and one of these words)
Blvd.	(ADDRESS)	used with addresses (cap up to two words between a number and one of these words)
Boulevard	(ADDRESS)	used with addresses (cap up to two words between a number and one of these words)

Depending on your number writing style or theory, you may want to [modify](#) the NumberConversion.ini file to maximize the benefits of the Automatic Number Conversion feature. The NumberConversion.ini file comes with a default set of keyword entries. You can add, delete or modify entries to customize the file.

Keywords have a maximum length of 63 characters. If you create an entry for an existing keyword a message displays. When a duplicate keyword entry exists that can convert a number two different ways, the number conversion applies the last entry in the list. For example, you have the word "highway" listed as a keyword for {ADDRESS} rule. You also have the word "highway" listed as a keyword for {DIGITAFTER}{CAPWITHNUM} rule. You write "1234 rough old highway" The words "rough" and "old" are not capped because this uses the first format in the list. If you write "highway 66", highway is initial capped because it is the last entry. The result is Highway 66.

[Keyboard Map](#) Function: Open BCS Number Conversion

## Modify the NumberConversion.ini File

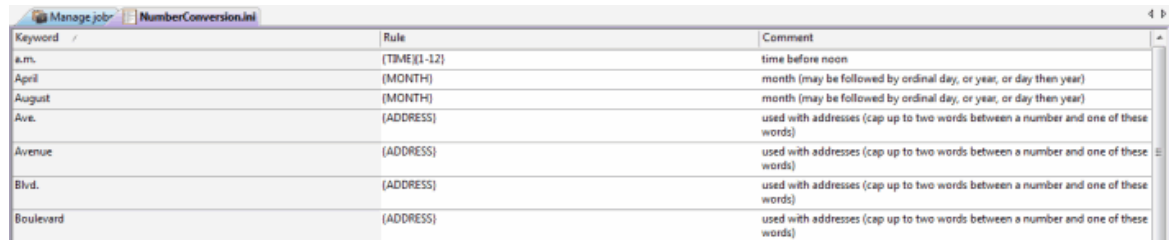

The BCS NumberConversion.ini file is located in the Captioning case in your System Files case and contains keywords and rules when writing numbers and text that should be formatted a specific way. For example, let's say you have Automatic Number Conversion feature selected and you write "3 hundred thousand fifty two dollars." Automatic Number Conversion would convert that to "\$300,052".

Add, modify or remove entries from the NumberConversion.ini file.

## Add or Modify an Entry

- To open the NumberConversion.ini file, do one of the following:
  - Press **Alt + f, o, i, n** (**File, Open, List/Table, Number Conversion**).
  - On the Caption Options, Options tab, click **numberconversion...** you will be prompted with the following message: *To view this file, the Translate dialog box needs to close. Apply changes and continue?* The default is set to Yes. If you press **Enter** or click Yes, any changes will be saved and the Broadcast Captioning Translate dialog box will automatically close and the numberconversion file will open.

The NumberConversion.ini contains three columns. The Keyword column lists the keyword for the automatic number conversion. This word has a maximum length of 63 characters. The Rule column is the instruction for the keyword. The Comment column is a brief description of what is going to be the result of this entry.

Keyword	Rule	Comment
a.m.	(TIME)(1-12)	time before noon
April	(MONTH)	month (may be followed by ordinal day, or year, or day then year)
August	(MONTH)	month (may be followed by ordinal day, or year, or day then year)
Ave.	(ADDRESS)	used with addresses (cap up to two words between a number and one of these words)
Avenue	(ADDRESS)	used with addresses (cap up to two words between a number and one of these words)
Blvd.	(ADDRESS)	used with addresses (cap up to two words between a number and one of these words)
Boulevard	(ADDRESS)	used with addresses (cap up to two words between a number and one of these words)

2. Do one of the following:
  - Add Entry — Press **Ctrl + i (Edit/Insert)**. The Insert Entry dialog box displays.
  - Modify Entry — Highlight the entry to modify and press **Ctrl + m (Edit/Modify)**. The Modify Entry dialog box displays.
3. Make entries as necessary:

### Keyword

Type the word you want to associate to the rule. If you create a duplicate keyword entry, a message displays indicating a duplicate entry.

### Rule

Highlight the rule to associate with the keyword. Available options applicable to the rule display in the Options field.

### Options

Options applicable to the Rule selected display in this field. Highlight an option to select it.

### Money Symbol

This field displays when you select the {MONEY} rule. Depending on the Options selected, the following fields are available. Select one:

- Dollars [\$] — Select this option to include a dollar sign in the money conversion.
- Cents [¢] — Select this option to include a cents sign in the money conversion.
- Other — Select this option to include a customized symbol in the money conversion. Type a money symbol in the [ ] field that will display before the numbers. If you select the {MONEY} {MONEYSUFFIX} rule, then up to three characters that appear between the brackets in Other will display after the number with a space in between. For example, you select {MONEYSUFFIX} and Other and USD in the brackets. When you write "fifty dollars," automatic number conversion converts it to 50 USD.

### Description

A sample and brief description of how the selected rule with the selected option is applied.

### Personal Comments

Entry in this field is optional. Type any comments you want to note about your entry.

4. Press **Enter (OK)**.

5. **Ctrl + s (File/Save)** to save the file.
6. Press **Alt + f, x (File/Exit)** to exit the NumberConversion.ini file.

## Remove an Entry

1. To open the NumberConversion.ini file, do one of the following:
  - Press **Alt + f, o, i, n (File/Open/List Table/Number Conversion)**.
  - On the Caption Options, Options tab, click **numberconversion...** you will be prompted with the following message: *To view this file, the Translate dialog box needs to close. Apply changes and continue?* The default is set to Yes. If you press **Enter** or click Yes, any changes will be saved and the Broadcast Captioning Translate dialog box will automatically close and the numberconversion file will open.
2. Do one of the following:
  - To disable the number conversion keyword but leave it in the Numberconversion file in case you change your mind, highlight the entry and press **Ctrl + m**. The Modify Entry dialog box displays. In the Keyword field, type two forward slashes (//) in front of the keyword. For example, if the keyword is "drive," it will now look like "//drive." (without the quotes.) This allows the entry to remain the in the numberconversion file but is not active.
  - Highlight the entry you want to remove from the file and press **Delete** or click the Delete  icon.
3. Press **Enter (OK)**.
4. **Ctrl + s (File/Save)** to save the file.
5. Press **Alt + f, x (File/Exit)** to exit the NumberConversion.ini file.
  - To disable the number conversion keyword but leave it in the Numberconversion file in case you change your mind, highlight the entry and press **Ctrl + m**. The Modify Entry dialog box displays. In the Keyword field, type two forward slashes (//) in front of the keyword. For example, if the keyword is "drive," it will now look like "//drive." (without the quotes.) This allows the entry to remain the in the numberconversion file but is not active.
  - Highlight the entry you want to remove from the file and press **Delete** or click the Delete  icon.

## Change NumberConversion.ini Fonts

The font type and size for the body and heading text in the NumberConversion.ini file are customizable. The font type and size applies equally to the body and heading text.

### Modify the Font:

1. Press **Alt + f, o, i, u (File, Open, List/Table, NumberConversion)**. The NumberConversion (.ini) table displays.
2. Do either of the following:
  - If the Dictionary/List Toolbar (  ) is displaying, go to Step 3.
  - If the Dictionary/List Toolbar is not displaying, right click a toolbar and select Dictionary/List Toolbar.

3. Do any of the following:
  - Click the Font style icon (  ) to change the font type.
  - Click the Font size icon (  ) to change the font size.
4. Closing the NumberConversion file saves the font change information. If you have made other changes, you will be prompted to save your changes.

## Filter NumberConversion.ini File

The Filter feature allows you to limit the display of the NumberConversion.ini entries to specific Keyword, Rule or Comment. You can further customize the filtered display using additional criteria. Filter does not remove entries from the NumberConversion.ini file. All entries display when you apply the Unfilter feature. A filtered display is [searchable](#).

### Filter Entries

1. Press **Ctrl + y (View/Filter)**. The Filter dialog box displays.
2. Make necessary entries:

#### Filter

##### Keyword

Filter on a specific word or words in the *Keyword* field. Type the text in the field. To filter on a specific type of *Key word*, check the option, **Entry Type**, and select a type from the drop down list.

##### Rule

Filter on a specific rule. Type the text.

##### Comment

Filter on specific text in the *Comment* field. Type the text. To filter on a specific type of Comment, check the option, **Entry Type**, and select a type from the drop down list.

##### Entry Type

Filter on text by entry type. Select an entry type from the drop down list. This option is available when filtering by *Keyword* or by *Comment*.

##### Case Sensitive

Filter on the text identified in the field, as it is typed in upper and lower case. If you do not select Case Sensitive, the filter includes all words containing the indicated characters, regardless of the case typed into the field.

##### Whole Word

Filter only on whole words that match the text typed in the field. When Whole Word is not selected, the search finds the word both as it stands alone and as part of another word.

#### Location

Select the filter parameter:

##### Exact Match

Filter on text that matches the text in the field exactly as it is entered.

**Begins With**

Filter on text that begins with the text entered in the field.

**Ends With**

Filter on text that ends with the text entered in the field.

**Contains**

Filter on text that contains, anywhere in the entry, the text entered in the field.

3. Press **Enter (OK)**. The Filter dialog box closes and the screen displays the filtered entries. If no entry matches the filter criteria, a message displays.

If you search within a filtered display, the search is limited to the filtered entries. If your search cannot locate the desired entry, unfilter the display or filter by different criteria.

4. Press **Alt + v, u (View/Unfilter)** to redisplay all the entries. If you close the NumberConversion.ini file in a filtered display, all entries display when you open the file.

## Search NumberConversion.ini File

Search allows you to locate a word or words in the NumberConversion.ini File. You can locate information in the Keyword, Rule and Alternate Suggestions columns, searching forward or backward for a whole word, part of a word or a phrase. Once a searched entry displays, you can repeat the Search by using Repeat Search Forward or Repeat Search Backward.

## Search Entries

1. To open the NumberConversion.ini file, do one of the following:
  - Press **Alt f, o, i, n (File/Open/List Table/Number Conversion)**.
  - On the Caption Options, Options tab, click **numberconversion**. A message prompts you to close the Translate dialog box in order to open the NumberConversion.ini file.
2. Press **Ctrl + f (Edit/Search)**. The Search dialog box displays.
3. Make necessary entries:

**Search**

Type the text you want to locate in the field. Use the remaining options, as necessary.

**Entry Type**

Check this box to limit the search to include one of the following criteria. From the drop down list in the Search field, select one of the following criteria:

- Numbers — The first entry that contains numbers.
- All Capped — The first entry that contains all capped text.
- Contains capped — The first entry that contains at least one capital letter.
- Phrase — The first entry that contains two or more words separated by a space.
- Contains punctuation — The first entry that contains punctuation.
- Numeral Words — The first entry that contains number words.

### **Case Sensitive**

Check this box to limit the search based on the upper and lower case letters of text typed in the Search field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field. This field is unavailable when you select to search by Entry Type.

### **Whole Word**

Search only for the words that match the text typed in the Search field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. This field is unavailable when you select to search by Entry Type.

### **Location**

Limit the search to include one of the following criteria. These fields are unavailable when you select to search by Entry Type.

#### **Exact Match**

Search for entries that exactly match the text entered in the Search field.

#### **Begins With**

Search for entries that begin with the text entered in the Search field.

#### **Ends With**

Search for entries that end with the text entered in the Search field.

#### **Contains**

Search for entries that contain, anywhere in the entry, the text entered in the Search field.

### **Direction**

Select one of the following:

#### **Forward**

Search forward from the cursor position to the end of the table.

#### **Backward**

Search backward from the cursor position to the beginning of the table.

4. Press **Enter (OK)** to start the search. If no match is found for the search item, a message displays.
5. To repeat the same search, press **F3 (Edit/Repeat Search Forward)** or **Shift + F3 (Edit/Repeat Search Backward)**.

## **Search and Replace in NumberConversion.ini**

Search and Replace allows you to search for and replace words in the Keyword or Comments column of a NumberConversion.ini entry. You can search forward or backward. Once a searched entry displays, you can repeat Search for the same text and search parameters by using Repeat Search Forward or Repeat Search Backward.

### **Search and Replace Entries**

1. To open the NumberConversion.ini file, do one of the following:

- Press **Alt f, o, i, n (File/Open/List Table/Number Conversion)**.
  - On the Caption Options, Options tab, click **numberconversion**. A message prompts you to close the Translate dialog box in order to open the NumberConversion.ini file.
2. Press **Alt + e, e (Edit/Search and Replace)**. The Search and Replace dialog box displays.
  3. Make necessary entries:

### **Search**

Type the text you want to locate in the field. Use the remaining options, as necessary.

#### **Case Sensitive**

Check this box to limit the search based on the upper and lower case letters of text typed in the Search field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field.

#### **Whole Word**

Search only for the words that match the text typed in the Search field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word.

### **Location**

#### **Exact Match**

Search for entries that exactly match the text entered in the Search field.

#### **Begins With**

Search for entries that begin with the text entered in the Search field.

#### **Ends With**

Search for entries that end with the text entered in the Search field.

#### **Contains**

Search for entries that contain, anywhere in the entry, the text entered in the Search field.

### **Direction**

Select one of the following:

#### **Forward**

Search forward from the cursor position to the end of the table. A confirmation message displays for each possible replacement.

#### **Backward**

Search backward from the cursor position to the beginning of the table. A confirmation message displays for each possible replacement.

### **Replace With**

Type the replacement text for the entry in the Search field.

4. Press **Enter (OK)** to start the search.
5. When a match is found, the Confirm dialog box displays with the Original word and the Replacement word. Select one of the following:

**Yes**

Apply the replacement to this occurrence and search for any other occurrence.

**Yes To All**

Apply the replacement to all occurrences of the Original word.

**Goto Next**

Do not apply the replacement to this occurrence and search for any other occurrence.

**Done**

Do not apply the replacement to any occurrences and close the Confirm dialog box.

## Phonetic Table

The Phonetic Table contains steno outlines and phonetic text equivalents. When the Advanced Caption Option, [Phonetic untranslates display as words](#) is set to **No** and you select the [Phonetic Translation](#) option or use the [Toggle Phonetic Mode](#) during realtime, steno outlines normally displayed as untranslates translate phonetically based on the text equivalent entry in the Phonetic Table.

Each user has a Phonetic Table located in the System Files case. The default Phonetic Table contains 60 text equivalent entries in all capital letters. You can change the entries to use lower case. Stenograph recommends you review entries in the Phonetic Table and modify them according to your writing style. The Phonetic Table is not accessible in CATalyst BCS during an active session.

### Example

The caption session includes the name Jaymes. If no dictionary entry for the steno SKWRAEUPLZ exists, the steno outline displays as an untranslate. Using the Phonetic Table, each steno combination matches to the text equivalent. The result displays as JAIMZ instead of SKWRAEUPLZ, as shown:

SKWR = J

A = A

EU = I

PL = M

-Z = Z

When the Advanced Caption Option, [Phonetic untranslates display as words](#) is set to **Yes**, CATalyst BCS use a phonetic algorithmic logic to determine the intended pronunciation. The Phonetic Table is not used.

Phonetically translated words appear in the selected untranslate color. If your [Scan For Options](#) are set to stop on untranslates, then **F8 (Scan)** and **Shift + F8 (Scan Backward)** stop on phonetically translated words.

1. From anywhere in CATalyst BCS, press **Alt + f, o, i, p (File/Open/List/Table/Phonetic Table)**. The Phonetic Table displays.
2. Do **any** of the following:

### Insert an Entry

Press **Ctrl + i (Edit/Insert)**. The Insert Entry dialog box displays with empty Steno and Text fields.

### Modify an Entry

Highlight the entry you want to modify. Press **Ctrl + m (Edit/Modify)**. The Modify Entry Dialog box displays with the steno and text.

### Delete an Entry

Highlight the entry and press **Delete**. A confirmation message displays. Press **Enter**.

3. Make entries as necessary:

#### Steno

Type new or modify existing steno outlines. Type a - (hyphen) before the steno outline to indicate final steno (right bank). If you want to stay consistent with the default entries, type the text in capital letters. The *Steno is invalid.* message displays if no steno characters are in the Steno field when inserted or modified.

#### Text

Type a new or modify the existing text equivalent or phonetic sound for the steno outline. The text characters are limited to 11 characters. Although more than 11 characters can be typed in the Text field, when the entry is inserted or modified, the *Text is too long.* message displays. The Text field also cannot include spaces. If the Text field contains at least one space, the *No spaces allowed.* message displays when the entry is inserted or modified. The user will need to adjust the Text field characters to eliminate the messages.

4. Press **Enter (OK)**. To exit the Insert dialog box, press **Esc (Cancel)**.
5. Press **Ctrl + s (File/Save)** to save the changes.

## Change Phonetic Table Font

The font type and size for the body and heading text in the Phonetic Table are customizable. The font type and size applies equally to the body and heading text.

### Modify the Font:

1. Press **Alt + f, o, i, u (File, Open, List/Table, Phonetic Table)**.
2. When the phonetic table displays, do either of the following:
  - If the Dictionary/List Toolbar (  ) is displaying, go to Step 3.
  - If the Dictionary/List Toolbar is not displaying, right click a toolbar and select Dictionary/List Toolbar.
3. Do any of the following:
  - Click the Font style icon (  ) to change the font type.
  - Click the Font size icon (  ) to change the font size.
4. Closing the Phonetic Table saves the font change information. If you have made other changes, you will be prompted to save your changes.

## User Definitions Table

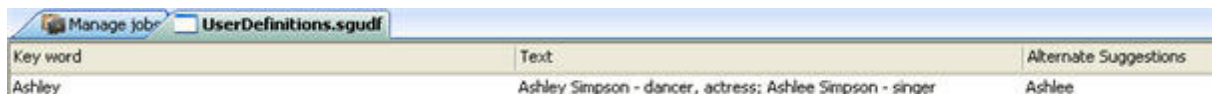

The User Definitions table, UserDefinitions.sgudf, works in conjunction with Spell Check allowing you to [add](#) a word with comments, definitions or alternate word Suggestions accessible from the Spell Check or Spelling Lookup dialog boxes. There is one User Definitions Table per user. It is stored in the User's System Files case.

When you add a word to the User Definitions table and add the same word to a Wordlist set to Suggest, Spell Check stops on the word which displays with a Red Squiggle. Alternate words set in the User Definitions table display in the Spell check Suggestions list. Clicking the User Def button, you can view the comment or definition for the word.

If the word from the User Definitions table is spelled correctly or in a wordlist and the Suggest attribute is not set for that word in a wordlist, Spell Check does not stop on the word. Use the Spelling Lookup feature to access any alternate suggestions. Clicking the User Def button displays the customized definition if one exists.

### Example

Using the User Definitions Table, add a word to a wordlist and create a comment. For example, you come across the name "Ashley" and want to add an alternate spelling and comment to the wordlist identifying the different spellings of celebrity Ashley. In the User Definitions Table you add the word "Ashley," with "Ashley Simpson, dancer; actress"; Ashlee Simpson, singer" as the comment and "Ashlee" as the alternate spelling, as shown below:

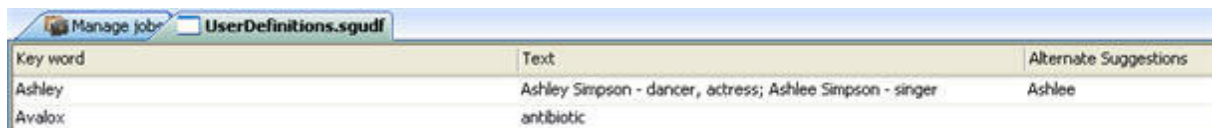

Key word	Text	Alternate Suggestions
Ashley	Ashley Simpson - dancer, actress; Ashlee Simpson - singer	Ashlee

You then add the word "Ashley" to your Personal or Job Wordlist and set it to Suggest the word "Ashlee." When Spell Check stops on the occurrence of Ashley in the job, it suggests "Ashlee." Click the User Def button in the Spell Check dialog box to view the comment associated with Ashley and determine the correct spelling for the person mentioned in the job.

### Example

The User Definitions Table can also be used to add a customized definition for a word in the Personal or Job wordlist. The customized definition might be for a word a definition is not available or an existing definition for which you need additional clarification. For example, the word Avalox occurs in several medical depositions. You add the word "Avalox" with the definition "antibiotic" to help identify the correct word as shown below.

Key word	Text	Alternate Suggestions
Ashley	Ashley Simpson - dancer, actress; Ashlee Simpson - singer	Ashlee
Avalox	antibiotic	

The word "Avalox" is spelled correctly. It is not in a wordlist and Spell Check does not stop on it. Invoke Spelling Lookup and click on the User Def button to access the definition.

You can [change the font type and/or font size in the User Definitions Table](#) to make it more readable.

## Add/Modify User Definitions

You can add, modify and delete entries from the User Definitions table. There is one User Definitions Table per user. It is stored in the User's System Files case.

## Add or Modify Entries

1. From CATalyst BCS, press **Alt + f, o, i, u** (**File/Open/List Table/User Definitions Table**). The UserDefinitions.sgudf. file displays.
2. Do one of the following:
  - Press **Ctrl + i** (**Edit/Insert**) to add a new user definition. The Insert User Definition dialog box displays.
  - Highlight an entry to modify. If necessary, use [Search](#) to help locate the entry. Press **Ctrl + m** (**Edit/Modify**). The Modify User Definition dialog box displays.
3. Make necessary entries:

**Keyword**

Type the word to which you want to add a definition or comment.

**Definition**

Type the text that displays when you press the User Definitions button during Spell Check or Spelling Lookup.

**Alternates**

Add, modify or delete alternate words for the Keyword. These words display in the Spell Check dialog box as Suggestions.

**New**

Type a word in the blank field that displays. To modify a word, double click on it and type the change.

**Delete**

Delete a word from the list. Highlight a word and click the **Delete** icon.

**Move Up**

Move the word up in the Suggestion list. Highlight the name and click the **Move Up** icon.

**Move Down**

Move the word down in the Suggestion list. Highlight the name and click the **Move Down** icon.

4. Press **Enter** (**OK**) to add the word to the User Definitions table.
5. Press **Ctrl + s** (**File/Save**) to save the changes to the User Definitions table.
6. Press **Ctrl + F4**, to close the User Definitions table.

**Delete an Entry**

1. Press **Alt + f, o, i, u** (**File/Open/List Table/User Definitions Table**). The UserDefinitions.sgudf table displays.
2. Highlight an entry to delete. If necessary, use [Search](#) to help locate the entry. Click the **Delete**  icon. A message displays prompting you to confirm the deletion.
3. Press **Enter** (**OK**) to delete the entry.

4. Press **Ctrl + s (File/Save)** to save the changes to the User Definitions table.
5. Press **Ctrl + F4**, to close the User Definitions table.

## Change User Definitions Table Fonts

The font type and size for the body and heading text in the User Definitions table are customizable. The font type and size applies equally to the body and heading text.

### Modify the Font:

1. Press **Alt + f, o, i, u (File, Open, List Table, User Definitions Table)**. The UserDefinitions (.sgudf) table displays.
2. Do any of the following:
  - If the Dictionary/List Toolbar (  ) is displaying, go to Step 3.
  - If the Dictionary/List Toolbar is not displaying, right click a toolbar and select Dictionary/List Toolbar.
3. Do any of the following:
  - Click the Font style icon (  ) to change the font type.
  - Click the Font size icon (  ) to change the font size.
4. Closing the User Definitions Table saves the font change information. If you have made other changes, you will be prompted to save your changes.

## Filter User Definitions Table

The Filter feature allows you to limit the display of the User Definitions Table entries to specific Keyword, Text or Alternate Suggestion. You can further customize the filtered display using additional criteria. Filter does not remove entries from the User Definitions Table. All entries display when you select the Unfilter feature. A filtered display is [searchable](#).

### Filter Entries

1. From CATalyst BCS, press **Ctrl + y (View/Filter)**. The Filter dialog box displays.
2. Make necessary entries:

#### Filter

##### Key word

Filter on a specific word or words in the *Key word* field. Type the text in the field. To filter on a specific type of *Key word*, check the option, **Entry Type**, and select a type from the drop down list.

##### Text

Filter on specific text the *Text* field. Type the text. To filter on a specific type of *Text*, check the option, **Entry Type**, and select a type from the drop down list.

##### Alternate Suggestion

Filter on specific text in the *Alternate Suggestion* field. Type the text. To filter on a specific type of *Alternate Suggestion*, check the option, **Entry Type**, and select a type from the drop down list.

**Entry Type**

Filter the display by entry type. Select an entry type from the drop down list.

**Case Sensitive**

Filter on the text identified in the field, as it is typed in upper and lower case. If you do not select Case Sensitive, the filter includes all words containing the indicated characters, regardless of the case typed into the field.

**Whole Word**

Filter only on whole words that match the text typed in the field. When Whole Word is not selected, the search finds the word both as it stands alone and as part of another word.

**Location**

Select the filter parameter. This option is unavailable when filtering by *Entry Type*.

**Exact Match**

Filter on text that matches the text in the field exactly as it is entered.

**Begins With**

Filter on text that begins with the text entered in the field.

**Ends With**

Filter on text that ends with the text entered in the field.

**Contains**

Filter on text that contains, anywhere in the entry, the text entered in the field.

3. Press **Enter (OK)**. The Filter dialog box closes and the screen displays the filtered entries. If no entry matches the filter criteria, a message displays.

If you search within a filtered display, the search is limited to the filtered entries. If your search cannot locate the desired entry, unfilter the display or filter by different criteria.

4. To return the display to a full view with all the entries, press **Alt + v, u (View/Unfilter)**.

**Search User Definitions Table**

Search allows you to locate a word or words in the User Definitions table. You can locate information in the Keyword, Text and Alternate Suggestions columns, searching forward or backward for a whole word, part of a word or a phrase. Once a searched entry displays, you can repeat the Search by using Repeat Search Forward or Repeat Search Backward.

**Search Entries**

1. From CATalyst BCS, press **Alt + f, o, i, u (File/Open/List Table/User Definitions Table)**. The UserDefinitions.sgudf. file displays.
2. Press **Ctrl + f (Edit/Search)**. The Search dialog box displays.
3. Select the method by which you want to search the User Definitions table.

## Search

Type the text you want to locate in the field. Use the remaining options, as necessary.

### Entry Type

Check this box to search by entry type. Case CATalyst searches all the columns for entries that contain the selected entry type. Click the down arrow to select an entry type from the list:

#### Numbers

The first entry that contains numbers.

#### All Capped

The first entry that contains all capped text.

#### Contains capped

The first entry that contains at least one capital letter.

#### Phrase

The first entry that contains two or more words separated by a space.

#### Contains punctuation

The first entry that contains punctuation.

#### Numerical Words

The first entry that contain a word number including hundred, thousand, million, etc.

4. Use the remaining field as necessary:

#### Case Sensitive

Check this box to limit the search based on the upper and lower case letters of text typed in the Search field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field. This option is unavailable when searching by *Entry Type*.

#### Whole Word

Search only for the words that match the text typed in the Search field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. This option is unavailable when searching by *Entry Type*.

## Location

Limit the search to include one of the following criteria. This option is unavailable when searching by *Entry Type*.

#### Exact Match

Search for entries that exactly match the text entered in the Search field.

#### Begins With

Search for entries that begin with the text entered in the Search field.

#### Ends With

Search for entries that end with the text entered in the Search field.

### **Contains**

Search for entries that contain, anywhere in the entry, the text entered in the Search field.

### **Direction**

Select one of the following:

#### **Forward**

Search forward from the cursor position to the end of the table.

#### **Backward**

Search backward from the cursor position to the beginning of the table.

5. Press **Enter (OK)** to start the search. If no match is found for the search item, a message displays.
6. To repeat the same search, press **F3 (Edit/Repeat Search Forward)** or **Shift + F3 (Edit/Repeat Search Backward)**.

## **Search and Replace User Definitions**

Search and Replace allows you to search for and replace the Keyword in a User Definitions entry. You can search forward or backward. Once a searched entry displays, you can repeat Search for the same text and search parameters by using Repeat Search Forward or Repeat Search Backward.

## **Search and Replace Keywords**

1. From CATalyst BCS, press **Alt + f, o, i, u (File/Open/List Table/User Definitions Table)**. The UserDefinitions.sgudf. file displays.
2. Press **Alt + e, e (Edit/Search and Replace)**. The Search and Replace dialog box displays.
3. Make necessary entries:

### **Search**

Type the text you want to locate in the field. Use the remaining options, as necessary.

#### **Case Sensitive**

Check this box to limit the search based on the upper and lower case letters of text typed in the Search field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field.

#### **Whole Word**

Search only for the words that match the text typed in the Search field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word.

### **Location**

#### **Exact Match**

Search for entries that exactly match the text entered in the Search field.

#### **Begins With**

Search for entries that begin with the text entered in the Search field.

**Ends With**

Search for entries that end with the text entered in the Search field.

**Contains**

Search for entries that contain, anywhere in the entry, the text entered in the Search field.

**Direction**

Select one of the following:

**Forward**

Search forward from the cursor position to the end of the table. A confirmation message displays for each possible replacement.

**Backward**

Search backward from the cursor position to the beginning of the table. A confirmation message displays for each possible replacement.

**Replace With**

Type the replacement text for the entry in the Search field.

4. Press **Enter (OK)** to start the search.
5. When a match is found, the Confirm dialog box displays with the Original word and the Replacement word. Select one of the following:

**Yes**

Apply the replacement to this occurrence and search for any other occurrence.

**Yes To All**

Apply the replacement to all occurrences of the Original word.

**Goto Next**

Do not apply the replacement to this occurrence and search for any other occurrence.

**Done**

Do not apply the replacement to any occurrences and close the Confirm dialog box.

## CATalyst VP

CATalyst® VP allows you to transcribe proceedings through dictation. Using Case CATalyst along with Dragon Naturally Speaking or IBM ViaVoice software, you can perform voice translation through a microphone or mask. You must be using Case CATalyst version 7.0 or higher with the voice option included on your e-Key license. The voice software, Dragon NaturallySpeaking® Version 8.10.000.279 SP1 or higher or IBM ViaVoice Version 10 must be installed on the same computer as your Case CATalyst system for the voice feature to function properly.

The success of voice translation depends on training the voice engine to recognize your speech patterns and voice. You must initially "train" the software to recognize your voice using the Dragon or ViaVoice training feature. As you use CATalyst VP, you can continue to train Dragon or ViaVoice, improving your recognition accuracy.

During voice translation, CATalyst VP uses the Dragon or ViaVoice vocabulary to match words with what it hears. CATalyst VP also uses the Personal VoiceCommands dictionary along with any other voice job dictionaries to format text such as Q, A, Colloquy, predefine speakers, etc. The voice dictionaries may also contain entries for Auto Includes, number conversion, translation commands and macros invoked by your voice, called AccelerWriters. CATalyst VP allows you to record the room noise with AudioSync while separately recording your voice.

The Dragon NaturallySpeaking Help provides information specific to Dragon features while ViaVoice Help provides information specific to ViaVoice. The Case CATalyst Help provides information specific to CATalyst VP functions and features as well as all other Case CATalyst functions. This includes steps on how to perform various tasks and how to use CATalyst VP features such as translate options, editing tools, customizing the Personal VoiceCommands dictionary and other voice job dictionaries, job management and more. Detailed help for voice translation can be found in the CATalyst VP section of the Case CATalyst Help. The word "voice" precedes all keywords when searching voice translation help topics. The general help section contains documentation for all other Case CATalyst features.

## CATalyst VP Hardware Guidelines

The following hardware guidelines reflect the recommended requirements to run CATalyst VP:

<b>Operating System</b>	Windows 10 (32-bit or 64-bit)
	Windows® 8 (32-bit or 64-bit)
	Windows 7 (32-bit or 64-bit).
	<b>Important:</b> Microsoft ended Windows Vista support as of April 2017. CATalyst VP is no longer supported when running Windows Vista.
<b>Processor</b>	Windows 7/Windows 8/Windows 10 - Pentium processor speed of 2GHZ or higher. A Pentium D, Core 2 Duo, i3, i5, i7 or AMD equivalent processor is strongly recommended.
<b>System Memory</b>	At least 4GB of RAM is recommended but please contact Stenograph's Technical Support Department for the optimal performance hardware recommendations.
<b>Hard Drive</b>	40 GB HD with at least 20 GB free minimum. 80 GB highly recommended.

<b>Monitor</b>	SVGA 1024 X 768 or higher.
<b>Graphics Processor</b>	<b>Windows 7:</b> DirectX 9-capable video card offering Windows Vista drivers with a minimum of 256MB of VRAM.
<b>Optical Drive</b>	DVD drive or multi-layer DVD burner.
<b>Ports</b>	Serial port for CaseView® II output or a USB port with a USB to Serial converter.
<b>Speech Recognition Engine</b>	<b>Windows 7:</b> Dragon Naturally Speaking® 10.01 or higher.
<b>Audio</b>	A Windows compatible sound card capable of recording audio at 8KHz, 16-bit and an external microphone with its own power source.
<b>Internet Access</b>	Microsoft® Internet Explorer 8 or higher.

## Getting Started

To begin voice translation, complete the following steps. For details on each step, refer to the appropriate CATalyst VP, Getting Started topic or click the associated link.

1. Do one of the following:

### Dragon Naturally Speaking

Perform the [initial setup](#) to install, train and [set options](#) in the Dragon Naturally Speaking software using the Dragon installation instructions. You must have Dragon Naturally Speaking Version 8.10.000.279 SP1 or above installed on the same computer as your Case CATalyst system for the voice feature to function properly. If you are recording room noise using Case AudioSync, be sure to accurately [configure](#) the audio input sources for AudioSync and Dragon.

### ViaVoice

Perform the [initial setup](#) to install, train and [set options](#) in the ViaVoice software using the ViaVoice installation instructions. You must have ViaVoice 10.0 installed on the same computer as your Case CATalyst system for voice translation to function properly. If you are recording room noise using Case AudioSync, be sure to accurately [configure](#) the audio input sources for AudioSync and ViaVoice.

2. Install Case CATalyst and [create](#) a user name in Case CATalyst, if you did not create one during the Case CATalyst installation process.
3. Download the default sample VoiceCommands dictionary from Stenograph's web site ([www.stenograph.com](http://www.stenograph.com)), select Support and then Solution Center. Then copy the files to the System Files case of your Case CATalyst user. You must have a Personal VoiceCommands dictionary in the System Files case of your user to run CATalyst VP.
4. Review the [Introduction](#) section in the Case CATalyst Help to familiarize yourself with the Case CATalyst screens, menus, common features, system files, system messages and how to [modify](#) Case CATalyst windows.

5. Create or modify a page [Layout](#) in Case CATalyst. Layout refers to how the transcript page looks when using Page View in Edit, during translation and when it is printed. It includes parameters such as, paper size, margins, transcript lines per page, transcript box lines, and header and footers.
6. Make necessary command entries in your CATalyst VP Personal [VoiceCommands](#) dictionary. Entries in the Personal VoiceCommands dictionary provide instructions to CATalyst VP for invoking commands and inserting text into the job file as you speak.

## CATalyst VP Initial Setup

To use CATalyst VP, it is necessary to install the Dragon/ViaVoice software, correctly connect the microphone and headphones, perform the initial voice recognition training and set Dragon/ViaVoice options. Follow the instructions in the Dragon NaturallySpeaking or ViaVoice User's Guide as necessary to complete the following steps:

1. Do one of the following:

### **Dragon Naturally Speaking**

Install the Dragon NaturallySpeaking Software using the Dragon installation instructions. You must have Dragon Naturally Speaking Version 8.10.000.279 SP1 or above installed on the same computer as your Case CATalyst system for voice translation to function properly. Dragon Naturally Speaking Version 9 and above is Windows Vista Compatible.

**Important:** Microsoft ended Windows Vista support as of April 2017. CATalyst VP is no longer be supported when running Windows Vista.

### **ViaVoice**

Install the ViaVoice software using the ViaVoice installation instructions. You must have ViaVoice 10.0 installed on the same computer as your Case CATalyst system for voice translation to function properly.

To use CATalyst VP, it is necessary to properly install and train the ViaVoice software. Follow the instructions in the ViaVoice User's Guide.

2. Open Dragon NaturallySpeaking or ViaVoice.
3. Follow the instructions to connect the microphone and headphone to your computer.

If you are recording room noise using Case AudioSync, you may need to change your AudioSync settings on the Case CATalyst Realtime tab. By default, AudioSync uses the Windows settings. ViaVoice also uses the Windows default. ViaVoice users will need to select an alternative port for AudioSync to prevent a port usage conflict. Dragon users may want to connect the microphone for mask input using an alternative input source such as a USB connection, an Andrea audio device or the computer's Line In jack. You may want to use an Andrea adapter to boost the recording.
4. Follow the Dragon/ViaVoice instructions to create a Dragon/ViaVoice user.
5. Follow the Dragon/ViaVoice instructions to perform the audio test.
6. Conduct the initial voice recognition training in Dragon/ViaVoice. The success of voice translation is dependent on training the voice engine to recognize your voice. The more training you perform in the voice engine, the better the translation results in CATalyst VP.
7. Set [Dragon](#) or [ViaVoice](#) options.

## Set Dragon Options

To prepare Dragon for use with CATalyst VP, you must select the recognition mode for translation and set options on the Dragon Options tabs. If necessary, see the Dragon NaturallySpeaking User's Guide for additional information.

Set the following Dragon options:

### Recognition Mode

Select the recognition mode from the Words menu. Consider the following recommendations:

- CATalyst VP has an Automatic Number Conversion feature to instantly format common number formats such as dollars, dollars and cents, time, exhibit numbers and more. Dragon also has a number conversion feature, Numbers Mode. You must choose only one: **either** CATalyst VP Automatic Number Conversion or Dragon Numbers Mode. If both the CATalyst VP Automatic Number Conversion feature and Dragon Numbers Mode are active at the same time, undesirable number conversion results occur.

CATalyst VP generally converts numbers as words instead of digits. If you choose to use the CATalyst VP Automatic Number Conversion to format numbers, ensure your Automatic Number Conversion settings deliver your expected results. Carefully review the [Automatic Number Conversion](#) feature and other number translate options used in conjunction with Automatic Number Conversion: [With Thousands Separator](#), [Display 10 and Under as Words](#) and [Otherwise display as Digits](#).

- Do not use Command mode.

### Options

From the Dragon Tools menu, select **Options**. The Options dialog box displays. The following settings are recommended for each tab:

#### Correction

Turn off all options.

#### Commands

Turn off all options.

#### View

The DragonBar does not automatically display and should not be open when working in CATalyst VP.

For viewing when Case CATalyst is not open, use the default Mode selection, **Docked to Top**. You can choose the options *Show message* and *Show extras* if desired. Turn off all remaining options.

#### Hot Keys

Use default selections. The Dragon Hot keys default entries do not conflict with the CATalyst VP default keyboard assignments.

#### Text-to-speech

Use default selections.

#### Miscellaneous

Use default selections. The following is active:

## **Use Active Accessibility for menu and dialog control**

### **Formatting**

When using the CATalyst VP Automatic Number Conversion feature to format numbers, select the Dragon option, **Do not automatically format text**.

### **Data**

Use the default selection unless a change is indicated for the option:

#### **Store corrections in archive**

This stores voice correction data used when you run the Acoustic Optimizer for enhanced voice recognition accuracy.

#### **Disk space reserved for playback 40 MB**

Set the reserved disk space to a minimum of 300 MB. If you experience audio difficulties, it may be necessary to increase the disk space to as much as 1000 MB.

#### **Save recorded dictation with document – Ask me**

#### **Automatically back up user files every 5 saves.**

If you notice a slow down in your computer system, increase the time in between the automatic backups. Set the option to save every 15 saves or higher.

## **Set ViaVoice Options**

To prepare ViaVoice for use with CATalyst VP, set the following ViaVoice options. From the ViaVoice menu, select **User Options/ViaVoice Options**. The ViaVoice Options dialog box displays.

Set options on the tabs as follows:

### **At Startup**

CATalyst VP automatically turns the microphone On when you begin translation. Turn off all options and click **Apply**.

### **Voice**

In the Recognition field, select **Automatic performance** and click **Apply**.

### **Dictation**

Turn off all options. The Source and Target fields do not apply to CATalyst VP and can remain as currently selected. When finished, click **Apply**.

### **Direct Dictation**

Turn off all options and click **Apply**.

### **Correction**

Use the default settings for the two fields, Maximum number of alternate words and Text search direction from cursor. Uncheck the option, Check spelling of added words and click **Apply**.

### **Command Sets**

Turn off all options and click **Apply**.

### Text-To-Speech

Use default settings.

### Formatting

No action is necessary on this tab. These options do not apply when using CATalyst VP. CATalyst VP automatically converts ordinal word numbers to digit ordinals. If you do not want to convert ordinal word numbers to digits, you can [modify](#) your UserSettings.sgxml file.

### Formatting 2

No action is necessary on this tab. CATalyst VP uses [number conversion](#) formats in the [NumberConversion.ini](#) and the [VoiceCommands](#) dictionary to convert numbers which are written as numerals, words or a combination of numerals and words during translation.

## Copy the Voice Files

CATalyst VP comes with several sample files including two sample [VoiceCommands](#) dictionaries. All sample files are available for download from the Stenograph web site ([www.stenograph.com](http://www.stenograph.com)). Select Support and then Solution Center. The Sample Voice Files folder contains the following files. Your Windows settings determines if the display of file extensions is hidden or display. It is not necessary to display the file extensions.

- Sample1 VoiceCommands.sgvcd
- Sample2 VoiceCommands.sgvcd
- UserLayout.sgcui
- VP Keyboard.sgkbd
- Sample Voice Files Document.PDF

The Sample Voice Files Document.PDF contains detailed information about the VP Keyboard and the Sample1 and Sample2 VoiceCommands Dictionaries. You may want to copy this file to a location on your computer for easy reference.

## Copy Voice Files

1. Download the Sample Voice Files from Stenograph's web site ([www.stenograph.com](http://www.stenograph.com)), select Support and then Solution Center.
2. Using Windows conventions, copy any of the voice files to the System Files case in your user name. For example: CAT4\Karen\System Files.

If you choose to use a sample VoiceCommands dictionary, it must be [renamed](#), **Personal VoiceCommands** after copying it to your computer. CATalyst VP can only recognize the Personal VoiceCommands dictionary by this name. There can only be one Personal VoiceCommands dictionary per user.

If desired, copy the *Sample Voice Files Document.pdf* file to any location on your computer.

3. Remove the Case CATalyst Installation DVD from your computer.

## Configure Audio Settings

During voice translation, Dragon/ViaVoice records your voice as you speak into the mask. Dragon records your dictation in the voice file with a .DRA file extension using the audio settings set in Dragon. ViaVoice records your dictation in the voice file with a .SGVOD file extension. If you are also recording room noise through Case CATalyst, AudioSync records the audio file with a standard .WAV file extension. Your Case CATalyst e-Key must include the AudioSync option in order to use AudioSync.

When you install Dragon and create a new user, Dragon prompts you to select a dictation source for the mask input. If you are not using AudioSync, select the appropriate audio source for your microphone. If necessary, you can later change the dictation source or create multiple dictation sources. See the Dragon NaturallySpeaking User's Guide for information on changing or adding dictation sources.

ViaVoice uses the Windows settings for your dictation. ViaVoice users recording room noise must select another input source for AudioSync. The input source in Case CATalyst is set in the Voice [Realtime Options](#). See the ViaVoice User's Guide for information on changing or adding dictation sources.

When you are recording room noise using AudioSync and your voice engine, it is recommended that you use the computer's microphone jack for AudioSync input and use another input source such as a USB, Andrea adapter or the Line In jack on your computer for your dictation microphone. With AudioSync connected to the computer's microphone jack, audio settings for the room noise are controlled through Windows.

When using AudioSync, test your microphone recording and playback setup for room noise along with your voice input. When the input is configured as recommended, test the room noise through Windows following the instructions in [AudioSync Microphone Set Up and Test](#) help topic. Test the voice dictation input following the instructions in the Dragon NaturallySpeaking/ViaVoice User's Guide. If you do not properly set up the audio setting for both room noise and dictation source, you may end up with two recordings of your voice file instead of one voice audio file and room noise audio file.

If you have different types of jobs where you have only dictation recording and other jobs where you also record the room noise, it is recommended that you create different users for each type of job. This allows you to easily open the appropriate user with the correct audio settings instead of switching settings for different job types.

Once you begin recording room noise with AudioSync, do not change the clock time on your computer. Also, be sure you do not have any operating system setting that could automatically update your clock during the recording of room noise. Changing the clock time once audio recording begins can affect the playback of the recording.

## AudioSync Microphone Set Up and Test

Before using AudioSync, set up and test your microphone to ensure clear recording and playback sound. Your CATalyst VP e-Key license must include the AudioSync option in order to use AudioSync's recording feature.

**IMPORTANT:** When synchronizing with a videographer, adjust the clock time on your computer, if necessary, **before** starting the realtime file. Do NOT change the clock time on your computer at any time during a realtime session or have any operating system setting that automatically updates your clock. Changing the clock time once realtime begins affects the playback of the audio recording.

## Set Up the Microphone

1. Plug the microphone into the correct port. Computers generally have different ports for sound input and output. Some notebook computers have a combined sound input and output port.

You may need an adapter to connect a microphone to a combined port. Some microphones connect via a USB port, instead of the 3.5mm jack. Refer to the documentation for your microphone for additional connection information.

If you are using ViaVoice, plug the microphone for AudioSync into the port designated in the CATalyst VP Realtime Options.

You can identify the most common ports by the following symbols:

Headphones

Line in (Sound coming in from an external hardware device other than a microphone.)

Microphone

Combined Input/Output

USB

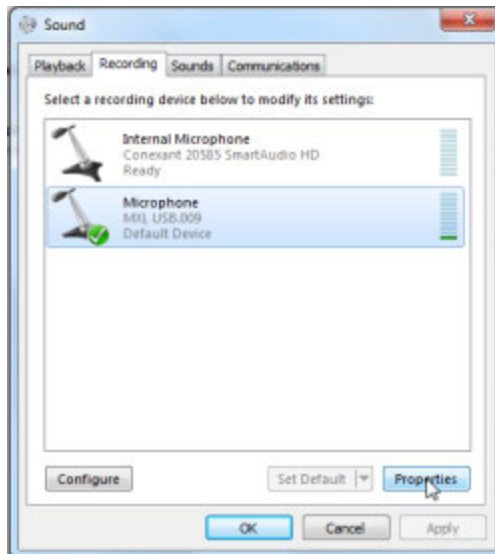

- 
2. If your microphone is battery-powered, you may need to turn it on. You may want to use an Andrea adapter with your microphone to boost the recording.

## Adjust Recording and Playback Volume

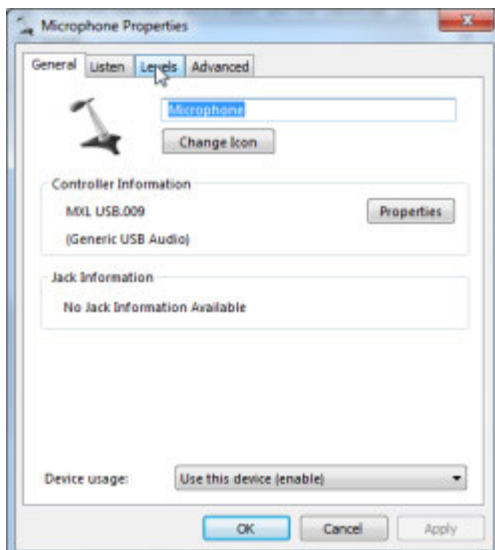

Different types of sounds can play at different volume levels on your computer. Sounds attached to events such as starting or closing Windows, the playback of an audio CD, and the sounds recorded by a microphone may all play back at different volume levels. The volume levels depend on your sound card sound level settings.

### Windows 7

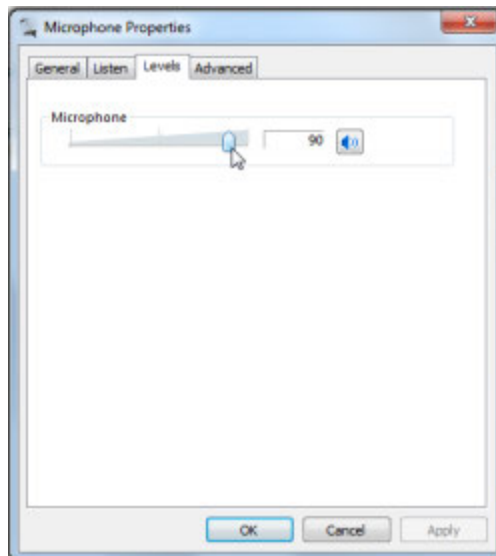

1. Right click the volume control  icon on the Windows taskbar and select **Recording Devices**. The Sound dialog box displays
2. On the **Recording** tab, click the microphone you are using for room sound and then click **Properties**. Only one microphone may displays.

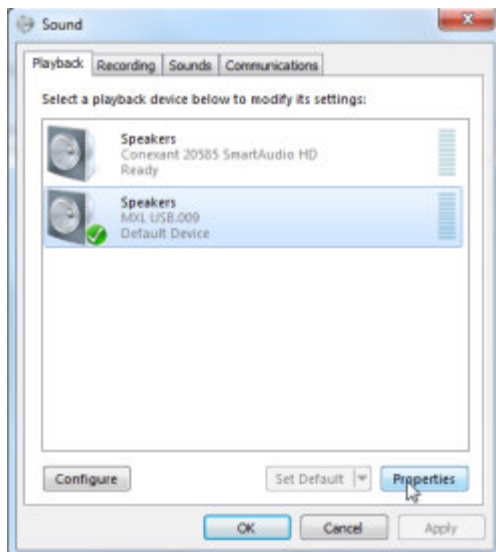

3. The Microphone Properties dialog box displays. Click the **Levels** tab.

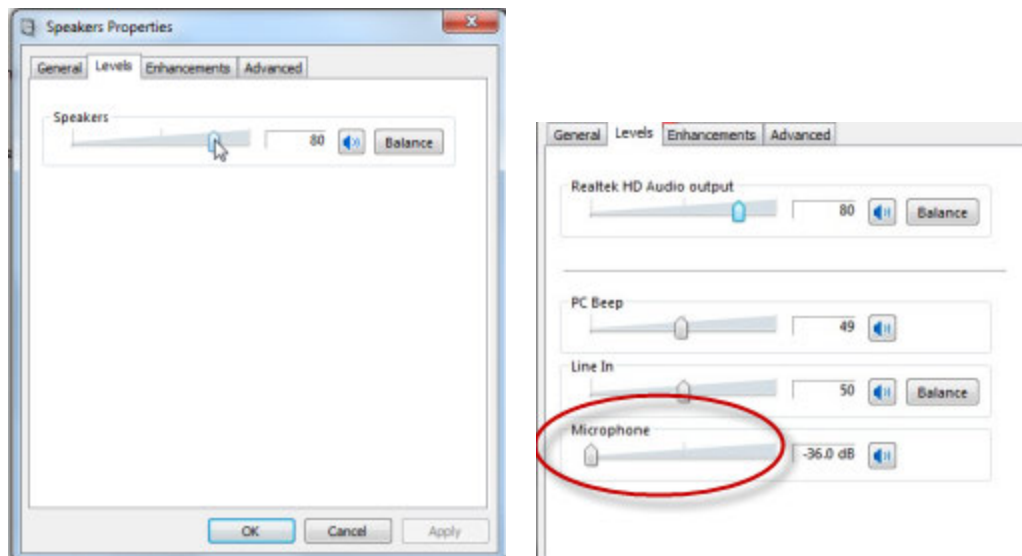

4. On the Levels tab, use the mouse to drag the Microphone level to approximately **90** percent.

5. Click **OK** to save the change. The Sound dialog box displays.
6. Click the **Playback** tab.
7. On the Playback tab, click the speakers you are using for playback and then click **Properties**.

8. The Speaker Properties dialog box displays. Click **Levels**.
9. On the Levels tab, use the mouse to drag the Speaker output level to approximately **80** percent. If a microphone volume control also displays on the tab, ensure that it is first set completely to the left before adjusting the volume output level for the speakers. This ensures the speaker setting is configured correctly.

10. Click **OK** to save the change. The Sound dialog box displays.

11. In the Sound dialog box, click **OK**.

12. Test the recording and playback levels.

**Important:** Microsoft ended Windows Vista support as of April 2017. Case CATalyst is no longer supported when running Windows Vista.

## Test the Recording and Playback Levels

### Windows 7 and Windows Vista

1. From the Windows Start Menu select **All Programs/Accessories/Sound Recorder**. The Sound Recorder dialog box displays.
2. Click **Start Recording**. Say a few words to test the microphone, standing at different distances and then click **Stop Recording**. The Save As dialog box displays.
3. Name the test audio file and save it to a convenient location, such as the Desktop.
4. Close the Sound Recorder.
5. Using Windows Explorer, navigate to the test audio file.
6. Double click the file to playback the recording. The file plays in the default selected media player.

## Downloading Sample Voice Command files

Sample Voice Command files are available for download from the Stenograph Solution Center. The Sample Voice Commands files contain detailed information about the VP Keyboard, UserLayout, Sample 1 and 2 VoiceCommands.sgvc (sample Voicecommand dictionaries) that are contained in the Sample Voice Commands.zip file. All of these are sample files that can be restored to the appropriate location in a user name and then can be modified to conform to the specific user. Or these files can be referenced and the user can create their own files. There are two sample voicecommands dictionaries, one with basic samples and more extensive entries.

### Downloading the Sample Files from Stenograph's Solution Center

1. You need to have an Internet connection. In Case CATalyst, press **Alt + h** (Help), **s** (Support Help Desk).
2. At the Stenograph Solution Center, locate the Search section in the upper left hand side and type: **sample voice command** and press **Enter**. The Sample Voice Commands.zip file should begin downloading to your Downloads folder and you should see the following message.

#### Downloading...

Your download should begin shortly. If you are experiencing problems with the download please use [this](#) link.

If the download doesn't automatically begin (look in the lower left-hand corner of the screen to see if it says "downloading," then click the link in the message on the Solution Center screen.

Once the download is complete, you can exit/close the Solution Center.

3. In Case CATalyst press, **Ctrl + r** (Restore). Navigate to your Downloads folder and select the *Sample Voice Commands.zip* file and restore the files to your user.

## Sample Voice Commands information

This topic contains information about the VP Keyboard, UserLayout, Sample 1 and 2 VoiceCommands.sgvc (sample Voicecommand dictionaries) that are available for [download from the Stenograph Solution Center](#). While in Case CATalyst you can click Help, Support Center to download the Sample Voice Commands.zip file or open your browser and go to [www.stenograph.com](http://www.stenograph.com), Support and then Tech Support and click Solution Center. All of the sample files can be restored to the appropriate location in a user name and then can be modified to conform to the specific user. Or these files can be referenced and the user can create their own files. There are two sample voicecommands dictionaries, one with basic samples and more extensive entries.

### VP Keyboard.sgkbd

The VP Keyboard contains specific key assignments for controlling the audio (both voice and room noise) associated with voice produced transcripts. Most of the VP Keyboard assignments are the same as the CATalyst default keyboard assignments except the following keys have been reassigned:

Key	Function
Ctrl + a	Voice: Play Voice Audio
Ctrl + Shift + a	Voice: Play Voice Audio with Scroll Text
Ctrl + d	Voice: Pause Dictation

Ctrl + Shift + d	Voice: Resume Dictation
Ctrl + Shift + e	Voice: Correct Words
Ctrl + l (L)	Voice: Toggle Voice and Room Audio
Ctrl + Shift + l	Voice: Stop Voice Audio
Ctrl + n	Pause Audio
Ctrl + Shift + n	Resume Audio

You can copy this file to the System Files case in the appropriate user name if you want to use it. You can also modify this keyboard and/or rename it if you want. You can also set your options so this keyboard is automatically used when starting voice translation or editing.

### **Userlayout.sgcul**

The Userlayout.sgcul is a file that controls the placement of toolbars and what icons display on the Function Bar and Toolbars and the placement of dialog panes. You can copy this file to the System Files case in the appropriate user name if you want to use it. CATalyst should be closed when copying the file.

### **Sample 1 VoiceCommands.SGVCD and Sample 2 VoiceCommands.SGVCD**

The sample VoiceCommands.SGVCD files can be customized based on your voice style or can serve as a sample if you want to create your own VoiceCommands.ini file.

The Sample VoiceCommands dictionaries contains entries that control format, speaker identification, invoke translation commands, bring in include files (i.e. title page, parentheticals, etc.), convert numbers and invoke macros (AccelerWriters). One Personal VoiceCommands.sgvcf file can exist in the System Files case and if so, it will automatically be used when starting a voice translation. To use one of these files as your Personal VoiceCommands dictionary, simply copy one of the samples VoiceCommands.SGVCD to the System Files case in your CATalyst user directory and rename it to Personal VoiceCommands.sgvcf. For example, the user name is Penny. The most common path for the Penny user is: c:\CAT4\usr\Penny\System Files. You select the sample voicecommands file and copy it to the System Files case in the Penny user. You can then rename it to be Personal VoiceCommands to use it as your Personal voicecommands dictionary. Although you can only have one Personal VoiceCommands.sgvcf file per user in the System Files case, you can use additional voice dictionaries to help translate.

VoiceCommands dictionaries load into memory while translating. You can open a dictionary during translation, make and save changes and then use the Add/Remove Dictionaries function to have those changes take effect in the realtime file.

The Sample VoiceCommands.sgvcf files contain two parts to an entry. The Voice Text (what the voice engine hears) and the Case CATalyst Text (what CATalyst should do with what the voice engine hears).

### **Sample 1 VoiceCommands.sgvcf file:**

Voice Text	Case CATalyst Text	Explanation
------------	--------------------	-------------

Queco	<Question>	When the voice engine hears “queco,” CATalyst will format it as a Question bank.
Aeco	<Answer>	When the voice engine hears “aeco,” CATalyst will format it as an Answer bank.
Qmac	<Question>	When the voice engine hears “qmac,” CATalyst will format it as a Question bank.
Amac	<Answer>	When the voice engine hears “amac,” CATalyst will format it as an Answer bank.
iz	{Suffix}'s	When the voice engine hears “iz” CATalyst adds apostrophe s ('s) to the current word.
speeone	<Colloquy> [!EZ SPEAKER 01]:	When the voice engine hears “speeone,” CATalyst will format it as Colloquy with EZ Speaker Field 01. If EZ Speaker 01 field has been filled in, the actual speaker name will display.
Byspeeone	<By-line>BY [!EZ SPEAKER 01]: <Question>	When the voice engine hears “byspeeone,” CATalyst will format it as a <By-line> paragraph style followed by the word “BY” followed by the EZ Speaker 01 field and then a question bank on the following line.
speethree	<Colloquy> [!EZ SPEAKER 03]:	When the voice engine hears “speethree,” CATalyst will format it as Colloquy with EZ Speaker field 03. If EZ Speaker 03 field has been filled in, the actual speaker name will display.
byspeethree	<By-line>BY [!EZ SPEAKER 03]: <Question>	When the voice engine hears “byspeethree,” CATalyst will format it as a <By-line> paragraph style followed by the word “BY” followed by the EZ Speaker 03 field and then a question bank on the following line.
Social Security	Social Security{Number Trigger} [NNN-NN-NNNN]	This entry will result in a properly formatted number conversion if nine consecutive numbers follow the words social security. The nine consecutive numbers can be within three paragraphs of the words “Social Security.”
s	{Suffix}'s	When the voice engine hears “s” CATalyst adds apostrophe s ('s) to the current word.

new page	<New Page>	When the voice engine hears the words “new page,” CATalyst will insert a new page format symbol which will place any following text on the new page.
Tighttight	@includes\title.sgngl[y]	When the voice engine hears the words “tight tight,” CATalyst will automatically locate the file named “title” (in the “includes” case) insert it into the transcript and retain the page layout of the title page. The [y] indicates to bring the page layout. The title include file is not included in the sample files.
z	{Suffix}'s	When the voice engine hears “z” CATalyst adds apostrophe s ('s) to the current word.
zipmar	@includes\exhibit marked.sgngl	When the voice engine hears the word “zipmar,” CATalyst will automatically locate the file named “exhibit marked” (in the “includes” case) and insert it into the transcript. The exhibit marked include file is not included in the sample files.
paz paz	{Pause Audio}	When the voice engine hears “paz paz,” CATalyst will temporarily suspend the recording of the “room noise” (AudioSync).
zoom zoom	{Resume Audio}	When the voice engine hears “zoom zoom,” CATalyst will automatically start the recording for the “room noise” audio.
backque	&&readback question.sgmacc	When the voice engine hears “backque,” CATalyst will invoke the macro named ‘readback question.’ Macros are stored in the Macros case which is located in the System Files case.

**Sample 2 VoiceCommands.sgvcd file:**

Voice Text	Case CATalyst Text	Explanation
A cap	{Glue}-A	When the voice engine hears “A cap,” CATalyst will format it as A- as long as there is another {Glue} format symbol following.
aeco	<Answer>	When the voice engine hears “aeco,” CATalyst will format it as an Answer bank

B cap	{Glue}-B	When the voice engine hears “B cap,” CATalyst will format it as B- as long as there is another {Glue} format symbol following.
benben	{Toggle Bench Mode}	Bench Mode suspends the text being sent to other computers receiving the realtime feed. This command toggles between turning Bench Mode On and Off.
byspeeeight	<By-line>BY [!EZ SPEAKER 08]: <Question>	When the voice engine hears “byspeeeight,” CATalyst will format it as a <By-line> paragraph style followed by the word “BY” followed by the EZ Speaker 08 field and then a Question bank on the following line.
byspeefive	<By-line>BY [!EZ SPEAKER 05]: <Question>	When the voice engine hears “byspeefive,” CATalyst will format it as a <By-line> paragraph style followed by the word “BY” followed by the EZ Speaker 05 field and then a Question bank on the following line.
byspeefour	<By-line>BY [!EZ SPEAKER 04]: <Question>	When the voice engine hears “byspeefour,” CATalyst will format it as a <By-line> paragraph style followed by the word “BY” followed by the EZ Speaker 04 field and then a Question bank on the following line.
byspeenine	<By-line>BY [!EZ SPEAKER 09]: <Question>	When the voice engine hears “byspeenine,” CATalyst will format it as a <By-line> paragraph style followed by the word “BY” followed by the EZ Speaker 09 field and then a Question bank on the following line.
byspeeone	<By-line>BY [!EZ SPEAKER 01]: <Question>	When the voice engine hears “byspeeone,” CATalyst will format it as a <By-line> paragraph style followed by the word “BY” followed by the EZ Speaker 013 field and then a Question bank on the following line.

byspeeseven	<By-line>BY [!EZ SPEAKER 07]: <Question>	When the voice engine hears “byspeeseven,” CATalyst will format it as a <By-line> paragraph style followed by the word “BY” followed by the EZ Speaker 07 field and then a Question bank on the following line.
byspeesix	<By-line>BY [!EZ SPEAKER 06]: <Question>	When the voice engine hears “byspeesix,” CATalyst will format it as a <By-line> paragraph style followed by the word “BY” followed by the EZ Speaker 06 field and then a Question bank on the following line.
byspeeten	<By-line>BY [!EZ SPEAKER 10]: <Question>	When the voice engine hears “byspeeten,” CATalyst will format it as a <By-line> paragraph style followed by the word “BY” followed by the EZ Speaker 10 field and then a Question bank on the following line.
byspeethree	<By-line>BY [!EZ SPEAKER 03]: <Question>	When the voice engine hears “byspeethree,” CATalyst will format it as a <By-line> paragraph style followed by the word “BY” followed by the EZ Speaker 03 field and then a Question bank on the following line.
byspeetwo	<By-line>BY [!EZ SPEAKER 02]: <Question>	When the voice engine hears “byspeetwo,” CATalyst will format it as a <By-line> paragraph style followed by the word “BY” followed by the EZ Speaker 02 field and then a Question bank on the following line.
C cap	{Glue}-C	When the voice engine hears “C cap,” CATalyst will format it as C- as long as there is another {Glue} format symbol following.
capfour	{Cap Previous 4 Words}	When the voice engine hears “capfour,” CATalyst will initial cap the previous four words.

capone	{Cap Previous 1 Word}	When the voice engine hears "capone," CATalyst will initial cap the previous word.
capthree	{Cap Previous 3 Words}	When the voice engine hears "capthree," CATalyst will initial cap the previous three words.
captwo	{Cap Previous 2 Words}	When the voice engine hears "captwo," CATalyst will initial cap the previous two words.
certsign	@Includes\Cert Sign	When the voice engine hears the words "certsign," CATalyst will automatically locate the file named "Cert Sign" (in the "includes" case) and insert it into the transcript. The Cert Sign include file is not included in the sample files.
certwaive	@Includes\Cert Waive	When the voice engine hears the words "certwaive," CATalyst will automatically locate the file named "Cert Waive" (in the "includes" case) and insert it into the transcript. The Cert Waive include file is not included in the sample files.
clearclearA	&&Delete to last A	CATalyst invokes a macro that deletes all text written after the last Answer symbol and positions the cursor following the A. The Delete to last A macro is not included with this file.
clearclearclear	&&Clear Screen	CATalyst invokes a macro that pushes the existing text off the realtime screen. The Clear Screen macro is not included.
clearclearQ	&&Delete to last Q	CATalyst invokes a macro that deletes all text written after the last Question symbol and positions the cursor following the Q. The Delete to last Q macro is not included.
clerkclerk	<Colloquy>THE CLERK:	When the voice engine hears "clerkclerk," CATalyst will format it as Colloquy with THE CLERK followed by a colon and space.

concon1	{Resolve Conflict, Choice 1}	When the voice engine hears "concon1," CATalyst will select the first choice in the previous conflict.
concon2	{Resolve Conflict, Choice 2}	When the voice engine hears "concon2," CATalyst will select the second choice in the previous conflict.
concon3	{Resolve Conflict, Choice 3}	When the voice engine hears "concon3," CATalyst will select the third choice in the previous conflict.
courtcourt	<Colloquy>THE COURT:	When the voice engine hears "courtcourt," CATalyst will format it as Colloquy with THE COURT followed by a colon and space.
dash	<Sticky Space>--	CATalyst inserts a Sticky Space format symbol followed by a dash (--) to keep the previous word with the dash if the line should wrap.
date1	{Number Conversion}[nN/Nx/nn]	When the voice engine hears "date1," CATalyst searches back for previously written numbers, which fit the conversion criteria, and converts the series of numbers to a date separated by slashes. This entry was designed for one digit month dates month.
date2	{Number Conversion}[NN/nn/Nn]	When the voice engine hears "date2," CATalyst searches back for the previously written numbers, which fit the conversion criteria, and converts the series of numbers to a date separated by slashes. This entry is designed for two digit month dates.
Disusso	<Parenthetical>(WHEREUPON, a discussion was had off the record which was not reported.)	CATalyst inserts the formatted parenthetical.
DX1	<Parenthetical>(WHEREUPON, Defendant Exhibit Number 1 was marked for identification.)	CATalyst inserts the formatted parenthetical.

DX2	<Parenthetical>(WHEREUPON, Defendant Exhibit Number 2 was marked for identification.)	CATalyst inserts the formatted parenthetical.
DX3	<Parenthetical>(WHEREUPON, Defendant Exhibit Number 3 was marked for identification.)	CATalyst inserts the formatted parenthetical.
DX4	<Parenthetical>(WHEREUPON, Defendant Exhibit Number 4 was marked for identification.)	CATalyst inserts the formatted parenthetical.
DX5	<Parenthetical>(WHEREUPON, Defendant Exhibit Number 5 was marked for identification.)	CATalyst inserts the formatted parenthetical.
Endo	<Parenthetical>(The proceeding recessed at [!Static Time – 12 Hour])	CATalyst inserts the formatted parenthetical and fills in the time field with the current computer time.
I cap	{Glue}-I	When the voice engine hears “I cap,” CATalyst will format it as I- as long as there is another {Glue} format symbol following.
iz	{Suffix}'s	When the voice engine hears “iz” CATalyst adds apostrophe s ('s) to the current word.
know it isn't	^ no, it isn't ^ know it isn't<Conflict End>	CATalyst inserts the conflict for selection.
L cap	{Glue}-L	When the voice engine hears “L cap,” CATalyst will format it as L- as long as there is another {Glue} format symbol following.
markmark	@Includes\Exhibit	When the voice engine hears the words “markmark,” CATalyst will automatically locate the file named “Exhibit” (in the “includes’ case) and insert it into the transcript. The Exhibit include file is not included in the sample files.
no, it isn't	^ no, it isn't ^ know it isn't<Conflict End>	CATalyst inserts the conflict for selection.

nocall	<Answer>I don't recall<Question>	CATalyst inserts an Answer format symbol followed by the text "I don't recall" followed by a Question format symbol.
noco	<Answer>No<Question>	CATalyst inserts an Answer format symbol followed by the text "No" followed by a Question format symbol.
nodnod	(Moving head up and down.)	Inserts the text without any specific formatting.
nomem	<Answer>I don't remember<Question>	CATalyst inserts an Answer format symbol followed by the text "I don't remember" followed by a Question format symbol.
nomum	<Answer>No, ma'am<Question>	CATalyst inserts an Answer format symbol followed by the text "No, ma'am" followed by a Question format symbol.
nossir	<Answer>No, sir<Question>	CATalyst inserts an Answer format symbol followed by the text "No, sir" followed by a Question format symbol.
O cap	{Glue}-O	When the voice engine hears "O cap," CATalyst will format it as O- as long as there is another {Glue} format symbol following.
offoff	<Parenthetical>(Discussion off the record.)	CATalyst inserts the formatted parenthetical.
pierco	.	Inserts a period with a space which results in two spaces following the period and initially caps the first letter of the following word.
pren	(	Inserts an open parenthesis.
prenpren	)	Inserts a closed parenthesis.
PX1	<Parenthetical>(WHEREUPON, Plaintiff Exhibit Number 1 was marked for identification.)	CATalyst inserts the formatted parenthetical.

PX2	<Parenthetical>(WHEREUPON, Plaintiff Exhibit Number 2 was marked for identification.)	CATalyst inserts the formatted parenthetical.
PX13	<Parenthetical>(WHEREUPON, Plaintiff Exhibit Number 3 was marked for identification.)	CATalyst inserts the formatted parenthetical.
PX4	<Parenthetical>(WHEREUPON, Plaintiff Exhibit Number 4 was marked for identification.)	CATalyst inserts the formatted parenthetical.
PX5	<Parenthetical>(WHEREUPON, Plaintiff Exhibit Number 5 was marked for identification.)	CATalyst inserts the formatted parenthetical.
queco	<Question>	Inserts a Question format symbol based on the current page layout.
quex	?	Inserts a question mark followed by a space which results in two spaces following the question mark and initial caps the following word.
quote	"<Delete Space>	Inserts an opening quote and deletes the space following the open quote.
quotequote	<Delete Space>"	Inserts a closing quote and deletes the space before the closing quote.
R cap	{Glue}-R	When the voice engine hears "R cap," CATalyst will format it as R- as long as there is another {Glue} format symbol following.
readread	<Parenthetical>(Requested portion was read.)	CATalyst inserts the formatted parenthetical.
recesso	<Parenthetical>(Recess taken.)	CATalyst inserts the formatted parenthetical.
repeato	<Answer>Could you repeat the question? <Question>	Inserts an Answer format symbol followed by the words "Could you repeat the question?" followed by a Question format symbol.
reprep	&&Replace exhibit number	Invokes the Replace exhibit number macro. The Replace exhibit number macro is not included in the sample files.

s	{Suffix}'s	When the voice engine hears “s” CATalyst will apply the rules of spelling and apostrophe s ('s) to the current word.
shakeshake	(Moving head side to side.)	Inserts the appropriate text surrounded by parenthesis.
Social Security	Social Security{Number Trigger}[NNN-NN-NNNN]	Formats a series of numbers following the words “Social Security” which fit the conversion criteria into the appropriate social security number format.
speeeight	<Colloquy> [!EZ SPEAKER 08]:	When the voice engine hears “speeeight,” CATalyst will format it as Colloquy with EZ Speaker field 08. If EZ Speaker 08 field has been filled in, the actual speaker name will display.
speefive	<Colloquy> [!EZ SPEAKER 05]:	When the voice engine hears “speefive,” CATalyst will format it as Colloquy with EZ Speaker field 05. If EZ Speaker 05 field has been filled in, the actual speaker name will display.
speefour	<Colloquy> [!EZ SPEAKER 04]:	When the voice engine hears “speefour,” CATalyst will format it as Colloquy with EZ Speaker field 04. If EZ Speaker 04 field has been filled in, the actual speaker name will display.
speenine	<Colloquy> [!EZ SPEAKER 09]:	When the voice engine hears “speenine,” CATalyst will format it as Colloquy with EZ Speaker field 09. If EZ Speaker 09 field has been filled in, the actual speaker name will display.
speeone	<Colloquy> [!EZ SPEAKER 01]:	When the voice engine hears “speeone,” CATalyst will format it as Colloquy with EZ Speaker field 01. If EZ Speaker 01 field has been filled in, the actual speaker name will display.

speeseven	<Colloquy> [!EZ SPEAKER 07]:	When the voice engine hears “speeseven,” CATalyst will format it as Colloquy with EZ Speaker field 07. If EZ Speaker 07 field has been filled in, the actual speaker name will display.
speesix	<Colloquy> [!EZ SPEAKER 06]:	When the voice engine hears “speesix,” CATalyst will format it as Colloquy with EZ Speaker field 06. If EZ Speaker 06 field has been filled in, the actual speaker name will display.
speeten	<Colloquy> [!EZ SPEAKER 10]:	When the voice engine hears “speeten,” CATalyst will format it as Colloquy with EZ Speaker field 10. If EZ Speaker 10 field has been filled in, the actual speaker name will display.
speethree	<Colloquy> [!EZ SPEAKER 03]:	When the voice engine hears “speethree,” CATalyst will format it as Colloquy with EZ Speaker field 03. If EZ Speaker 03 field has been filled in, the actual speaker name will display.
speetwo	<Colloquy> [!EZ SPEAKER 02]:	When the voice engine hears “speetwo,” CATalyst will format it as Colloquy with EZ Speaker field 02. If EZ Speaker 02 field has been filled in, the actual speaker name will display.
starto	<Parenthetical>(The proceeding began at [!Static Time – 12 Hour])	Inserts the appropriate parenthetical and fills in the static time field with the current computer time.
startstart	@Includes\StartStart	When the voice engine hears the words “startstart,” CATalyst will automatically locate the file named “StartStart” (in the “includes’ case) and insert it into the transcript. The StartStart include file is not included in the sample files.
stopstop	<Parenthetical>(Deposition concluded at [!Static Time – 12 Hour])	CATalyst inserts the formatted parenthetical and fills in the time field with the current computer time.

sumesume	{Resume Audio}	When the voice engine hears “sumesume,” CATalyst will automatically start the recording for the “room noise” audio.
swearswear	<Centered Paragraph>[!Witness],<New Line Paragraph><Uncap Next>having been duly sworn, testified as follows:	Inserts the text with the appropriate formatting.
swornco	@Includes\Sworn	When the voice engine hears the words “swornco,” CATalyst will automatically locate the file named “Sworn” (in the “includes” case) and insert it into the transcript. The Sworn include file is not included in the sample files.
tax ID	tax ID{Number Trigger}[NN-NNNNNNN]	Formats the following nine digit/number words to the appropriate tax ID format.
timetime	{Number Conversion}[*Time00]	CATalyst searches back for a one, two, three or four digit numbers and converts the series of numbers to a time format. If CATalyst finds one or two numbers, two zeros will be added to the number(s) in a time format.
tighttight	@Includes\title.sgngl[y]	When the voice engine hears the words “tighttight,” CATalyst will automatically locate the file named “title” (in the “includes” case) and insert it into the transcript. The [y] indicates to bring the page layout. The title include file is not included in the sample files.
whatwit	(Inaudible.)	When the voice engine hears the words “whatwit,” CATalyst inserts the text without any formatting.
witbooboo	(Crying.)	When the voice engine hears the words “witbooboo,” CATalyst inserts the text without any formatting.
witca	(Indicating.)	When the voice engine hears the words “witca,” CATalyst inserts the text without any formatting.

withaha	(Laughing.)	When the voice engine hears the words “withaha,” CATalyst inserts the text without any formatting.
witmo	(Motioning.)	When the voice engine hears the words “witmo,” CATalyst inserts the text without any formatting.
witnod	(Witness nods head.)	When the voice engine hears the words “witnod,” CATalyst inserts the text without any formatting.
witshake	(Witness shakes head.)	When the voice engine hears the words “witshake,” CATalyst inserts the text without any formatting.
witwit	<Colloquy>THE WITNESS:	When the voice engine hears “witwit,” CATalyst will format it as Colloquy with THE WITNESS followed by a colon and space.
yeahco	<Answer>Yes<Question>	When the voice engine hears the word “yeahco,” CATalyst inserts an Answer followed by the word “Yes” followed by a Question.
yessir	<Answer>Yes, sir<Question>	When the voice engine hears the word “yessir,” CATalyst inserts an Answer followed by the words “Yes, sir” followed by a Question.
yessum	<Answer>Yes, ma’am<Question>	When the voice engine hears the word “yessum,” CATalyst inserts an Answer followed by the words “Yes, ma’am” followed by a Question.
zipzip	{Number Conversion}[NNNNn-nnnn]	When the voice engine hears the word “zipzip,” CATalyst looks backward in the file for last four to nine numbers (or word numbers) in a series formats the number accordingly (five numbers followed by a hyphen with four numbers).
z	{Suffix}'s	When the voice engine hears “z” CATalyst adds apostrophe s ('s) to the current word.

## Basic Transcript Production

Basic transcript production includes editing the translated text file, printing the edited text when complete and backing up and managing your vocabulary file. The CATalyst VP, Basic Transcript Production topics includes instruction on the basic steps to read and manage steno notes, translate and edit your notes, delivery, and file and dictionary management.

You can [download sample voice files](#) to assist you in getting started with basic CATalyst VP features and transcript production. The Sample Voice Command files are available for download from Stenograph's Solution Center (Help, Support Help Desk) or [www.stenograph.com](http://www.stenograph.com). The sample files are also available when downloading the latest version of Case CATalyst with IVTs (Integrated Training Videos) and copying the files in the Sample Voice Files folder located in the CAT4 folder. You can use these sample files, making any necessary individualized modifications.

The sample files contained in the [Sample Voice Files](#) folder include: UserLayout.sgcul, Sample 1 VoiceCommands.sgvc and Sample 2 VoiceCommands.sgvc and VP Keyboard.sgkbd. The Sample Voice Files Document, in PDF format, provides information about the files and how to use them.

## Copy Sample Voice Files

To use the files, download them from Stenograph's web site ([www.stenograph.com](http://www.stenograph.com)), select Support and then Solution Center to the appropriate location on your computer in Case CATalyst.

1. Once the files are downloaded, double click the folder, **Sample Voice Files**.
2. Using Windows conventions, copy each file you are using to the specified Case CATalyst location:
  - UserLayout.sgcul - System Files case.
  - Sample 1 VoiceCommands.sgvc - Copy to the System Files case. A sample voice dictionary can be renamed, Personal VoiceCommands.sgvc, for use with CATalyst VP only. CATalyst VP automatically uses this dictionary during voice translation. The dictionary name must be, Personal VoiceCommands.sgvc and reside in the System Files case for CATalyst VP to use it automatically. You can also create a new voice dictionary with the name, Personal VoiceCommands.sgvc.
  - Sample 2 VoiceCommands.sgvc - Copy to the System Files case. This sample voice dictionary can be renamed, Personal VoiceCommands.sgvc, for use with CATalyst VP only. CATalyst VP automatically uses this dictionary during voice translation. This dictionary must be named, Personal VoiceCommands.sgvc and reside in the System Files case for CATalyst VP to use it automatically. You can also create a new voice dictionary with the name, Personal VoiceCommands.sgvc.
  - VP Keyboard.sgkbd - Copy to the System Files case. Keyboard maps must reside in the System Files case.
  - Sample Voice Files Document.pdf - this document provides information and use regarding the contents of the Sample VoiceCommands dictionaries.

## Step 1: Translating

The first step to starting voice translation is to connect your mask and microphone for room noise, then open the Translate & Edit function. The [Translate and Edit](#) function uses the Dragon/ViaVoice vocabulary to translate words into text. CATalyst VP voice commands dictionaries format text and invoke commands. The Translate [options](#) allow you to customize certain features for each translation activity to meet your particular dictation style and job needs. Once translation starts, you can begin editing.

## Begin Translation

1. Open Case CATalyst.
2. Connect your mask for dictation and microphone for room noise to the appropriate ports on the computer.
3. Press **Alt + u, t (Function/Translate & Edit)**. The Translate dialog box displays.
4. In the Steno Source field, select **Voice**.
5. Select **Options** to display the Case CATalyst Translate Options dialog box where you can set necessary Translate [options](#).

The first time you translate, you must set up your translate options or the following message displays: "The first time you translate you must set up your options. Please either walk through this Wizard, or go back and click the Options button."

The Translate Wizard successively displays each tab. If you do not need to set options for a particular tab, click Next. You can also manually access each of the translate options.

6. In the File field, type a name for the job and press **Enter (OK)** to begin Translate.
7. The CATalyst VP Edit screens displays. The Start Dictation dialog box displays with following message: *This could take a moment...please wait.*
8. CATalyst VP opens Edit with the voice dictation microphone On. The microphone icon displays in the SysTray at the bottom of your Windows screen. Using the Voice translation toolbar you can view and control the status of the voice microphone. To display the Voice translation toolbar, select **View/Show/Voice**.
9. As you speak, the Dragon/ViaVoice voice box displays what Dragon/ViaVoice hears. CATalyst VP then displays the translated text on the Edit screen, formatted according to the applied [Layout](#). Once translation starts, you can begin editing the file.

## Step 2: Editing

The Edit function contains several features to help you make necessary corrections when editing a job. Use the following basic editing commands to make changes to your job. Because editing involves typing, it is often easier and faster to press a keyboard command than click a toolbar button. Editing instructions focus on using the keyboard.

## Using Mark Commands

A Mark command selects text for the purpose of performing another command, such as defining, deleting or searching for text. Use any of the following commands to Mark text.

- **Shift** + any basic cursor movement, such as left or right arrow
- **Ctrl** + [
- Click and hold the left mouse button + drag the mouse the text you want to mark
- **Click** + **hold Shift** + click at the end of the text
- Select **Special Edit/Mark Start** and use a key command such as the Search, Go To and Down Arrow to Mark text. When finished marking text, select Special Edit/Mark End

To unmark selected text click the mouse once anywhere on the screen, except when using the Mark Start command. To unmark any selected text when using the Mark Start command, press **Alt + s, k (Special Edit/Unmark)**.

## Inserting Text

Type directly on the screen to insert text, format symbols format symbols, and punctuation. When typing, the cursor pushes the text to the right as you type if you are in Insert mode. When you are in Overwrite mode, the text you type overwrites the existing text. The default cursor mode in Edit is Insert. OVR displays in the Status bar at the bottom of the screen when you are in Overwrite mode. To change the Insert/Overwrite mode, press the Insert key.

## Replacing Text

The [Replace](#) command allows you to replace text for a single occurrence, listen to what Dragon/ViaVoice heard and train words to update your voice translation file. When using Replace and the [Intuitive Replace](#) option is active, CATalyst VP remembers all the replacements and suggests a word in the New Text field.

## Replacing Text Globally

Using the [E-Define](#) (Ctrl + e) command you can replace text applying the change throughout the job, listen to what Dragon/ViaVoice heard and train words to update your voice translation file. E-Defines are placed into a Global Table which you can use for future translations.

## Search

The [Search](#) (Ctrl + f) command allows you to locate specific text in your transcript. When searching for text, you can look for forward or backward in the file for whole, partial or multiple words. Search looks for the specified text within fields, hidden text and any header/footer text changed with format symbols in Edit. If Search finds text in hidden text or header/footer text, the Reveal Codes dialog pane displays with the header/footer or hidden text line highlighted.

Once a searched entry for text displays, you can repeat the search for the same text and search parameters without reentering the information by using Repeat Search Forward (F3) or Repeat Search Backward (Shift F3).

## Deleting Text

Delete text using any of the following:

- Position your cursor immediately after the character or word you want to delete. Press **Backspace** to delete one character at a time.
- Position your cursor immediately before the word you want to delete. Press **Ctrl + Delete** to delete the word. You can continue to delete successive words.
- Mark text and then press **Delete**. CATalyst VP deletes only the highlighted text. If you mark a single word, CATalyst VP deletes only the word and does not delete any adjoining spaces.

## Step 3: Delivery

Delivery includes printing your completed transcript. The [Print](#) function displays the Print dialog box where you can send the current file or selected portions of the file to the printer or to create a [PDF](#).

Delivery can also include exporting an [ASCII](#) or [RTF/CRE](#) file of the completed text. ASCII is an acronym for American Standard Code for Information Interchange. In all ASCII files, formatting attributes such as bold, underline, italics, subscript and superscript text are removed. You can create the ASCII file on disk or on a hard drive.

RTF is an acronym for Rich Text Format. CRE is an acronym for Court Reporter Extension. RTF/CRE is universal file formats that retain much of the original file formatting and text attributes.

### Print a Job

1. Press **Alt + u, p (Function/Print)**.
2. In the [Print](#) dialog box, select the job you want to print, output type, printer and print range.
3. Press **Enter (Print)** to begin printing.

### Create an ASCII or RTF/CRE

1. Press **Alt + u, x (Function/Export)**.
2. In the Export dialog box, select the **ASCII** or the **RTF/CRE** tab.
3. Set any necessary options. Select **Options** to display export options.
4. Select the job from which you want to create the ASCII.

## Step 4: Dragon File Management

Backing up is the most important aspect of managing your Dragon data and CATalyst VP job files. Regular backups of your most currently trained Dragon vocabulary file and other critical Dragon and Case CATalyst files provide access to additional copies, safeguarding your work. As a standard procedure, you should keep backup copies of:

- Dragon vocabulary and user data file
- CATalyst VP transcript files, including all subfiles
- CATalyst VP voice commands dictionaries
- Other Case CATalyst System files such as, Include files, Index Templates, Keyboard Maps and Layouts

### Dragon User Backup

Your Dragon User file contains important data which is critical to maintaining and enhancing your vocabulary and voice recognition accuracy. The Manage Users feature in Dragon enables you to backup your vocabulary and user file data, creating an additional copy of this information. The default backup location is the individual user folder. To specify a different backup location, refer to the Dragon User's Guide.

Using the Dragon Restore feature, you can retrieve your backup files if necessary. It is recommended that you use only the Dragon Backup and Restore features. **Currently Windows System Restore feature does not work correctly with Dragon. If used, it will corrupt your Dragon user files.**

It is also recommended that you store a copy of your files in another location. Using the Export feature in Manage Users, you can store your Dragon files to another drive or memory stick for safeguarding or file transfer purposes.

#### Dragon Backup

To backup Dragon user files from CATalyst VP:

1. Right click the microphone icon in the SysTray at the bottom of your screen. Select **File/Manage Users**. The Dragon Manage Users dialog box displays. If necessary, select the appropriate user.
2. In the Manage Users dialog box, select **Advanced**.
3. From the Advanced menu, select **Backup**. Dragon backs up the user files to the default folder. The default folder is where you originally installed Dragon.

To change the folder where backup and user files are stored, refer to the Dragon Naturally Speaking User's Guide and Dragon Help for information.

### Dragon Export

To export Dragon user files from CATalyst VP:

1. Right click the microphone icon in the SysTray at the bottom of your screen. Select **File/Manage Users**. The Dragon Manage Users dialog box displays. If necessary, select the appropriate user.
2. In the Manage Users dialog box, select **Advanced**.
3. From the Advanced menu, select **Export**. The Browse For Folder dialog box displays.
4. Select an export location and press **Enter (OK)**.

## CATalyst VP Job File Backup

The [Manage Jobs](#) function enables you to back up your jobs, creating an additional copy of your work which you can use for storage, transferring files to another system or safeguarding your files.

The [Backup](#) function compresses a copy of the selected files and saves them to a specified name with a .ZIP extension. You can also transfer backed up jobs to external media such as thumb drive, another Case CATalyst system, or send them electronically.

As a standard procedure, you should keep backup copies of your transcript files including subfiles such as text (.sgn) files, Dragon Voice Data (.dra) files and audio (wav), if using AudioSync. It is strongly recommended that you backup your System Files case which contains the Index templates, Keyboard Maps, Layouts and the voice commands dictionaries. You should also keep backup copies of your Include files.

To back up files:

1. From Manage Jobs, press **Ctrl + b (Tools/Backup)**.
2. In the Save in field, select the location to store the backup.
3. If necessary, set [backup options](#). Press **Options** to display the Backup Options dialog box. Make changes and press **Enter (OK)** when finished.
4. Press **Enter (Save)**.

## Step 4: ViaVoice File Management

Backing up is the most important aspect of managing your ViaVoice data and CATalyst VP job files. Regular backups of your most currently trained ViaVoice speech files and Case CATalyst files provide access to additional copies, safeguarding your work. As a standard procedure, you should keep backup copies of:

- ViaVoice User data files

- CATalyst VP transcript files, including all subfiles
- CATalyst VP voice commands dictionaries
- Other Case CATalyst System files such as, Include files, Index Templates, Keyboard Maps and Layouts

### ViaVoice User Backup

Your ViaVoice User data contains important speech files which are critical to maintaining and enhancing your vocabulary and voice recognition accuracy. The ViaVoice Backup User feature enables you to backup your user data. When ViaVoice backs up the file, it places it in a compressed (.zip) file for storage. Using the ViaVoice Restore User feature, you can retrieve your backup files if necessary. It is recommended that you use only the ViaVoice Backup and Restore features. **Windows System Restore feature may not work correctly with ViaVoice. If used, it may corrupt your ViaVoice user files.**

In addition to storing a backup file on your computer, you want to store a copy of your files in another location in case you are not able to access your computer or computer files.

### ViaVoice User Data Backup

To backup your ViaVoice user data file in ViaVoice:

1. From the ViaVoice Menu, select **User Options/ViaVoice Options**. The ViaVoice Options dialog box displays.
2. Select the **User** tab.
3. In the User Name field, be sure your user name displays.
4. Click **Backup User**. The Backup for user dialog box displays.
5. In the Backup description field, type a name for the backup. ViaVoice creates an informational (.ini) file for the backup in which this information is stored.
6. In the Back up to field, use the Browse button to select a location. The VoiceModel Backup dialog box displays. Navigate to the location where you want to store the backup.
7. In the File name field, type a name for the backup and click **Save**. ViaVoice uses this file name to create a folder in which to store the backup file.
8. In the Backup to user dialog box, click **Backup**. ViaVoice displays a confirmation message when the backup is complete.
9. In the ViaVoice Options dialog box, click **OK**. For additional information about backing up and restoring your ViaVoice user data files, see the ViaVoice Help or your ViaVoice user guide.

### CATalyst VP Job File Backup

The [Manage Jobs](#) function enables you to back up your jobs, creating an additional copy of your work which you can use for storage, transferring files to another system or safeguarding your files.

The [Backup](#) function compresses a copy of the selected files and saves them to a specified name with a .ZIP extension. You can also transfer backed up jobs to external media such as a thumb drive, another Case CATalyst system, or send them electronically.

As a standard procedure, you should keep backup copies of your transcript files including subfiles such as text (.sgnfl) files, ViaVoice Voice Data (.sgvod) files and audio (.wav), if using AudioSync. It is strongly recommended that you backup your System Files case which contains the Index templates, Keyboard Maps, Layouts and the voice command dictionaries. You should also keep backup copies of your Include files.

To back up files:

1. From Manage Jobs, press **Ctrl + b (Tools/Backup)**.
2. In the Save in field, select the location to store the backup.
3. If necessary, set [backup options](#). Press **Options** to display the Backup Options dialog box. Make changes and press **Enter (OK)** when finished.
4. Press **Enter (Save)**.

## Step 5: Run Dragon Acoustic Optimizer

The Dragon Acoustic Optimizer, stores correction and training data in an archive. When you run the Acoustic Optimizer, Dragon incorporates the acoustic data into your user file for improved voice recognition accuracy. You must have the Dragon option, *Store corrections in archive* selected to use the Acoustic Optimizer.

Run the Acoustic Optimizer to integrate corrections made during dictation and after reading stories and training Dragon. Dragon stores correction and training data in an archive. When you make corrections during Edit to train Dragon and update the voice engine, CATalyst VP prompts you to save the changes when you exit the file. When you select to save the changes, CATalyst VP updates the voice engine, remembering the corrections in the voice data file. When you run the Acoustic Optimizer, Dragon incorporates the voice data into your vocabulary file for improved voice recognition accuracy. Dragon Natural Speaking suggests that you run the Acoustic Optimizer on files where corrections are complete. If you run the Optimizer on files that contain partial corrections, Dragon may interpret mistranslates that are not corrected as valid translations for future translations.

Running the Acoustic Optimizer may take considerable time but increases the accuracy of voice translation. The Acoustic Optimizer requires a significant amount of computer resources to run. It is recommended that you use the Acoustic Optimizer when you are not using your computer for other tasks.

You can run the Acoustic Optimizer from Dragon or right click on the microphone icon in the SysTray and select **Tools/Accuracy Center/Run the Acoustic Optimizer**. See the Dragon User's Guide for detailed information about using the Acoustic Optimizer before selecting to run it.

## Dragon V9.0

In Dragon V9.0, the Acoustic Optimizer has been renamed to the Acoustic and Language Optimizer. The Language Model, an additional feature in V9.0, stores statistical data used to predict words when dictating. When you run the Language Model Optimizer, Dragon incorporates data from the .DRA files into the Language Model for improved voice recognition. You can run the Language Model Optimizer along with the Acoustic Optimizer.

To run the Acoustic and Language Model Optimizer from Dragon or right click on the microphone icon in the SysTray and select **Tools/Accuracy Center/Run the Acoustic and Language Model Optimizer**. In the Acoustic and Language Model Optimizer dialog box, check the box, **Run Acoustic Optimization**. Check the box, **Run Language Model Optimization**, to run the Language Model Optimizer. See the Dragon User's Guide for detailed information about using the Acoustic and Language Model Optimizer before selecting to run it.

## Step 5: ViaVoice Analyze My Documents & Vocabulary Manager

CATalyst VP automatically creates the Analyze case and stores the audio (.wav) and a text (.txt) file of the dictation for each job. You can use the ViaVoice Analyze My Documents feature to analyze the text files for word usage and context to improve your voice translation accuracy. You can then use the ViaVoice Vocabulary Manager to help you manage your Personal vocabulary. Using the Vocabulary Manager, you can add and delete words in your Personal vocabulary as well as train words. The Vocabulary Manager displays all the words you add to your vocabulary. See the ViaVoice Help or user guide for additional information about using Analyze My Documents and the Vocabulary Manager.

## Step 6: Run Dragon Vocabulary Optimizer

CATalyst VP automatically creates the Analyze case and stores the audio (.wav) and a text (.txt) file of the dictation for each job. It is important to analyze your word usage and context of the text files to improve voice translation accuracy. It is suggested that you run the option, *Add words from your documents to the vocabulary* from Accuracy Center and select the documents in the Analyze Case.

Run the *Add words from your documents to the vocabulary* option from Dragon or right click on the microphone icon in the SysTray and select **Tools/Accuracy Center/Add words from your documents to the vocabulary**. See the Dragon User's Guide for detailed information about using the *Add words from your documents to the vocabulary* option.

## Voice Command Dictionaries

CATalyst VP allows you to create and maintain multiple Case CATalyst voice command dictionaries. During voice translation, CATalyst VP uses the Dragon or ViaVoice vocabulary to match words with what it hears. Case CATalyst voice command dictionaries contain entries that provide instructions to CATalyst VP on how to translate text, format text and invoke commands in the job file as you speak.

Each entry consists of two parts, Voice Text and CATalyst Text. Voice Text is what you speak. This is what the voice engine hears. CATalyst text is the instruction to CATalyst VP. For example, you speak "queco" which is defined as a question, <Question>. CATalyst VP translates the word as a Question paragraph style based on the format in your [layout](#) setting. Voice dictionaries can also contain entries for translation commands, Auto Includes, and AccelerWriters, macros invoked by your voice. For example, you define "zipmar" as an auto include for your exhibit marked parenthetical phrase. In a job, you speak "zipmar" and CATalyst VP brings your exhibit marked parenthetical into the transcript.

There are two types of voice dictionaries, a Personal VoiceCommands dictionary and job voice dictionaries. If a Personal VoiceCommands dictionary exists, it is automatically used with voice translation and loads into memory while translating. If a Personal VoiceCommands dictionary does not exist, you can create a new one by [opening](#) Personal VoiceCommands dictionary and inserting new entries. You can also use one of the sample VoiceCommands dictionaries, available on Stenograph's web site ([www.stenograph.com](http://www.stenograph.com)) select Support and then Solution Center. You can then modify it to match your dictation style and theory. When you [copy](#) a sample VoiceCommands dictionary from the downloaded voice files to your user's System Files case, you must change the name to **Personal VoiceCommands**. CATalyst VP can only recognize the Personal VoiceCommands dictionary by this name. Only one Personal VoiceCommands dictionary can exist in the System's Files case.

Job voice dictionaries are additional VoiceCommands dictionaries used in translation that contain specific formatting and command instructions you may not want to place in your Personal VoiceCommands dictionary. These dictionaries might contain entries that include speaker names or technical terms for specific jobs. You can create an unlimited number of additional job dictionaries.

All CATalyst VP voice command dictionaries have the .sgvcd file extension.

[Keyboard Map](#) Function: Open Job Voice Dictionary

Open Personal Voice Dictionary

## File - New - Job Voice Command

The Job Voice command feature allows you to create a voice command dictionary for a specific job or job type such as medical, construction, etc. You can have multiple Job Voice Command dictionaries in your user. This option is only available if you have the CATalyst VP option on your e-key license.

To create a new Job Voice Commands dictionary file:

1. Press **Alt + f, n, j** (File, New, Job Voice Command).
2. In the Create New Document dialog box, with the Files of field defaulting to Voice Command Files (\*.sgvcd). Type the name of the job voice commands dictionary in the File name field and press **Enter** (Open). A blank job voice command dictionary displays. You can [insert or paste entries](#).
3. When finished, save and close the job voice commands dictionary.

## Modify Voice Commands Dictionary

Voice command entries can include instructions to CATalyst VP on how to translate text, format text or invoke commands in the job file as you speak. You can create new entries and modify existing ones for your Personal VoiceCommands dictionary and other job VoiceCommands dictionaries. Refer to the [Sample Voice Commands Dictionary Entries](#) as necessary.

You can add or modify Voice Command entries to a Voice Command dictionary that immediately apply during Edit only when making an E-Define or Replace in the job. Select the, [Update Voice Commands](#), option in the E-Define or Replace dialog box. When you add an entry to a Voice Commands dictionary using this feature in realtime, the dictionary refreshes and the entry is available for translation when spoken again in the job.

## Create or Modify Voice Command Entries

1. Press **Alt + f, o, v** (File/Open/Voice Commands).
2. From the Voice Commands menu, select a voice commands dictionary type:

### Personal

The Personal VoiceCommands dictionary displays.

### Job

The Open Existing Document dialog box displays. Select a dictionary and press **Enter**.

3. Do **either** of the following:

### Insert an Entry

Press **Ctrl + i** (**Edit/Insert**). The Modify/Insert Voice Command dialog box displays with empty Voice Text and CATalyst Text fields.

### Modify an Entry

Use Search (**Ctrl + f**) or cursor movements to find the entry you want to modify and then press **Ctrl + m (Edit/Modify)**. The Modify/Insert Voice Command dialog box displays with the current Voice Text and CATalyst Text entries.

4. Make necessary entries:

#### Voice Text

Type new or modify existing voice text. This is the command you speak and what the voice engine hears.

#### CATalyst Text

Type new or modify existing CATalyst text. This is the instruction given to Case CATalyst. Include any format symbols or extended characters.

#### Insert Field

Display the Insert Field dialog box from which you can select [fields](#) to insert into the text portion of the definition.

#### FS

Display the list of available [format symbols](#). Double click the format symbol you want to use in the definition. You can insert a format symbol at any point in the text entry. You can also use shortcut keys to insert a format symbol in the Text field. Place the cursor in the Text field, press **F4** and then press the appropriate letter or symbol.

#### F9

With the cursor in the CATalyst Text field, press **F9** to display the Insert Character dialog box where you can select an extended character to insert.

#### Insert AccelerWriter

Display the Auto AccelerWriter dialog box where you can create an [AccelerWriter](#). Click **Browse** to display the Choose Macro File dialog box and select a macro file. Your selection displays in the *Entry Text* field of the Auto AccelerWriter dialog box.

#### Insert AutoInclude

Display the Auto Include dialog box where you can an [Auto Include](#). Click **Browse** to display the Choose Include File dialog box to select an Include file. Your selection displays in the *Entry Text* field of the Auto Include dialog box.

It is necessary to create the include files before using auto include commands. An "Include File Not Found" message displays during translation if you invoke an auto include command without an associated include file.

5. Press **Enter (OK)**. If an existing dictionary entry contains the exact voice command as another entry, the following message displays, "This insertion will cause a duplicate value for the voice text." Click **OK**. The Modify/Insert Voice Commands dialog box displays. Type new voice text and press **Enter** or press **Cancel** to close the dialog box.
6. Press **Ctrl + s (File/Save)** to save the dictionary when finished.
7. Press **Ctrl + F4** to close the voice commands dictionary. If another voice commands dictionary is open, the contents of the contents displays. If no other dictionary is open, the Voice Commands function closes.

[Keyboard Map](#) Function: Open Job Voice Dictionary

Open Personal Voice Dictionary

## Copy, Cut, Paste Dictionary Entries

The Copy feature copies the selected voice command dictionary entries leaving them in the original dictionary and places a copy on the Windows clipboard. The Cut feature removes selected entries from the original dictionary and places them on the Windows clipboard. The Paste feature inserts copied or cut dictionary entries from the Windows clipboard into another dictionary. There is no limit to the amount times you can paste the entries, however, only the last set of copied or cut dictionary entries remain on the clipboard.

### Copy, Cut and Paste Dictionary Entries

1. Open the source dictionary which contains the entries you want to copy or move. Press **Alt + f, o, d** (**File/Open/Dictionary**). From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the source dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Use Windows conventions to highlight the dictionary entries for copying or cutting:

#### Select an individual entry

Click to highlight the entry.

#### Select all the entries in the update area or dictionary

Press **Ctrl + a** to highlight all the entries in the update area or dictionary.

#### Select a consecutive group of entries

Click to highlight the first entry of the group. Locate the last entry to select. Press and hold **Shift**, while you click the last entry. All the entries in-between are highlighted.

#### Select specific entries

Press and hold **Ctrl** while you click to highlight the individual entries to add.

4. Press **Ctrl + c** (**Edit/Copy**) to copy the selected entries or **Ctrl + x** (**Edit/Cut**) to move the selected entries.
5. Open the destination dictionary.
6. Press **Ctrl + v** (**Edit/Paste**) to insert the dictionary entries into the destination dictionary. If an entry conflicts, a message displays with the entry conflicts and prompts you to replace (Yes) or cancel (No) the Paste.
7. Press **Ctrl + s** (**File/Save**) to save the changes to the destination dictionary.
8. In the source dictionary, press **Ctrl + s** (**File/Save**) to save the changes.

## Sample Voice Commands Entries

The following examples include some of the type of voice commands dictionary entries that you might use in your Personal VoiceCommands and job voice commands dictionaries.

### **Question Paragraph**

To create an entry that formats a Question paragraph, make an entry similar to the following:

Voice Text	CATalyst Text
queco	<Question>

When you say "queco" CATalyst VP translates the words as a Question paragraph style based on the format in your layout setting. If Dragon/ViaVoice hears "q co" instead of "queco", you would need to train Dragon/ViaVoice that "q co" is "queco." You can train Dragon/ViaVoice during a job when using the Replace command. Do not add an "q co" entry to your Personal VoiceCommands or a job voice commands dictionary.

### **Answer Paragraph**

To create an entry that formats an Answer paragraph, make an entry similar to the following:

Voice Text	CATalyst Text
aeco	<Answer>

When you say "aeco", CATalyst VP formats an Answer paragraph style using the settings in your current layout. If Dragon/ViaVoice hears "a co" instead of "aeco", you would need to train Dragon/ViaVoice that "a co" is "aeco." You can train Dragon/ViaVoice during a job when using the Replace command. Do not add an "a co" entry to your Personal VoiceCommands or a job voice commands dictionary.

### **Colloquy With EZ Speakers**

To create an entry that formats a Colloquy paragraph with an EZ Speakers field, make an entry similar to the following:

Voice Text	CATalyst Text
speethree	<Colloquy>[!EZ SPEAKER 03]

When you say "speethree" CATalyst VP translates it as Colloquy followed by the EZ Speaker 03 field. If you use the Speaker List prior to translation, the speaker name displays in place of the field.

### **AccelerWriter**

To create an entry that automatically invokes a macro, make a entry similar to the following:

Voice Text	CATalyst Text
clearclearA	&&Delete to last A

You created a macro, "Delete to last A," that deletes the text from the current cursor location to the previous Answer. When you say "clearcleara" CATalyst VP invokes the macro. All the text between the current cursor location to the previous Answer symbol is deleted.

### **Auto Include**

To create an entry that automatically copies a file into the transcript, make an entry similar to the following:

Voice Text	CATalyst Text
zipmar	@includes\exhibit marked.sgngl.

When you say "zipmar" CATalyst VP includes your exhibit marked parenthetical file at the cursor position in the job.

It is necessary to create the include files before using auto include commands. An "Include File Not Found" message displays during translation if you invoke an auto include command without an associated include file.

## Using the Delete Command

Use the {Delete} command in your Personal VoiceCommands dictionary to delete the previous word or words that Dragon or Via Voice has translated as one item. In most situations, speaking the delete command removes one word, however, it is possible the delete command may remove two words or a short phrase. No pause is required between speaking the word for one delete command and another delete command.

## Accelerwriters for Voice Dictionary Entries

An AccelerWriter is a [macro](#), invoked using a voice command during the proceedings. You must first create the macro during edit or translation, save it and name it before creating an AccelerWriter entry in a voice commands dictionary. For example, you want to suspend recording the room noise and the dictation at the same time. While editing, you create a macro that includes the Pause Audio and Pause Dictation commands, naming it "pause audio recordings." You then create a voice commands dictionary entry inserting "paumac" as the Voice Text and selecting the pause audio macro, "&&pause audio recordings," to display as the CATalyst Text. The next time you want to suspend recording the room noise and your dictation, you speak "paumac" to invoke the macro.

### Create An AccelerWriter

1. Create the [macro](#).
2. Open the desired voice commands dictionary.
3. Do one of the following to display the Auto AccelerWriter dialog box:
  - From the Modify/Insert Voice Command dialog box, click **Insert AccelerWriter**.
  - Press **Alt +e, w** (**Edit/Insert AccelerWriters**).
4. Click **Browse** to display the Choose Macro File dialog box. By default, the Macros case opens. Macros are stored in the Macros case located in the System Files case. You can only select a macro from your user name.
5. Select a macro and click **Open**. The Modify/Insert Voice dialog box displays. CATalyst VP automatically fills in the *CATalyst Text* field with the selected macro file name. Two ampersands (&&) precede the selected macro name to identify it as an AccelerWriter. You cannot type directly into this field.
6. In the *Voice Text* field, type the text for the command spoken to invoke the AccelerWriter.
7. Click **OK** to insert the definition into the dictionary.

8. When finished creating AccelerWriters, press **Esc (Cancel)**.
9. Press **Ctrl + s (File/Save)** to save the dictionary. If you are writing realtime, you can test the AccelerWriters by returning to the realtime file and writing the steno outline for the selected AccelerWriter.

## Fields in Voice Dictionary Entries

[Fields](#) are placeholders for information that changes in a job, such as page numbers, appearance data, witness names and dates and times. A field is surrounded by square brackets with an exclamation mark immediately following the open square bracket, such as [!JUDGE].

The most common field used in a voice commands dictionary entry is an EZ Speaker field, [!EZ SPEAKER 01]. EZ Speaker fields, when used in combination with the Speaker List allow you identify speaker names before translation and easily insert them during translation and while editing.

You can combine fields with [format symbols](#). For example, you can combine an EZ Speaker field with a Colloquy or By Line format symbol, such as:

Voice Text	CATalyst Text
speeone	<Colloquy>[!EZ SPEAKER 01]:space
byspeethree	BY <Colloquy>[!EZ SPEAKER 03]:<Question>

(press the Spacebar where "space" is indicated)

### Example

To create an entry that notes time when the proceedings end or a recess is taken, make an entry similar to the following using the Static Time field:

Voice Text	CATalyst Text
endo	<Parenthetical>(The proceedings ended at [!StaticTime – 12 Hour].)

When you say “endo,” CATalyst VP formats a Parenthetical paragraph style according to layout being used and inserts the text and time field, filling in the time field with the current time on your computer.

## EZ Speakers in Voice Dictionary Entries

EZ Speaker entries in a voice commands dictionary work in conjunction with the [Speaker List](#) to automate the insertion of speaker names into the job during translation. When you identify the speaker names using the Speaker List in the Translate dialog box, CATalyst VP replaces the field in the EZ Speaker entry with the actual speaker name during translation.

EZ Speaker entries are created using EZ Speaker fields, format symbols and text. The Speaker fields function as placeholders for speaker names in the EZ Speakers entries. The format symbols determine how the speaker name displays in the job according the applied Layout. You can create up to 99 different speaker names. The color associated with the speaker name in the Speaker List applies during translation.

### Example

Voice Text	CATalyst Text
speeone	<Colloquy>[!EZ SPEAKER 01]
speethree	<Colloquy>[!EZ SPEAKER 03]

Before translating, you type MR. KLINGER in the Speaker List for number 01 and MS. MILLER for 03. When you say, "speeone" during realtime, CATalyst VP inserts MR. KLINGER, formatted as a Colloquy paragraph style, into the job. When you say, "speethree" CATalyst VP inserts MS. MILLER as a Colloquy style paragraph.

## Format Symbols in Voice Dictionary Entries

[Format symbols](#) are codes or commands that help you format text during translation and edit. For example, you can create a voice commands dictionary entry using a format symbol to format text as an Answer. Format symbols are surrounded by angle < > brackets. CATalyst VP has an extensive list of Format Symbols to provide for flexible formatting in a transcript. The following is a list of commonly used format symbols in a voice commands dictionary entry:

<Answer>  
 <Question>  
 <By-line>  
 <Colloquy>  
 <Parenthetical>  
 <Continuation Paragraph>  
 <New Line Paragraph>  
 <New Page>

### Example

Format a Question paragraph style. In the Voice Text field type the word you speak. In the CATalyst Text field, insert the <Question> format symbol.

Voice Text	CATalyst Text
new page	<New Page>

Using the example, when you say "new page" CATalyst VP create a new page.

## Macros

A macro is a recorded series of keystrokes, mouse clicks and associated keyboard commands. A filename assigned to the macro allows for playback. Playing back a macro performs the series of recorded commands which reduces the amount of keystrokes required to perform a task or process.

Macros are recordable in Edit and Manage Dictionary. It is possible to begin the recording or playback of a macro in one of the functions and have it continue in the other function. For example, you can begin a macro in Edit and continue the macro within a dictionary. You may want to use a separate naming convention for macros created for Manage Dictionary that identifies them from other macros. For example, "dict - modify entry."

When recording a macro, you can use the mouse and keyboard commands to select menus or icons, however, within a dialog box, only keyboard commands are recorded, such as Alt + a (Cap) in a Global Define dialog box. Mouse clicks within a dialog box are not recognized and are not recorded as part of the macro. Once a dialog box opens, you can Pause recording the macro to select a file name or option using the mouse. When you close the dialog box, by pressing Enter or an Alt key combination, the macro continues to record and you can return to using mouse clicks. When the macro plays back, it pauses once the dialog box is open, allowing you to select the file or option and then continues once you press Enter. For example, you want to record a macro to Include a file and choose a file while using the macro. When the Include dialog box display, click Pause and select a file. File selection is not recorded as part of the macro. After selecting the file, press Enter in the Include dialog box. The macro continues recording once you press Enter.

You can playback a macro by selecting it from a list, pressing a user assigned keyboard command or writing a steno stroke on your writing machine during realtime. To quickly invoke a macro, you can assign it to a [keyboard command](#) or [AccelerWriter](#) dictionary definition. Keyboard command assignments and AccelerWriter definitions can be made immediately after saving the macro or at a later time. Stenograph recommends you set up a realtime session when creating a macro for an AccelerWriter definition to assure the macro works as intended.

Macro files have a .sgmac extension and are stored in a Macros case within the System Files case. You can quickly view the list of existing macros by pressing, **Alt + f, o, m (File/Open/Macros)**. Recorded commands for an existing macro can be viewed or modified using the [Macro Editor](#). You can add and remove functions, text and key combinations allowing you to make changes without re-recording the entire macro. Manage Dictionary functions end with - Dict." when viewing them in the Macro Editor or a Keyboard Maps.

The Macro feature contains a submenu of features that include Record, Playback and Playback Last Macro. You can [create a toolbar](#) from the submenu to float or dock it like any other toolbar.

[Keyboard Map](#) Function: Record Macro

Play Macro

Play Last Macro

### Record Macro

The Macro Record feature allows you to record a series of commands and save them as a [macro](#). Once the macro is recorded and named, you can assign a [keyboard command](#) or define an [AccelerWriter](#) to the macro as desired. Stenograph recommends creating a macro for an AccelerWriter dictionary definition during setup for the realtime session to ensure the macro works in realtime as intended.

Recorded commands for an existing macro can be viewed or modified using the [Macro Editor](#). This allows you to add and remove functions, text and key combinations without recording the entire macro again.

[Keyboard Map](#) Function: Record Macro

## Create and Assign Macro

1. Place your cursor in the most logical position where you would want the commands of the macro performed.
2. Press **Alt + t, m, r (Tools/Macro/Record)**. The RecordMacro toolbar displays at the top of the screen with Pause and Stop buttons.
3. Record the commands for the macro. Use the mouse and keyboard commands to select menus or icons, however, in a dialog box, only keyboard commands are recorded. Mouse clicks within a dialog box are not recognized and are not recorded as part of the macro.

When in a dialog box, click **Pause** on the RecordMacro toolbar to suspend the macro in order to select a file or type text. For example, you are recording a macro to include a file and want to be able to select any file while using the macro. When the Include dialog box display, click **Pause** and select a file. File selection is not recorded as part of the macro. After selecting the file, press **Enter** in the Include dialog box. The macro continues recording once you press Enter.

4. When finished, click **Stop** on the RecordMacro toolbar. The Save Macro dialog box displays.

If you attempted to record commands that are not recordable functions, the following error message displays: *The actions you took are not recordable. There are no actions that can be saved for a macro.* Press **Enter (OK)** to close the message.

5. In the *File name* field, type a name for the macro. Select the option, *Assign to key in keyboard map (Alt + a)*, to assign a key combination in your keyboard map to the macro after saving it.

To define the macro as an AccelerWriter, you must first complete creating the macro and save it. Defining an AccelerWriter is done from within a voice commands dictionary.

6. Press **Enter (Save)**. One of the following occurs:
  - The Save Macro dialog box closes if *Assign to key in keyboard map* is not selected.
  - The Open Keyboard Map dialog box displays if you selected to *Assign to key in keyboard map*. If the option, [Keyboard to open when assigning recorded macros](#), is active, the selected default Keyboard map opens. Make necessary entries to [assign a keyboard command](#) to the macro.
7. Test the macro. Do the following:
  - Playback the macro using the Playback Macro feature. Press **Alt + t, m, p (Tools, Macro, Playback Macro)** or click **Playback Macro** on the Macros toolbar. The Choose Macro dialog box displays. Select the macro just recorded and press **Enter (Open)**.
  - If you created an AccelerWriter definition, use the **Add/Remove Dictionaries** command to reload the dictionaries and then write the steno outlines for the AccelerWriter definition.
  - If you assigned the macro to a keyboard command, press the assigned keys.

## Assign to key in keyboard map

When you select the option, *Assign to key in keyboard map*, in the Save Macro dialog box, you can immediately assign a key combination to invoke the macro. One of the following occurs after you press Enter (Save) in the Save Macro dialog box:

- The Open Keyboard Map dialog box displays. Select a keyboard map to open and press **Enter**. Macros are stored in a Macros case within the System Files case. The Keyboard map displays.
- If the Advanced Edit option, [Keyboard to open when assigning recorded macros](#), is active, the selected default Keyboard map opens with the recorded macro highlighted in the *Functions* list of the Assign Key to Function dialog box.

## Assign to Key in Keyboard Map Macro

Make necessary entries in the Assign Key to Function dialog box. The newly created macro displays highlighted in the Functions field under the MACROS section. When finished, press **Enter (Assign)**. The entry displays in the Keyboard Map list and the keyboard map closes.

### Currently Assigned to

The keyboard function presently assigned to the key or key combination identified in the Key field.

### Key

The Key field contains a list of keyboard keys. The options below the Key field indicate if the key is used alone or in conjunction with Ctrl, Shift, or Ctrl and Shift. The selected radio button designates the active key combination. You can assign a different keyboard function to each of the key combinations. For example, in the Default keyboard map, n alone displays the letter "n". **Ctrl + n** displays the View Vertical Notes feature. **Shift + n** displays a capital letter "N".

Select a key for assignment from the drop down list and then click the radio button next to one of the following: Key Only, Ctrl + Key, Shift + Key, Ctrl + Shift + Key. The keyboard function presently assigned for the selected key combination displays in the Currently Assigned to field. If no keyboard function is assigned, the field is blank.

When you assign a single key to invoke a command, consider assigning Shift plus the same key to the same command. This helps to prevent the possibility of invoking the capped version of a keyboard command when the Caps Lock is on.

### Restore Default Assignment

Restore the default keyboard function assignment for the identified in the Key field. This only restores the default assignment for the current key.

### Filter by Category

Click a category to display only the keyboard functions for the selected category in the Functions list. For example, you want to locate Move to next red squiggle, which is a Spell Check keyboard function. Select the Category, Spell Check to display a list of only the available Spell Check keyboard functions. Select All to display all the keyboard map functions available for assignment.

### Functions

To change the keyboard function for the key in the Key field, highlight the desired keyboard function from the list. Recorded Macros display alphabetically at the end of end of the list in the MACROS section.

When you assign a key combination immediately after creating the macro, the newly created macro displays highlighted in the MACROS section.

### Search

Display the Find dialog box to search for a specific keyboard function.

#### Find Search Functions List

1. Type a keyboard function name or portion of a name in the *Search for* field. To limit the search to a particular category, first select the category in the Filter by Category field and then select Search.
2. Select the direction to search.
3. Press **Enter (OK)**. To repeat the search, press **F3** to search forward or **Shift + F3** to search

backward. If you limited the search by category for the desired keyboard function and it does not display in the list, the incorrect category was selected. For example, you select to filter by Punctuation for Move Word Left. This keyboard function is a Cursor action so Search does not locate it in the Punctuation category.

### Use Windows Default

Use the Windows default keyboard assignment if your Windows Regional Language setting is set to a language other than English. For example, if French is selected as your Windows Regional and Language and the key assignment in the Keyboard Map is set to Windows default, the keyboard action follows the Windows default French language keyboard.

## Define in dictionary to invoke macro from writer

An AccelerWriter is a [macro](#), invoked using a voice command during the proceedings. You must first create the macro during edit or translation, save it and name it before creating an AccelerWriter entry in a voice commands dictionary. For example, you want to suspend recording the room noise and the dictation at the same time. While editing, you create a macro that includes the Pause Audio and Pause Dictation commands, naming it "pause audio recordings." You then create a voice commands dictionary entry inserting "paumac" as the *Voice Text* and selecting the pause audio macro, "&&pause audio recordings," to display as the *CATalyst Text*. The next time you want to suspend recording the room noise and your dictation, you speak "paumac" to invoke the macro.

## Define AccelerWriter for Macro

Make necessary entries in the Assign Key to Function dialog box. When finished, press **Enter (OK)** to add the entry to the selected dictionary.

1. Create the macro.
2. Open the desired voice commands dictionary.
3. Do one of the following to display the Auto AccelerWriter dialog box:
  - Press **Alt + e, w (Edit/Insert AccelerWriter)**.
  - From the Modify/Insert Voice Command dialog box, click **Insert AccelerWriter**.
4. Click **Browse** to display the Choose Macro File dialog box. By default, the Macros case opens. Macros are stored in the Macros case located in the System Files case. You can only select a macro from your user name.
5. Select a macro and click **Open**. The *Entry Text* field automatically fills in with the assigned macro name. Two ampersands (&&) precede the name to identify the entry as an AccelerWriter. You cannot type in the *Entry Text* field.
6. Press **OK** in the Auto AccelerWriter dialog box. The Modify/Insert Voice Command dialog box displays. CATalyst VP automatically fills in the *CATalyst Text* field with the selected macro file name.
7. In the *Voice Text* field, type the text for the command spoken to invoke the AccelerWriter.
8. Click **OK** to insert the definition into the dictionary.
9. When finished creating AccelerWriters, press **Esc (Cancel)** to close the Insert AccelerWriter dialog box.
10. Press **Ctrl + s (File/Save)** to save the dictionary.

11. Test the AccelerWriter in a current voice translation. Do the following:

- Press **Ctrl + F4 (File/Exit)** to close the open dictionary.
- Press **Alt + t, d (Tools/Add/Remove Dictionaries)** to reload the dictionary.
- Speak the command for the selected AccelerWriter.

## CATalyst VP Translate Commands

Translate commands invoke a specific action while translating a job. For example, you can create a voice commands dictionary entry that converts a number to a specific number format or an entry that pauses the room audio recording. Translate Commands are surrounded by brace { } brackets. CATalyst VP has an extensive list of Translate Commands to provide for flexible formatting during a job. The following is a list of commonly used translate commands in a voice commands dictionary entry.

{Pause Audio}

{Resume Audio}

{Number Trigger}

{Number Conversion}

## Voice Translate Command Dictionary Entries

### *Example*

A {Pause Audio} entry may be:

Voice Text	CATalyst Text
paupau	{Pause Audio}

When you say "paupau," CATalyst VP suspends the room noise audio recording. To resume the room noise audio recording, create a voice commands dictionary entry defined as {Resume Audio}.

### *Example*

A {Number Trigger} entry for a Social Security Number may be:

Voice Text	CATalyst Text
social security number	Social Security Number[NNN-NN-NNNN]

When you say "social security number," CATalyst VP looks forward in the transcript for a nine consecutive numbers. If nine consecutive numbers are found within approximately three paragraphs, CATalyst VP converts the numbers to the Social Security Number format indicated in the Number Trigger entry, NNN-NN-NNNN, using all digits.

## Auto Include

In CATalyst VP, standard pages and parenthetical are referred to as Include files or "Includes." Include files contain pages or sections of text that you use time after time in your jobs, such as title pages, certificate pages, an indication of taking a recess, or going off the record. You can insert a copy these pages manually into the file or use the Auto Include feature to automatically insert a copy.

To use the Auto Include feature first create the [include](#) file and then create an Auto Include entry in your voice commands dictionary for each file you want to insert. During the job, speak the designated command for the file selected for insertion. CATalyst VP inserts a copy of the file at the point in the job you speak the command. For example, you have an Include file called CERT that contains your Certificate Page. You use the Certificate Page at the end of every job. You create the Auto Include entry with the Voice Text as certmac and the CATalyst Text as @CERT. At the end of your job, you speak "certmac." CATalyst VP inserts the CERT file.

## Create an Auto Include Entry

1. [Create](#) the include file.
2. Open the desired voice commands dictionary.
3. Do one of the following to display the Auto Include dialog box:
  - From the Modify/Insert Voice Command dialog box, click **Insert Auto Includes**.
  - Press **Alt + e, a** (**Edit/Insert Auto Include**).
4. Click **Browse** to display the Choose Include File dialog box.
5. Select an Include file and click **Open**. The Modify/Insert Voice dialog box displays. CATalyst VP automatically fills in the *CATalyst Text* field with the selected include file name. The @ sign precedes the entry to identify it as an include file. Depending on the location of the selected include file, the *CATalyst Text* field displays the Auto Include in one of the following formats. You cannot type directly into this field.

### @title

The Include file is the current user name.

### @includes\title

The Include file is in a case in the current user name. In this example, the case name is "includes".

### @<Kirsten>title

The Include file is in another user name. In this example, the user name is "Kirsten".

### @<Kirsten>includes\title

The Include file is in a case in another user name. In this example "Kirsten" is the other user and "includes" is the case name.

6. To bring in the page layout for the selected Include file, check the option *Bring Layout*. The layout only applies to the Include file and does not affect the rest of the job.
7. In the *Voice Text* field, type the text for the command spoken to invoke the Auto Include.
8. Click **OK** to insert the entry into the dictionary.
9. When finished creating the Auto Include, press **Esc** (**Cancel**).
10. Press **Ctrl + s** (**File/Save**) to save the dictionary.

## Pause Audio

To pause the AudioSync recording of room noise during proceedings, [create](#) a voice commands dictionary entry with the translate command, {Pause Audio}. When AudioSync is paused, the Audio Pulse meter on the Translate & Edit Status Bar turns gray.

[Keyboard Map](#) Function: Pause Audio

## Resume Audio

To resume the AudioSync recording of room noise during proceedings, [create](#) a voice commands dictionary entry using the translate command, {Resume Audio}.

[Keyboard Map](#) Function: Resume Audio

## Number Conversion

Use the Number Conversion translate command in a voice commands dictionary to indicate a specific format for a number when you speak the Number Conversion command. A [Number Conversion](#) voice commands dictionary entry works backward in the file during translation and only affects numbers which meet the Number Conversion format criteria.

Number Conversion formats allow you to convert numbers, which are dictated as numerals, words or a combination of numerals and words, during translation. For example, you can create an entry to convert "fifty nine" to "59". Using the Number options in [Input Translate Options](#), you can select how you have CATalyst VP process the word "and", commas, periods, word numbers and spaces between numbers. For example, you select to have CATalyst VP process "and" when converting numbers to dollars. One hundred and 50 dollars converts to \$150.

The Number Conversion is invoked by speaking the designated word for the command after a number is spoken. For example, you have a Number Conversion voice commands dictionary entry for phone number. A phone number is given during the proceedings and you speak the seven digit phone number. You then speak the word "telmac" which you have identified as the telephone Number Conversion command. CATalyst VP formats the digits as a telephone number.

When creating a Number Conversion entry, the Number Conversion command is designated by { } brackets. It must be placed within brackets to perform the intended function. The number format immediately follows the Number Conversion command and must be placed between square brackets [ ]. The number format contains letters which function as placeholder for the actual digits.

### Examples

A Number Conversion entry to convert a number to a date format using periods may be:

Voice Text	CATalyst Text
dateco	{Number Conversion}[nN.nN.nN.]

A Number Conversion entry for a telephone number may be:

Voice Text	CATalyst Text
telmac	{Number Conversion}[NNN-NNNN]
telmac	{Number Conversion}[n-nnn-NNN-NNNN]

The [Automatic Number Conversion](#) feature in CATalyst is a translate option that also converts numbers and words to a specific format during translation. The number conversion is based on keywords in the NumberConversion.ini file. Automatic Number Conversion does not use a voice commands dictionary.

## Create a Number Conversion Entry

1. Open the desired voice commands dictionary.
2. Press **Ctrl + i (Edit/Insert)**. The Modify/Insert Voice Command dialog box displays with empty *Voice Text* and *CATalyst Text* fields.
3. In the *Voice Text* field, type the phrase you speak to invoke the Number Conversion.
4. In the *CATalyst Text* field, type the phrase you want to associate with the Number Conversion. For example, telephone number.
5. Press **Alt + f (FS)** to display the list of format symbols.
6. Use the Up and Down Arrow keys to locate **{Number Conversion}** and press **Enter** to insert the highlighted translate command into the *CATalyst Text* field. You must select the Number Conversion command from the list. Number Conversion does not work if you type it in the field.
7. In the *CATalyst Text* field, type the number format. For example, telephone number {Number Conversion}[nnn-NNN-NNNN].

See [Number Conversion/Number Trigger Formats](#) to assist you in establishing number formats.

8. Press **Enter (OK)** to insert the definition into the dictionary.
9. When finished creating voice command entries, press **Esc (Cancel)**.
10. Press **Ctrl + s (File/Save)** to save the dictionary.

## Number Trigger

Use the Number Trigger translate command in a voice commands dictionary to indicate a specific number format when the number follows a designated phrase such as "social security number" or "what time". Number Trigger works forward from where you speak and only affects numbers which meet the Number Trigger format criteria.

Number Trigger formats allow you to convert numbers, which are dictated as numerals, words or a combination of numerals and words, during translation. For example, you can create an entry to convert "fifty nine" to "59". Using the Number options in [Input Translate Options](#), you can select how you have CATalyst VP process the word "and", commas, periods, word numbers and spaces between numbers. For example, you select to have CATalyst VP process "and" when converting numbers to dollars. One hundred and 50 dollars converts to \$150.

The Number Trigger is invoked when you speak the designated word for the Number Trigger command before a number and remain active for three paragraphs. This eliminates the step of speaking a designated word to convert numbers. When a phrase, such as, "social security number" is spoken and it is followed, within the next three paragraphs, by the specific number of digits or words that match the number format, that number converts. For example,

- Q. What is your Social Security Number?  
 A. Could you repeat the question?  
 Q. What is your Social Security Number?  
 A. 111111111 (converts to) 111-11-1111.

When creating a Number Trigger entry, the Number Trigger command is designated by { } brackets and follows the word or phrase associated with the Number Trigger command. It must be placed within brackets to perform the intended function. The number format immediately follows the Number Trigger command and must be placed between square brackets [ ]. The number format contains letters which function as placeholder for the actual digits. If you do not want to apply the Number Trigger to the next number, create an entry to turn off the Number Trigger by placing empty square brackets after the Number Trigger command, {Number Trigger}[] . [Number format guidelines](#) can help you in establishing number formats.

### Example

You have a Number Trigger voice commands dictionary entry for Social Security Number with the format, {NNN-NN-NNNN}. Notice that the "trigger" phrase is placed before the Number Trigger command. When you speak "Social Security Number" in the question, "What is your social security number?" CATalyst VP looks for the next nine consecutive digits. When the answer is given with 9 numbers, CATalyst VP automatically converts the nine digit number to the designated social security format.

Voice Text	CATalyst Text
social security number	Social Security Number{Number Trigger}[NNN-NN-NNNN]

A Number Trigger entry for a time phrase may be:

Voice Text	CATalyst Text
what time	{Number Trigger}[nN:ON]

The [Automatic Number Conversion](#) feature in CATalyst is a translate option that also converts numbers and words to a specific format during translation. The number conversion is based on keywords in the NumberConversion.ini file. Automatic Number Conversion does not use a voice commands dictionary.

## Create a Number Trigger Entry

1. Open the desired voice commands dictionary.
2. Press **Ctrl + i (Edit/Insert)**. The Modify/Insert Voice Command dialog box displays with empty Voice Text and CATalyst Text fields.
3. In the *Voice Text* field, type the phrase you speak to invoke the Number Trigger.
4. In the *CATalyst Text* field, type the phrase you want to associate with the Number Trigger. For example, social security number.
5. Press **Alt + f (FS)** to display the list of format symbols.
6. Use the Up and Down Arrow keys to locate **{Number Trigger}** and press **Enter** to insert the highlighted translate command into the *CATalyst Text* field. You must select the Number Trigger command from the list. Number Trigger does not work if you type it in the field.
7. In the *CATalyst Text* field, type the number format. For example, Social Security Number{Number Trigger}[NNN-NN-NNNN].  
See [Number Conversion/Number Trigger Formats](#) to assist you in establishing number formats.
8. Press **Enter (OK)** to insert the definition into the dictionary.
9. When finished creating voice command entries, press **Esc (Cancel)**.

10. Press **Ctrl + s (File/Save)** to save the dictionary.

## Number Format Guidelines

Number conversion formats allow you to convert numbers, which are dictated as numerals, words or a combination of numerals and words, during translation. The [Number Conversion](#) and [Number Trigger](#) translate commands are surrounded by brackets in a voice commands dictionary entry; {Number Conversion} and {Number Trigger}. They are immediately followed by a specific number format placed in square brackets [ ]. The number format contain letters which function as placeholders for the actual digits.

Create Number Conversion and Number Trigger voice commands dictionary entries using number format placeholders letters as described below. Use the examples as necessary to assist you in creating the entry.

## Number Format Placeholder Letters

### N (upper case)

Use an N whenever the number is mandatory. For example, the Number Trigger telephone format in the United States is {Number Trigger}[n-**n**nn-NNN-NNNN]. Currently, all telephone numbers have a minimum of seven digits: three digits followed by a hyphen followed by four digits. When an attorney or witness states a valid telephone number, they will always state at least seven digits. The capital letter N represents these mandatory numbers. In this example, the mandatory numbers are the seven digits of the telephone number.

### n (lower case)

Use an n whenever the number is optional and when the punctuation to the right of that number requires removal if the number is not used. For example, in the U.S. telephone Number Trigger format, {Number Trigger}[n-**n**nn-NNN-NNNN], an attorney or witness may or may not state the three-digit area code when they state a telephone number. When they do include the area code with the seven-digit phone number, there usually is punctuation between the area code and phone number. If no area code is given, no punctuation should appear to the left of the phone number. The lower case n represents an optional number that does not retain punctuation. In this example, the optional numbers are the single digit access code and the three digits for the area code.

### X or x (upper or lower case)

The X or x is used whenever the number is optional but the punctuation is mandatory. For example, the {Number Conversion}[\$**n**nn,nnn,nn**X**.0N] format is a dollar conversion that indicates cents. An attorney or witness states "It was between fifty cents and one seventy-five". You want those numbers to convert to \$.50 and \$1.75, whether or not the speaker states a dollar amount, which requires a decimal point to the left of the second digit. The X or x represents an optional number that retains punctuation to the right of the X or x, whether or not a number is written for that space.

### 0 (zero)

Use the 0 whenever a number is optional and the number 1 through 9 replaces it and is retained if there is an N to the right of the zero. For example, in the dollar conversion format, {Number Conversion}[\$**n**nn,nnn,nn**X**.0N], if the attorney or witness states "It was five cents. No, it was two twenty-five. The result is \$.05 and \$2.25.

### \_ (underscore)

An \_ (underscore) works the same as the 0 except it inserts a blank space instead of a zero.

**\ (backslash)**

Use the \ (backslash) whenever you want an "n", "0" (zero), or "x" to literally print in the converted number. For example, {Number Conversion}[\NnnNNN] results in N123.

**Number Conversion/Number Trigger Examples**

Description	Number Format
Date with 1-digit month (1/29/66)	{Number Conversion}[nN/Nx/NN] what date{Number Trigger}[nN/Nx/NN]
Date with 2-digit month (11/10/64).	{Number Conversion}[NN/nn/Nn] what date{Number Trigger}[NN/nn/Nn]
Dollars with commas.	{Number Conversion}[\$nnn,nnn,nnn,nnN] how much{Number Trigger}[\$nnn,nnn,nnn,nnN]
Dollars and cents with commas.	{Number Conversion}[\$nnn,nnn,nnn,nnX.ON] how much {Number Trigger}[\$nnn,nnn,nnn,nnX.ON]
Numbers with hyphens.	{Number Conversion}[nn-nn-nN-nN] driver's license number{Number Trigger}[nn-nn-nN-nN]
Telephone number with area code in parentheses.	{Number Conversion}[X (XXn) NNN-NNNN] telephone number{Number Trigger}[X (XXn) NNN-NNNN]
Social security number	{Number Conversion}[NNN-NN-NNNN] social security number{Number Trigger}[NNN-NN-NNNN]

**CATalyst VP Translation**

CATalyst VP automatically incorporates the Dragon NaturallySpeaking/ViaVoice program when you start voice translation making it unnecessary to open Dragon/ViaVoice manually. During translation, the CATalyst VP Translate and Edit function matches vocabulary entries from Dragon NaturallySpeaking/ViaVoice with the words you dictate through the microphone attached to your CATalyst VP system. The translated words display on your computer screen. The Translate and Edit function also matches entries in the CATalyst VP voice commands dictionaries with voice commands used to perform designated tasks such as line formatting, including a file or invoking a macro. In addition to CATalyst VP, you can output realtime voice data to CaseView, another litigation system or Speche. Once translation begins, you can edit the file.

The [translate options](#) allow you to customize certain features for each translation activity to meet your particular dictation style and job needs. You can also identify speaker names in the Speaker List to use in conjunction with [EZ Speaker](#) entries in your voice commands dictionaries. During translation, CATalyst VP can automatically display the speaker name designated in the [Speaker List](#). This is a quick way to translate speaker names and manage them throughout the job.

During translation, the cursor focus must be on the Edit screen. If the cursor focus is in a another window or a dialog box, such as the [Timers](#) dialog box, when you speak, Dragon/ViaVoice is not able to hear your voice and no recording takes place. Be sure to verify your cursor focus when speaking.

By default, the CATalyst VP Dragon Faster Drop option for Dragon NaturallySpeaking users is turned On. This option improves the drop down speed for text which is the time it takes for text to display on the computer screen after you speak. If you do not find this a benefit to your voice translation, you can disable this feature by [changing a setting](#) in your UserSettings file.

While the majority of your voice translation training should be completed in Dragon/ViaVoice, CATalyst VP allows you to update the voice engine from Edit. For Dragon users, it is important to run the Acoustic Optimizer feature after editing to continually improve voice recognition accuracy.

## Starting CATalyst VP Translation

1. Start Case CATalyst.
2. Press **Ctrl + t** (**Functions/Translate & Edit**). The Translate dialog box displays.
3. Make entries in the following fields:

### Saved Translate Options

Saved Translate Options allows you to save your translate options to a file which you can use for future translations. Settings saved include: translate options, layout selection, steno source, output and global tables. Before translating, you load the settings file you want and CATalyst VP loads the translate settings from the file. For example, you can create a file to remember settings for different types of work, such as CART, court and depositions making it faster and easier to change settings making it faster and easier to change settings.

CATalyst VP also remembers the settings used for the last translation and stores them in the LastUsedSettings.ini file located in the Saved Translation Settings folder within the System Files case.

### Load Settings

Select this option to load a different set of Translate options for translation. The Saved Translation Settings dialog box displays where you can select a file to use. Choose the file and press **Enter (Open)** to load the settings.

If you choose a Settings file in which the selected layout for that settings file is no longer available, CATalyst VP uses the layout from the Lastusedsettings.ini file.

### Save Settings

Save the current Translate settings. The Save Translation Settings dialog box displays. Type a name in the File name field and press **Enter (Save)**. CATalyst VP saves the file in the Saved Translation Settings folder within the System Files case.

### Always Load Last Used

Check this box to always translate with the last settings file used. You may want to select this option to save setup time if you do one type of job most of the time.

### Steno Source

Select **Voice**.

### Layout File

Select the page layout you want to apply to this job.

### Job

A list of existing cases and jobs for the current user.

### **Show All Jobs**

Display all job files and subfile types for the current user.

### **File**

Type a new file name or select an existing job from job file window. To display files within a case in the job file window, double click the case.

### **Output To**

 Output To Options:

#### **None**

You are not outputting the realtime data.

#### **CaseView**

You are sending realtime to a CaseView receive system or CaseView compatible receive system.

#### **ASCII/ANSI**

You are sending realtime to an ASCII/ANSI file.

#### **Speche**

Not currently available.

#### **Caption**

You are sending realtime to a captioning encoder.

#### **Other Devices**

Not currently available.

#### **StenoKeys**

Not currently available.

#### **Multiple Outputs**

You are sending the realtime data to multiple outputs. When you select this option, the Output Choices dialog box displays. Check the box next to the output choices you want to use.

### **Record Audio**

Check this option if you are recording room noise. You must also initially set the [Audio](#) options in the Realtime tab.

### **Remember Setting**

Check the appropriate box to have CATalyst VP remember the Output To setting or the Record Audio setting.

### **Additional Dictionaries**

Check the box next to any [Global Table](#) you want to use for translation. For voice translation, only E-Defines apply.

#### **Show All Global Tables**

Check this box to display global tables in the Additional Dictionaries field.

**Show All Users**

Check this box to display all CATalyst VP users. You can select a global table from any user. When you select to display all users, CATalyst VP deselects any currently selected global tables and displays a warning message. Select **OK** to continue or **Cancel** to redisplay the current user.

**Dragon Naturally Speaking 8**

Select this option when using Dragon Naturally Speaking for voice translation.

**ViaVoice for Windows 10**

Select this option when using ViaVoice for Windows 10 for voice translation.

**Create EZ Speakers**

Not applicable to CATalyst VP.

**Speaker List**

Use [Speaker List](#) to identify speaker names for translation to use in conjunction with EZ Speaker entries in voice commands dictionaries. You can also insert speaker names into the transcript from the Speaker List while editing a job.

**Options**

Display the Case CATalyst Translate Options dialog box. On the [Realtime](#) tab, select the voice engine you use for voice translation and the audio settings if you are recording room noise. Set any other necessary options for voice translation and output options to CaseView, ASCII/ANSI and Caption. When finished press **Enter (OK)**.

**Define Fields**

Define [fields](#) prior to translation which you want to use for this job during Edit. You can also use field values from previous jobs if this is a continuation job. Field values cannot exceed 1024 typed characters.

4. Press **Enter (OK)** to begin translation. If you selected an existing job name, CATalyst VP prompts you to Append the newly translated text to the existing job; Overwrite the existing file and subfiles which include the audio file (.wav); or Cancel to choose a different job name.
5. When translation begins, the following messages displays: **This could take a moment. Please wait...**
6. When the message box closes, begin dictating. The small Dragon box displays your translation before displaying the text on the Edit screen. You can reposition the box. When CATalyst VP opens the realtime screen for translation, the dictation microphone is On. Use features from the Voice menu to pause and resume dictation and play and stop room noise. You may want to display the Voice toolbar; select **View/Show/Voice**.
7. To stop realtime press **Ctrl + \** (backslash) (**File/Stop Translation**). Depending on your Edit options, a warning message may display. Select **Yes** to end realtime. You can remain in the Edit function when realtime ends.
8. To close the file, press **Alt + f, c** (**File/Close**). If you made editing changes, CATalyst VP prompts you to save them. If you made changes to update the voice engine, you are prompted to save the changes. Press **Enter (Yes)** to retain the changes. If you select No, changes are not saved.
9. It is recommended that Dragon users run the [Acoustic Optimizer](#). It is important to run the Acoustic Optimizer after editing to continually improve voice recognition accuracy.

## Using the Speaker List for Translation

The Speaker List allows you to identify speaker names to use in conjunction with [EZ Speaker](#) fields. When you create an EZ Speaker entry in a voice commands dictionary, you assign a number to the EZ Speaker field. Before beginning translation, you can identify a name and color with the same speaker number using the Speaker List in the Translate dialog box. During realtime, CATalyst VP inserts the name into the job in the assigned color. CATalyst VP also formats the paragraph according to the format symbols contained in the EZ Speaker entry and the format of the applied Layout.

### Speaker List Settings

#### Allcap Text

Check this box to type the speaker name in all capital letters. Caps Lock does not affect case when you check this box. Uncheck this box to type the Speaker Name in upper and lower case letters.

#### Show All

Check this box to display all the available speaker lines with associated token numbers. Uncheck this option to only display token numbers with assigned speaker names.

#### Name

Speaker names. Click the title bar to display the names in ascending or descending alphabetical order.

#### Number

The speaker number associated with the speaker name. Click the title bar to display the speaker numbers in ascending or descending order.

#### Fill in Speaker

Modify an existing speaker name. Highlight a field and select **Fill in Speaker**. Type the speaker name in the field and press **Enter**.

#### New Speaker

Type a new speaker name. The Select EZ Speaker dialog box displays with the next sequential number. Use the displayed number in the Enter Value field or type a new number and press **Enter (OK)**. Valid numbers are 1 - 99. A new speaker name field displays with the assigned number. Type the name in the field and press **Enter**.

#### Change Color

Change the speaker name color. Highlight the field and select **Change Color**. The [Color](#) dialog box displays. Select a color and press **Enter (OK)**.

#### OK

Accept the changes and close the Speaker List dialog box.

#### Cancel

Close the Speaker List dialog box without making any changes.

#### Help

Display the Case CATalyst Help.

## Dragon Drop Down Text Delay

The CATalyst VP *Dragon-Guess-Delay-ms* option for Dragon NaturallySpeaking users is set to 750 milliseconds by default. This option controls the drop down delay. The drop down delay is the time CATalyst VP waits, in milliseconds, to display text on the computer screen after you speak. In most situations, this option affects captioners using CATalyst BCS.

If necessary, you can modify the number of milliseconds by changing a setting in your UserSettings. A higher number increases the delay before the text in the Dragon result box drops onto the computer screen, but may also increase accuracy. A lower number decreases the delay but may also decrease the accuracy or cause CATalyst VP to delete and resend the accurate text.

This setting has no effect on numbers. Numbers are held until the entire number plus a few words are received.

### Adjust Drop Down Text Delay

1. Be sure you are in your User name.
2. From Manage Jobs, open the **System Files** case.
3. Double click the **UserSettings.sgxml** file. The Settings Manager dialog box displays.
4. Click in the dialog box and press **Ctrl + f**. The Find dialog box displays.
5. Type: **Dragon-Guess-Delay-ms** and press **Enter**. CATalyst VP locates the option.
6. Click the **Edit** icon.
7. Type the desired number of milliseconds in the field and click **OK**. To restore the default setting, click **Default**.
8. Press **Alt + s (Save)** to save the setting and close the dialog box.

## Dragon Drop Down Text Speed

The CATalyst VP *Dragon Faster Drop* option for Dragon NaturallySpeaking users is turned On by default. This option improves the drop down speed for text. The drop down speed is the time it takes for text to display on the computer screen after you speak. If you do not find this a benefit, you can disable this feature by changing a setting in your UserSettings:

### Adjust Drop Down Text Speed

1. Be sure you are in your User name.
2. From Manage Jobs, open the **System Files** case.
3. Double click the **UserSettings.sgxml** file. The Settings Manager dialog box displays.
4. Click in the dialog box and press **Ctrl + f**. The Find dialog box displays.
5. Type: **Dragon-Faster-Drop** and press **Enter**. CATalyst VP locates the option.
6. Click the **Edit** icon. The Confirm Edit warning displays.
7. If you are certain, you want to disable the option, click **Yes**.
8. Type the number, **0**, in the field and click **OK**. To restore the default setting and turn the setting On, click **Default**.
9. Press **Alt + s (Save)** to save the setting and close the dialog box.

## CATalyst VP Translate Options

Translate options are a group of settings that affect how CATalyst VP translates the words you speak into text. The following tabs in the Translate Options dialog box are applicable to voice translation: Input, Realtime, Output to CaseView, Output to ASCII/ANSI and Output to Caption.

The first time you translate, you must set up your translate options. If you do not set your options before translating, the following message displays and initiates the Translate Wizard: "The first time you translate you must set up your options. Please either walk through this Wizard, or go back and click the Options button." The Translate Wizard successively displays each of the translate options tabs for you to set your options. If you do not need to set options for a particular tab, click Next. Not all tabs contain features applicable to voice translation.

Option settings remain until you change them. You can change the translate options each time you translate a file by selecting Options in the Translate dialog box.

### Access Translate Options

1. Press **Ctrl + t (Functions/Translate & Edit)**. The Translate dialog box displays.
2. Select **Options**. The Case CATalyst Translate Options dialog box displays.
3. Review the options for the [Input](#) and [Realtime](#) tabs in the Translate Options dialog box. Select a feature by checking the box next to it. Uncheck the box to deselect the feature.
4. If you are outputting to another system, review the Output to [CaseView](#), Output to [ASCII/ANSI](#) and Output to [Caption](#) tabs as necessary. Not all features are applicable to voice translation.
5. Press **Alt + a (Apply)**. CATalyst VP saves the setting for the current user. Once you select Apply, the settings remain until you change them, even if you choose Cancel to exit the Translate function.
6. Press **Enter (OK)** to return to the Translate dialog box.

## CATalyst VP Realtime Options

Set options on the Case CATalyst Translate Options Realtime tab to record the room noise using AudioSync. To use the AudioSync feature, your e-Key license must include the AudioSync option.

To verify your e-Key license includes the AudioSync option, press **Alt + h, b (About Case CATalyst)** In the programmed Options section, AudioSync displays when your e-Key license has the AudioSync option.

### Realtime Options

#### Audio

In addition to setting the following Audio options, you must check the Record Audio [option](#) on the Translate dialog box.

**IMPORTANT:** Do NOT change the clock time on your computer at any time during the realtime session or have any operating system setting that automatically updates your clock. Changing the clock time once translation begins affects the playback of the recording.

#### Record To

When using AudioSync, select the folder where you want to write the audio room noise for the file. The default is the current user folder. If necessary, use **Browse** to select another location such as a network or external drive.

**Compression Type**

When using AudioSync, select **one** of the following to indicate the compression rate:

**14 MB/Hr**

This is the default setting. Recording at 14 MB per hour produces a higher quality recording but takes up more hard drive space.

**6 Mb/Hr**

It is strongly recommended that you test the writing and recording ability of your computer to handle this setting due to the system resources required. This setting takes up less hard drive space but requires more computer resources.

**Audio Input (Advanced)**

By default, AudioSync uses the Windows default to control the room noise audio [settings](#) for the microphone connected to the Microphone port. If you have an audio feed already using the Windows default setting, it may be necessary to change the input location to use a different audio recording device. For example, you can change AudioSync from the Microphone port to the Line In port. Use the drop down box to select an alternate recording input device.

ViaVoice uses the microphone port for recording your dictation. It is necessary to select an alternative location for the AudioSync room noise.

**Auto Pause Audio**

Not applicable to voice translation. Deselect this option to ensure voice translation functions properly.

You can create a [AccelerWriter](#) voice command or keyboard assignment in a [keyboard map](#) to pause and resume the room noise audio recording.

**After Seconds**

Not applicable when Auto Pause Audio is not active. Verify the Auto Pause Audio option is deselected.

**Hold Strokes**

This option does not apply to voice translation. Be sure this option is deselected to ensure voice translation functions properly.

**Voice Engine**

Select the voice engine you use for voice translation. You must have the software for the selected voice engine installed on your computer.

**Dragon Naturally Speaking 8**

Select this option when using Dragon Naturally Speaking Version 8.10 or higher for voice translation.

**ViaVoice for Windows 10**

Select this option when using ViaVoice for Windows 10 for voice translation.

## Ordinal Number Conversion in ViaVoice

When using ViaVoice with CATalyst VP, ordinal word numbers convert to digit ordinals. For example, if you speak "eighty ninth" CATalyst VP converts the words to 89th. Case CATalyst automatically places the ORDINAL\_CONVERSION\_DETECTED entry into your Personal Voice Dictionary, if it does not already exist, when you start ViaVoice. This entry is used to manage ordinal number conversion. The Ordinal Number Conversion only applies when using ViaVoice as the voice engine.

If you prefer not to have CATalyst VP convert ordinal word numbers to digits, you can modify your UserSettings.sgxml file to change the default to not convert the ordinal numbers. The ORDINAL\_CONVERSION\_DETECTED entry remains in your Personal Voice Dictionary but has no effect on ordinal numbers.

## Prevent Ordinal Word Number Conversion to Digits

1. Be sure you are in your User name.
2. From Manage Jobs, open the **System Files** case.
3. Double click the **UserSettings.sgxml** file. The Settings Manager dialog box displays.
4. Click in the dialog box and press **Ctrl + f**. The Find dialog box displays.
5. Type: **ViaVoice-Auto-Ordinal** and press **Enter**. CATalyst VP locates the option.
6. Click the **Edit** icon.
7. Type the number, **0**, in the field and click **OK**. To restore the default setting, click **Default**.
8. Press **Alt + s (Save)** to save the setting and close the dialog box.

## Input Options

A limited selection of options on the Case CATalyst Translate Options Input tab apply to voice translation. Click the associated link for additional information.

Additional Input translate options are located in the general Case CATalyst Help, Translate & Edit section. Some of these topics may reference creating dictionary definitions, however, when creating voice commands dictionary entries, follow the formats to [create and modify voice command dictionary entries](#) outlined for CATalyst VP.

[Capitalize All Text](#)

Translate the text in all capital letters.

[Colloquy + A =](#)

Automatically change an Answer format symbol following Colloquy to Colloquy followed by THE WITNESS:<space>.

[Colloquy + Q=Auto By Line](#)

Automatically insert a By Line before the next Question when a question is dictated immediately following Colloquy. The By line paragraph style is controlled by your layout settings.

[Parenthetical + Q = Auto By Line](#)

Automatically formats a Question as a By line when following a parenthetical format symbol. The By line paragraph style is controlled by your layout settings.

[Automatic Number Conversion](#)

Automatically convert numbers based on the keywords and conversion rules in the NumberConversion.ini file.

[With Thousands Separators](#)

Convert digit and words numbers with commas when the numbers are followed by a measurement keyword

[Display 10 and Under as Words](#)

Translate numbers 1 through 10 as words when no keyword or number conversion rule controls a conversion.

[Otherwise Display as Digits](#)

Forces all numbers to automatically display as digits when no keyword or number conversion rule controls a conversion.

[Timers](#)

Track the amount of time a speaker or group of speakers talks during a job.

## Capitalize All Text

Capitalize All Text is a Translate option. When active, CATalyst VP translates the realtime text in all capital letters. When selected, the entire transcript is created in all capital letters and cannot be changed without re-translating or retyping. If you select an Output option, such as CaseView, all capital letters are sent to the receive system.

To display and edit in all capital letters, insert the All Caps On format symbol at the beginning of the Edit file. Delete the All Caps On format symbol prior to printing.

## Colloquy + A =

Colloquy + A = is a Translate option. When active, CATalyst VP automatically changes an Answer format symbol that follows a colloquy or colloquy and parenthetical format symbol, to a Colloquy format symbol followed by text you specify in the Text field.

If you check this option, you can change the text in the field. The default is THE WITNESS:space. Check the Bold box to have the text translate in bold letters.

### **Example**

MR. JONES: Tell your client to answer the question.

A. I told you, I don't remember.

### **When Colloquy + A option is active:**

MR. JONES: Tell your client to answer the question.

THE WITNESS: I told you, I don't remember.

## Colloquy + Q = Auto By Line

Colloquy + Q = Auto By Line is a Translate option. When active, CATalyst VP automatically formats a question as a By line when following colloquy or colloquy and parenthetical format symbols. Using a By line entry in a voice commands dictionary, you dictate an initial By line. Then when you have a colloquy designation and proceeding return to Q & A, CATalyst VP automatically formats the By line using the most recent By line name. The By line paragraph style is controlled by your layout settings.

Common By line entries for a voice commands dictionary:

<By Line>Q. (By<EZ Speaker 01>)

<By Line>By <EZ Speaker 01>: Q.

Some transcript layouts require more than one By Line format; By line text follows an examination, while other By line text returns to testimony following Colloquy. Use the examples provided later in this topic, "Using Different By Line Formats With Colloquy + Q" to help you create voice commands dictionary entries for using two different By line format.

You must dictate an initial By line definition in the transcript for the Auto By Line feature to work correctly. The By line entry must use a By Line format symbol. Only a By line format symbol is recognized by CATalyst VP as a By line. You must also include a colon ( : ), closed parenthesis ( ) ) or Q included at the end of the By line definition for Auto By Line to work correctly. Only a Parenthetical paragraph style can occur between the colloquy and the Q without affecting the performance of Colloquy+ Q = Auto By Line. For example, Colloquy + Q= Auto By Line does not work if you substitute <New Line Paragraph><Tab><Tab> for a Parenthetical paragraph style.

When using a single By line format with this feature, the By line automatically uses the same name as the previous By line provided no "examination" occurs in between the information. CATalyst VP inserts THE ATTORNEY: surrounded by Scanstop format symbols at the By Line paragraph setting when a previous By line does not exist.

## Using a Single By Line Format with Colloquy + Q = Auto By Line

In this example, a By line entry in a voice commands dictionary is <By line>BY [!EZ SPEAKER 01]:<Question>. While dictating, there is colloquy followed by question:

BY MS. TAYLOR:

Q. Where were you last night?

MR. JONES: Objection.

THE COURT: Overruled.

Q.

**The result is:**

BY MS. TAYLOR:

Q. Where were you last night?

MR. JONES: Objection.

THE COURT: Overruled.

BY MS. TAYLOR:

Q.

**Definition Guidelines**

To achieve the above results in the previous example, create By line entries with EZ Speakers fields in a voice commands dictionary using the following sample entry:

voicecommand =<By-line>BY [!EZ SPEAKER 01] space

## Using Different By Line Formats with Colloquy + Q = Auto By Line

In this example, a specific format for the first occurrence of a By line following an Examination and a different By line format following Colloquy requires two different By line voice commands dictionary entries. The By line following the Colloquy contains the By Line format symbol. Writing an initial By Line definition is necessary for the Colloquy + Q = Auto By Line feature to recognize the name in subsequent occurrences.

### EXAMINATION

BY MS. RICHARDSON:

Q. What is your relationship with...

MR. ARNOLD: Objection.

THE COURT: Sustained.

Q. (By Ms. Richardson) Do you have a relationship...

### Definition Guidelines

To achieve the above results, create By line entries with EZ Speakers in a voice commands dictionary using the following examples as format guidelines. When using two different By line formats with the Auto By Line feature, define the By line following the Examination with a <New Line Paragraph> format symbol. This formats the text as necessary and allows the By Line format symbol to be used for the By Line following Colloquy. The New Line Paragraph format symbol is not recognized as a By line.

Depending on your By Line requirements, you may want set the By Line margin setting to the same margin settings for your Question [paragraph](#) style. In the Symbol field type a Q and a period, if appropriate. In the Ending Punctuation field, type a ? (question mark).

voicecommand=<Centered Paragraph>EXAMINATION<New Line Paragraph>BY [!EZ SPEAKER 01]:<Question>

voicecommand=<By-line>(BY [!EZ SPEAKER 01]) space<Cap Next>

## Parenthetical + Q = Auto By Line

Parenthetical + Q = Auto By Line is a Translate option. When active, CATalyst VP automatically formats a Question as a By line when following a parenthetical format symbol. When you write a parenthetical paragraph style and the proceedings return to Q & A, CATalyst VP automatically formats the By line using the name in the last By line. The By Line paragraph style is controlled by your layout settings. Common By line formats include:

<By Line>By Attorney name

<Question>

<By Line>Q. (By Attorney Name)

<By Line>By Attorney Name: Q.

An example of the use of a Parenthetical paragraph style would be:

<Parenthetical>(Discussion off the record.)

The Parenthetical + Q = Auto By Line option is similar to the Colloquy + Q = Auto By Line option. The [Colloquy + Q = Auto By Line](#) contains additional details on formatting By Lines.

## Automatic Number Conversion

Automatic Number Conversion is a Translate option that converts numbers and words to a specific format as indicated in the [NumberConversion.ini file](#). The CATalyst VP NumberConversion.ini file contains formatting rules based on keywords. You can view and modify the entries in the NumberConversion.ini file, customizing it to meet your needs.

### Example

You speak, "one thousand twenty three dollars". The keyword in the NumberConversion.ini file is "dollars." The formatting rule for dollars converts words to digits and places a dollar sign in front of the number. When Dragon/ViaVoice hears the word keyword "dollars," CATalyst VP converts the number, resulting in \$1,023. The word "dollars" is removed from the transcript.

### Example

You speak 123 sunshine lane. The keyword in the NumberConversion.ini file is "lane." The formatting rule for lane instructs CATalyst VP to cap up to two words in between the number and the word lane. The result is 123 Sunshine Lane.

Depending on the settings in the NumberConversion.ini file, Automatic Number Conversion converts dates to numbers or ordinal numbers and inserts a comma when appropriate. For example, saying July two 2005 converts to July 2nd, 2005.

There are no entries in a voice commands dictionary to control the Automatic Number Conversion feature. If you require a number conversion format Automatic Number Conversion cannot accommodate, you can create specific voice commands dictionary entries containing Number Conversion or Number Trigger translate commands to use in conjunction with the Automatic number Conversion feature. You can also use the translate option, [Display 10 and Under as Words](#) in conjunction with Automatic Number Conversion. Display 10 and Under as Words is only available when Automatic Number Conversion is active. When selected, CATalyst VP converts digits 1 through 10 to words when no other number conversion keywords or rules apply.

To use the Automatic Number Conversion feature in CATalyst VP, select the Automatic Number Conversion option in the Input tab of the Translate Options dialog box. Dragon users must turn off the number conversion feature in Dragon in order to use the Automatic Number Conversion feature in CATalyst VP. In Dragon, select Tools/Options/Formatting and check the box, Do not automatically format text. You can use either the CATalyst VP or Dragon number conversion feature but you cannot have both active at the same time. If both are active, undesirable number conversion results occur.

You can also manually use Automatic Number Conversion in Edit.

The [Automatic Number Conversion](#) feature uses the NumberConversion.ini file to convert numbers and words into specific formats. The NumberConversion.ini file contains formatting rules based on word and number combinations.

To open the NumberConversion.ini file, do one of the following:

- Press **Alt f, o, i, n** (**File/Open/List Table/Number Conversion**).
- On the Case CATalyst Translate Options Input tab, click **numberconversion**. A message prompts you to close the Translate dialog box in order to open the NumberConversion.ini file.

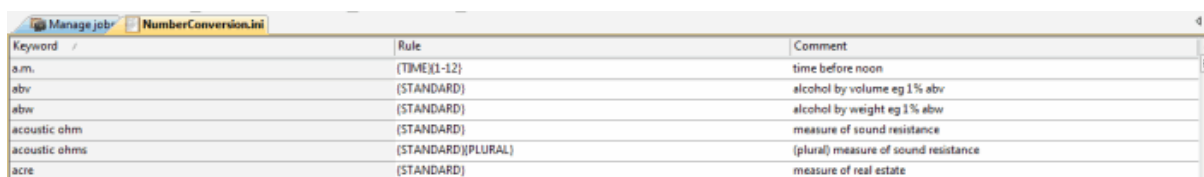

### Example

The keyword "avenue" is associated with the number conversion rule for {ADDRESS}. This rule looks to the left of the keyword and caps up to two words when preceded by numbers. When Automatic Number Conversion is active and you speak "1234 red pine avenue", the result is "1234 Red Pine Avenue."

### Example

The keywords "a.m." and "p.m." are associated with the number conversion rule for {TIME}. This rule dictates that a 3 or 4 digit number appears with a colon before the last two digits. When Automatic Number Conversion is active and you speak eleven forty-five a.m., the rule for a.m. applies after translation, resulting in 11:45 a.m. If you speak "315 a.m.," it converts to "3:15 a.m."

When you open the NumberConversion.ini file, the contents display in three columns: Keyword, Rule and Comment. The Keyword column indicates the keyword that you speak; the rule column indicates the type of automatic number conversion instruction; and the Comment column briefly describes the function of the rule. You can sort the entries in ascending or descending order by clicking the desired column heading.

Keyword	Rule	Comment
a.m.	(TIME)(1-12)	time before noon
abv	(STANDARD)	alcohol by volume eg 1% abv
abw	(STANDARD)	alcohol by weight eg 1% abw
acoustic ohm	(STANDARD)	measure of sound resistance
acoustic ohms	(STANDARD)(PLURAL)	(plural) measure of sound resistance
acre	(STANDARD)	measure of real estate

Depending on your number writing style or theory, you may want to [modify](#) the NumberConversion.ini file to maximize the benefits of the Automatic Number Conversion feature. The NumberConversion.ini file comes with a default set of keyword entries. You can add, delete or modify entries to customize the file.

Keywords have a maximum length of 63 characters. If you create an entry for an existing keyword a message displays. When a duplicate keyword entry exists that can convert a number two different ways, the number conversion applies the last entry in the list. For example, you have the word "highway" listed as a keyword for {ADDRESS} rule. You also have the word "highway" listed as a keyword for {DIGITAFTER}{CAPWITHNUM} rule. You speak "1234 rough old highway" The words "rough" and "old" are not capped because this uses the first format in the list. If you speak "highway 66", highway is initial capped because it is the last entry. The result is Highway 66.

There is one NumberConversion.ini file per person. It is located in the System Files case.

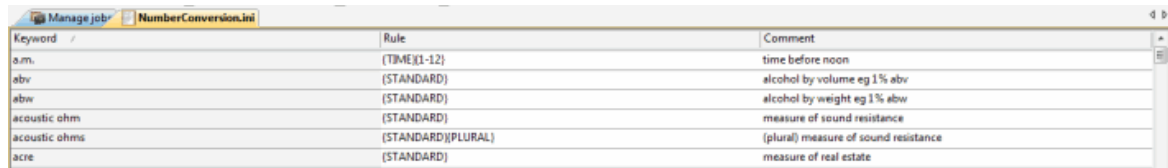

The NumberConversion.ini file is located in your System Files case and contains keywords and rules when writing numbers and text that should be formatted a specific way. For example, let's say you have Automatic Number Conversion feature selected and you write "3 hundred thousand fifty two dollars." Automatic Number Conversion would convert that to "\$300,052".

Add, modify or remove entries from the NumberConversion.ini file.

## Add or Modify an Entry

- To open the NumberConversion.ini file, do one of the following:
  - Press **Alt + f, o, i, n** (**File, Open, List/Table, Number Conversion**).
  - On the Case CATalyst Translate Options Input tab, click **numberconversion...** *To view this file, the Translate dialog box needs to close. Apply changes and continue?* The default is set to Yes. If you press **Enter** or click Yes, any changes will be saved and the Translate Input dialog box will automatically close and the numberconversion file will open.

- The NumberConversion.ini contains three columns. The Keyword column lists the keyword for the automatic number conversion. This word has a maximum length of 63 characters. The Rule column is the instruction for the keyword. The Comment column is a brief description of what is going to be the result of this entry.

Keyword	Rule	Comment
a.m.	(TIME)(1-12)	time before noon
abv	(STANDARD)	alcohol by volume eg 1% abv
abw	(STANDARD)	alcohol by weight eg 1% abw
acoustic ohm	(STANDARD)	measure of sound resistance
acoustic ohms	(STANDARD)(PLURAL)	(plural) measure of sound resistance
acre	(STANDARD)	measure of real estate

- Do one of the following:
  - Add Entry — Press **Ctrl + i (Edit/Insert)**. The Insert Entry dialog box displays.
  - Modify Entry — Highlight the entry to modify and press **Ctrl + m (Edit/Modify)**. The Modify Entry dialog box displays.
- Make entries as necessary:

### Keyword

Type the word you want to associate to the rule. If you create a duplicate keyword entry, a message displays indicating a duplicate entry.

### Rule

Highlight the rule to associate with the keyword. Available options applicable to the rule display in the Options field.

### Options

Options applicable to the Rule selected display in this field. Highlight an option to select it.

### Money Symbol

This field displays when you select the {MONEY} rule. Depending on the Options selected, the following fields are available. Select one:

- Dollars [\$] — Select this option to include a dollar sign in the money conversion.
- Cents [¢] — Select this option to include a cents sign in the money conversion.
- Other — Select this option to include a customized symbol in the money conversion. Type a money symbol in the field.

### Description

A sample and brief description of how the selected rule with the selected option is applied.

### Personal Comments

Entry in this field is optional. Type any comments you want to note about your entry.

- Press **Enter (OK)**.
- Ctrl + s (File/Save)** to save the file.
- Press **Alt + f, x (File/Exit)** to exit the NumberConversion.ini file.

## Remove an Entry

- To open the NumberConversion.ini file, do one of the following:

- Press **Alt f, o, i, n** (**File/Open/List Table/Number Conversion**).
  - On the Case CATalyst Translate Options Input tab, click **numberconversion...** *To view this file, the Translate dialog box needs to close. Apply changes and continue?* The default is set to Yes. If you press **Enter** or click Yes, any changes will be saved and the Translate Input dialog box will automatically close and the numberconversion file will open.
2. Highlight the entry to disable and press Delete or click the Delete  icon.
  3. Press **Enter (OK)**.
  4. **Ctrl + s** (**File/Save**) to save the file.
  5. Press **Alt + f, x** (**File/Exit**) to exit the NumberConversion.ini file.

Search allows you to locate a word or words in the NumberConversion.ini File. You can locate information in the Keyword, Rule and Alternate Suggestions columns, searching forward or backward for a whole word, part of a word or a phrase. Once a searched entry displays, you can repeat the Search by using Repeat Search Forward or Repeat Search Backward.

To search:

1. To open the NumberConversion.ini file, do one of the following:
  - Press **Alt f, o, i, n** (**File/Open/List Table/Number Conversion**).
  - On the Case CATalyst Translate Options Input tab, click **numberconversion**. A message prompts you to close the Translate dialog box in order to open the NumberConversion.ini file.
2. Press **Ctrl + f** (**Edit/Search**). The Search dialog box displays.
3. Make necessary entries:

### Search

Type the text you want to locate in the field. Use the remaining options, as necessary.

#### Entry Type

Check this box to limit the search to include one of the following criteria. From the drop down list in the Search field, select one of the following criteria:

- Numbers — The first entry that contains numbers.
- All Capped — The first entry that contains all capped text.
- Contains capped — The first entry that contains at least one capital letter.
- Phrase — The first entry that contains two or more words separated by a space.
- Contains punctuation — The first entry that contains punctuation.
- Numeral Words — The first entry that contains number words.

#### Case Sensitive

Check this box to limit the search based on the upper and lower case letters of text typed in the Search field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field. This field is unavailable when you select to search by Entry Type.

#### Whole Word

Search only for the words that match the text typed in the Search field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. This field is unavailable when you select to search by Entry Type.

#### Location

Limit the search to include one of the following criteria. These fields are unavailable when you select to search by Entry Type.

##### Exact Match

Search for entries that exactly match the text entered in the Search field.

##### Begins With

Search for entries that begin with the text entered in the Search field.

##### Ends With

Search for entries that end with the text entered in the Search field.

##### Contains

Search for entries that contain, anywhere in the entry, the text entered in the Search field.

#### Direction

Select one of the following:

##### Forward

Search forward from the cursor position to the end of the table.

##### Backward

Search backward from the cursor position to the beginning of the table.

4. Press **Enter (OK)** to start the search. If no match is found for the search item, a message displays.
5. To repeat the same search, press **F3 (Edit/Repeat Search Forward)** or **Shift + F3 (Edit/Repeat Search Backward)**.

Search and Replace allows you to search for and replace words in the Keyword or Comments column of a NumberConversion.ini entry. You can search forward or backward. Once a searched entry displays, you can repeat Search for the same text and search parameters by using Repeat Search Forward or Repeat Search Backward.

To search and replace:

1. To open the NumberConversion.ini file, do one of the following:
  - Press **Alt f, o, i, n (File/Open/List Table/Number Conversion)**.
  - On the Case CATalyst Translate Options Input tab, click **numberconversion**. A message prompts you to close the Translate dialog box in order to open the NumberConversion.ini file.
2. Press **Alt + e, e (Edit/Search and Replace)**. The Search and Replace dialog box displays.
3. Make necessary entries:

#### Search

Type the text you want to locate in the field. Use the remaining options, as necessary.

**Case Sensitive**

Check this box to limit the search based on the upper and lower case letters of text typed in the Search field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field.

**Whole Word**

Search only for the words that match the text typed in the Search field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word.

**Location****Exact Match**

Search for entries that exactly match the text entered in the Search field.

**Begins With**

Search for entries that begin with the text entered in the Search field.

**Ends With**

Search for entries that end with the text entered in the Search field.

**Contains**

Search for entries that contain, anywhere in the entry, the text entered in the Search field.

**Direction**

Select one of the following:

**Forward**

Search forward from the cursor position to the end of the table. A confirmation message displays for each possible replacement.

**Backward**

Search backward from the cursor position to the beginning of the table. A confirmation message displays for each possible replacement.

**Replace With**

Type the replacement text for the entry in the Search field.

4. Press **Enter (OK)** to start the search.
5. When a match is found, the Confirm dialog box displays with the Original word and the Replacement word. Select one of the following:

**Yes**

Apply the replacement to this occurrence and search for any other occurrence.

**Yes To All**

Apply the replacement to all occurrences of the Original word.

**Goto Next**

Do not apply the replacement to this occurrence and search for any other occurrence.

## Done

Do not apply the replacement to any occurrences and close the Confirm dialog box.

## Display 10 and Under as Words

Display 10 and Under as Words is a Translate option that is available when [Automatic Number Conversion](#) is active. When selected, CATalyst VP convert digits 1 through 10 to words when no other number conversion keywords or rules apply. For example, if you write "4 boxes", the result is "four boxes". This option only affects numbers 1 through 10 and does not apply to zero.

Keywords in the NumberConversion.ini file take priority over this option. For example, the word "mile" is in the NumberConversion.ini file as a unit of measure. You speak, "There was a three mile backup." The result is "There was a "3-mile backup."

## NumberConversion

The NumberConversion option on the Case CATalyst Translate Options Input tab opens the [NumberConversion.ini](#) file. When you click **numberconversion**, CATalyst VP prompts you with a message to close the Translate box, saving any changes. Select **Yes** to continue and open the NumberConversion.ini file. The *numberconversion* option is not available when CATalyst VP cannot locate a NumberConversion.ini file in the System Files case for the current user.

## Otherwise Display as Digits

Otherwise Display as Digits is a Translate option. When active, CATalyst VP forces all word numbers, which are not controlled by a another number conversion keyword or rule, to automatically display as digits without commas. For example, "There were three thousand of them." translates as "There were 3000 of them."

CATalyst VP applies Otherwise Display as Digits when Automatic Number Conversion is active and there is no matching keyword entry in the NumberConversion.ini file. Keywords in the [NumberConversion.ini](#) file take priority over this option.

To select Otherwise Display as Digits, first select the *Automatic Number Conversion* option in the Translate option dialog box.

## With Thousands Separators

With Thousands Separator is a Translate option that is available when [Automatic Number Conversion](#) is active. When selected, CATalyst VP converts digit and word numbers with commas when the numbers are followed by a measurement keyword. For example, one thousand miles converts to 1,000 miles. The word "miles" is a measurement keyword.

If Otherwise Display as Digits is also selected when With Thousands Separator is selected, numbers over a thousand and not followed by a keyword convert to digits with commas. For example, "one thousand parking tickets" converts to "1,000 parking tickets".

If With Thousands Separator is selected, Otherwise Display as Digits is not selected and the *(new) Digits With words convert With commas Up To=* option in the UserSettings.sgxml file is set to thousands or millions, then CATalyst VP converts digits followed by word numbers such as thousands and millions to numbers with commas. For example, 3 thousand 4 hundred people attended the concert would convert to 3,400. Conversion takes place without a keyword. If word numbers are written followed by word numbers, they do not convert. For example, three thousand four hundred people attended the concert would not convert.

## Don't Convert Word Numbers

*Don't Convert Word Numbers* is a Translate option that is available when the [Automatic Number Conversion](#) option is active. If you identify a sound that is a number for when it is a "word number" and a different sound for a number that is a "digit number," then selecting the *Don't Convert Word Numbers* option allows you to say word numbers along with a number conversion keyword and have no number conversion take place. This is a great option if you want to say a word number along with a number conversion keyword and retain the word number. For example, if you say two dollars, it remains *two dollars*. Or if you say two million three hundred thousand dollars, no number conversion takes place. However, if you say words defined as digits and a number conversion keyword, you can still have the number conversion take place. For example, 2 dollars (number conversion keyword), it converts to \$2. If you write 2 million 3 hundred thousand dollars (number conversion keyword), it converts to \$2,300,000.00.

When this option is selected, if you say a word number and a number conversion keyword that would normally insert a hyphen between two words, there will be no hyphenation between the word number and the keyword when this option is selected. For example, you say two barrel shotgun, no hyphen would be placed between "two" and "barrel" when "barrel" is a keyword in the Numberconversion file. If you say 2 barrel shotgun, the conversion is 2-barrel shotgun.

### To select or deselect the Don't Convert Word Numbers Option:

- From Manage Jobs, press **Alt + t, o, t** (Tools, Options, Translate) and then press **Alt + p** (Options button). In the Automatic Number Conversion section on the Input tab, select or deselect the Don't Convert Word Numbers option.
- From the Translate dialog box, press **Alt + p** (Options button). In the Automatic Number Conversion section on the Input tab, select or deselect the Don't Convert Word Numbers option.

## Timers

Timers is a Translate option that allows you to track the amount of time a particular speaker talks during a job. Some jurisdictions limit the time allotted for an expert witness testimony and require the court reporter to track the time. You can also create [Timer groups](#) to track the time for a group of speakers. For example, there is one plaintiff attorney and two attorneys for the defendant. You can track the individual time for each defense attorney and the total time for both of them.

Create entries in a voice commands dictionary to start and stop Timers. A {Start Timer} entry in a voice commands dictionary is necessary to start each individual Timer. Only one Timer can be active at a time. The Timer for a speaker stops when you start the Timer for another speaker or use the {Stop All Timers} command. The {Start Timer} and {Stop All Timers} translate commands must exist in a voice commands dictionary in the current user.

You may want to include the Timer commands as part of a speaker entry. The Timer information automatically changes when you change the speaker. For example, you speak the command for Speaker 1 which includes {Timer 1}. After awhile you speak the command for Speaker 2 which includes {Timer 2}. CATalyst VP automatically suspends tracking time for Speaker 1 and starts tracking time for Speaker 2. When you are finished with the job, stop the Timers with the command for a {Stop All Timers} entry.

CATalyst VP displays Timer 1, Timer 2, etc in the Timer dialog box to indicate which Timer is active. Using [Timer Options](#), you can assign specific names to each Timer so the speaker's name displays in the Timer dialog box instead of Timer 1, Timer 2, etc. For example, you change the name of Timer 1 to Plaintiff Attorney and Timer 2 to Defendant Attorney. When you dictate the command for Timer 1, the Timer information displays in the Timer dialog box as Plaintiff Attorney. Timer 2 displays as Defendant Attorney. You can also assign specific names to each Timer group.

Timer and [Timer group](#) names are job specific. You can, however, select a Timer and Timer group to act as a default for all jobs. CATalyst VP saves and displays all Timer information in the Job History file, on the Translation tab, for each job.

You can display the Timer dialog box containing Timer information by selecting Timers in Translate Options when writing realtime or View/Show/Timers in Edit.

Inserting [Timer fields](#) into the transcript or Include file allows you to view the cumulative time for each speaker. If you also use Timer Groups, you can insert a TimerGroup field to view the cumulative time for the group of speakers in their specified Timer Group.

Timer Information allows you to set up Timer names, [Timer groups](#), and automatically display the Timer dialog box when [Timers](#) are active. You can also designate a separate text color for each Timer name and Timer group.

Timer information is job specific. You can, however, designate a Timers and Timer groups to act as a default for all jobs.

To set Timer options:

1. In Edit, press Alt + t, o, m (Tools/Options/Timer Information). The Timer Options dialog box displays.
2. Make necessary entries:

### **Available Timers**

The list of Timers identified for this job.

### **New Timer**

Add a new Timer to the Available Timers list. New Timers use a default name of Timer followed by a sequentially assigned number. You can rename the Timer. The Timer retains its assigned number although it is no longer visible when you rename it.

### **Delete Timer**

Remove a Timer from the Available Timers list. Highlight the Timer and then select Delete Timer.

### **Rename**

Highlight a Timer and then select Rename. A rectangular box displays around the Timer name. Type a new name and then press **Enter**. CATalyst VP uses the assigned name unless you change it.

### **Set as Default**

Have the Timers always default to the currently assigned names, until changed.

### **Groups**

Create [Timer groups](#) to have CATalyst VP track total time for multiple individuals. You can continue to track time for each individual within the group.

### **LED Color**

Choose a text color for the highlighted Timer name.

### **Display timers window when a timer is started**

Check this box to have the Timers window open when you start a Timer.

3. Press **Enter (OK)** when finished.

Some jurisdictions require the reporter to keep track of the time for each testimony. Using the CATalyst VP [Timer](#) feature you can track time for each speaker. The Translate command {Start Timer} is used to create a Start Timer entry for each individual speaker. The {Stop All Timers} command is used to create one Timer entry to stop all the Timers. The Timer for one speaker stops when you dictate a command for another Timer entry or when you dictate a command to Stop All Timers.

You can add the Timer translate command to a speaker entry so that when you dictate to change the speaker, the Timer information automatically changes. For example, you might create the following entry

Voice Text	CATalyst Text
speeone	<Colloquy>[!EZ SPEAKER 01]: {Start Timer}[1]
speetwo	<Colloquy>[!EZ SPEAKER 02]: {Start Timer}[2]

When you say "speeone" Timer 1 starts. When you say "speetwo" CATalyst VP automatically suspends the tracking of time for Timer 1 and starts tracking time for Timer 2. When you finish using Timers, you dictate the command for the entry to Stop All Timers.

To create a Start Timer and Stop Timer entry:

1. Open the desired voice commands dictionary.
2. Press **Ctrl + i (Edit/Insert)**. The Modify/Insert Voice Command dialog box displays with empty Voice Text and CATalyst Text fields.
3. In the *Voice Text* field, type the phrase you speak to invoke the Start or Stop Timer.
4. In the *CATalyst Text* field, type the phrase you want to associate with the Timer command.
5. Do either of the following:

#### Start Timer

- a. Press **Alt + f (FS)** to display the list of format symbols.
- b. Use the Up and Down Arrow keys to locate **{Start Timer}** and press **Enter** to insert the highlighted command into the *CATalyst Text* field.
- c. After {Start Timer} type **[** (left bracket) followed by the Timer number, and then type **]** (right bracket). For example: {Start Timer}[1].
- d. Type additional text, insert format symbols and fields as necessary. For example, you may want to add the <Colloquy> format symbol or type a speaker name.

#### Stop Timer

- a. Press **Alt + f (FS)** to display the list of format symbols.
  - b. Use the Up and Down Arrow keys to locate **{Start Timer}** and press **Enter** to insert the highlighted command into the *CATalyst Text* field.
6. Press **Enter (OK)** to insert the definition into the dictionary.
  7. When finished creating voice command entries, press **Esc (Cancel)**.
  8. Press **Ctrl + s (File/Save)** to save the dictionary.

## Output Options

Output options allow you to determine settings for realtime output to another format such as ASCII/ANSI or CaseViewNet. The output location can be another location on your system, a remote location or both. Output to:

- [ASCII/ANSI](#) format.
- An encoder for [Captioning](#).
- [CaseViewNet and CaseView II](#).

## Output to ASCII/ANSI

You can send the realtime output in ASCII/ANSI format to another location on your system, to a remote location or both. You might use this feature if you are sending to a third-party software package. This type of output is often used for financial reporting.

In addition to setting the following Output to ASCII/ANSI options, you must select ASCII/ANSI in the [Output To](#) field in the Translate dialog box. To have CATalyst VP remember the output destination, check the accompanying box, Remember Setting.

## ASCII/ANSI Options

To access the ASCII/ANSI options, from the Translate dialog box select Options and then select the Output to ASCII/ANSI tab.

### Connection

#### Output over comm port

Check this box to send the realtime output to another computer or remote location. Uncheck this box to send realtime data only to your computer.

#### Comm Port

Select the appropriate COM port on the CATalyst VP computer for the cable connection between the CATalyst VP system and the receive system. For more information on COM or serial ports, refer to the user guide for your computer.

#### Direct (Cable)

Select this option when you connect the CATalyst VP system and the receive system with a realtime cable.

#### Modem

Select this option when you connect the CATalyst VP system to the receive system remotely over the phone lines. The CATalyst VP system is connected to a phone jack via a modem cable. The receive system is connected to a phone jack in the remote location via a modem cable.

#### Call

Have the CATalyst VP system call the receive system remotely. Enter the phone number in the *Number* field.

#### Answer

Have the receive system call the CATalyst VP system.

#### Number

When you select *Call*, type the telephone number for the location of the receive system. If applicable, include any numbers required to access an outside telephone line. Insert commas between numbers to have the system pause a second before dialing the next number. This allows the system to receive a dial tone before sending the next number. For example, if you need to dial 9 to reach an outside line and 1 to reach a different area code, the number would resemble the following: 9, 1, 123-456-7890.

### Wrap Lines at margin

This option will automatically wrap lines (new line inserted) based on the file's margins. If you want the ASCII/ANSI output file lines to only wrap (new line inserted) when there is a new paragraph, deselect this option. When outputting to a remote display via StreamText, best results may be achieved by deselecting this option. This option is selected by default.

### Output to file

Check this box to send the ASCII/ANSI realtime output to a file which you can store or send electronically. Use the **Browse** button to display the ASCII Output Filename dialog box, where you can name and select a destination location for the file. Once selected, the location path displays in the field.

## Options

### Hold Strokes

This option does not apply to voice translation. Be sure this option is deselected to ensure voice translation functions properly.

## Output to Caption

Output to Caption allows you to send text directly to an encoder for realtime captioning as you speak. All text is sent to the encoder. The use of pre-scripted text is not compatible with this feature.

Special [captioning realtime commands](#) allow you to control certain captioning functions, such as setting the encoder on or off-line, setting the number of characters per line and the number of caption lines. You create entries in a voice commands dictionary with captioning format symbols to control these commands. It is necessary to define a stroke as <Caption: Block> and use that stroke to begin the realtime session.

All captions are sent in roll-up mode. The first line displayed on the screen rolls off the screen as the next line of text written displays at the bottom. For example, you set the number of lines to display as 3 so that three lines of text always display on the caption screen. When you write the fourth line, the first line rolls off the screen to make room for the fourth line on the caption display.

Generally, captions are displayed in all caps. If you select the ALL CAPS options and a word requires lower case characters, use the <Caption: KeepCaseNext>, <Caption: KeepCaseOn> and <Caption: KeepCaseOff> format symbols. For example, in order to keep the "c" in lower case in the name McLaughlin, use the <Caption: KeepCaseNext> format symbol, M<Caption: KeepCaseNext>Laughlin. The translated result is McLAUGHLIN. In another example, in order to keep CATalyst VP in the same case, use: <KeepCaseOn>CATalyst<KeepCaseOff> VP

In addition to setting the following Output to Caption options, you must select Caption in the [Output To](#) field in the Translate dialog box. To have CATalyst VP remember the output destination, check the accompanying box, Remember Setting.

## Caption Options

To access the Caption options, from the Translate dialog box select Options and then select the Output to Caption tab.

## Connection

### Output over comm port

Check this box to send the realtime data over the COM port to an encoder. Designate the COM port by making an entry in the *Comm Port* field.

Uncheck this box to view the Closed Caption Preview Window while writing but not sending realtime data to an encoder. You may want to do this to practice.

### Comm Port

Select the appropriate COM port on the CATalyst VP system for the encoder cable connection to the computer. For more information on COM or serial ports, refer to the user guide for your computer.

### Direct (Cable)

Select this option when you directly connect the CATalyst VP system to the encoder with a realtime cable. For more information on the connecting the encoder, see the user's guide for your encoder.

### Modem

Select this option when you are writing to an encoder remotely over the phone lines. The CATalyst VP system is connected to a phone jack via a modem cable. The encoder is connected to a phone jack in the remote location via a modem cable. For more information on connecting the encoder, see the user's guide for your encoder.

### Call

Select this option if the CATalyst VP system is calling the encoder remotely. Enter the phone number in the *Number* field below.

### Answer

Select this option if the encoder is calling the CATalyst VP system.

### Number

When you select *Call*, type the telephone number for the location of the receive system. If applicable, include any numbers required to access an outside telephone line. Insert commas between numbers to have the system pause a second before dialing the next number. This allows the system to receive a dial tone before sending the next number. For example, if you need to dial 9 to reach an outside line and 1 to reach a different area code, the number would resemble the following: 9, 1, 123-456-7890.

## Hold Strokes

This option does not apply to voice translation. Be sure this option is deselected to ensure voice translation functions properly. If this option is selected with an entry in the *Strokes of Held for seconds* fields, the last word spoken does not display. Use the Caption Flush command to force the last word to display.

## Encoder Options

### Encoder Model

Select an encoder from the drop down list. The most common model of encoders are listed. If the model of encoder you are using is not listed, try selecting the EEG Compatible option.

## Captioning Options

The following captioning options can also be set or modified during a session by using captioning realtime commands in a voice commands dictionary.

### Number of Lines

Select the number of captioning rows to display. Choose a number between **2** and **4**.

### Characters Per Line

Select the number of characters on each caption line. Choose a number between **16** and **32**.

### Baseline

Select the line where the bottom line of the captions is placed. Choose a number between **1** and **15**. For example, if you select line 4 and you are using 4 caption lines, the bottom line of the caption displays on line 4.

To place the captions on the top of the screen, select line 3 or 4 depending on the number of caption lines. To place the captions on the bottom of the screen, select line 15.

### Indent

Indicate the number of spaces to indent all caption lines. Choose one of the following numbers: **0, 4, 8, 12, or 16**.

### Language

When using the Subtitle Encoder NEWFOR encoder model, select the language in which you want the subtitles to display.

The *Language* field is only available when using Subtitle Encoder NEWFOR.

### Teletext

When using encoder model, Subtitle Encoder NEWFOR, type the teletext page to which you are writing. Verify the correct language selection in the *Language* field.

The *Teletext* field is only available when using Subtitle Encoder NEWFOR.

## Translate Options

During captioning, the only translate option that applies to voice translation is All Caps. Selecting this option, takes priority over the same options set on another Translate Options tab.

### ALL CAPS

Display the realtime text in all capital letters.

## Output to CaseView

While reporting you can send the realtime text to one or more CaseView receive computers. CaseView provides participants online instant access to current and past testimony, allowing them to read, scroll back, search, and mark text for later reference. For detailed information about CaseView setup and connections, refer to the CaseView documentation.

In addition to setting the following Output to CaseView options, you must select CaseView in the [Output To](#) field in the Translate dialog box. To have CATalyst VP remember the output destination, check the accompanying box, Remember Setting.

## CaseView Options

To access the CaseView options, from the Translate dialog box select Options and then select the **Output to CaseView** tab.

### Connection

#### Output over comm port

Check this box to send the realtime data over the COM port. Designate the COM port by making an entry in the *Comm Port* field. Uncheck this box if you are using the SamePC option and sending only to your computer.

#### Comm Port

Select the appropriate COM port on the CATalyst VP computer for the cable connection between the CATalyst VP system and the receive system. For more information on COM or serial ports, refer to the user guide for your computer.

#### Direct (Cable)

Select this option when you connect the CATalyst VP system and the receive system with a realtime cable. Use this option when you connect the CATalyst VP system to a Multi-Line Block or Digital Sharing device for multiple CaseView receive systems.

#### Modem

Select this option when you connect the CATalyst VP system to the receive system remotely over the phone lines. The CATalyst VP system is connected to a phone jack via a modem cable. The receive system is connected to a phone jack in the remote location via a modem cable.

#### Call

Have the CATalyst VP system call the receive system remotely. Enter the phone number in the *Number* field below.

#### Answer

Have the receive system call the CATalyst VP system.

#### Number

When you select *Call*, type the telephone number for the location of the receive system. If applicable, include any numbers required to access an outside telephone line. Insert commas between numbers to have the system pause a second before dialing the next number. This allows the system to receive a dial tone before sending the next number. For example, if you need to dial 9 to reach an outside line and 1 to reach a different area code, the number would resemble the following: 9, 1, 123-456-7890.

### Options

#### CaseView II Same PC

Check this box to display CaseView on the same PC as CATalyst VP. You must have CaseView V1.02i to use this feature.

#### Save CaseView File

Check this box to allow the CaseView receive systems to save the realtime text, notes, and marked text. This option only affects CaseView receive systems and does not apply to other receive systems.

Uncheck this box to have the CaseView receive systems save only notes and marked text.

**Password Protection**

Check this box to restrict the receive system's ability to save the realtime text only when they enter a password. You must also select the *Save CaseView File* option to use this feature.

The password for this realtime session displays in the Translate Statistics box. Password Protection only applies when sending to CaseView receive systems and does not apply to other receive systems.

**Time Stamps**

Choose **one** of the following options to determine how the receive system displays timestamps. If you are using the CaseView synchronization feature, you must send timestamps to the receive system.

**None**

Do not send timestamps.

**Clock**

Send timestamps in actual time format.

**Elapsed**

Send timestamps in elapsed format: starting 00 hours, 00 minutes, 00 seconds

**Max Marked Lines**

Type a number to determine how many lines can be marked on the CaseView receive system. A password is not required to be able to mark lines.

**Starting Page Number**

Check this box and type a page number to change the starting page number for realtime text on the receive system. If you are appending the realtime text to an existing job, CATalyst VP creates a new section and applies the new page number to the realtime text.

**TCP/IP or Internet Connection**

Send the CaseView feed to a specified TCP/IP address and port. CaseView software cannot currently receive input via TCP/IP and requires a serial to TCP/IP converter. Stenograph is evaluating changes to the CaseView receive software.

**UserSettings End Replacement options**

The Dragon-Allow-End-Replacement-BCS and Dragon-Allow-End-Replacement-Translate options are available when using Dragon NaturallySpeaking software with CATalyst VP. The settings control whether regular translate and/or BCS makes corrections at the end the of drop-down text when Dragon has made a change.

By default, the Dragon-Allow-End-Replacement-BCS option is turned off which means if you are using Dragon for voice captioning and Dragon makes a change at the end of the drop-down text, BCS will not delete the ending of the text and correct it.

By default, the Dragon-Allow-End-Replacement-Translate option is turned on which means if you are using Dragon for voice translation and Dragon makes a change at the end of the drop-down text, CATalyst will delete the ending of the text make the correction.

In order to modify either of these option's action, you will need to modify your UserSettings file which is located in your System files case.

### To modify your UserSettings file:

1. Be sure you are in your User name.
2. From Manage Jobs, open the System Files case and double click the **UserSettings.sgxml** file.  
Or, you can click the System Files case icon () on the Open Special toolbar. In the Open Existing Document dialog box, your cursor defaults to the File Name field. Type **usersettings** and press **Enter**.
3. The Settings Manager dialog box displays.
4. Click in the dialog box (to set the cursor focus) and press **Ctrl + f**. The Find dialog box displays.
5. Type **Dragon-Allow** and press **Enter** to move to the Voice-Tran-Settings section. '
6. Do any of the following:
  - To change the action of the Dragon-Allow-End-Replacement-BCS option to make it active in BCS, click the **Edit** button on the right, replace the -1 with a **1**, press **Enter** and then click **OK**.
  - To change the action of the Dragon-Allow-End-Replacement-Translate option to make it inactive during translate, click the **Edit** button on the right, replace the -1 with **0**, **Enter** and then click **OK**.
7. Press **Alt + s** (Save) to save the settings and close the dialog box.
8. Start the appropriate function and test the changes.

## Pause and Resume Dictation

You can temporarily turn the dictation microphone off to stop dictating by pausing it using Pause Dictation. You can start dictating again using the Resume Dictation feature. You can create a voice command to pause the dictation, however, you cannot use a voice command to turn the microphone on.

### Pause Dictation

- Use a voice command to pause dictation.
- Press **Alt + i, p** (Voice/Pause Dictation).
- If the Voice toolbar is showing, click the Microphone Off  icon.
- Press an assigned key combination to invoke the Voice:Pause Dictation command.

### Resume Dictation

- Press **Alt + i, r** (Voice/Resume Dictation).
- If the Voice toolbar is showing, click the Microphone On  icon.
- Press an assigned combination to invoke the Voice:Resume Dictation command.

[Keyboard Map](#) Function: Voice: Pause Dictation

## Correct Words

Correct Words is a Voice feature that allows you to add words to the vocabulary file or correct words or phrases not recognized by the voice engine. To invoke the correct words feature, press **Alt + i, c** (**Voice/Correct Words**).

## Dragon

Dragon displays the Dragon Spell dialog box where you can spell a word that is not in your vocabulary and insert it into the job. The word is added to your active vocabulary unless it contains a number. The Spell dialog box also provides you with up to 9 selections from which you can "choose" instead of spelling. See the Dragon NaturallySpeaking User's Guide for more information about spelling while you dictate.

Stenograph recommends that you use the Replace or E-Define dialog box to correct and train words during translation. The Replace and E-Define dialog box allows you to expand and collapse the selected text to include the appropriate text for correction and training.

## ViaVoice

ViaVoice displays the Global - [Replace](#) dialog box where you can correct and train the word or phrase.

[Keyboard Map](#) Function: Voice: Correct Words

## Play Voice Audio

You can playback the voice dictation for the current word, highlighted selection or text or more extensive amounts of text by using Play Voice Audio With Scroll Text.

## Play Voice Audio

Play Voice Audio plays back the recorded voice dictation for the current word or the highlighted selection of text. To playback recorded voice dictation, press **Alt + i, a** (**Voice/Play Voice Audio**). To stop the play back, press **Alt + i, v** (**Voice/Stop Voice Audio**).

## Play Voice Audio With Scroll Text

Play Audio with Scroll Text combines the [Scroll Text](#) feature with the Play Voice Audio feature, allowing CATalyst VP to scroll through the text using the synchronized playback of the voice audio track.

To play voice audio with scrolling text, press **Alt + i, x** (**Voice/Play Audio with Scroll Text**). The cursor begins to move and the voice audio plays back. To stop the play back, press **Alt + i, v** (**Voice/Stop Voice Audio**).

[Keyboard Map](#) Function: Voice: Play Voice Audio  
Voice: Play Voice Audio With Scroll Text  
Voice: Resume Voice Audio  
Voice: Stop Voice Audio  
Voice: Toggle Voice and [Room Audio](#)

## Play Room Noise Audio

The Play Audio feature plays the synchronized AudioSync audio file for the room noise. The audio file synchronizes with the text while dictating. You can position your cursor anywhere in the file and playback the audio file from the cursor location. Once you invoke the Play Audio command, the audio file plays until you invoke the Stop Audio command. If the [option](#), *Stop audio when dialog opens*, is active, the audio pauses when a dialog box opens and automatically resumes when the dialog box closes. You can playback the audio during realtime without pausing AudioSync. For volume control during audio playback, refer to your Windows documentation.

Playback speed is adjustable on the Audio Playback Speed toolbar. You can also assign keyboard commands to increase and decrease the audio playback speed using the Increase Audio Playback Speed and Decrease Audio Playback Speed assignments in a [keyboard map](#).

Dead air may result when there is a pause in the conversation or proceedings. It may be noticeable when a longer silence occurs without the pausing the audio, either automatically or manually. Use the *Skip Quiet Audio* option in the Audio Playback Speed dialog to adjust the amount of dead air that plays back.

If you re-translate a file with audio, CATalyst VP retains the audio synchronization. The synchronization may not be as accurate as the original translation.

[Keyboard Map](#) Function: Play Audio  
Pause Audio  
Increase Audio Playback Speed  
Decrease Audio Playback Speed  
Stop Audio  
Voice: Toggle Voice and Room Audio

## Play Audio

To start the playback of the synchronized audio file:

1. Move the cursor to the location in the job where you want to begin the playback.
2. Press **Shift + F9** (**Tools/Audio/Play Audio**). The Audio Playback Speed toolbar displays.

### Horizontal Bar

Use the mouse cursor to adjust the play back speed. Moving the indicator to the left slows the speed; to the right increases the speed. You can also create key assignments to increase and decrease the audio playback speed using the Increase Audio Playback Speed and Decrease Audio Playback Speed commands in a [keyboard map](#).

### Skip Quiet Audio

Use the mouse cursor to determine the level of noise that is considered dead air during playback. This does not affect volume level. Move the indicator up to indicate a lot of background noise is considered silence. You might use a higher vertical setting when a lot of background noise occurs during the recording but no one was speaking. Move the indicator down when little background noise occurs during the recording. **If you feel the audio is "skipping" during playback, adjust vertical bar lower.**

### Normal Speed

Reset the audio playback speed to the original speed setting. A "Set Normal Audio Speed" keyboard function is available in the keyboard map.

- When finished press **Ctrl + F9 (Tools/Stop Audio)** or, if the Edit toolbar is showing, click the Stop Audio  icon to stop the audio playback.

## Play Audio Messages

The following messages may display when you invoke Play Audio:

### "No Audio information available for this text"

This usually results from pausing and never resuming the audio recording during realtime writing. It can also result from deleting the underlying steno for that portion of the text using Steno Delete command.

### "no Audio"

There is no associated Audio subfile for the current job. This is not a realtime job, you re-translated the job, or you did not use AudioSync in this realtime job.

### Audio File Path dialog box displays

Play Audio will first look for the audio file in the location where the audio was recorded and if found, will automatically play the audio. If the audio file in the transcript file information doesn't match the current transcript name but there is an audio file with the correct name in the same folder as the current job, CATalyst VP will automatically link the audio and start audio playback. If still not found, CATalyst VP will look for an audio file with the same name as the job in the same user folder and then automatically link the audio file and start audio playback. If the audio file still cannot be located, the Choose Audio File dialog box displays allowing you to select the audio file and link it to the transcript and begin audio playback.

If prompted, click the Browse button to search for and select the audio file or type the path for the new location or new name of the Audio subfile and press **Enter** to begin the playback.

### Toggle Voice and Room Audio

Toggle Voice and Room Audio feature allows you alternately play the voice audio and room audio associated with the same text. Selecting Toggle Voice and Room Audio initially plays the voice audio. Selecting the feature again, plays the room noise. You can assign the keyboard command, Voice: Toggle Voice and Room Audio, to activate this feature.

To toggle voice and room audio, press **Voice/Toggle Voice and Room Audio**.

### CATalyst VP Editing Tools

Editing tools consists of CATalyst VP features that assist you in making changes to translated or typed text. Some Editing tools, such as Speaker List are available prior to translation, allowing you to make changes that take affect during the translation process which help to reduce editing time.

### E-Defines

E-Defines allows you to globally change text so that all occurrences of the word or words apply throughout the job. An E-Define (Ctrl + e) globally changes words from the point in the job you create the global through to the end of the job or throughout the entire file, depending on the option selected. It also puts the change into the Global Table which you can use for future translations.

While making an E-Define, you can playback the voice recording for the selected text to listen to what Dragon/ViaVoice heard. If your initial selection did not include all the appropriate text for the E-Define, you can expand and collapse the selection of words to choose the correction text. If necessary, use the Train Words option to train words, updating your voice data file. For Dragon users, it is important to later run the Acoustic and Language Model Optimizer after training words for optimal translation accuracy.

To create a case sensitive E-Define, select the Case Sensitive option so that the E-Define is applied to words that match the case of the word in the Old Text field. If you do not select this option, CATalyst VP changes all occurrences of the word in the Old Text field regardless of case. For example, to change Mark to Marc throughout the job without changing the word "mark", you could select the Case Sensitive option and type "Marc".

CATalyst VP interprets words which are automatically initial caps, such as the first word following a Q or A symbol, as lower case words. CATalyst VP only recognizes the word as initial capped when it is typed initial cap, it is initial cap in a voice commands dictionary entry and when it is initial capped as the result of a Cap Previous command or Cap Next command.

When the [Apply E-Defines to Typed Text](#) option is active, E-defines apply to Include files, appended files, Auto Include files and Realtime data. It does not affect restored text, such as using Undo or number converted text.

## Create an E-Define

1. If necessary, pause dictation and AudioSync.
2. Place the cursor immediately before the word, on the word, or mark the text you want to define.
3. Press **Ctrl + e (E-Define)**. The Global – E-Define dialog box displays.
4. Make necessary entries. When finished defining, press **Enter (OK)** to apply the definition. If you choose the option, *Update Voice Commands*, you are prompted to update your Voice Commands dictionary with the new entry.

### Old Text

The selected text to global.

### Steno

Not applicable to voice translation.

### Mark/Unmark Left

Press **Alt + [** (left bracket) to expand or **Alt + ]** (right bracket) to deselect the marking to the left.

### Mark/Unmark Right

Press **Alt + Right Arrow** or **Ctrl + g** to expand or **Alt + Left Arrow** to deselect the marking to the right.

### New Text

Do any of the following:

- Type the new text, including any format symbols. Press **F9** to add [extended characters](#).
- Copy the old text to the New Text field by pressing **F6**.
- Cycle through the last ten typed replacement words by pressing **Ctrl + r** with the cursor in the New Text field; or **Ctrl + Shift + r** to cycle backwards through the selection.

If [Spell Check While Defining](#) is active, CATalyst VP automatically spell checks the text. When the option, Spell Check While Defining is not active, press Shift + F7 to spell check the text in the New Text Field.

### FS

E-Defines you want to add to your voice engine which format text, should be added to a voice commands dictionary. For example, if you dictate "a mac" to format an Answer, add the entry, a mac=<Answer> to a voice commands dictionary.

In the E Define dialog box, you want to replace a translation that should translate as "a mac." For example, if Dragon/Via Voice translates "amac" you would use the E-Define dialog box to replace "amac" with "a mac" resulting in CATalyst VP formatting it as an Answer.

If the Update Voice Engine option is not selected, you can add format symbols to the text. FS displays the list of available format symbols. To always display the format symbol list, check the box, Always Show Format Symbols. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry.

You can also use shortcut keys to insert a format symbol. Place the cursor in the New Text field, press **F4** and then press the appropriate letter or symbol.

### Insert Field

E-Defines you want to add to your voice engine which contain fields in the text should be added to a voice commands dictionary. For example, you dictate "speethree" to format Colloquy with the EZ Speaker 03 field. The voice commands dictionary entry would be: speethree=<Colloquy[!EZ SPEAKER 03]:.

In the E-Define dialog box, you want to replace a translation that should translate as "speethree" For example, if Dragon/Via Voice translates "speed three," then you would use the E-Define dialog box to replace "speed three" with speethree" resulting in CATalyst VP formatting it in Colloquy with [!EZ SPEAKER 03]: when you complete the global.

If the Update Voice Engine option is not selected, you can add fields to the text. Insert Field displays the [Insert Field](#) dialog box from which you can select a field to insert into the text portion of the definition.

### Cap

Copy the text in the Old Text field to the New Text field and cycle through three Cap/Uncap options for the text in the New Text field:

- Capitalize the first letter in a word or phrase, except for words in the NoCapWords list
- Capitalize all the letters in a word or phrase
- Uncap the letters in a word or phrase

### Conflict

This option is available when a conflict is part of the Old Text. When you select Conflict, CATalyst VP copies the text from the Old Text field to the New Text field, automatically choosing the first conflict. If you select Conflict a second time, CATalyst VP chooses the second conflict. If additional conflict choices exist, select Conflict until the desired choice displays in the New Text field. When more than one conflict exists in the Old Text field, your selection applies to all the conflicts.

### Suggest

Not applicable to voice translation.

### Endings

Not applicable to voice translation.

### Spaces

When two or more words display in the Old Text field, Spaces copies the text to the New Text field and toggles the placement of a [<Sticky Space>](#) format symbol between words, removes the spaces between words and returns to the original state. Spaces is also available when you type two or more words in the New Text field.

### S-t-i-t-c-h

Copy the text in the Old Text field to the New Text field and places hyphens between each letter. Stitch is also available when you type words in the New Text field. If there is one word, the letters are hyphenated. If there are two or more words, the words are hyphenated. For example step-by-step. To undo a stitch, select this feature again.

### Open with Suggestions

Not applicable to voice translation.

**Global Type**

Displays the type of global selected. Only Replace and E-Define is available. All other global types are not applicable to voice translation.

**Pick Other Dictionary**

Not applicable to voice translation.

**Entire File**

Check this box to apply the global change forward and backward throughout the job.

**Case Sensitive**

Check this box for CATalyst VP to change any occurrence of the word in the Old Text field only when it matches the same upper and lower case letters as the text in the New Text field. Uncheck this box, to change all occurrences of the word in the Old Text field regardless of the case.

**Selective**

Check this box to have Case CATalyst mark the global as [Selective](#) and identify it in the Global Table. CATalyst VP stops on the first occurrence affected by the global change. You can choose to apply the change to this occurrence, all occurrences, to the current Section only, skip the occurrence and go to the next occurrence or take no action and return to Edit.

CATalyst VP marks the global as Selective and identifies it in the Global Table. A Selective global used during realtime does not apply to new realtime text. If you select to apply the change to all occurrences or use the Add Other Globals command to apply the global, CATalyst VP no longer considers the global Selective. If you use the [Entire Section](#) option, the global remains selective. Use the Global Table [option](#), *Exclude Selective Globals*, to prevent selective globals from being added when copying and pasting global table entries or using the Add Other Globals command.

Actions in the Selective Confirmation dialog box:

**Original**

The existing text or steno you are replacing.

**Steno**

The marked steno if making a D-Define, J-Define or K-Define.

**Replacement**

The new text replacing the original text or steno.

**Type of Define**

E-define

**Yes**

Change the occurrence and move to the next occurrence.

**Yes To All**

Change all the occurrences from the cursor position forward in the file. Once you select Yes To All, the global is no longer considered selective.

**Entire Section**

Applies the selective global to all occurrences in the current section. The global remains selective in the Global Table.

**Goto Next**

Do not change this occurrence and move to the next occurrence.

**Done**

Do not make any more changes and cancel the command. The cursor remains in the current position.

**Playback**

Play the voice audio for the selection in the Old Text field. This audio is what Dragon/Via Voice heard when you dictated the words that display in the Old Text field.

**Train Words**

Display the Train Words dialog box where you can train Dragon/ViaVoice on the words in the Old Text field. Select **Go**, speak the word into the mask and then select **Done**. When finished, select **Cancel** to close the Train Words dialog box and return to the Global dialog box.

**Update Voice Engine**

Check this box to update the voice data file with the word you trained in the Old Text field. Dragon integrates this information into your vocabulary file when you run the Vocabulary Optimizer. ViaVoice automatically integrates this information into your vocabulary file (.sgvod).

**Update Voice Commands**

Add entries to a Voice Commands dictionary. The [Modify/Insert Voice Command](#) dialog box displays after you press **Enter (OK)** to apply the E-Define. When you add an entry to a Voice Commands dictionary using this feature in realtime, the dictionary refreshes and the entry is available for translation when spoken again in the job.

**Learn as phrase**

Check this box to train two or more words that display in the New Text field as a phrase. This feature is active when the Update Voice Engine option is selected and only applies to ViaVoice.

**Playback when dialog opens**

Automatically playback the voice audio for the selected word or phrase in the Old Text field when the Global define dialog box opens.

**Generate All Possible Misstrokes**

Not applicable to voice translation.

## Replace

The Replace command allows you to replace text for a single occurrence. You can also playback the voice recording for the selected text to listen to what Dragon/ViaVoice heard. If your initial selection did not include all the appropriate text for the Replace, you can expand and collapse the selection of words to choose the correct text. If necessary, use the Train Words option to train words to update your voice data file. For Dragon users, it is important to later run the Acoustic and Language Model Optimizer, after training words, for optimal translation accuracy.

When [Intuitive Replace](#) is active, CATalyst VP suggests a word in the New Text field based on previous replacements. When you replace a word not previously replaced and you place your cursor in the New Text field, the most recently replaced word displays. You can toggle through the last 10 replacements by pressing Ctrl + r.

## Replace Text

1. If necessary, pause dictation and AudioSync.

2. Position the cursor immediately before the word you want to replace. To replace more than one word, first Mark the text.
3. Press **Ctrl + r (Replace)**. The Global – Replace dialog box displays.
4. Make necessary entries. When finished, press **Enter (OK)** to replace the text.

### Old Text

The text selected for replacement.

### Steno

Not applicable.

### Mark/Unmark Left

Press **Alt + [** (left bracket) to expand or **Alt + ]** (right bracket) to deselect the marking to the left.

### Mark/Unmark Right

Press **Alt + Right Arrow** or **Ctrl + g** to expand or **Alt + Left Arrow** to deselect the marking to the right.

### New Text

Do one of the following:

- Type the new text, including any format symbols. Press **F9** to add [extended characters](#).
- Copy the old text to the New Text field by pressing **F6**.
- Select a previous replacement. Cycle through the last ten typed replacement words by pressing **Ctrl + r** with the cursor in the New Text field; or **Ctrl + Shift + r** to cycle backwards through the selection.

If [Spell Check While Defining](#) is active, CATalyst VP automatically spell checks the text. When the option, Spell Check While Defining is not active, press Shift + F7 to spell check the text in the New Text Field.

### FS (Alt + f)

Replacements or globals you want to add to your voice engine that format text should be added to a voice commands dictionary. For example, if you dictate "a mac" to format an Answer add the entry, a mac=<Answer>, to a voice commands dictionary.

In the Replace dialog box, you want to replace a translation that should translate as "a mac." For example, if Dragon/ViaVoice translates "amac" you would use the Replace dialog box to replace "amac" with "a mac" resulting in CATalyst VP formatting it as an Answer.

If the Update Voice Engine option is not selected, you can add format symbols to the text. Clicking the FS () or pressing **Alt + f** icon displays the list of available format symbols. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can insert a format symbol at any point in the text entry. You can also use shortcut keys to insert a format symbol. Place the cursor in the New Text field, press **F4** and then press the appropriate letter or symbol.

To always display the format symbol list, check the box, Always Show Format Symbols. Double click the format symbol you want to use in the definition. You can insert a format symbol at any point in the text entry.

### Insert Field

Replacements or globals that you want to add to your voice engine which contain fields in the text should be added to voice commands dictionary. For example, you dictate "speethree" to format Colloquy with the EZ Speaker 03 field. Add the entry, speethree=<Colloquy[!EZ SPEAKER 03]: to a voice commands dictionary. In the Replace dialog box, you want to replace a translation that should translate as "speethree" For example, if Dragon translates "speed three," then you would use the Replace dialog box to replace "speed three" with speethree" resulting in CATalyst VP formatting it in Colloquy with [!EZ SPEAKER 03]:

If the Update Voice Engine option is not selected, you can add fields to the text. Insert Field displays the [Insert Field](#) dialog box from which you can select a field to insert into the text portion of the definition.

### Cap

Copy the text in the Old Text field to the New Text field and cycle through three Cap/Uncap options:

- Capitalize the first letter in a word or phrase, except for words in the NoCapWords list
- Capitalize all the letters in a word or phrase
- Uncap the letters in a word or phrase

### Conflict

This option is available when a conflict is part of the Old Text. When you select Conflict, CATalyst VP copies the text from the Old Text field to the New Text field, automatically choosing the first conflict. If you select Conflict a second time, CATalyst VP chooses the second conflict. If additional conflict choices exist, select Conflict until the desired choice displays in the New Text field. When more than one conflict exists in the Old Text field, your selection applies to all the conflicts.

### Suggest

Not applicable to voice translation.

### Endings

Not applicable to voice translation.

### Spaces

When two or more words display in the Old Text field, copies the text to the New Text field and places a [<Sticky Space>](#) format symbol between the words. Spaces is also available when you type two or more words in the New Text field.

### Stitch

Copy the text in the Old Text field to the New Text field and places hyphens between each letter. Stitch is also available when you type words in the New Text field. If there is one word, the letters are hyphenated. If there are two or more words, the words are hyphenated. For example step-by-step. To undo a stitch, select this feature again.

### Open with Suggestions

Not applicable to voice translation.

### Global Type

Displays the type of global selected. Only Replace and E-Define is available. All other global types are not applicable to voice translation.

**Entire File**

Not applicable to Replace.

**Case Sensitive**

Not applicable to Replace.

**Selective**

Not applicable to Replace.

**Playback**

Play the voice audio for the selection in Old Text field. This audio is what Dragon/ViaVoice heard when you dictated the words that display in the Old Text field.

**Train Words**

Display the Train Words dialog box where you can train Dragon/ViaVoice on the words in the Old Text field. Select **Go**, speak the word or words into the mask and then select **Done**. When finished, select **Cancel** to close the Train Words dialog box and return to the Global dialog box.

**Update Voice Engine**

Check this box to update the voice data file with the words you trained in the Old Text field. Dragon integrates this information into your vocabulary file when you run the Vocabulary Optimizer. ViaVoice automatically integrates this information into your vocabulary file (.sgvod).

**Update Voice Commands**

Add entries to a Voice Commands dictionary. The [Modify/Insert Voice Command](#) dialog box displays after you press **Enter (OK)** to apply the E-Define. When you add an entry to a Voice Commands dictionary using this feature in realtime, the dictionary refreshes and the entry is available for translation when spoken again in the job.

**Learn as phrase**

Check this box to train two or more words that display in the New Text field as a phrase. This feature is active when the Update Voice Engine option is selected and only applies to ViaVoice.

**Generate All Possible Misstrokes**

Not applicable to voice translation.

## Update Voice Commands During Edit

The *Update Voice Commands* option, available when making an E-Define or Replace, allows you to update a Voice Commands dictionary while editing. When you select the *Update Voice Commands* option, the Modify/Insert Voice Command dialog box displays after you press **Enter (OK)** in either the Global - E-Define or Global - Replace dialog box. When you add an entry to a Voice Commands dictionary using this feature in realtime, the dictionary refreshes and the entry is available for translation when spoken again in the job.

You can always [modify](#) entries in a Voice Commands dictionary prior to beginning a job. Open the desired dictionary and use the Insert and Modify features. If you open and modify a Voice Commands dictionary during Edit, the changes apply to the next translation.

## Modify/Insert Dialog Box

Make necessary entries. Press **Enter (OK)** when finish.

If an existing dictionary entry contains the exact voice command as the new entry, the following message displays when you press Enter (OK), *This insertion will cause a duplicate value for the voice text.* Click **OK** to close the message to display the Modify/Insert Voice Commands dialog box. Type new voice text and press **Enter** or click **Cancel** to close the dialog box without making any changes.

### Voice Text

Type new or modify existing voice text. This is the command you speak and what the voice engine hears.

### CATalyst Text

Type new or modify existing CATalyst text. This is the instruction given to Case CATalyst. Include any format symbols or extended characters.

### Insert Field

Display the Insert Field dialog box from which you can select [fields](#) to insert into the text portion of the definition.

### FS

Display the list of available [format symbols](#). Double click the format symbol you want to use in the definition. You can insert a format symbol at any point in the text entry. You can also use shortcut keys to insert a format symbol in the Text field. Place the cursor in the Text field, press **F4** and then press the appropriate letter or symbol.

### F9

With the cursor in the *CATalyst Text* field, press **F9** to display the Insert Character dialog box where you can select an extended character to insert.

### Insert AccelerWriter

Display the Auto AccelerWriter dialog box where you can create an [AccelerWriter](#). Click **Browse** to display the Choose Macro File dialog box and select a macro file. Your selection displays in the *Entry Text* field of the Auto AccelerWriter dialog box.

### Insert AutoInclude

Display the Auto Include dialog box where you can select an [Auto Include](#). Click **Browse** to select an Include file. Your selection displays in the *Entry Text* field of the Auto Include dialog box.

It is necessary to create Include files before using Auto Include commands. An "Include File Not Found" message displays during translation if you invoke an Auto Include command without an associated include file.

### Voice Commands

Do one of the following:

#### Active Voice Commands Dictionary

Insert the entry into a voice commands dictionary used for translation in the realtime job, click the down arrow to select from the list.

#### Other Voice Commands Dictionary

Insert the entry into a voice commands dictionary currently not in use for translation. Click the **Browse** button and navigate to the location of the dictionary. Select the dictionary and click **Open**.

## Speaker List

The Speaker List contains speakers created using the [Create EZ Speakers](#) feature, typed speaker names entered before translating in the [Translate Speaker List](#) and Common Speakers added in [Field Options](#). The Speaker List pane in Edit allows you to insert speaker names or other fields directly into the job. For example, you may need to insert the speaker name for a dropped steno outline or misidentified speaker. Speaker fields from the Fill In Field List or [Field List Groups](#) used to identify speakers, can be added to the Speaker List. In addition to using EZ Speaker fields and Speaker fields from the Fill In Field List, you can add predefined fields such as the Seal Date field or a user define field such as Location. Speaker names and Speaker # fields display in the Speaker section of the Speaker List. All other fields display in the Fields section.

The Speaker section of the Speaker List displays the speaker name along with the speaker number, if applicable. Speakers from the Speaker section insert into the transcript as Colloquy, unless the cursor location is immediately before or after a Question, then CATalyst VP inserts it as a By Line. To specify the By Line format, use the [By Line Options](#). The speaker name displays in the job with the color assigned to it in the Speaker List. You can add and modify speaker entries in the Speaker List.

The Field section of the Speaker List displays the field value in the Name column and the empty field name in the Number column. Fields from the Field section insert into the transcript as text without formatting. Fields can be added to the list using the [Settings](#) option in the Speaker List dialog pane. Other Field options can also be accessed through the Settings option.

Insert a speaker name or field into the job by double clicking the entry or highlighting the entry and clicking the Insert button. To insert a speaker name into the transcript without opening the Speaker List, use the [Insert Speaker](#) command.

Using the speaker names from the Speaker List, you can create a graphical [Seating Chart](#), viewable in the MiniViewer at the top of the Speaker List dialog pane or on the computer screen. Speakers display in their assigned colors. When viewing the Seating Chart on the screen, the speaker indicator includes the speaker name, speaker number and, if applicable, the associated steno.

The Speaker List works in conjunction with Spell Check during Edit. For example, you have a repeated speaker in colloquy. Spell Check displays speaker names from the Speaker List in the Suggestions field and allows you to change to another speaker name in that job.

The Speaker List works in conjunction with Spell Check during Edit. For example, you have a repeated speaker in colloquy. Spell Check displays speaker names from the Speaker List in the Suggestions field and allows you to change to another speaker name in that job.

To access the Speaker List pane in Edit, press **Alt + v, e, k (View/Panes/Speaker List)**.

[Keyboard Map](#) Functions: Insert Field

Seating Chart: Show MiniViewer

Seating Chart: Hide MiniViewer

Seating Chart: Show All Speakers

Seating Chart: Hide All Speakers

Seating Chart: Toggle AutoHide Feature

## Speaker List Pane Features

### Name

In the Speaker section, the defined speaker name or the name of the speaker field. In the Field section, the value of the field or the empty field name. Click the title bar to display the names in ascending or descending alphabetical order.

### Number

In the Speaker section the speaker number associated with the speaker name. In the Field section, the empty field. Click the title bar to display the numbers in ascending or descending order.

### Steno

Type the steno, if any, you want to associate with the speaker. You can retain the association by checking the box in the Locked field. If you have your speaker identifications defined in a dictionary, most likely your Personal Dictionary, and you always want them to display in the speaker list, type the associated steno and select the Locked column. Instead of using the Create EZ Speakers feature, you will simply fill in the field in the transcript or Speaker List.

### Locked

Check this box to retain the association of the steno entered in the Steno field with the speaker number. If you have your speaker identifications defined in a dictionary, most likely your Personal Dictionary, and you always want them to display in the speaker list, type the associated steno in the Steno field and select the Locked column. Instead of using the Create EZ Speakers feature, you will simply fill in the field in the transcript or Speaker List.

### Insert

Insert the highlighted speaker name or field into the transcript. You can also double click an entry to insert it into the transcript. Speaker fields either insert as Colloquy or Byline depending on cursor location.

### New Speaker

Create a new speaker name. The Select EZ Speaker dialog box displays with the next sequential speaker number. Use the displayed number in the Enter Value field or type a new number and press **Enter (OK)**. Valid numbers are **1 - 99**. A new speaker name field displays with the assigned speaker number. Type the name in the field and press **Enter**.

### Fill in Speaker

Modify an existing speaker or user defined field name. Highlight an entry and select **Fill in Speaker**. When you modify a speaker name, type the change and press **Enter**. When you modify a user defined field, the [Fill in Field](#) dialog box displays. Make necessary entries and select **OK**.

### Change Color

Change the speaker name color. Highlight the field and select **Change Color**. Select a color from the color palette. The More Colors options displays the [Color](#) dialog box for additional and custom colors.

You can also change the field color assignment. Highlight a field and select **Change Color** to select a color from the color palette. The change affects the user color for all fields.

**Delete**

Delete an existing speaker name entry. Highlight the entry and press **Delete** or click the Delete icon. To remove a field from the list, click the Settings icon to uncheck the field from the list in the Choose Speaker List Fields dialog box.

**Filter**

Select this option to display all the available speakers with associated speaker numbers. Deselect this option to only display speaker numbers with assigned speaker names.

**Allcap Text**

Select this option to enter the speaker name in all capital letters. Deselect this option to enter the Speaker Name in upper and lower case letters.

**Show/Hide Seating Chart MiniViewer**

Select this option to display the [Seating Chart](#) MiniViewer above the speaker list in the Speaker List dialog pane. The MiniViewer shows the placements of the Seating Chart speakers. Deselect this option to hide the MiniViewer. You can still display the Seating Chart speakers.

**Show/Hide Seating Chart Speakers**

Select this option to display [Seating Chart](#) speakers on the screen. Deselect this option to automatically hide the Seating Chart speakers. This is the default. When you move your cursor over the MiniViewer, the Seating Chart speakers display on the screen for a few seconds and then automatically hide. You can [change](#) the number of seconds the Seating Chart displays before it automatically hides or have the Seating Chart continuously display.

**Settings**

Display the Speaker List / Seating Chart Options dialog box where you can choose additional fields to add to the Speaker List. Click the option, *Add fields to Speaker List* and check the box next to the fields you want to add to the Speaker List. Click **OK** when finished. You can modify the name of new user defined fields. [Field Options](#) are also accessible from the Choose Speaker List Field dialog box.

**Help**

Display the Case CATalyst Help.

## Insert Speaker

Insert Speaker allows you to insert a speaker name from the Speaker List without opening the Speaker List dialog pane. CATalyst VP inserts the speaker name into the job as Colloquy unless the speaker name is inserted directly before or after a Question when it displays as a By Line. To customize the By Line format, use the [By Line Options](#).

### Insert a Speaker

1. Press **Alt + e, i, s (Edit/Insert/Speaker)**. The Select EZ Speaker dialog box displays.

2. In the *Enter Value* field, type the token number associated with the speaker name you want to insert and press **Enter (OK)**.
3. The speaker name displays in the associated color in Colloquy format.

### Insert Speaker from Speaker List

1. Open the Speaker List. Press **Alt + v, e, k (View/Panes/Speaker List)**.
2. Double click the entry or highlight the entry and click the **Insert** button.

### By Line Options

By Line Options allow you to set the line format for the By Line when inserting a speaker name from the [Speaker List](#) while editing whether during realtime or after translation is complete. A By Line format automatically applies when inserting a speaker name immediately before or after a <Question> format symbol.

To set the By Line format:

1. Press **Alt + t, o, L (Tools/Options/By Line Options)**. The By Line Options dialog box displays.
2. Select one of the following:

#### Before Q

Place the Speaker By Line before the Question. Formatting of the By Line is controlled by the Layout. The results are:

<By-line>BY SPEAKER NAME:

Q

Use format symbols as necessary. Select **FS** to display the list of available [format symbols](#) and shortcut keys from which you can select a format symbol to insert into the By Line format. Double click the format symbol you want to use or place your cursor in the field and type the shortcut key to insert a format symbol. Check the box, Always Show Format Symbols, to keep the format list open.

#### After Q

Place the By Line after the Question on the same line as the Q. When After Q is selected, the Format section allows you to customize the appears of the By Line following the Q. The default setting is:

Q. By (SPEAKER NAME:)space space

To modify the By Line, make necessary entries in the Before and After fields. CATalyst VP assumes the Q and [!EZ SPEAKER ##] field in the format. For example, you want format the By Line as: Q (BY SPEAKER NAME:). In the Before field, type: **(BY**. In the After field, type: **:)** followed by the appropriate spacing.

To format the By Line as: Q BY SPEAKER NAME: In the Before field, remove the **(** and in the After field remove the **)**.

Use format symbols as necessary. Select **FS** to display the list of available [format symbols](#) and shortcut keys from which you can select a format symbol to insert into the By Line format. Double click the format symbol you want to use or place your cursor in the field and type the shortcut key to insert a format symbol. Check the box, Always Show Format Symbols, to keep the format list open.

3. Press **Enter (OK)** to accept the entries.

## Seating Chart

The Seating Chart feature allows you to create a graphical Seating Chart of speakers from the Speaker List, placing speaker information on the computer screen in a position relative to where the speakers are sitting during the proceedings. The Seating Chart is viewable on the computer screen and in the MiniViewer located above the [Speaker List](#) in the Speaker List dialog pane.

The Seating Chart MiniViewer, by default, displays when you open the Seating Chart. The Show/Hide Seating Chart MiniViewer  icon toggles the display of the MiniViewer. By default, the MiniViewer displays when the Speaker List opens. Add speakers to the Seating Chart by displaying the MiniViewer and dragging a speaker from the Speaker List onto the MiniViewer or right clicking the speaker and selecting Add to Seating Chart. Speaker items in the MiniViewer and the computer screen display in the assigned speaker color. Speaker items on the computer screen display in a default height and width that can be modified or temporarily changed by clicking and dragging the edges. Each speaker item on the computer screen, by default, shows the speaker name on the top line, the speaker number and, if applicable, the associated steno on the second line. To reposition a speaker item, click and drag the speaker item on the computer screen to a different location. Moving a speaker item on the computer screen changes the position of the speaker item in the MiniViewer.

You can remove individual or all speaker items from the Seating Chart by right clicking and selecting the desired option. Once a speaker item is removed, it is necessary to add the speaker item again if you want to redisplay it in the Seating Chart. If you remove all the speakers items from the Seating Chart and want to redisplay them, it is necessary to add each speaker item individually.

The Seating Chart speaker items display on the computer screen when you click the Show/Hide Seating Chart Speakers  icon or when you position your cursor over the MiniViewer. When the Seating Chart displays, the Show/Hide Seating Chart Speakers icon is highlighted. By default, the Seating Chart is set to AutoHide after displaying for 3 seconds. You can change the display time or disable the AutoHide feature to continuously display the speakers items. Changing the Seating Chart options or using the Seating Chart: Toggle AutoHide Feature key combination, you can toggle between enabling and disabling the AutoHide feature. When you display the Seating Chart speaker items while the AutoHide feature is disabled, the speaker items remain on the computer screen until you enable AutoHide. CATalyst VP remembers the last display state of the Seating Chart.

You can modify the Seating Chart options to automatically populate the Seating Chart with speakers when you start a new job. You can set the scope of the Seating Chart to display for a job, case or user. When you set the Seating Chart scope, you can choose speakers to populate the seating chart. In the current job, when you write the steno for the selected speaker, the Speaker List is populated. For example, the case you are working on has ten attorneys. You determine the Seating Chart arrangement and set the scope to Case. The Seating Chart arrangement is remembered for all jobs in that case. Settings apply to new jobs or cases and do not affect the current job or previous jobs or cases.

[Seating Chart options](#) allow you to customize the actions and display of the Seating Chart and speaker items, such as modifying the Seating Chart display time, Seating Chart scope, speaker item transparency or changing the text layout for the speaker items.

[Keyboard Map](#) Functions: Seating Chart: Show MiniViewer  
Seating Chart: Hide MiniViewer  
Seating Chart: Show All Speakers  
Seating Chart: Hide All Speakers

## Seating Chart: Toggle AutoHide Feature

### Create a Seating Chart

1. Press **Alt + v, k (View/Speaker List)** to display the Speaker List dialog pane.
2. Do one of the following to add speakers to the Seating Chart:
  - Right click a speaker name in the Speaker List and select **Add to Seating Chart**. The speaker name displays in the middle of the computer screen. Click the Seating Chart speaker item and drag it to the desired position on the screen.
  - Click the Show/Hide Seating Chart MiniViewer  icon to display the MiniViewer if it is not displayed. Click a speaker name and drag it to the desired position in the MiniViewer. The speaker item displays on the computer screen in the same position as the MiniViewer.
3. Do any of the following:

#### Reposition a seating chart speaker

Click and drag the Seating Chart speaker item to the correct position.

#### Change the size of the seating chart speaker

Click the edge or corner of a Seating Chart speaker item and drag to the desired size. The change only applies to the selected Seating Chart speaker. There is a default minimum and maximum size. You can [change](#) the default.

#### Remove a speaker from the seating chart

Position the cursor on the Seating Chart speaker item, right click and select **Remove from Seating Chart**. To remove all the speakers from the Seating Chart, select **Remove All from Seating Chart**.

#### Toggle the display of the seating chart items

Click Show/Hide Seating Chart Speakers  icon to toggle the display of the Seating Chart on the computer screen.

#### Toggle the display of the MiniViewer

Click the Show/Hide MiniViewer  icon.

#### Toggle the Auto Hide Feature

Invoke the Toggle AutoHide feature command. You must have [assigned](#) the Toggle AutoHide Feature command to a keyboard map function.

### Speaker List/Seating Chart Options

Speaker List and Seating Chart options determine certain customized settings that control Seating Chart actions and display. Access Speaker List / Seating Chart Options from the Speaker List dialog pane. In Edit, open the Speaker List. Press **Alt + v, k (View/Speaker List)**. In the Speaker List dialog pane, click the Settings  icon.

### Speaker List/Seating Chart Options

Use the following fields to customize Speaker List and Seating Chart settings:

### **Add fields to Speaker List**

Display the Select Fields for Speaker List dialog box. Choose fields to display in the Speaker List that do not usually display. The Speaker List is most commonly populated using the Create EZ Speaker feature and the selection of common speakers.

### **Show MiniViewer**

Select **Show** to automatically display the Seating Chart MiniViewer in the Speaker List dialog pane. Select **Hide** to manually open the Seating Chart MiniViewer Speaker.

### **Show Common Speakers**

Select **Yes** to display Common Speakers, such as THE WITNESS or the THE COURT, in the Speaker List. Select **No** to hide the Common Speakers. The default is No.

### **Default Seating Chart/Scope**

Automatically display selected speakers in the Seating Chart when you start a new job. You can set the scope of the Seating Chart to display for a job, case or user. Settings apply to speakers selected for new jobs or cases and do not affect the current job or previous jobs or cases. Highlight the option, click the drop-down arrow, select the scope and click the Edit button to select the specific speakers you want in the Seating Chart in future jobs.

When the Default seating chart is set to Case, the seating chart information is saved in the *nameofcase\_case* settings file. When the Default seating chart is set to User, the seating chart information is saved in the *UserSettings* file located in your System Files case.

### **Sticky Windows**

Select **Yes** to easily align speaker items with each other or along the monitor borders using your mouse. Speaker items remain independent allowing you to reposition them individually. The default setting is No.

### **Speaker Item Transition**

Select how the speaker items change from visible to hidden and hidden to visible. Choose one:

#### **Fade**

Speaker items show on the screen and fade from the screen in their designated locations.

#### **Zoom**

Speaker items move on and off the screen in a zooming motion between the MiniViewer and their designated location.

### **Speaker Item Transparency**

Select **Yes** to have the speaker items display at a specified level of transparency when they do not have cursor focus. When you click a speaker item, the speaker item displays as a solid image until you remove the cursor focus. Set the transparency level in the *Transparency Setting* field. Select **No** to have the speaker items always display as a solid image.

#### **Transparency Setting**

When the *Speaker Item Transparency* option is active, use the slider bar to set the transparency level. A low setting increases the transparency and a high setting decreases the transparency.

### **Speaker Item Layout**

Determine the layout for the speaker items on the screen. Layouts determine the text arrangement of the speaker name, speaker number, if available, and steno for the speaker items. Choose one:

- Layout 1 – Name on the top, steno on the bottom, number on bottom left.
- Layout 2 – Steno on the top, name on the bottom, number on bottom left.
- Layout 3 – Name on the top, steno on the bottom, large number on left.
- Layout 4 – Steno on the top, name on the bottom, large number on left.
- Layout 5 – Name on the top, steno on the bottom, no speaker number.
- Layout 6 – Steno on the top, name on the bottom, no speaker number.

### Auto Hide Speakers Items

Select Yes to automatically hide the speaker items when they do not have cursor focus. Select No to continuously display the speaker items on the screen. Using the Seating Chart: Toggle AutoHide Feature command, you can toggle between enabling and disabling the AutoHide feature. You can create a [keyboard assignment](#) for the command.

### Auto Hide Close Delay

Use the slider bar to determine the number of milliseconds the speaker items display before automatically hiding when they no longer have cursor focus. This option is only available when the *Auto Hide Speakers Items* option is set to Yes.

### Auto Hide Show Delay

Use the slider bar to determine the number of milliseconds the speaker items wait before displaying

when you hover the cursor over the MiniViewer or click, , Show/Hide Seating Chart Speakers. This option is only available when the *Auto Hide Speakers Items* option is set to Yes.

### Speaker Item Size

The current width and height of the speaker items. Make entries in the *Width* and *Height* fields to customize the default size of new speaker items. If there are current speaker items that you want to reflect the default settings, remove all speakers from the Seating Chart and then add them to the Seating Chart.

To temporarily customize the size of current speaker items, click and drag the sides while displayed on the screen. Manually resizing one speaker item does not affect the other speaker items on the screen.

## Save the Voice File as a .WAV File

You can have CATalyst VP automatically make a copy of the Dragon or ViaVoice voice file and save it as .wav file. The Dragon .DRA file is the voice file that contains your mask dictation and can only be heard by Dragon users. The .SGVOD file is the ViaVoice data file that contains your mask dictation. It can only be heard by ViaVoice users. A .wav file is a more common audio format accessible through Windows. You may want to create .wav files if you are using a scopist who needs to listen to the voice file.

CATalyst VP places the voice .wav file in the Analyze case. This separates the dictation file from an AudioSync .wav file, which is a recording of the room noise.

## Save the Voice File as a .wav File

1. Be sure you are in your User name.

2. From Manage Jobs, open the **System Files** case.
3. Double click the **UserSettings.sgxml** file. The UserSettings.sgxml file displays in Notepad or WordPad.
4. Click in the dialog box and press **Ctrl + f**. The Find dialog box displays.
5. Type **Always Save Wav File** and press **Enter**. CATalyst VP locates the option.
6. Click the **Edit** icon.
7. Type the number **1** in the field and click **OK**. To restore the default setting, click **Default**.
8. Press **Alt + s (Save)** to save the setting and close the dialog box.
