## Case CATalyst .ini to .sgxml File Conversion

Case CATalyst version 11 and higher automatically converts all the data in the history and user settings .ini file types to a .sgxml file type enabling Case CATalyst to operate more efficiently. These files convert when you first access your user in Case CATalyst or when using the ConvertUserFiles Wizard prior to first accessing your user in Case CATalyst. Case CATalyst version 11 and higher does not use .ini files, except for the DialogSettings.ini, Numberconversion.ini and prefixsuffixrules.ini files which Case CATalyst retains. A .sgxml file for each of these .ini files is created during file conversion and is necessary for Case CATalyst to perform properly.

If you have multiple users on your Case CATalyst system, you may want to consider using the ConvertUserFiles Wizard prior to running Case CATalyst version 11 or higher to convert the .ini files for all users at once. The wizard provides the option to remove or retain the unnecessary .ini files. When you choose to remove the unnecessary .ini files for a user, Case CATalyst deletes them from Manage Jobs and stores a ' copy of the removed files in the user's System Files, Archive Settings Files case with the file name: *ini\_currentdate.zip*. Choosing to retain files keeps the .ini files along with the converted .sgxml files in Manage Jobs. For example, the Job History file, Anderson\_093009.ini converts to Anderson\_093009.sgxml. Manage jobs displays both Anderson\_093009.ini and Anderson\_093009.sgxml.

If you do not convert your .ini files using the ConvertUserFiles Wizard, Case CATalyst automatically converts the files the first time you access your user in Case CATalyst version 11 or higher. Depending on the number of files, a message may display while the files convert. Case CATalyst automatically retains the original .ini files in Manage Jobs.

Customized toolbars, right-click menus and dialog panes settings are controlled by the UserLayout.sgcui file. Once you load Case CATalyst version 11 or higher, the UserLayout.sgcui is no longer compatible with earlier versions of Case CATalyst. If it is necessary to work in both Case CATalyst version 11 or higher and an earlier version of Case CATalyst, use Windows Explorer to copy the old UserLayout.sgcui from the Archived Settings folder to the System Files folder. If you customized toolbars, right-click menus and dialog panes in Case CATalyst version 11 or higher before copying the file and go back to a previous Case CATalyst version, the customization will be lost when you return to Case CATalyst version 11.

The UserSettings file in Case CATalyst version 11 or higher no longer opens in Notepad but does remain accessible for modifications. All but a few user settings, however, are customizable options from within Manage Jobs or a particular function. Job History contents continue to be accessible as in previous versions of Case CATalyst. The Notes feature in Job History for a Case CATalyst version 11 or higher job, however, is not available in previous Case CATalyst versions. If you use the Notes feature to exchange information between yourself and a scopist or another reporter, it is only available when you are both using Case CATalyst version 11 or higher.

### Access the ConvertUserFiles Wizard

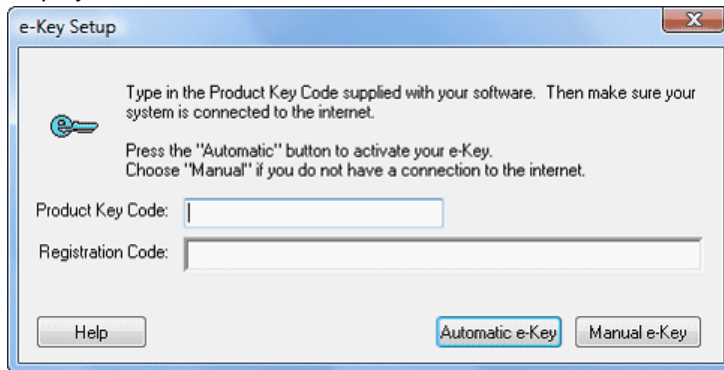

Use Windows Explorer to navigate to the folder in which Case CATalyst version 11 or higher is installed and double click the **ConvertUserFiles.exe**. When the Case CATalyst Data Conversion and Clean Up Wizard dialog box displays, follow the conversion instructions on each screen.

## e-Key Activation

When running Case CATalyst the first time after an installing, if you did not enter your PKC code during the install or entered the code but did not have Internet access, the e-Key™ Setup dialog box displays. If you entered the code during installation, the PKC code and Registration Code fields will be filled in, go to the Activate e-Key section in this topic.

If you did not type your Product Key Code when prompted during installation, the following dialog box displays:

1. In the Product Key field, type the Product Key Code (PKC) you received from Stenograph. If a valid/complete PKC is typed, the Registration field displays and is filled in.
2. To activate e-Key, follow the steps below based on whether or not you have Internet access at the time of activation.

### Activate e-Key

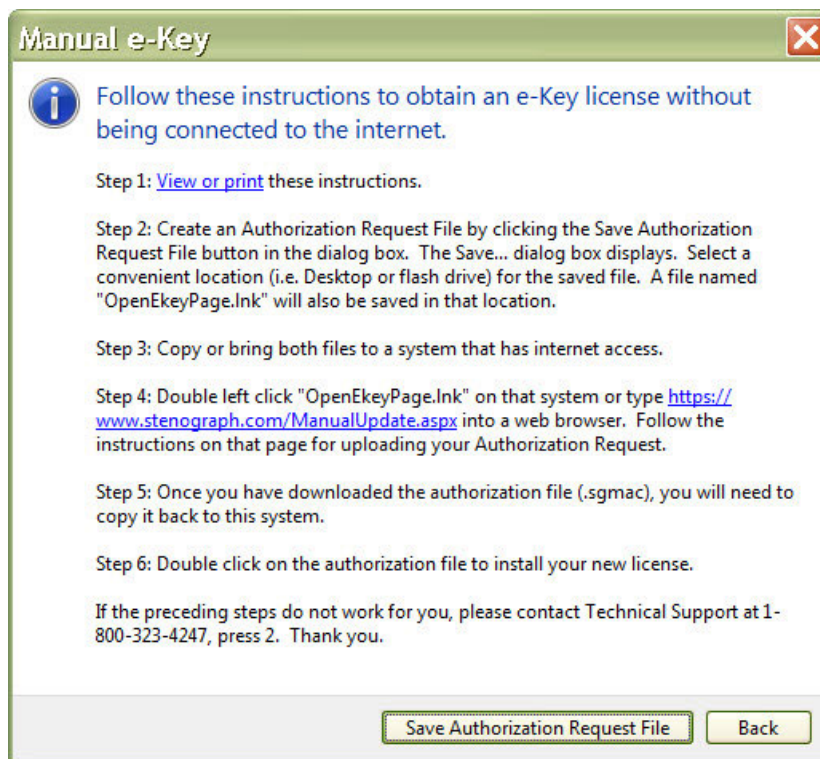

From the e-Key Setup dialog box, do one of the following to activate your e-Key:

#### Internet Access

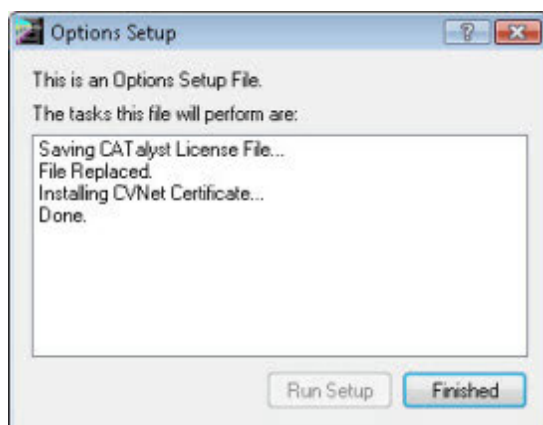

1. With your PKC typed in the Product Key Code field, click **Automatic e-Key**. A message displays prompting you to wait. The download may take up to a minute.
2. Once the download is complete, the Options Setup dialog box displays.
3. Click **Finished**. Case CATalyst opens.

#### No Internet Access

1. Click **Manual e-Key**. The Manual e-Key dialog box displays.

2. Click **Save License Request File**. The Save Authorization Request To File dialog box opens to the last accessed location. Insert a thumb drive or other removable media device into the computer.
3. Navigate to the thumb drive or removable media device and click **Save**. Two files are saved to the designated location - the authorization file and an OpenEkeyPage.Ink file. A reminder message displays prompting you to re-open Case CATalyst after installing the authorization file.
4. Press **Enter (OK)** to close the reminder message. Case CATalyst closes.
5. On a computer with an active Internet connection, insert the thumb drive or removable media device with the Authorization Request File and double click the OpenEkeyPage.Ink file or open your browser and type <https://www.stenograph.com/ManualUpdate.aspx>.
6. Follow the instructions on the web page to download the authorization file to the thumb drive or removable media.
7. Return to the Case CATalyst computer. Copy the downloaded authorization file from the thumb drive or removable media device to the computer's desktop.
8. Double click the authorization file to install it. Once the download is complete, the Options Setup dialog box displays.

9. Click **Finished**. Case CATalyst opens.

## e-Key Reauthorization

Your e-Key, keyless access, requires reauthorization every 90 days. By default, reauthorization is set to automatically renew when the renewal date falls within 29 days and you have an internet connection. When reauthorization successfully completes, a message displays indicating successful reauthorization. Close the message box by pressing **Enter**. The 90 days of reauthorization is added to the amount of authorized days currently remaining. Automatic reauthorization requires an Internet connection. To change the automatic renewal setting, at Manage Jobs go to Tools, Options, [Application/Computer Options](#) and change the *Renew expiring e-Key license* option.

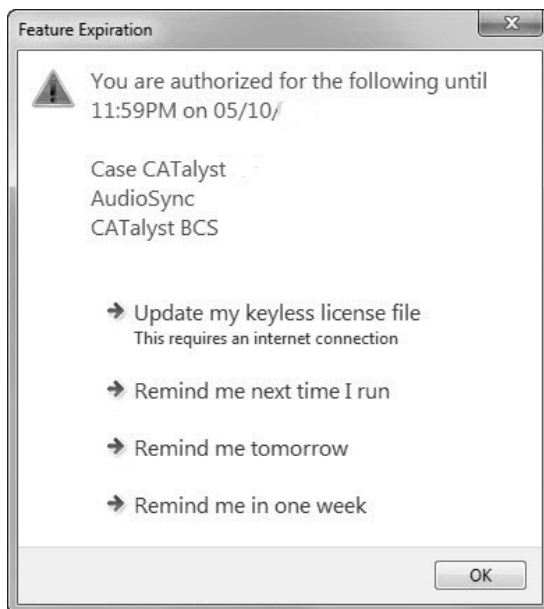

A reauthorization reminder message displays if automatic reauthorization is unavailable. For example, this may happen if you do not have Internet access at the time of automatic reauthorization.

### Manually Reauthorize via Renewal Notification

You can manually reauthorize your e-Key. A reauthorization reminder message displays that requires you to manually respond to the renewal message. To change reauthorization to manual renewal, set the option, Renew expiring e-Key, to At User Direction Only in [Application/Computer Options](#).

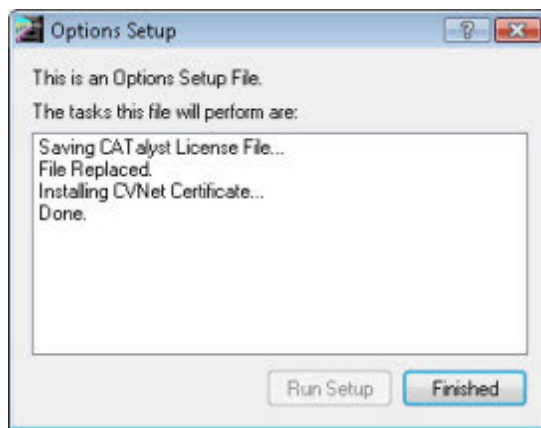

To renew your license authorization via renewal notification:

1. From the reminder message, click **Update My Keyless License** File. Case CATalyst automatically connects to the Stenograph website.

If no Internet connection is available, a message displays prompting you to manually download the authorization file. Click **OK** and follow the instructions in *e-Key Activation* for [No Internet Access](#).

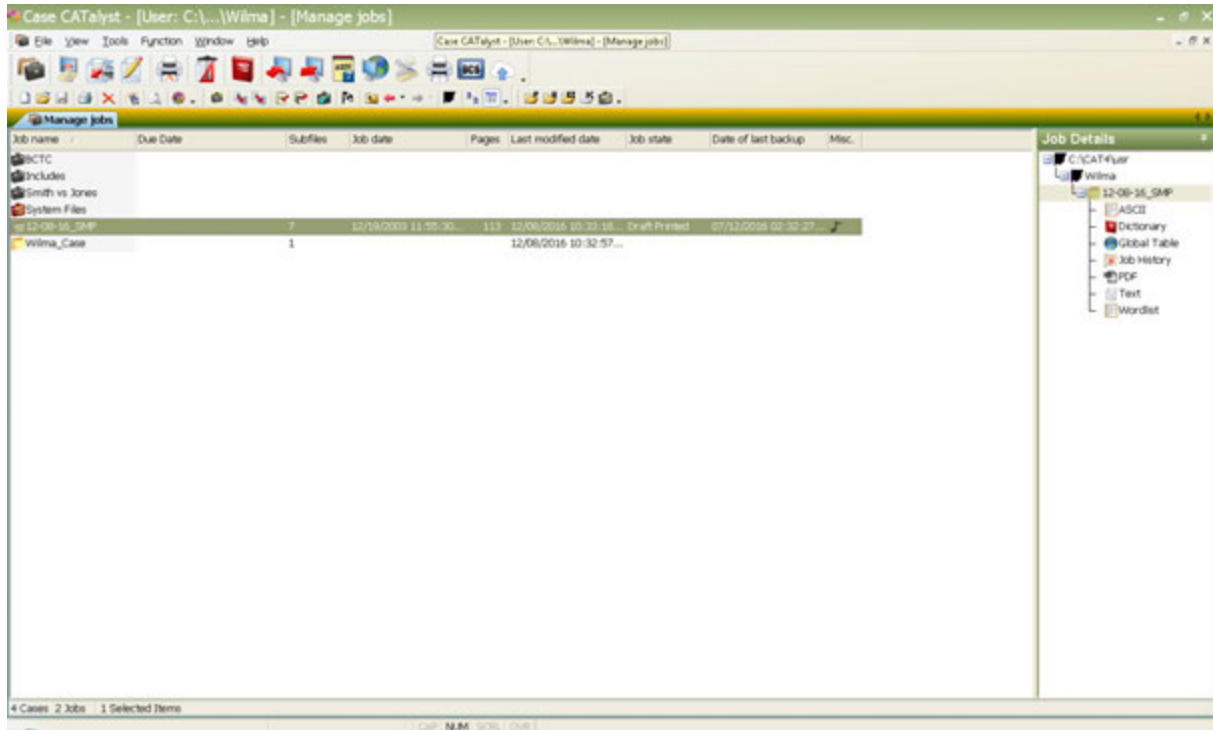

2. A message displays prompting you to wait while the authorization file downloads. The download may take up to a minute.
3. Once the download is complete, the Options Setup dialog box displays.

4. Press **Enter (Finished)**. Case CATalyst Opens.

## Work Area Navigation

The Case CATalyst screen is divided into areas, each providing certain types of information. Each area is described below.

Case CATalyst screen

### Title Bar

Displays across the top of the screen and displays the current user, case name (if appropriate), file name (if appropriate) and current function.

-  Minimize the window, which minimizes the entire Case CATalyst program and displays it as a button on the Window's task bar.
-  Maximize the window, which displays the Case CATalyst program in full screen view. This button toggles with the Restore button.
-  Restore the window to the previous manually set window dimensions. This button toggles with the Maximize button.
-  Exit the program, which closes all open Case CATalyst functions, such as Edit along with any open jobs and Manage Dictionary along with any open dictionaries. You will be prompted if open files contain unsaved changes.

### Menu Bar

Displays just below the Title Bar, by default. It lists the menus available in the current Case CATalyst function. Menus, in turn, list the features available in the current Case CATalyst function. Although you can move the Menu bar to various screen locations, you cannot hide the Menu Bar except when in Full Screen mode in Translate & Edit / Edit (View, Full Screen). An open file displays in the Work Area and the following Windows® buttons display to the right side of the Menu Bar that control the current open file and are separate from the similar Title Bar icons. Click the icon to affect the window for the open file:

Minimize the open file's window. The window displays as a Title bar in the lower left side of the screen.

Restore the open file's window to the previous manually set dimensions. This button toggles with the Maximize button.

Close the current open file. If only one file is open, also close the Case CATalyst function. For example, you have two jobs open in Edit. Clicking this button closes the current open file and displays the second job in the Edit function. The Case CATalyst program remains open.

## Function Bar

Displays below the Menu Bar, by default. It contains icons for the most commonly used Case CATalyst functions. You can [customize](#) the Function bar, adding, moving and removing buttons. You can move the Function Bar to any location on the screen or hide it.

## Toolbars

Toolbars contain icons for the most commonly used features in the current function. The icons available on the toolbar change for each function. You can [customize](#) your toolbars, adding, moving and removing buttons to suit your needs. You can have specific toolbars show or hide depending on the CATalyst function. For example, you may want fewer toolbars while editing to increase the amount of screen space and because you can use convenient and logical keyboard commands to navigate and edit the file.

## Tabs

Open files display as color coded tabs below the Toolbars. Double click a tab to close the open file or right click a tab to display a menu that allows you to select to Save, Close or Save and Close the open file. If unsaved changes exist when closing a file, you are prompted to save the changes.

The color of a file tab corresponds with a particular file type or function that is open. For example, Case CATalyst indicates Manage Jobs is open with a light blue tab, open Edit files with green tabs and open dictionaries with red tabs. The name of the file currently displayed on the screen appears on the tab in bold. An asterisk displays on the tab when unsaved changes exist in a file. If a long file name does not fit on the tab, Case CATalyst displays the first and last portion of the name with an ellipsis in the middle.

**Unsaved File with Asterisk**

**Long File Name with Ellipsis**

### Work Area

The center of the screen. Displays information based on the current Case CATalyst function. For example, in Manage Jobs, the work area contains job file information such as the date of the job, the number of subfiles, number of pages, etc. In Edit, your transcript text displays in the work area.

When a file displays in the Work Area, the Minimize, Maximize/Restore, and Exit buttons display on the right side of the Menu Bar. These buttons only affect the open file. They do not affect the Case CATalyst program.

### Dialog Panes

Select Case CATalyst features are accessible from a small self contained resizable "window" called a [dialog pane](#). In Manage Jobs, features such as Job Details, [Search File Contents](#), [Search Due Job Results](#) and [Integrated Video Training](#) in Manage Jobs display in dialog panes. In Translate and Edit, features such as [Reveal Codes](#), [Vertical Notes](#), [EZ Text](#), [Speaker List](#), [Hidden Text](#), [Hotspots](#), [Clipboard](#), [Brief It](#), [Cat Scratch](#), [Track Changes](#) and [Connected Users](#) display in dialog panes. Dialog panes, when selected to show, display in a default fixed position on the Case CATalyst screen. You can easily reposition dialog panes to vertical, horizontal, floating or auto-hide (tabbed) locations on the Case CATalyst screen.

### Status Bar

Displays at the bottom of the screen. It contains information based on the current Case CATalyst function. For example, in Edit, it displays steno outlines when marking and if you use the Hold Strokes option, it will show the steno strokes being held before being sent to the realtime screen. Conflict information and the CVNet connection indicator also displays on the Status Bar. In Manage Jobs, the number of cases and files display.

You can select to show or hide the Status Bar on the screen. From the View menu, select Show/Status Bar. When a check mark displays next to Status Bar, the Status Bar displays on the screen. No check mark indicates the Status Bar is hidden.

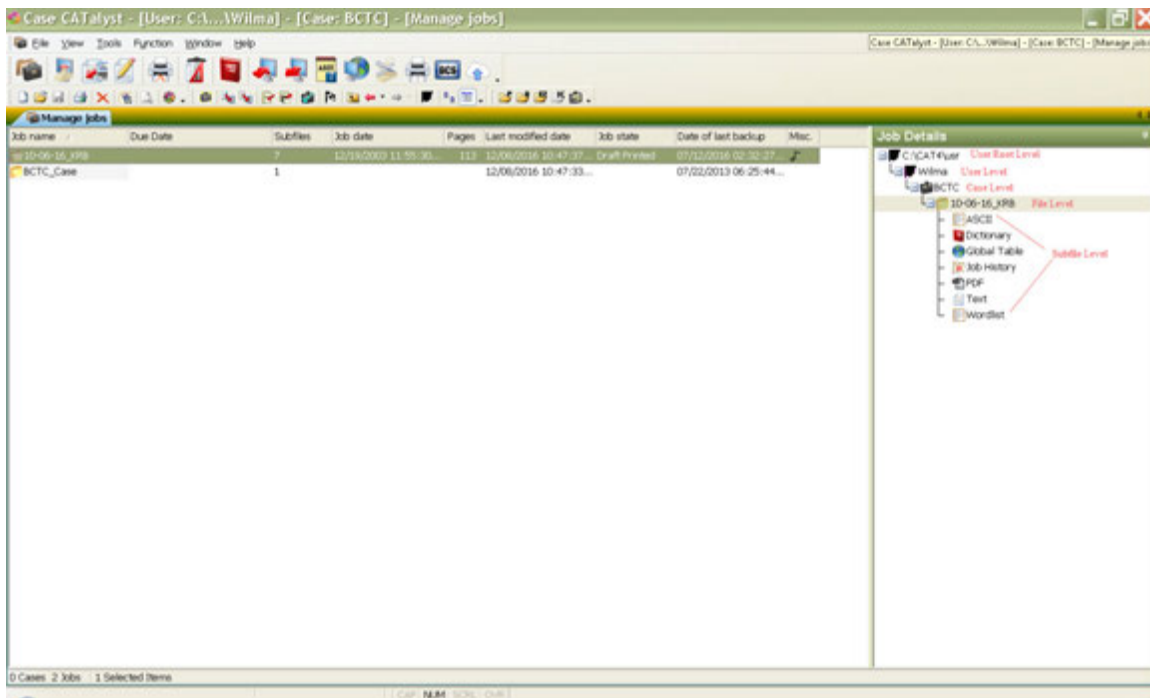

There is also a [stationary status bar](#) that is the frame of Case CATalyst. In Edit, the following items show on the stationary status bar - it displays the current page and section number, transcript line number of the cursor, cursor mode and position of the cursor in the text.

## Case CATalyst File Structure

Case CATalyst uses a five-level file structure to store information:

1. [User Root Level](#)
2. [User Name Level](#)
3. [Case Level](#) (optional)
4. [File Level](#)
5. [Subfile Level](#)

Case CATalyst File Structure

## User Root Level

User Root Level is the first level of information storage. The User Root contains the location of USR folder which contains user names and is necessary for the Case CATalyst software to run. You cannot start Case CATalyst without a User Root level.

## User Name Level

The User Name Level is the second level of information storage. The user name identifies all files belonging to a given user. Each user name has an associated user folder where all files for that user are stored. When you sign on with your user name, Case CATalyst automatically goes to your user folder and displays your files. If two users create different files with the same file name, the system distinguishes the file by the user folder in which it resides. The Title Bar at the top of the screen displays the current user folder.

You can customize the user icon through User Settings in Manage Jobs.

## Case Level

Case Level is the third level of information storage. A case is a sub-folder in your user name. The use of cases to organize your files is optional but can be an efficient method of organizing your work. For example, if you are an official reporter you might create cases for the type of work such as trials, pre-trials and no-writes. If you are a freelance reporter, you might create cases based on the name of the firm that hired you for the job. You can create cases within cases. Read, translate or move files into cases to organize related information. You can create Case dictionaries, Case Fill-in-Field list and Case Wordlists which you can apply to all the jobs in a Case.

Certain cases are automatically created and used by Case CATalyst. The cases are automatically created and are necessary for Case CATalyst to run properly:

### System Files Case

System files are files and cases, which are vital to the operation of your software. For example, the User Settings file, dialog settings, your Personal Dictionary and Keyboard Maps are system files. These system files are necessary to read, translate, edit, or print a transcript. Each user has individual system files. You can only have one of each type of system file within a user. All system files are stored in the System Files case.

It is a good practice to [back up](#) your System Files and any other important cases on a regular basis in addition to using [Cloud Backup](#). Simply select Backup and put a check mark before the System Files case and before any other cases you want to back up and all files in the cases will be backed up. Some users created a case for Include files which is an important case to back up. Some users store their Includes case inside the System Files case and some store it outside the System Files case.

### AutoArchive Case

The AutoArchive case is located at the root of the user's folder and may contain multiple copies of files when the [Auto Recover](#) feature is used along with the [Keep Auto Recover files in Archive](#) option or the Auto Save feature is used along with Archive File on Close option. When you display the contents of the AutoArchive case, the background displays a faded outline of a "red cross" in an effort to make it clearer that you are in the the AutoArchive case and not at the current user's level.

### Index Templates Case

The Index Templates case is located in the System Files case. The Index Templates case contains all Case CATalyst index templates. In order for the [Build Index](#) feature to work, Case CATalyst requires you create, modify, and store index templates in the Index Templates case located in the System Files case. There are multiple sample index templates for you to modify/use or you can create your own index template.

### Layouts Case

The Layouts case is located in the System Files case. All Case CATalyst layouts are automatically stored in the Layouts case. There are sample layout files that you can modify/use or create your own index template.

### Other Case CATalyst Cases

Examples of other Case CATalyst cases include Saved ASCII Settings, Dictionary Builder, Job Reports Templates, Macros, Saved Translate Settings and more.

### Support Info Files

The Support Info Files case stores \*.dmp files that are important to Stenograph's Technical Support Department in the rare instance that you experience an [Exception 3 error](#). If you experience the error, you should contact Technical Support and they will request you send the associated \*.dmp file.

### File Level

File Level is the fourth level of information storage. A file usually represents a single job. One deposition or hearing equals one file name. You create a new file by entering a unique name in the file name field of the dialog box.

### Subfile Level

Subfile Level is the fifth level of information storage. A subfile is a sub-unit of the file. In most instances, several subfiles make up a job. For example, if you reported a job with your writing machine, translated and edited it, at the very least you would have a steno subfile, job history subfile and text subfile. Case CATalyst subfiles include:

**.txt** ASCII  
If you create an ASCII with a different extension than 'txt', the file will be created but will not be recognized by Case CATalyst and will be listed as an unknown file type.

**.wav** Audio

**.sgngl\_A1** Auto Recover files for a particular job can have up to 4 recovered versions. The job .sgngl subfile is the most recent version of the file and  
**.sgngl\_A2**  
**.sgngl\_A3** sgngl\_A3 is the oldest version of the file.

**.sglog** Build Index information

**.ZIP** Compressed Backup File

**.sgcpo** CompressedPrintOptions File

**.sgcdb** Conflict Database

**.sgdct** Dictionary - Personal, Case, or Job

**.ezk** EZKeys Table

**.sgezt** EZ Text Table

	.csv	Fill In Field List

	.sgvcd	Case CATalyst Voice Command Dictionary
		Unknown file types - file types that are not recognized by Case CATalyst. If you create an ASCII with a different extension than 'txt' it will display as an unknown file type.

A typical file can contain several subfiles. When you perform a specific function, Case CATalyst automatically creates a subfile. For example, when you Read in your steno notes, Case CATalyst creates two subfiles: a steno notes subfile and Job History subfile.

When viewing files in Detailed List View, you can select to show or hide subfiles on the screen. From the Options menu, select View/Show/Subfiles. When a check mark displays next to the Show Subfiles options, each subfile displays on the screen. No check mark indicates the job name with subfiles displays in the split window.

## Accessing Functions and Features

All Case CATalyst functions and features are accessible from a menu on the Menu Bar. You can select any menu item by using the mouse to point and click or by pressing the assigned keyboard command, if an assignment exists. Depending on the Case CATalyst function, some features are also available from a short menu that displays when you click the right mouse button or by pressing an abbreviated series of keyboard commands called shortcut keys.

### Using the mouse to point and click

Place the cursor on the selection and single or double click the left mouse button to highlight and select the menu, select the function, or invoke a feature. Single or double clicking depends on the feature you are selecting.

#### *Example*

Instruction:

To close the current job and function, if no other file is open in the function, from the File menu, press **Alt + f, c (Close)**.

Action:

Using the mouse, click File on the menu bar to display the File menu, and then click Close.

### **Example**

Instruction:

In Manage Jobs, select **View/Show/Visible Columns (Alt + v, s, v)**. The Column Settings dialog box displays.

Action:

Using the mouse, click View on the menu bar. From the View menu click Show, and then from the Show menu, click Visible Columns.

## **Using the right mouse button**

Many features are available from a short menu that displays when you single click the right mouse button displaying the Right Click Menu. The available features vary depending on the Case CATalyst function. The Right Click Menu is [customizable](#) in select Case CATalyst functions.

### **Example**

In Edit, click the right mouse button and select Scan from the menu to scan to the next untranslate or conflict.

In Edit, right click on the job tab and select Save, Save and Close or Close.

In Manage Dictionary, click the right mouse button and select Insert to display the Insert Dictionary Entry dialog box.

## **Using keyboard commands**

You can access most functions and features using the Tab key, the Alt or Ctrl key in combination with another key or series of keys, and the arrow keys.

To use a keyboard command, press the indicated combination of keys on the keyboard to highlight and select the desired menu or function and to invoke a feature. Use the Tab key in the dialog boxes to move from field to field and the arrow keys to move the cursor up and down in a list.

Instructions for using keyboard commands often appear in parenthesis along with the instructions for using the mouse.

### **Example**

Instruction:

To close the current job, from the File menu, select **Close (Alt + f, c)**.

Action:

Using the keys on the keyboard, press Alt and f at the same time to display the File menu, then press c to select Close.

### **Example**

Instruction:

In Edit, press **Alt + v, z (View/Zoom)** to display the Zoom menu. In the Zoom list, use the ↓ (arrow keys) to highlight the desired percent and press Enter.

Action:

Using the keys on the keyboard, press Alt and v at the same time to display the View menu, and then press z to display the Zoom menu. Press the Up or Down arrow keys to highlight the desired percentage, and then press Enter.

## Using Shortcut Keys

Some features have shortcut keys programmed to perform a specific action.

The shortcut key usually appears on the drop down menu to the right of the command. To use shortcut keys, press the designated key or combination of keys on the keyboard to access a specific function or invoke a specific command. You can customize Edit shortcut keys by modifying your [Keyboard Map](#).

Instructions for using a shortcut key often appear along with the instructions for using the mouse.

### Example

Instruction:

Press **Ctrl + w** (**Special Edit/Word Swap**).

Action:

Using the keys on the keyboard, press Ctrl + w at the same time.

## Dialog Panes

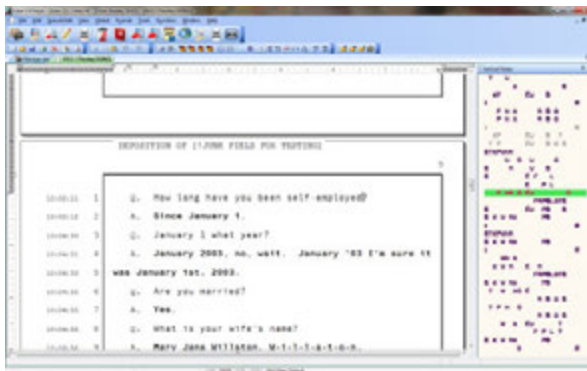

Select Case CATalyst features, such as [Vertical Notes](#), [Reveal Codes](#), [Hotspots](#), [Brief It](#), [Hidden Text](#), [Cat Scratch](#), [Speaker List](#), [EZ Text](#), [Search Results](#), [Clipboard](#) and [Track Changes](#) are accessible from a small self contained resizable window called a dialog pane. Dialog panes, when selected to show, display in a default fixed position on the Case CATalyst screen. A fixed position is indicated by the vertical push pin  on the Title bar of the pane. You can easily click and drag the pane to a new vertical or horizontal position, change it to a "floating" pane or store the pane as an auto hide tab along the edge of the screen. The panes retain their new location until repositioned.

To display a closed dialog pane, press **Alt + v, e** (**View/Panes**) and then select a pane from the submenu. A check mark shows next to the feature to indicate it is displayed. To close a dialog pane, click the X in the title bar or deselect it from the View/Panes submenu.

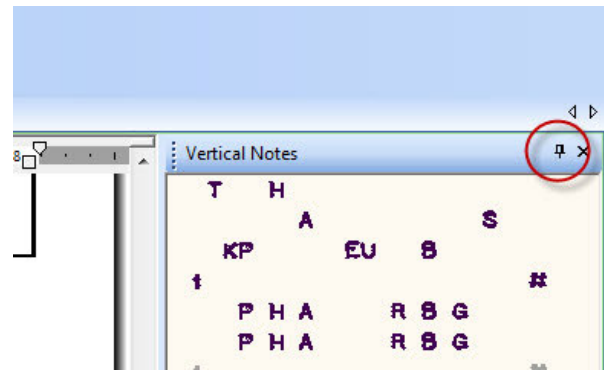

You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to

move) of the pane, your cursor will change to a horizontal double arrow (  ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen.

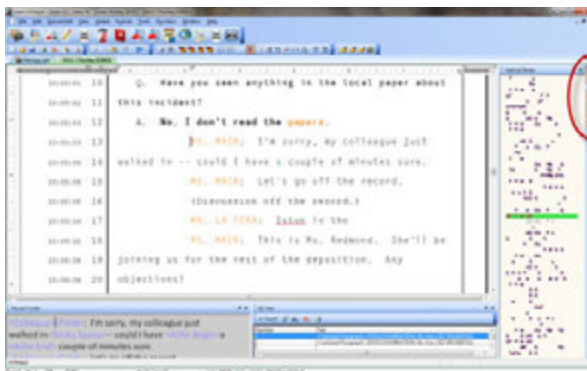

Dialog Pane in Default Fixed Position

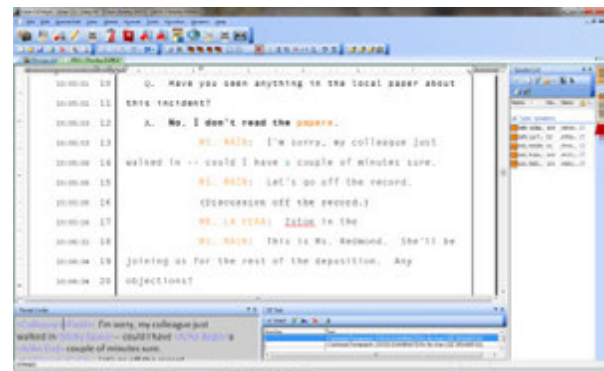

Vertical Push Pin Shows Fixed Position

## Auto Hide Dialog Panes

Dialog panes in auto hide mode quickly display when you hover your cursor on the auto hide tab. To auto hide a pane, click the push pin  on the title bar of a dialog pane, changing it to a horizontal position . The horizontal position indicates the pane is in auto hide mode. Move the cursor off the pane to hide it as a tab along the edge of the Case CATalyst screen. Hover the cursor over or click the tab to temporarily display the pane. To return the pane to the fixed position on the screen, click the push pin from a horizontal to vertical position.

Dialog Panes in AutoHide Mode

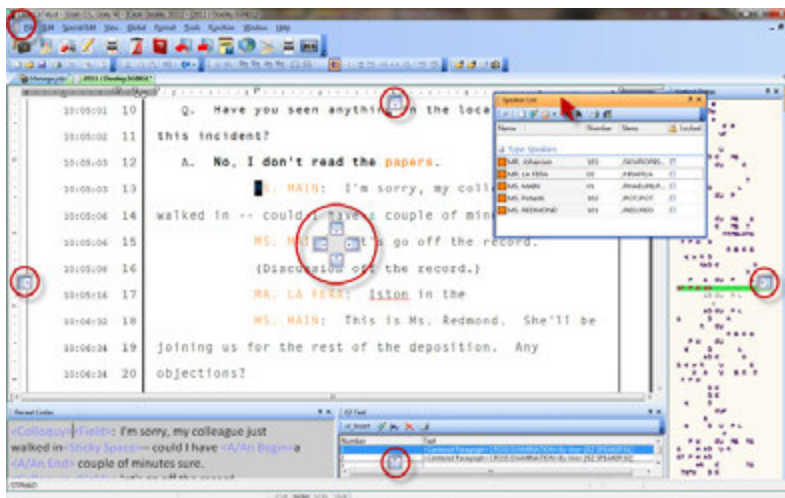

Auto Display Speaker List Pane

## Reposition Dialog Panes

A fixed or "docked" pane and a floating pane can be repositioned. You cannot reposition a pane that is in AutoHide mode. The Title bar of a dialog pane with a vertical push pin  indicates the pane is in a "docked position. To return a dialog pane from AutoHide to a docked position, hover the cursor on the auto hide tab. When the pane displays, double click the Title bar of the pane or click the push pin to a vertical position.

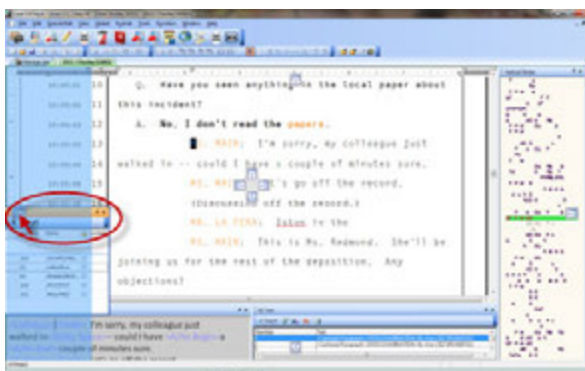

To move a dialog pane, click the Title bar and hold the mouse button. As you move the pane, placement icons display on the screen. Single arrow icons display on each side of the screen and a multi-arrow icon displays in the center of the screen. These placement icons provide positioning options. Hover the cursor over an icon to view the new placement position. Release the mouse button to position the dialog pane in the new location.

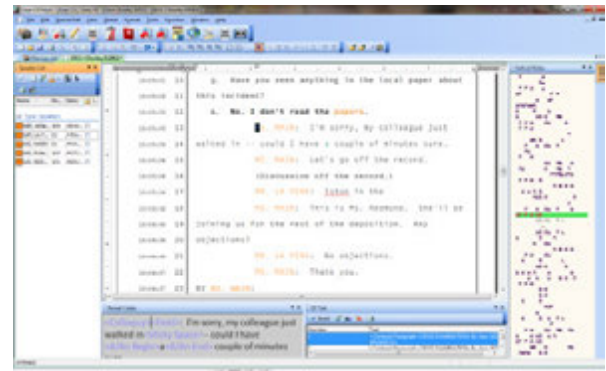

*Placement Icons*

## Position On Screen Edge

Use the single arrow icon to position a dialog pane along an edge of the Case CATalyst screen. Click the Title bar of a dialog pane and hold the mouse button as you move the pane. Place the tip of your cursor on the single arrow icon for the desired screen location. A transparent blue box displays, indicating the placement position. Release the mouse button to position the dialog pane in the current location.

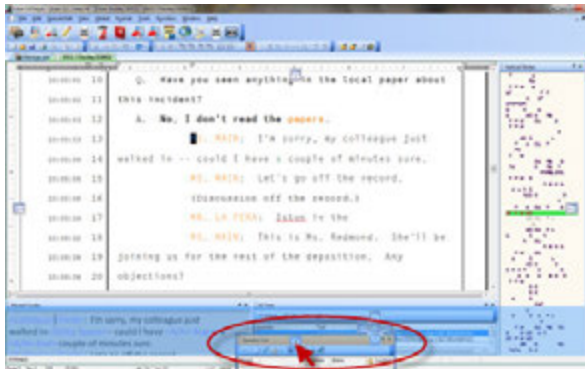

*Moving Speaker List Pane To Left Edge*

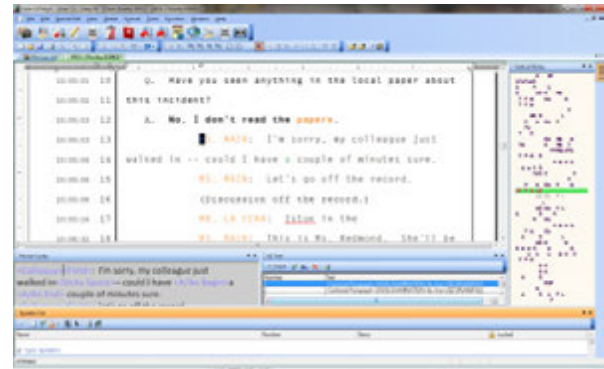

*Speaker List Pane On Left Edge*

When another pane or panes already display along the edge of the Case CATalyst screen, the moved dialog pane positions along the outermost edge of the screen.

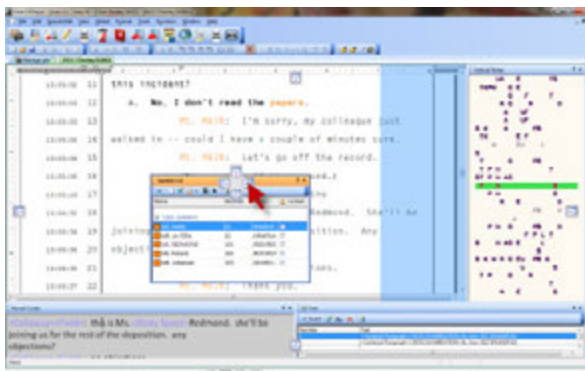

*Moving Speaker List Pane To Bottom Edge*

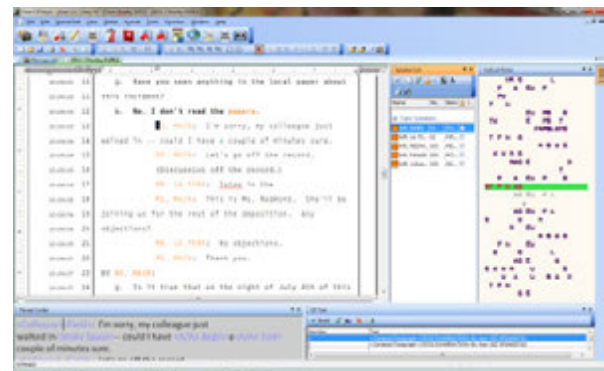

*Speaker List Pane On Bottom Edge*

### Position Next to Another Fixed Pane

Use the multi-arrow icon to position a dialog pane next to an existing fixed pane. Click the Title bar of a dialog pane and hold the mouse button. Place the tip of your cursor on one of the arrows in the multi-arrow icon. A transparent blue box displays, indicating the placement location. Release the mouse button. The moved dialog pane displays next to the existing fixed pane.

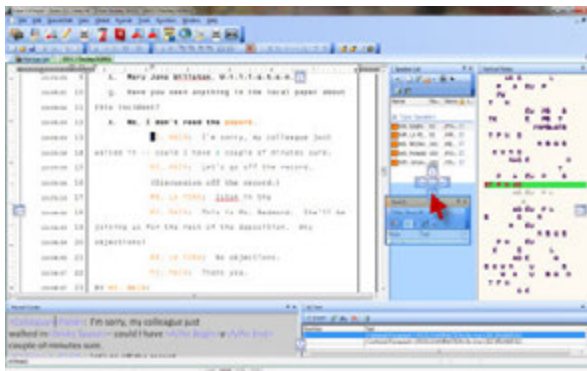

*Moving Speaker List Pane Left of Vertical Notes*

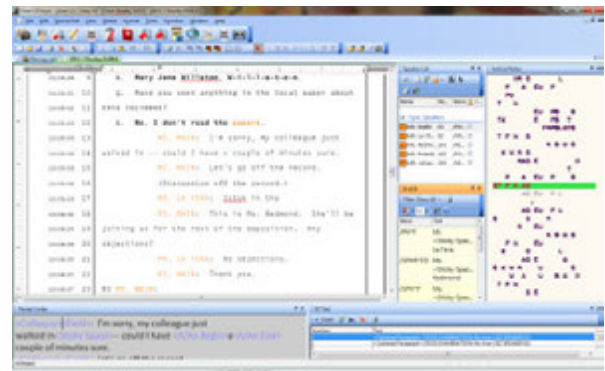

*Speaker List Pane Next to Vertical Notes Pane*

### Position to Share a Location

Use the multi-arrow icon position fixed dialog panes next to each other within the same location. Click the Title bar of a dialog pane and hold the mouse button as you move the pane to the desired fixed pane location. The multi-arrow icon displays in the center of the stationary pane. Place the tip of your cursor on one of the arrows. A transparent blue box displays, indicating the placement location. Release the mouse button. The moved dialog pane displays in the shared space.

Moving Brief It Pane Below Speaker List Pane

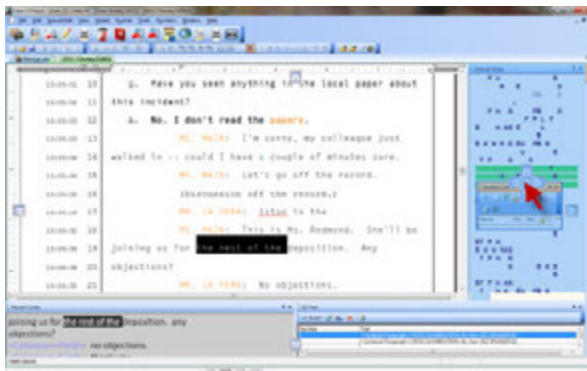

Brief It Pane Below Speaker List Pane

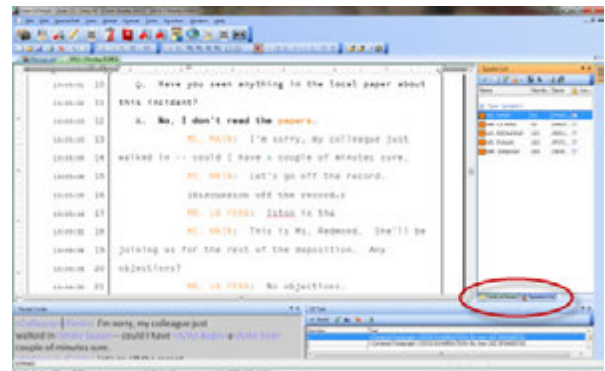

## Position to Share a Location Using Tabs

Use the multi-arrow icon to position a dialog pane in the same location of another fixed pane and add tabs. The tabs allow you to toggle the display of panes. Click the Title bar of a dialog pane and hold the mouse button as you move the pane to the desired fixed pane location. The multi-arrow icon displays in the center of the fixed pane. Place the tip of your cursor on the center of the multi-arrow icon. A transparent blue box displays, indicating the placement location. Release the mouse button. Tabs are added for each pane in that location. If tabs for multiple panes already exist, a tab is added for the moved pane.

To separate an individual pane from a shared position, double click the dialog pane tab. The selected dialog pane displays on the screen where you can move it to a new location or close it. To separate all the tabbed dialog panes, double click the title bar of the open pane.

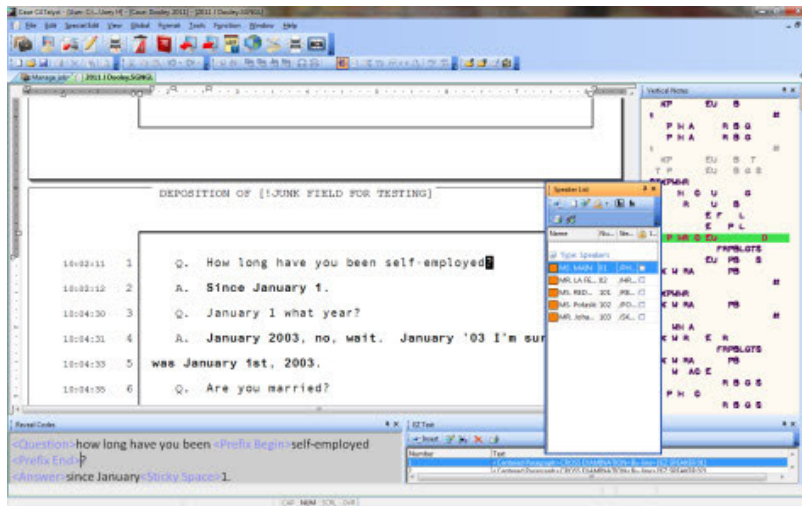

Moving Speaker List to Vertical Notes Pane

Speaker List and Vertical Notes Tabbed

## Float Dialog Panes

You can place a floating pane anywhere on the Case CATalyst screen. A floating pane is not anchored to a location and may cover text or other screen items depending on its placement. Double click the Title bar when the pane is floating, to place it in a fixed position.

*Floating Dialog Pane*

## Messages and Prompts

There are three types of screen messages in Case CATalyst. The message that displays depends on the function you are using.

### Prompts and Dialog Boxes

Prompts request information or action. Case CATalyst prompts generally appear in a dialog box in the middle of the screen, using the following forms:

#### Yes/No choice

Select either Yes or No.

#### Multiple choice

Select one of the several choices and then select **OK (Enter)**.

#### Dialog box

Enter information, such as a file name, page number, or text and then select **OK (Enter)**.

### Status Messages

Status Messages keep you informed about the program currently running. Unlike prompts, status messages do not require a response. For example, status messages display when processing is taking place, such as importing a dictionary.

### Error Messages

Error messages advise you of hardware and software problems and operator errors. You can resolve many of the error messages.

#### Example

When you select a file to move but the file is open or in use, Case CATalyst displays a message similar to the following:

*The following file cannot be moved: filename.xxx Check to make sure the file (s) is not in use.*

Press **Enter (OK)** to close the message. Close the open file and then move it.

### **Example**

When you attempt to record commands for a macro that are not recordable, Case CATalyst displays a message similar to the following:

*The actions you took are not recordable. There are no actions that can be saved for a macro.*

Press **Enter (OK)** to close the message.

### **Example**

An [Exception 3 error](#) occurs when Case CATalyst encounters an unknown action or a General Protection Fault (GPF) within a process. When an Exception 3 error occurs, a dialog box displays. **It is important that you press Enter (OK) in the dialog box.** Case CATalyst may close. Contact Technical Support to report the error and provide requested information.

## **Case CATalyst Student Version**

Case CATalyst student version is for educational purposes. This version of software allows the user to access functions and features for the purpose of learning transcript production, producing necessary documents for educational purposes, dictionary building and dictionary maintenance. Certain features are limited or inaccessible. If you attempt to access a feature that is not available in the Case CATalyst Student Version, a message displays indicating the feature's unavailability. Cloud Backup is not available in Case CATalyst's Student version.

## **Case CATalyst Student Version Functionality**

### **Manage Jobs**

All features in Manage Jobs are available.

### **Read**

All features in Read Notes are available.

### **Manage Notes**

Manage Notes capabilities are limited to printing steno notes.

### **Translate and Edit / Edit**

All features in Translate & Edit and Edit are available. The Case CATalyst Student Version, however, limits the amount of pages in a file to a maximum of 50 pages. The following applies to the 50 page limit:

- If you write realtime, when the file reaches 50 pages, CATalyst saves the file, closes realtime and displays the following message.

**Realtime exceeded the 50 page limit for Student Version. Your file is saved.**

- If you translate a note file that results in a file greater than 50 pages, Case CATalyst saves the file and displays the following message:

**The pages exceeded the limit for the Student Version. Your file is saved.**

**Press any key to exit.**

- If you attempt to open a file that exceeds 50 pages or you are editing and, for example, make a layout change or copy and paste text which increases the number of pages to exceed 50, the following message displays:

**A Case CATalyst Student device limits the number of pages you may edit to 50.**

**Any pages in excess of this limit will be deleted.**

- If you open a file in error which contains more than 50 pages, exit without saving the file to keep the file unchanged.

### **Print**

All features in Print are available with a maximum print output of 50 Pages. Steno notes can be printed to PDF while writing realtime. Specific headers and footers which print on each page are embedded and cannot be changed. They include:

#### **Headers**

- Case CATalyst – Student Version
- By Stenograph

#### **Footers**

- Not for Official Transcript Production
- Educational Use Only

### **Layout**

All features in Layout are available. Specific headers and footers which print on each page are embedded and cannot be changed.

### **Manage Dictionary**

All features in Manage Dictionary are available.

### **Wordlists**

All Wordlist features are available.

### **Import**

Import capabilities are limited to importing the following dictionaries: Stentura, RTF/CRE, Case CATalyst 3.x, and élan Mira.

### **Export**

Export capabilities are limited to:

- exporting dictionaries in Luminex, Diamante, Stentura or élan Mira format.
- exporting dictionaries to RTF/CRE.
- exporting to ASCII in Page Image format with a 50 page limit and embedded headers and footers.

### **AudioSync**

The AudioSync feature (record audio) is not available.

## Common Menus

The Menu Bar displays menus with available features for the active Case CATalyst function. Certain menus commonly display on the Menu Bar in multiple the Case CATalyst functions. For example, the Function menu displays in all CATalyst functions as it provides easy access to all CATalyst functions. Other menus and features display only for the specific Case CATalyst function. For example, Special Edit is a menu containing commands/features only available in the Edit function. The Special Edit menu does not display in other Case CATalyst functions. When your Translate & Edit / Edit [keyboard map](#) assignment change, any Translate & Edit / Edit menu items affected by the change will show the keyboard map assignments instead of the default shortcut key assignments. For example, let's say there is no shortcut key assigned to the Mistran Minder feature but you use the feature all the time. You open your keyboard map and assign Ctrl + Shift + m to the Tools, Mistran Minder field and then save and close the file. In Edit, you press Alt + t to display the Tools menu and you see Ctrl + Shift + m assigned to Mistran Minder. You can now click Tools and be reminded of the shortcut key assignment or you can press Ctrl + Shift + m to invoke the command. You can also [view and/or print your keyboard assignments](#).

### Common Menus

- [File](#) - lists common menu features for a file or job, such as Open, Close, Save, and Exit.
- [Edit](#) - lists common menu features for a file in Edit, Dictionary Management, and Manage Notes.
- [View](#) lists the common menu features to display and customize toolbars.
- [Function](#) - lists all the available Case CATalyst functions.
- [Window](#) - lists the open windows in Case CATalyst and provides options to change how these windows display.
- [Help](#) - provides access to various types of help information including Study Guides for particular features and Exceptional Extra guides and files for Case CATalyst.

## File Menu

Common File menu features available in multiple Case CATalyst functions include:

### New

The New feature displays a menu from which you select a file type to create. Once you create the new file, it opens in the appropriate function. For example, when you select a Dictionary (.sgdct) from the menu, a submenu displays from which you select the dictionary type. The new dictionary opens in the Manage Dictionary function. When you select Layout (.sgpgl), the sample Layout file opens in the Layout function.

There are two exceptions to a new file opening in the related function. When you select Read Notes from the New menu, the Read Setup dialog box displays. In Manage Jobs, when you select Case from the New menu, a new case displays in the Manage Jobs window.

### Create a New File

You can create a new file by using the File New option. The following new files types can be created: [Case](#), [Read Notes](#), [Text](#), [Dictionary](#), [Wordlist](#), [Layout](#), [List/Table](#), [Fill-In-Field List](#) and Notes File. If you have CATalyst BCS you can also create a Caption file and if you have CATalyst VP, you can also created a Job Voice Commands file. Press **Alt + f, n (File/New)** and choose the desired file type. A submenu may display depending on the type of new file you are creating. Select the file type from the submenu if appropriate. Caption File.

A submenu may display depending on the type of new file you are creating. Select the file type from the submenu if appropriate. The Create New Document box displays. Make necessary entries:

### Look in

Defaults to the current user. To create a file in a location other than the current Users level, use **Browse**.

#### Back

Return to the previous folder viewed.

#### Up One Level

Move one folder level up in the file structure. To move to a location other than the current Users level, use **Browse**.

### File Window

Available files for the current user. Highlight a file to open. The selected file name displays in the File name field below. To select a file within a case, double-click the case to open it.

#### Create New Case

Create a new case in which you can place related files. The case icon along with a default name, New Case, displays in the File Window. Type a new name in the highlighted area, then press **Enter**.

#### Icon View

Display the files in the File Window as icons.

#### Detail List View

Display the files in the File Window as a list with file details.

### File name

Type a new file name. You can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: ' ~ ! @ # \$ % ^ & ( ) - \_ { }

Some character are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , | = < > ? \* .

### Files of type

The type of file that displays in the File Window which also indicates the type of file you are creating. To change the file type, click the down arrow and select from the list.

### Layout Name

This field only displays when you select to create a new text file. Select the layout you want to apply to the new document.

**Open**

Open the new file in the appropriate function.

**Browse**

Locate a different folder.

**Cancel**

Closes the Create New Document dialog box without opening a file.

**Open**

The Open feature allows you to open an existing file. In Manage Jobs, the Open feature opens the highlighted file in the appropriate function. For example, Depending on the current Case CATalyst function:

- the file opens in the appropriate Case CATalyst function.
- the Open Existing Document dialog box displays files for the appropriate file type selected.
- the Open submenu displays.

For example, in Manage Jobs the highlighted file opens in the appropriate function, such as a highlighted dictionary opens in Manage Dictionary. In Edit, the Open Existing Document dialog box displays with all the available text files for the current user; in Manage Dictionary a menu of dictionary types displays.

You can bypass the Open menu and submenus to display the Open Existing Document dialog box. Press **Ctrl + o (File/Open)**.

**Open an Existing File**

Use the following fields and options in the Open Existing Document dialog box as necessary.

**Look in**

Defaults to the current user. To locate a file in a location other than the CAT4 users level, use **Browse**.

**Back**

Return to the previous folder viewed.

**Up One Level**

Move one folder level up in the file structure. To move to a location other than the CAT4 users level, use **Browse**.

**File Window**

Available files for the current user. Highlight a file to open. The selected file name displays in the File name field below. To select a file within a case, double-click the case to open it.

### Create New Case

Create a new case in which you can place related files. The case icon along with a default name, New Case, displays in the File Window. Type a new name in the highlighted area, and then press **Enter**.

### Icon View

Display the files in the File Window as icons.

### Detail List View

Display the files in the File Window as a list with file details.

### File name

The selected file to open. Click a file to select it or type the file name. If you type a new file name, one of the following occurs:

- The Create New Document dialog box displays with a Layout Name field.
- A message displays indicating the file does not exist and asks if you want to create a new file. Choose Yes (Enter) to continue and create a new file.

When typing a file name, you can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: ' ~ ! @ # \$ % ^ & ( ) - \_ { }

Some character are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , | = < > ? \* .

### Files of type

The type of file that displays in the File Window which also indicates the type of file you are opening. To change the file type, click the down arrow and select from the list.

### Open

Opens the selected file in the appropriate Case CATalyst function.

### Browse

Locate for a different folder.

### Cancel

Closes the Open Existing Document dialog box without opening a file.

## Translate & Edit

Translate & Edit (Ctrl + t) displays the [Translate Options](#) dialog box where you can set translate options and select a file for translation.

## Close

Close (Ctrl + F4) exits the current file. In most functions, you can open multiple files and do not need to close a file or job to open another.

## Save

Save (Ctrl + s) writes the changes made in the current file to the hard drive. For example, in Manage Dictionary, changes to the open dictionary are written to the hard drive when you select Save. In Manage Notes, changes to the open note file are saved. In Edit, changes to the open job are saved. Use the [Auto Recover Options](#), Auto Recover and Auto Save to automatically save the current transcript at specified timed intervals along with options that put a copy of the file in the [AutoArchive](#) case.. You can continue working while Case CATalyst saves the file to the hard drive.

## Save As

Save As (Alt + f, e ) displays the Save As dialog box, which allows you to save the current file to another name, case, user folder, or drive. The original file is saved and closed and a copy of the file with the new file name is created and opened. **You are now working in the new (Save As named) file.** You can automatically have Case CATalyst display the Save As dialog box with the last folder location in which you saved a file or the folder location of the current file by setting the [Advanced Edit Option, Remember last folder used for Save As](#).

## Save As Fields and Options

### Save in

Defaults to the current user.

#### Go To Last Folder Visited

Return to the previous folder viewed.

#### Up One Level

Move one folder level up in the file structure.

### File Window

Available files for the current user.

#### Create New Folder

Create a new folder with a default name in the File Window. The folder icon along with a default name displays in the File Window. Type a new name in the highlighted area, then press **Enter**.

### View Menu

Display the files in the selected view: Thumbnails, Tiles, Icons, List, or Details.

### Save Selection Only

When you save selected text, this field displays allowing you to save the selection to a file.

### File name

Select an existing file name or type a new file name in the field. If you type the same name as an existing file, the following message displays when you select Save: "*filename.xxxx* already exists. Do you want to replace it?" If you select Yes, the existing file is overwritten by the current file. If you select No, the Save As dialog box displays and you can type a different name.

When typing a new file name, you can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: ' ~ ! @ # \$ % ^ & ( ) - \_ { }

Some characters are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; . , | = < > ? \*

If you type the same name as an open file in another application, the following message displays: "This file is already is use. Select a new name or close the file in use by another application." Select **OK** and type a different file name or close the job or application and type the file name again.

### Save as type

The type of file that displays in the File Window which also indicates the type of file you are saving. To change the file type, click the down arrow and select from the list.

### Save

Save the current file to a new name and open it to allow you to work in the new file.

### Cancel

Close the Save As dialog box without saving the file. If you selected to save multiple files and want to cancel the save for all of them, use the Cancel All Remaining Saves option.

### Cancel All Remaining Saves

Check this box when you have selected multiple files to save and want cancel the save for all of them. If you do not check this box, Case CATalyst displays a cancel confirmation message for each file. If you only want to cancel the save for some of the files, leave this box blank.

This option box displays in the Save As dialog box in functions where multiple saves are available.

### Print

Print (Ctrl + p), opens the [Print](#) function and displays the Print dialog box where you can send the current file or selected portions of the file to the printer or to a file (PDF). Open the appropriate function to print the desired file type. For example, you must open the Dictionary function to print dictionary entries. You can print a job (transcript/text file) any where in Case CATalyst by pressing **Alt + u, p** or clicking

the Print  icon.

### Exit

Exit (Alt +F4) closes all the open files that do not contain unsaved changes and exits Case CATalyst. In certain functions, such as Edit and Page Layout, Case CATalyst first prompts you to save any unsaved changes before exiting.

## Edit Menu

Common Edit menu features available in multiple Case CATalyst functions include Copy, Cut, Paste, Undo and Redo.

### Cut/Copy/Paste

Copy leaves selected text leaving it in its original location in the file and places a copy on the Windows clipboard. Cut removes selected text from its original location and places it on the Windows clipboard. Using paste, you can place copied or cut text within the same file, into another file or into a file outside of Case CATalyst as many times as you want. Use the Copy, Cut and Paste features to move text in Edit, notes in Manage Notes, globals between Global tables, dictionary entries between dictionaries and wordlists entries between Wordlists.

There is no limit to the amount of text you can copy or cut. You can store up to 10 copied or cut items on the [Clipboard](#). Selecting Copy twice on the same highlighted text automatically opens the Clipboard.

The Case CATalyst default includes the underlying steno from the copied or cut text. You can change this setting in [Advanced Edit Options](#) to not include the underlying steno or to have Case CATalyst automatically prompt you with a Yes/No option to include the underlying steno.

## Undo

Undo allows you to reverse the most recent changes or actions in the current file. Only consecutive actions are reversible. If you cannot undo an action, the Undo option on the menu is unavailable. You can restore an action by pressing Ctrl + Shift + z (Redo).

The Undo command in Translate & Edit and Edit reverses most editing actions except globals and cursor movements. There are specific commands available to undo globals.

To undo the most recent changes, do one of the following:

- Press **Ctrl + z (Edit/Undo)**. Repeat until you delete all the desired actions.
- Use the  icon on the Standard Plus toolbar to do one of the following:
  - ▶ Click the Undo arrow until you reverse all the desired actions.
  - ▶ Click the Down Arrow next to the Undo button to display a list of most recent changes.

Highlight down the list to select the number of changes you want to undo and then click the left mouse button. You can only select consecutive actions to undo.

## Redo

Redo allows you to restore the most recent changes or actions in the current file. Only consecutive actions can be redone. If you cannot redo an action, the Redo option on the menu is unavailable. You can undo an action by pressing Ctrl + z (Undo).

To redo the most recent changes, do one of the following:

- Press **Ctrl + Shift + z (Edit/Redo)**. Repeat until you restore all the desired actions. You can only select consecutive actions to restore.
- Use the  icon on the Standard Plus toolbar to do any of the following:
  - ▶ Click the Redo arrow until you restore all the desired actions.
  - ▶ Click the Down Arrow next to the Redo button to display a list of most recent actions.

Highlight down the list to select the number of changes you want to restore and then click the left mouse button. You can only select consecutive actions to restore.

## View Menu

Common features accessible on the Manage Job View menu from multiple Case CATalyst functions include:

- [Show Toolbars and Features](#)
- [Customize Toolbars](#)

Specific [Manage Jobs View](#) menu items are also available.

## Show Toolbars and Features

The Manage Jobs Show feature allows you to customize the display of toolbars and certain features that display on your screen. Press **Alt + v, s (View/Show)** to display the Show menu. Click an Toolbar to select or deselect it. A check mark next a menu item indicates the feature is active. Not all toolbars listed are appropriate for Manage Jobs. For example, Open Special is a great toolbar for Manage Jobs as it gives you instant access to your Personal Dictionary and more. On the other hand, Dictionary List is useful toolbar to display in Manage Jobs but wonderful for Manage Dictionary.

## Case CATalyst Toolbars

The following Toolbars are shown with the Case CATalyst default icons. The Macro Pull Away toolbar only [displays](#) by clicking and dragging the Macro submenu. Once displayed, the Macro toolbar appears in the Show menu and you can click it to remove the toolbar from the screen.

### Function Bar

### Standard

### Job Manager

### Standard Plus

### Edit

### Marks

### Open Special

### Dictionary/List

**Dictionary Extra****Compress Print****Full Screen****Voice (only available if you have the CATalyst VP option on your e-Key)****Words Per Minute****Macro Pull Away****Macro****RealTeam**

## Moving Toolbars

Toolbars can be positioned for display in different locations in the Case CATalyst screen. You can rearrange them in the upper portion of the screen, display them along the side or bottom, or float them. To move a toolbar:

1. Position the cursor on the left corner ( ) of the Toolbar.
2. Click and hold the left mouse button
3. Move the toolbar to the desired location on the side, bottom or top of the screen and release the mouse button. To have the toolbar float, release the cursor anywhere on the screen.

## Customize Toolbars

Case CATalyst comes with a default set of toolbars which you can choose to display, hide and customize. You can add icons, remove icons and reposition icons from one toolbar to another. If the Customize Toolbar option, Show ScreenTips on toolbars, is active, you can view the function of each icon. Rest your cursor on the icon to display the function. You can also view the function of each icon in the [Customize](#) Toolbar dialog box, Command tab. [Translate and Edit's Macro toolbar](#) allows you to assign macros for playback to the toolbar's icons.

## Show/Hide Case CATalyst Screen Features

### Status Bar

Show or hide the Case CATalyst Status Bar at the bottom of the Case CATalyst screen. The Status Bar displays above the [stationary Status Bar](#). The CATalyst Status Bar displays steno strokes when marking and steno strokes held ([Translate's Hold Strokes option](#)), if any and on the right side, the AudioSync indicator, CaseViewNet network or Cloud connection status (if outputting) and the last conflict in the realtime file when writing and following realtime. While editing, the left side of the Status Bar displays marked steno outlines and the right side displays conflicts and conflicts resolved by EZ Choice or Auto Conflict when your cursor is position immediately before or on a conflict or resolved conflict.

### Stationary Status Bar

### Timers

Show or hide the [Timers](#) On/Off dialog box.

### Translate Statistics

Show or hide the [Translation Status](#) dialog box.

### Reporter's Area

Show or hide the Reporter's Area (shading to show where the reporter can make changes from the writer) on the screen during realtime writing.

### Bench Text

Show or hide text written in [Bench Mode](#) during a realtime session.

### Timestamps

Show or hide the [Show Timestamps](#) dialog box on the Edit screen.

### Timestamps in Vertical Notes

Show or hide the [Timestamps](#) in the Vertical Notes.

### Audio Indicators

Show the [Audio Indicators](#) in Normal View.

### Double Space in Normal View

Show text [double spaced](#) when in Normal View.

### Visible columns

Selecting Visible columns displays the Column Settings dialog box. You can [modify the column format](#) in Manage Jobs when you display the screen in Detailed List View. You can also choose which columns display, determine the order of the column display from left to right, and adjusts the width of the columns.

### Show Subfiles

Show or hide subfiles on the Manage Job screen.

## Customize Toolbars

Case CATalyst toolbars are customizable. This includes the dialog pane toolbars in Edit and the right click toolbar in Edit and Layout. In CATalyst BCS, this includes the Caption file and History window. Certain right click menus are also customizable. Depending on the toolbar, you can add icons, remove icons, rearrange the display order on the toolbar or [modify](#) the icon appearance and style.

To quickly show or hide current toolbar icons, click the down arrow located on the right side of a toolbar. Select Add or Remove Button and choose the toolbar to modify. Click a command to show or hide it from the toolbar. A check mark indicates the icon shows on the toolbar. This method does not apply to the right click toolbar in Edit.

Case CATalyst remembers the new settings for current user until changed. The customized toolbar and right click toolbar and menu settings are stored in the UserLayout.sgcui or UserLayoutPlus.sgcui file, located in the system Files case. When using Case CATalyst version 14 or higher, you may (or may not) notice a UserLayoutPlus.sgcui file in the System Files case. If the UserLayoutPlus file is available, contains information about toolbars placement and selection, right-click menus customization and dialog panes placements and visibility. Your original UserLayout.sgcui file is kept around to maintain compatibility with previous versions of Case CATalyst. You can backup and restore this file.

## Modify Toolbars

The Customize Toolbars feature allows you to make changes to the Case CATalyst toolbars, such as the Dictionary or Edit toolbar. You can also make changes to the [right click toolbar](#) and in Edit and Layout. To make dialog pane toolbar changes, see [Customize Dialog Pane Toolbars](#).

1. Press **Alt + v, s, z (View/Show/Customize Toolbars)**. The Customize dialog box displays with four tabs: Toolbars, Commands, Menus and Options. The Customize dialog box must remain open while making changes.
2. Make entries on each of the tabs as necessary:

### Toolbars

Check the box next to the toolbar you want to display. Uncheck the box to hide the toolbar.

### New

Create a custom toolbar. In the New Toolbar dialog box type a name and press **Enter (OK)**. The name displays in the Toolbar list and on the screen. On the Command tab, drag and drop icons to customize the toolbar.

### Rename

Rename a custom toolbar. Highlight the toolbar in the list and select **Rename**. In the Rename Toolbar dialog box, type a new name and press **Enter (OK)**. This option is only available for a custom or modified toolbar.

### Delete

Delete a custom toolbar. Highlight the toolbar in the list and select **Delete**. A confirmation message displays. Press **Enter (OK)** to remove the custom toolbar. This option is only available for a custom or modified toolbar.

### Reset

Reset all the default toolbars icons to their default appearance and to their original toolbar configuration. A confirmation message displays. Select **OK** to reset the toolbar.

### Commands

Add an icon to a toolbar. Select a Category on the left. Left click a command from the list on the right. Hold the mouse button and drag the command to a toolbar. While moving an icon, the cursor displays with an X on top of a rectangular box. When you move the cursor to a valid placement location on the toolbar, a black vertical bar displays on the Toolbar indicating the point of insertion when you release the mouse button. When a command has an associated icon, the icon displays on the toolbar. If you add a command without an associated icon, the command name is added as an icon to the toolbar.

Do any of the following:

#### Add a command

Using the left mouse button, click the desired command and continue to hold the button. Move the cursor to the desired location on a toolbar or the right click menu and release the button.

#### Remove a command

Use the left mouse button to click the desired command and hold the button. Move the cursor off the toolbar or right click menu to any location on the screen and release the button.

#### Relocate a command

Use the left mouse button to click the desired command and hold the button. Move the cursor to the new location on the toolbar.

### Menus

Customize a right click toolbar. It is necessary to customize them from within the associated Case CATalyst function. Currently right click toolbar customization is available in Case CATalyst Edit and Layout functions; and in the CATalyst BCS Caption file and History window.

Make necessary entries:

#### Select context menu

From the drop down list, select **Transcript View Right Click Toolbar**. Click the **Command** tab. Refer to "Commands" in this topic to add, remove or relocate a command on the right click toolbar.

#### Don't show the right-click toolbars in all areas

Check this box to hide the display of all right click toolbars in the Case CATalyst Edit and Layout function. In CATalyst BCS, check this box to hide the display of all right click toolbars in the Caption file and History window.

**Don't show the right-click toolbar in the *name* area**

Check this box to hide the display of the right-click toolbar displayed in the *Select context menu* field.

**Reset**

Reset the toolbar to the default settings.

**Options****Always show full menus**

Show all the commands on the menus. Uncheck this box to show only the basic and most frequently used menu features.

**Show full menus after a short delay**

When the cursor rests on a menu, all the commands display after a short delay.

**Reset menu and toolbar usage data**

Delete the record of commands used and restore the default set of visible commands to the menus and toolbars. It does not reset any explicit customizations. A confirmation message prompts you to continue.

**Large icons (all toolbars)**

Increase the size of icons on all toolbars.

**Function Bar Toolbar large icons**

Increase the size of icons on the Function Bar only.

**Show Text under Function Bar Toolbar**

Display text under each icon on the Function Bar.

**Show ScreenTips on toolbars**

Display a brief description of the toolbar function when the cursor rests on a menu.

**Show shortcut keys in ScreenTips**

Display keyboard shortcut key with the ScreenTip.

3. When finished, click **Close** to save the changes and exit the dialog box.

The customized toolbar and right click toolbar and menu settings are stored in the UserLayout.sgcul file, located in the system Files case. You can backup and restore this file.

**Modify Toolbar Icons**

The Customize Toolbars feature allows you to change the display of a toolbar icon. You can switch the style of an icon between icon only, text only or icon and text. Additionally, the icon text and image can be modified. The Customize dialog box must remain open and the toolbar visible on the screen in order to make modifications to the icons.

To modify icon appearance:

1. Press **Alt + v, s, z (View/Show/Customize Toolbars)**. The Customize dialog box displays with four tabs: Toolbars, Commands, Menus and Options. The Customize dialog box must remain open while making changes.
2. Place your cursor on the icon you want to modify.
3. Right click to display the right-click menu. Use the following options as necessary:

### **Reset**

Restore the icon to the default. This option is only available for an icon that has been modified from its default appearance.

### **Delete**

Remove the icon from the toolbar. You can restore the icon along with any other toolbar changes from the Customize dialog box. On the Toolbar tab, highlight the toolbar to which the icon belongs and select **Reset**. Resetting restores all the default icons in their default appearance to the selected toolbar. A warning message displays prompting you to continue. Select **OK** to continue with the restore or **Cancel** to retain the changes.

### **Name:**

Type the name you want to display for the icon. The text in this field displays on the toolbar when you select Text Only or Image and Text for the icon style. The name you type here does not change the toolbar tip that displays when you rest your cursor on the icon.

### **Change Icon Image**

Use the following options to copy, paste and edit the icon image. To restore an icon image to the default, use Reset Button Image.

#### **Copy Button Image**

Create a copy of the icon. Use Paste Button Image to paste the icon copy to another toolbar.

#### **Paste Button Image**

Paste the copied icon to a toolbar. The pasted icon replaces the icon on which your cursor is resting.

#### **Reset Button Image**

Return the icon image to the default.

#### **Edit Button Image**

The Button Editor dialog box displays where you can modify the current icon image. Select **OK** when finished to accept the changes or **Cancel** to have the icon retain the current image.

#### **Change Button Image**

A menu of icon images displays from which you can select a different icon to replace the current image. The function of the icon remains the same.

### **Set Icon Style**

Select one of the following. A check mark in front of the menu item indicates the active selection.

**Default Style**

Restores the icon to the original default appearance.

**Text Only**

Display the icon with text and no image. The text that display in the Name: field is the text that displays on the toolbar.

**Image and Text**

Display the icon with text and image. The text that display in the Name: field is the text that displays on the toolbar.

**Begin a Group**

Insert a delineating line to the left of the selected icon to indicate the beginning of a group of related icons on the selected toolbar. Position the cursor on the selected icon and choose **Begin a Group**.

4. Select **Close** to save the changes and exit the Customize dialog box. The new settings remain in effect for the current user until changed.

The customized toolbar and right click toolbar and menu settings are stored in the UserLayout.sgcul file, located in the system Files case. You can backup and restore this file.

## Customize Dialog Pane Toolbars

Dialog Pane toolbars in Edit are customizable by removing and adding icons. You may want to remove unused icons to reduce the size of the toolbar and increase the amount of data displayed in the dialog pane. The dialog pane must be visible to customize the toolbar. For example, display the Brief It dialog pane to customize the Brief It toolbar.

1. In Edit, display the desired dialog pane. Press **Alt + v, e (View/Panes)** and select a pane from the submenu.
2. Click the down arrow located on the right side of the toolbar.
3. Select **Add or Remove Button** and choose the toolbar to modify.
4. Click a command to show or hide it from the toolbar. A check mark indicates the icon shows on the toolbar.

Click **Reset Toolbar** to reset the toolbar display with the default icons. At the reset confirmation message, click **OK**.

5. Click anywhere on the screen to close the submenu. The Add or Remove Buttons menu closes.

## Customize Right Click Menu

Customize right click menus. It is necessary to customize the right click menu from within the Case CATalyst function. Currently right click toolbar customization is available in Case CATalyst Edit and Layout functions; and in the CATalyst BCS Caption file and History window.

1. Press **Alt + v, s, z (View/Show/Customize Toolbars)**. The Customize dialog box displays with four tabs: Toolbars, Commands, Menus and Options. The Customize dialog box must remain open while making changes.

2. Click the **Menus** tab.
3. In the *Select context menu* field, select **Transcript View Right Click** from drop down menu. The Edit Right Click menu displays.
4. Do any of the following:

#### **Add a Feature**

Click the **Commands** tab. Select a Category on the left. Left click a feature from the list on the right. Hold the mouse button and drag the item to the menu. While moving a feature, the cursor displays on top a rectangular box and a + icon displays at the bottom of the cursor indicating the addition of the feature. When you move the cursor to a valid placement location on the menu, a black horizontal bar displays on the menu indicating the point of insertion when you release the mouse button.

#### **Remove a Feature**

Left click a feature on the Right-click Menu. Hold the mouse button and drag the feature off the menu.

#### **Relocate a Feature**

Click a feature and move your cursor to the desired location on the menu. While moving a feature, the cursor displays on top a rectangular box. When you move the cursor to a valid placement location on the menu, a black horizontal bar displays on the menu indicating the point of insertion when you release the mouse button.

#### **Modify a Menu Icon or Name**

Add, change or modify the icon or name for a menu feature. Right click a feature and select the desired action from the submenu.

#### **Reset the Menu**

On the Menu tab, click **Reset** to return the menu to the default features.

5. Make other changes in the Customize dialog box as necessary.
6. When finished, click **Close** to save the changes and exit the dialog box.

The customized toolbar and right click toolbar and menu settings are stored in the UserLayout.sgcul file, located in the system Files case. You can backup and restore this file.

## **Change Menu Appearance**

Menu appearance in Case CATalyst and CATalyst BCS is customizable by choosing how the commands displays.

1. Press **Alt + v, s, z (View/Show/Customize Toolbars)**. The Customize dialog box displays with four tabs: Toolbars, Commands, Menus and Options. The Customize dialog box must remain open while making changes.
2. Click the **Options** tab.
3. Make entries on as necessary:

#### **Always show full menus**

Show all the commands on the menus. Uncheck this box to show only the basic and most frequently used menu features.

**Show full menus after a short delay**

When the cursor rests on a menu, all the commands display after a short delay.

**Reset menu and toolbar usage data**

Delete the record of commands used in this application and restore the default set of visible commands to the menus and toolbars. It does not reset any explicit customizations. A confirmation message prompts you to continue.

**Menu animations**

Determine the way menus display when you click on them. For example, Slide displays the menu in a sliding motion.

4. Make other changes in the Customize dialog box as necessary.
5. When finished, click **Close** to save the changes and exit the dialog box.

The customized toolbar and right click toolbar and menu settings are stored in the UserLayout.sgcul file, located in the system Files case. You can backup and restore this file.

## Function Menu

The Function Menu lists provides access to all the Case CATalyst functions. Select a function from the menu to open it:

**Manage Jobs**

The [Manage Jobs](#) function displays all the files for the current user and allows you to open, copy, move, delete and backup files and backup and restore users. When you start Case CATalyst, it opens in the Manage Jobs function.

**Read Notes**

The [Read Notes](#) function transfers steno notes from your steno machine to the hard drive of your computer.

**Translate & Edit**

The [Translate & Edit](#) function translates a steno note file on the hard drive or to write realtime. You can also view and set translate, realtime and output settings by selecting the Options button on the Translate dialog box. When Case CATalyst starts translating either during regular translation or realtime writing, you can begin editing the text.

**Edit**

The [Edit](#) function opens a translated job or to create a new text file. When an Edit file is already open, selecting the Edit function displays the open file.

**Print**

The [Print](#) function displays the Print dialog box where you can select and print a job in draft, final or compressed copy to a printer or PDF. Multiple options are available including adding a watermark and/or digitally signing and including attachments in the PDF.

**Layout**

The [Layout](#) function allows you to create new or modify existing page formats. The Sample Text file reflects the applied changes to the layout settings.

### Manage Dictionary

The [Manage Dictionary](#) function allows you to create, modify, include, delete, copy, cut and paste entries in your Personal, case, or job dictionaries.

### Import

The [Import](#) function displays the Import dialog box where you can convert Case CATalyst 3.x files, RTF/CRE and ASCII files into Case CATalyst files.

### Export

The [Export](#) function converts Case CATalyst files (transcripts and dictionaries) to other formats.

### Compress Print

The [Compress Print](#) function prints multiple pages of a Case CATalyst transcript on a single sheet of paper retaining all your formatting, such as underline, bold or italics.

### Manage Notes

The [Manage Notes](#) function breaks a steno note file into smaller note file, separate out notes in a file for immediate translation, or define steno outlines before translating.

### Wordlist

[Wordlist](#) allows you to select and open a Wordlist. A Wordlist contains words you decide Case CATalyst should ignore as a misspelling during Spell Check. There are three types of Wordlists: Personal, Case, and Job.

### Broadcast Captioning Suite

Opens Broadcast Captioning Suite (BCS), an optional program designed for steno caption providers, integrating live display and scripted program features. For additional purchasing information, contact Stenograph Sales Department, 1.800.323.4247 or 1.630.532.5100.

### Cloud Backup

[Cloud Backup](#) is a backup and restore service available in Case CATalyst. The service is exclusive to those who have Edge for Case Catalyst ("Edge"). Case CATalyst's Cloud Backup compresses and encrypts your files when uploading (backing up) and storing the files in the Cloud.

### Reporter Suite

Reporter Suite (<https://www.reportersuite.com>) is a third party application that allows users to manage reports, invoices, payees, expenses and time tracking from almost any device with an internet connection. At the time of this release, Reporter Suite's offering is limited to federal reporters. A state, freelance, proofreader and scopist version will be released soon. For more information about Reporter Suite, please see their web site.

[Finish 'em](#) e-mail options allow you to put in a Reporter Suite Invoice ID and when the e-mail is created, a link will be provided to the recipient to directly access the appropriate transcript page.

## Window Menu

The Windows menu contains features that affect the display of open Case CATalyst files.

### Cascade

Open Case CATalyst windows in cascade format, with one window overlapping another. For example, you have two transcripts open in Edit and a dictionary open. The Cascade command displays the three windows, one overlapping another.

### Tile

Open Case CATalyst windows with each window having equal display space. The amount of text that displays depends on how many windows are tiled and your Windows display settings. To change from tile view, click the full display icon in the upper right corner of one of the windows.

### More Windows...

Displays the currently opened files/functions in the Arrange Windows dialog box. The file/function that has the current focus is highlighted. You can highlight a different file/function and click Activate or OK to close the Arrange Windows dialog box and put the focus on the highlighted file/function. To close a window, highlight the file/function and click Close Window.

## Help Menu

The Help menu provides access to Case CATalyst Help and resources designed to assist you in learning how to effectively use Case CATalyst features. This includes the Case CATalyst manual, Case CATalyst [Command Summary cards](#), [Personal Command Summary Cards](#), [Integrated Video Training](#), [Self-Study Guides](#) and [Exceptional Extras](#) which cover such areas as Index Templates, Keyboard Maps and AccelerWriters.

The Help menu also provides quick access to the Stenograph website, what version of Case CATalyst you are using (Technical Support will probably ask) and e-Key information. Other software related access includes checking for Case CATalyst updates and activating CaseViewNet, an optional purchase.

For information about installing and configuring Case CATalyst, see the Case CATalyst Installation and Configuration Guide available from the CATalyst Downloads page on the Stenograph web site.

## Case CATalyst Help

Case CATalyst Help (F1) displays the Case CATalyst Help. The Case CATalyst Help contains comprehensive information about the Case CATalyst functions and features, including steps on how to perform various tasks such as reading notes, translating notes, editing, and managing job and dictionaries. Case CATalyst Help (F1) provides access to [CATalyst BCS](#) and [CATalyst VP](#) Help. There are steps that you need to follow and you want to print a topic, you can print it to your printer.

When opening Help, a pane opens to the right side of the Help information with four tabs:

- Contents displays the help topics based subject matter. You can click the plus (+) to expand the display to see more topics based on a specific subject matter. Click the minus (-) to collapse the display.
- Index displays the help topics alphabetically based on keywords.
- Search allows you to search for specific text or function.
- Favorites allows you to add specific topics to the list for easy access to them.

## Support Help Desk

Use Support Help Desk (**Alt + h, s**) to connect to the Stenograph's Solution Center. The Solution Center contains technical and how to information on Case CATalyst, CaseViewNet, CATalyst BCS and Stenograph writing machines and a limited amount of information on operating systems. To search for an article, click on one of the categories on the left side or use the search bar. Need to download a driver? Click the Downloads button. Have a question? Click the Ask a Question button to send an email to Technical Support. Have a suggestion? Send us an email at [support@stenograph.com](mailto:support@stenograph.com).

## Case CATalyst Manual

Help, Case CATalyst Manual (**Alt + h, m**) opens or displays the Case CATalyst manual in .PDF format. You can click on items in the Table of Contents and your cursor will move to that location in the PDF. You can also press **Ctrl + f** and search for specific text. You can also print selected pages of the manual if needed.

To display the manual, you need Adobe Acrobat Reader or a PDF reader installed on your computer.

## Command Summary Cards

Command Summary Cards contain a summary of Editing commands categorized by action or feature. There are three Case CATalyst versions and two CATalyst BCS versions. The Command Summary Cards are in electronic, PDF, format. You can open and display a card while editing or you can print a copy.

To access a Command Summary Card, press **Alt + h, o (Help/Command Summary Cards)**. Select a card from the submenu. The document displays in PDF format.

You can also customize your Keyboard Map and view/print a copy of the [Command Summary Card based on your customized Keyboard Map](#).

## Command Summary Cards

### 1 - Basic

A one page document that contains basic Editing keyboard commands for features such as cursor movement, global definitions, punctuation, search and spell check.

### 2 - Intermediate

A two page document that contains the Basic commands and other keyboard commands for features such as Brief It, Realtime, Keyboard and Macros.

### 3 - Advanced

A three page document that contains an extensive list of Editing keyboard commands. This includes all the commands contained in the Basic and Intermediate Command Summary Cards along with commands for most Edit functions.

### 4 - CATalyst BCS – Basic

A one page document that contains basic CATalyst BCS captioning commands such as editing, globals and sending scripts.

### 5 - CATalyst BCS – Advanced

A two page document that contain the basic CATalyst BCS commands along with more advanced commands for features such as NIK, spell check and Setup.

## Personal Command Summary Card

The Personal Command Summary Card feature displays your selected keyboard map assignments in a basic, intermediate or advanced command card version. For example, let's say that you have made many changes to the Default keyboard map. You can create a Command Summary Card (reference sheet) based on your own keyboard map assignments. You open your keyboard map, select View, then Personal Command Summary Card. Select the command summary version you want to view. The keyboard command summary card opens in your default browser. You can view the command summary card on the screen and/or select to Print Preview in your browser and then print it (landscape format is best).

The Personal Command Summary Card feature is available from the View menu when in a keyboard map and also available from the Help menu in any function where you may select any keyboard map. The Personal Command Summary Card always displays the current keyboard map assignments. In other words, if you make changes to your keyboard map at a later date, you simply select Personal Command Summary Card to see the latest version of your keyboard map.

If your e-Key license includes the BCS option, in addition to Basic, Intermediate and Advanced command summary card versions, the BCS Basic and BCS Advanced versions are available.

1. To view or print a personalized command summary card, do one of the following:
  - Open your keyboard map, select View and then Personal Command Summary Card.
  - From anywhere in Case CATalyst, select Help, Personal Command Summary Card.
2. Select Basic, Intermediate or Advanced.

If you selected Personal Command Summary Card from the help menu and you are not in a keyboard map, the Choose Keyboard Table dialog box displays. Select any keyboard map.
3. Your Personal Command Summary Card displays in your Internet browser.
  - You can display your Personal Command Summary Card while editing.
  - You can print your Personal Command Summary Card by selecting the Print Preview feature in your browser, confirm Landscape orientation and then click Print.
  - You can save your Personal Command Summary Card to an html file type which will always open in your default internet browser or a specific browser when using the Windows' Open With feature.
4. To close the Personal Command Summary Card display, press Ctrl + F4 or click the X in the upper right hand corner.

## View Readme

Displays the most recent Case CATalyst Readme file. The Readme file contains important information on the most recent update which includes changes to existing Case CATalyst features or might introduce a new feature. The Readme also contains a link to the current version Release Notes which explains in detail changes to the latest version. When you receive a new version of software (for example, you were using V17 and then V18 was released), you should always review the Release Notes to find out all the changes from the previous version.

## Integrated Video Training

Case CATalyst integrated video training (IVT), Essential Skills, provides instruction on basic steps necessary to produce a transcript, conduct dictionary and file maintenance, modify page layout settings and create include files. Additional video training modules, Skill Boosters, provide video training on Case CATalyst features beyond the basics such as compressing and e-mailing job files, Seating Chart setup, modifying global definitions and using the Cat Scratch pane.

### Access a Training Video

1. From Manage Jobs, press **Alt + h, i (Help/Integrated Video Training)**. The Integrated Video dialog pane displays, by default, on the right side of the screen.
2. Double click a heading to expand the list of available videos.
3. Choose a topic. Click a video name or hover your cursor over a name to display a brief description of the video content. Double click a topic name to begin playing the video.

Case CATalyst automatically tracks your viewing selection. An empty star, ☆, next to the name indicates the video has not been played. A filled star, ★, indicates the video has been previously viewed. You can manually manage the viewing indicators by right clicking and selecting the appropriate option: **Mark as Viewed**, **Mark as Not Viewed**, **Clear All Viewed History**.

4. Once the video begins, use the Pause/Play button in the lower left corner of the video screen to temporarily pause the video and resume playback. To exit the video at any time, press Esc or click the **X** in the upper right corner of the video screen display.

### Essential Skills:

- 1 - Read Lesson Folder - Learn how to copy your steno notes from your writer and save them to a file on your computer.

Read Lesson 1 - Read Setup: Learn to select the correct writer and connection method required to transfer your steno notes from your writer.

Read Lesson 2 - File Selection: Learn to select one or more steno note file(s) to transfer to the computer.

Read Lesson 3 - Name and Save: Learn the do's and don'ts of naming jobs.

- 2 - Translate Lesson Folder - Learn how to match steno notes to dictionaries and use a variety of features to create a text file.

Translate Lesson 1 - Translate File: Learn how to translate a previously saved steno file.

Translate Lesson 2 - Translate Options: Learn about each of the Input options and how selecting or deselecting these options will affect translation results.

Translate Lesson 3 - Realtime: Learn how to connect your writer to the computer and translate in realtime.

- 3 - Edit Lesson Folder - Learn how to make corrections to translated text.

Edit Lesson 1 - Keyboard Map Selection: Learn the difference between standard and command-style keyboards.

Edit Lesson 2 - Edit Screen Elements: Learn to identify and access elements of the edit screen, including program tabs, toolbars, dialog boxes.

Edit Lesson 3 - Navigation: Learn how to position the cursor using the keyboard or mouse to items you wish to modify.

### Productivity Boosters

Delivery - Finish Em, Print Compressed to PDF, Print Steno Notes to PDF, Send Em Email.

Edit - Attachment Points, Cat Scratch, Changing Page Numbers, Concordance Index, Copy Table, Cycle Homophones, Dialog Box Settings, Dialog Pane Movement, Extended Characters, Hotspots, List Search Results, Redact, Regular Expression Search, Reveal Codes, Split Compound Word, Uncap Next, Undo, Undoing and Modify Globals, User Definitions, Word Definitions.

Manage Jobs - Custom Reminders, Dialog Box Font Size, Due Dates, Job States, Set Auto Recover.

Realtime - Automatic Time Reference, Hotspots, Quick Tran, Seating Chart, Suggest a Brief.

Writer - Archiving Raw Steno.

## Create Training User

The Create Training User feature automatically creates a new user with sample files that you can use for hands-on practice. The sample files are designed to accompany the [Integrated Video Training](#). When selected, Create Training User, creates a user with the name "Training" followed by the current user name. For example, you are in the user "Mike" and select Create Training User. Case CATalyst creates the user, "Training Mike," and automatically opens the new user.

If you select to create a Training user and that Training user already exists, you are prompted to overwrite existing files. You may want to overwrite existing Training user files if new Integrated Video Training become available.

### Create a New Training User

1. From Manage Jobs, press **Alt + h, t (Help/Create Training User)**. If any files are open, Case CATalyst prompts you to close them before creating the new user.
2. Case CATalyst automatically creates and opens the new Training user.
3. Select an Integrated Video Training to view and follow the practice file information at the end of the video.

## Self-Study Guides

The Case CATalyst Self-Study Guides, available from the Help menu, can assist you in learning how to use basic Case CATalyst skills and other Case CATalyst features. These guides are in electronic PDF format. You can view and print the guides.

To access the self-study guides, press **Alt + h, g (Help/Self-Study Guides)**. Select a guide from the submenu. The guide displays in PDF format.

### Self-Study Guides

### **AudioSync® Self-Study Guide**

Learn how to set up and use AudioSync to create a synchronized audio (.wav) file of realtime sessions. The guide covers using AudioSync with the current version of Case CATalyst; using AudioSync On The Go with the Luminex, Diamante®, élan Mira A3® or the Stentura® Fusion; and working with audio files recorded on another device.

### **Automatic Indexing Self-Study Guide**

Learn the Indexing format symbols and how to create customized index pages for your transcripts using the Build Index feature.

### **Basic Realtime Self-Study Guide**

Discover the basics of realtime translation, including setup and how to make use of Case CATalyst features to improve realtime translation accuracy.

### **Fields Self-Study Guide**

Gain an understanding of how fields can help to quickly and efficiently insert information for standard pages, parentheticals, headers and footers.

### **Essential Skills Self-Study Guide**

Learn to the essential skills of transcript production and file maintenance.

### **Index Template Wizard Self-Study Guide**

Learn how to use the Index Template Wizard feature to create customized index templates for use with the Build Index feature.

### **Number Conversion Self-Study Guide**

Learn how the Case CATalyst Automatic Number Conversion feature and number conversion definitions can help convert combinations of numbers and words such as time, dates, addresses and measurements to a specific format.

### **RealTeam Self-Study Guide**

Learn how to use RealTeam to enable you and your team to edit a job simultaneously during realtime translation and/or after translation.

### **Speaker Features Self-Study Guide**

Learn how to identify speakers before and during translation using the EZ Speakers Dictionary, easily add or modify speakers in Edit using the Speaker List and take advantage of the Seating Chart during Realtime.

## **Exceptional Extras**

The Exceptional Extras feature, available from the Help menu, include step-by-step instructions to assist you in effectively taking advantage of certain Case CATalyst features beyond the basics. All instructions are in PDF format. An additional file, *Extras.zip*, contains Case CATalyst files such as dictionaries, keyboard maps and macros, which correspond to the instructions.

To access instructions for a topic, press **Alt + h, e (Help/Exceptional Extras)**. Select a topic from the submenu. The document displays in PDF format.

## Exceptional Extras Topics

- AccelerWriters
- Dictionary Keyboard Maps
- Edit Macros
- Edit Keyboard Maps
- Fingerspelling Dictionary
- Index Templates.
- The Restore Extras.zip file contains additional files that correspond to the appropriate Exceptional Extra guides.

## Open Device Manager

Open Device Manager is now available on the Help menu. If you need to verify a COM port setting or some other device, click Help and then Open Device Manager (**Alt + h, d**). Windows Device Manager opens. Technical Support may need access to Device Manager while troubleshooting.

## Open User In Windows Explorer

Open User in Windows Explorer is now available on the Help menu. If you want direct access to your user files in Windows Explorer (File Explorer in Windows 8), select Help and then Open User in Windows Explorer (**Alt + h, w**). Windows Explorer (File Explorer in Windows 8) opens displaying the contents of your user. Technical Support may need access to your user files in Windows Explorer (File Explorer in Windows 8) while troubleshooting.

## Stenograph Home Page

Stenograph Home Page (Alt + h, p) opens or displays your Internet Web Browser to the Stenograph Home page, [www.stenograph.com](http://www.stenograph.com). The Stenograph Web site provides, for example, updated product information and internet shopping, Technical Support's Solution Center where you can search for articles concerning Case CATalyst or your steno machine, product downloads, contact information for Stenograph's Certified Training agents and more.

Stenograph welcomes your product ideas for our existing products or something new. You can easily make an enhancement request via the Stenograph web site by selecting Home and then Contact Us or simply click the following link: <https://www.stenograph.com/contact-us>. Enhancement requests are periodically reviewed by members of Stenograph's Development Department for consideration for future versions and/or products.

## Check for Updates

Check for Updates connects to a special Stenograph internet site and compares your Case CATalyst program files against the most currently released files. Check for updates is available from the Help menu and also available in the [About Case CATalyst](#) dialog box. If your files are not current, you are prompted to install the new program files. At the same time the updater is checking for updates, your e-Key license is also being updated if needed.

When the option, [Check for Updates Enabled](#), is active, the Check for Updates feature is enabled on the Help menu. When you select Check for Updates and an update is available, a message displays prompting you to update the software. Some organizations, such as schools, need to maintain the control of the Case CATalyst software version being used and may want to disable the Check for Updates feature.

An active Internet connection is required to update Case CATalyst software. If you do not have an Internet connection on the Case CATalyst computer, follow the instructions for [No Internet Connection to Update Case CATalyst](#).

### Update Case CATalyst Program Files

You can check for updates at any time using the Check for Updates feature. You must have an active Internet connection.

1. From Case CATalyst, press **Alt + h, u (Help/Check for Updates)**. Case CATalyst begins checking for updates.
2. When an update is found, you are prompted to install the files. Select **Yes**. Case CATalyst automatically closes and the program files install. The update must completely finish installation before any of your system files are updated. If you lose connection to the Case CATalyst web site before the update completes, your current version is not modified. When you reestablish connection, the update continues from the point the connection was lost.
3. When installation completes, the Case CATalyst Updater screen displays. By default, the option to display Case CATalyst when finished is selected.
4. Click **Finish** to close the dialog box.
5. Any existing application files replaced by the update are stored in the Case CATalyst folder within the subfolder, SGUpdateBackup. The Case CATalyst folder is the location where Case CATalyst is installed, such as CAT4.

### No Internet Connection to Update Case CATalyst

When an internet connection is not available on the computer running Case CATalyst, you can download the update directly to a computer with Internet access and then copy it to a flash drive or memory stick for transfer to the Case CATalyst computer. Downloading directly to flash drive or memory stick may significantly increase the download time.

You cannot copy the update to a 1.44 floppy diskette. The update does not fit.

### Copy the Stenograph Download Updater

1. On the Case CATalyst computer, using Windows Explorer or My Computer, navigate to the folder where Case CATalyst is installed. This is often the CAT4 folder.
2. Locate the **SGDLUpdate.exe** file. Depending on your Windows settings you may not see the ".exe" extension.
3. Using Windows conventions, copy the **SGDLUpdate.exe** file to your flash drive or memory stick.
4. Remove the flash drive or memory stick from the Case CATalyst computer and insert it into the computer with Internet access and availability.

### Download the Update

1. On the computer with Internet access and availability, establish an Internet connection.

2. Make sure all applications are closed.
3. Using My Computer or Windows Explorer, locate the **SGDLUpdate.exe** file on the flash drive or memory stick.
4. Double click the **SGDLUpdate.exe** file. The Case CATalyst Version X (where X is the actual version number) Download Update screen displays.
5. Click **Next**. The Choose Save Location screen displays.

The *Destination Location* field indicates the location where the downloaded file is saved. If necessary, use **Browse** to identify another location. The default location is the Desktop.
6. Click **Download**. CaseCATalystUpdate.exe downloads to the specified location. This may take a few minutes. The download speed depends on your internet connection.
7. At the Completed screen, click **Finish**.
8. Copy the **CaseCATalystUpdate.exe** to the flash drive or memory stick. When the copy is complete, remove the flash drive or memory stick from the computer.

### Install the Update

1. Insert the flash drive or memory stick into the Case CATalyst computer and use My Computer or Windows Explorer to copy the **CaseCATalystUpdate.exe** onto the computer.
2. Double click the **CaseCATalystUpdate.exe** file. The Case CATalyst Version X Update Installation screen displays.
3. Click **Next**. The Choose Previously Installed Location screen displays. Confirm the current location of Case CATalyst. For example, C:\CAT4. If necessary, use **Browse** to locate a different folder.
4. Click **Update** to install the update. The Installing screen displays with a progress bar as the updated files install.
5. At the Completing the Case CATalyst Version X Update Installation screen, click **Finish**.

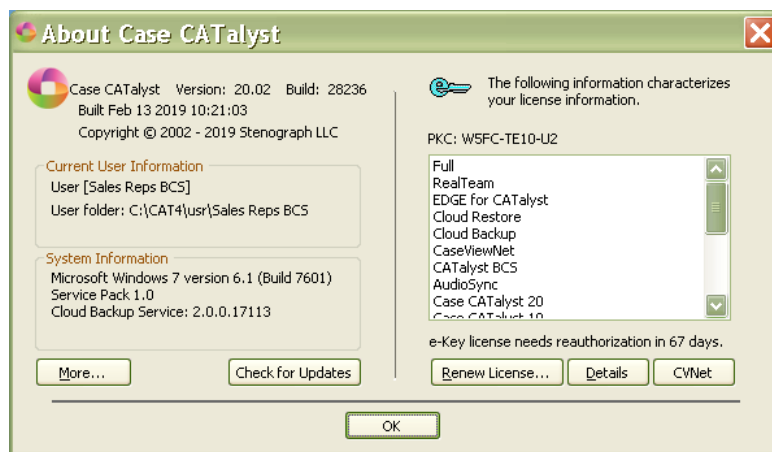

Any existing application files replaced by the update are stored in the Case CATalyst folder in the subfolder named SGUpdateBackup. The SGUpdateBackup folder is located where Case CATalyst is installed.
6. To review changes in the software, start Case CATalyst and select **Help, View Readme**.

### About Case CATalyst

About Case CATalyst (**Alt + h, a**) displays the About Case CATalyst dialog box. On the left side of the dialog box, the following information displays: Case CATalyst software version, copyright information, the current user name and user root information, and Windows operating system information. When speaking with a technical support representative, you should have the Version and Build information available. You can check for current updates by clicking the [Check for Updates](#) button. When you check for updates, your e-Key will also be updated if needed.

- Case CATalyst Version and Build information.
- Current User name and User path.
- System Information including the version of Windows and Windows service pack information.
- More button provides acknowledgment to third party opus and zlib.

- Check for Updates allows you to manually check for updates to Case CATalyst. An update could be for the current version of CATalyst you are using or it could be an update to the next version of Case CATalyst. If that is the case, you will be prompted to select your action.
- Your PKC (Product Key Code) identifier (e-Key).
- Your e-Key license information including optional software activation.
- Renew License... allows you to reauthorize your e-Key.  
Your e-Key is updated to the next reauthorization date or upgraded to change an Edit to Full or add CATalyst BCS or CATalyst VP or to authorize for the next major release of Case CATalyst, if eligible.
- Details gives information about your e-Key license such as when licenses are due to be renewed or expire.
- Get CVNet button allows you to purchase or renew your CaseViewNet license.

## Getting Started

During the Case CATalyst installation, you typed a user name. You will want to access that user to [install your Personal Dictionary](#), and select a [page layout](#). These tasks are all performed from within the Case CATalyst software.

The first time you start Case CATalyst, you use the user name typed during installation of the Case CATalyst software.

### Start Case CATalyst

1. Do **one** of the following:
  - Double-click the Case CATalyst shortcut icon on your desktop.
  - Complete these steps:
    - a. Display the Windows **Start** menu.
    - b. Select **Stenograph** from the Programs menu.
    - c. From the Stenograph menu, select **Case CATalyst**.
2. The Case CATalyst sign on screen displays.
3. Select the name you entered during installation and press **Enter**. Case CATalyst opens the Manage Jobs function in the user name you select. You can [create additional user names](#), if needed.
4. [Import or restore](#) your dictionary into Case CATalyst. If you have other files backed, you can restore those files also.
5. There are several short [training videos](#) covering basic and advanced Case CATalyst features. Stenograph encourages you to review the videos accessible from the Case CATalyst Help menu.

## Create a User Name

While installing Case CATalyst you typed a user name. Files are created and stored within a user name to maintain [file organization](#) in Case CATalyst. Once you access your user name, you can customize certain user options including those for reading notes, general dialog box appearance, Spell Check features, translate and edit options, user icon selection and more.

### Create additional User(s)

1. Open Case CATalyst.
2. Click the Users Level  icon. If this button is not available, you are already at the User Level.
3. Press **Alt + f, n, u (File/New/User)** to open the Create New User dialog box.
4. Use the following fields and options as necessary:

#### Look in

Displays the User Root level. (In most cases, the user root is C:\Cat4\usr).

#### User Name

Type a new user name. You can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: ' ~ ! @ # \$ % ^ & ( ) - \_ { }

Some characters are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , . | = < > ? \*

### Files of type

Displays the type of files displayed: users and cases.

### Copy Default Files

Check this box to copy the CATalyst default files to the new user name. The default files include: pre-made Layouts, Keyboard modes, Realtime Commands Sample Dictionary, and other System files.

Uncheck this box if you do not want to copy the Case CATalyst default files to the new user.

#### ☒ Case CATalyst Default Files

Case CATalyst default files are files that are loaded onto your system along with the software when you install Case CATalyst. Case CATalyst default files are located in the System File case. When you create a new user, you have the option to copy the default and other files to the new user. You can load your own default files in the folder so your specific files will be copied to all users on the system. For example, let's say you are a firm owner and you want specific layouts and EZ Speaker dictionary files loaded when a new user is created for a new reporter. This will help the reporter get up and running faster. You copy your files to C:\CAT4\DefaultUserFiles\System Files (if you installed CATalyst using the default settings) to the appropriate folder based on file type. The next time you create a new user, these default files will be copied to the new user.

There are several default files that include, but are not limited to:

- Realtime Commands Dictionary
- DialogSettings File
- EZ Speakers dictionary and EZ Speakers with Fields dictionary
- Index Templates case containing the six sample Index Templates: Index Template 1 - 2017, Index Template 1 - 2017 with [Bookmarks](#), Index Template 2 - 2017, Index Template 2 - 2017 with Bookmarks, Index Template 3 - 2017 and Index Template 3 - 2017 with Bookmarks.
- Keyboard Maps Default (internally) and CAT4
- Layouts case containing the sample layouts, Layout Sample 1, Layout Sample 2, CA layout, NY Court 25 Lines, Texas Layout 9 pitch and Texas Layout 10 pitch
- Macros Case
- Number Conversion File
- Phonetic Table
- Power Define Dictionary
- Steno Shortcut Table
- UserSettings File
- Captioning folder which contains a Default keyboard map and Number Conversion file to be used with CATalyst BCS.

### Change Icon

Select this option to display the Select User Icon dialog box where you can choose a different user icon for your user name. Choose an icon from the list or select Browse to choose an icon from a different folder. You can use almost any type of graphic.

Once you create a user, you can [change the user icon](#) at any time from Manage Jobs by selecting **Tools/Options/Manage Jobs General/Select User Icon**.

5. Press **Enter (Open)** to create the new user name.
6. If necessary, [change](#) to your user name.

## Changing Users

You can change to a different user once Case CATalyst is open. The current user name displays on the Title Bar.

### Change a User

1. From Manage Jobs, click the User icon  or press **Ctrl + t, s (Tools/Users Level)**. The User Level window displays.
2. Select the user name to which you want to change. Double-click the name or highlight the name and press **Enter**.
3. If there are files open in the user name you are switching *from*, a message box displays:

*Files are open using the current user's User Preferences.*

*To change users, these files must be closed,*

*or a new session of Case CATalyst must be started.*

*Please select one of these options.*

4. Select **one** of the following:

#### Close files

Close the files in the current user and open the selected user in the current Case CATalyst session. If there are unsaved changes in any of the open files, Case CATalyst prompts you to save them.

#### New session

Leave the current files open in the current Case CATalyst session and another session of Case CATalyst starts. Select the User name.

If you have Case CATalyst set to automatically Logon, the new session uses the Auto Logon settings and starts in the designated User.

5. Check the Title Bar to verify the change of user names.

## Importing a Dictionary

If your dictionary is not in Case CATalyst format, you must convert or import it. You can import your Personal or job dictionaries from:

- Case CATalyst 3.x
- RTF/CRE (Rich Text Format/Court Reporting Extensions).
- Stentura Dictionary

- Premier Power
- Eclipse

If you want to convert your files from Case CATalyst 3.x, you must import the Case CATalyst 3.x files. If Case CATalyst 3.x and Case CATalyst are on the same computer, you can import directly from the hard drive. If the Case CATalyst 3.x files are backed up, you can use the Restore function to unzip and import them at the same time.

If you sent your dictionary to Stenograph for conversion, use the Restore function in Case CATalyst. See the loading instructions included with your converted Stenograph dictionary.

You can also use the [Import](#) feature to import jobs.

### Import Your Dictionary

1. Press **Alt + u, i (Functions/Import)**. The Import dialog box displays.
2. In the Import Source field, choose **one** of the following depending on the type of dictionary you are importing.
  - [Case CATalyst 3.0](#)
  - [RTF/CRE Import](#)
  - [Stentura Dictionary](#)
  - [Premier Power Dictionary](#)
  - [Eclipse](#)

3. Locate and highlight the dictionary you want to import.

If you are importing a Case CATalyst 3.x personal dictionary, the file name is PERDICT\$.DCT. If the Case CATalyst 3.x dictionary is not on the same computer system as Case CATalyst, you must first backup and then unzip the dictionary on the Case CATalyst system.

If you are importing a RTF dictionary from TurboCAT®, a message displays prompting you to select whether the dictionary was from TurboCAT or CAPticator®. Your selection determines how Case CATalyst imports specific dictionary entries concerning format symbols for captioning.

If you are importing a RTF dictionary from an Eclipse® CAT software program, you may be prompted to import AI (conflict resolution) information. If you select Yes, the information is stored in the SecondChoice Conflict Resolution database and will be used if you select the Second Choice conflict resolution option in Translate.

4. Press **Enter (OK)**. The import completes. If you are importing a 3.x personal dictionary or the dictionary already exists in Case CATalyst, the Save As dialog box displays. The Personal Dictionary automatically imports into the System Files case.
5. In the Save dialog box, in the File name field, do **one** of the following:
  - Keep the default name.
  - Type a new name.
6. Press **Enter (Save)** to save the dictionary in Case CATalyst.
7. Run [Dictionary Verify](#) to check the dictionary entries for any problems. When Verify Dictionary is finished, a text file (.txt) displays the Dictionary Verify Report. Select **File/Exit** to close the report dialog box.

## Viewing and Modifying a Layout

A Layout controls how the text displays on the page when you print. This includes settings such as the right and left margins, the number of transcript lines per page, characters per inch, placement for Q and A, headers/footers, etc.

You can review, modify and use the default [layouts](#) provided with Case CATalyst, create your own layout, restore a layout or import a page layout from another CAT system. All layouts are stored in the Layout case which is located in the System Files case. You can also [modify the layout](#) of a particular file while editing by pressing **Alt + o, l** (Format, Modify Layout...).

When a layout uses the characters per inch setting, the Paragraph Style tab of a layout displays the “characters per line” information immediately below the Continuation field. As you change your margin settings, if you are using characters per inch in your layout, you will see the number of characters per line adjust for any particular paragraph style.

In addition, if you need help determining your right margin when you are required to use a specific number of characters per line, a Characters Per Line Assistant is available on the Format menu in the Layout function. This feature may be helpful to set the right margins for all your paragraphs when creating a new layout or modify an existing layout. If you are modifying an existing layout, in order for the Characters Per Line Assistant to be active on the Format menu, your cursor focus needs to be in the sample transcript portion in the layout, not in the settings pane.

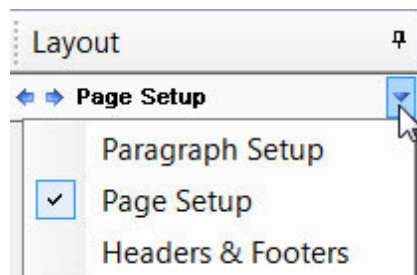

### Open the Layout Function

1. From Manage Jobs, press **Alt + u, l** (**Function/Layout**). The Layout function opens with the Open Existing Document dialog box.
2. Select the layout you want to view and press **Enter (OK)**. The preview transcript page and Layout dialog pane displays.

The Layout dialog pane on the right displays layout setting on three panes, [Paragraph Setup](#), [Page Layout](#) and [Headers and Footers](#). Paragraph Setup includes left and right margins, ending punctuation, tab settings and font style settings for each paragraph style. Page Layout includes line number position, paper size, top and bottom margins, timestamps and transcript box settings. Headers and Footers includes page number and header/footer text positions.

The sample transcript displays text using the current applied layout settings. When you make changes to the layout settings and click Apply, the preview text changes to reflect the settings.

3. View or modify layout settings. Make necessary entries on each of the Layout settings screens in the Layout dialog pane: Paragraph Setup, Page Layout and Headers and Footers. To switch screens, use the Left and Right arrows or click the down arrow to select a Layout group.

4. Close the current Layout, press **Ctrl + F4** (**File/Close**).

5. Exit the Layout function, select **File/Exit (Alt + f, x)**.

## Basic Transcript Production

Basic transcript production includes reading the steno notes you transcribed or writing with your writer connected to your computer into Case CATalyst, translating the steno notes (not needed if your writer was connected to CATalyst and writing [realtime](#), editing the translated text file, printing the edited text when complete, updating your dictionary and backing up your files. The Basic Transcript Production topics includes instruction on the basic steps to read and manage steno notes, translate and edit your notes, delivery, and file and dictionary management.

Stenograph provides a variety of additional tools to assist you in learning the essential transcript production skills as well as other more advanced Case CATalyst features. They include:

- Case CATalyst [Integrated Video Training](#). These short step by step training tutorials includes topics that cover essentials skills necessary to produce a transcript, conduct dictionary and file maintenance, modify page layout settings, and create include files. The Skill Booster videos offer training on effectively using Case CATalyst features that take you beyond the basics, such as using the [Cat Scratch](#) pane, [Hotspots](#), [Seating Chart](#) and [Suggest a Brief](#) features.
- Case CATalyst [Self-Study Guides](#) can assist you in learning how to use basic Case CATalyst skills and other Case CATalyst features such as realtime, automatic indexing and fields.
- [Exceptional Extras](#) include step-by-step instructions to assist you in effectively taking advantage of certain Case CATalyst features beyond the basics such as AccelerWriters and [Macros](#).

### Step 1: Sign On To Case CATalyst

To begin transcript production in Case CATalyst sign onto the program:

1. Double-click the Case CATalyst icon displayed on your desktop or from the Start Menu, select **Programs/Stenograph/Case CATalyst**.
2. When Case CATalyst opens, the User level screen displays with a list of current users. Double-click your user name to open a Case CATalyst session in your user.

If you are the only user on your system, you can set the [Auto Logon](#) option in Manage Jobs to bypass the User level screen when starting case CATalyst.

### Step 2: Reading Steno Notes

If you are writing with your steno machine only and not writing realtime (your writer connected to your computer), you must read your steno notes onto your computer for Case CATalyst to translate them. Depending on your steno machine, the [Read Notes](#) function in Case CATalyst enables you to copy your steno note files onto the hard drive of your computer from a Data SD card, diskette, USB cable or direct cable connection. When you read your steno notes from your writer, the steno notes are **copied** to Case CATalyst and the original file(s) remains on the writer unless you format the writer's media or clear the writer's memory.

#### Read Your Steno Notes

1. Press **Alt + u, r (Function/Read Notes)**.
2. At the [Read Setup](#) dialog box, select the correct options and press **Enter (OK)**. In the Device field you need to select your steno machine, in the Method field, you need to select how you are connected to you steno machine (if appropriate) or what media you are using and in the Drive/Path field, you need to select the drive for the media (if appropriate). Only specific fields are available

based on what you select Device and Method fields. For example, if you have a Luminex and you want to copy your notes from your Luminex to your computer via the USB cable, you would select Luminex in the Device field, USB in the Method field and Data SD Card in the Drive/Path field.

3. At the Read Selection dialog box, select the steno note files you want to read.
4. Click **Individual** or **All In One** to start the Read process.
5. At the Read Save dialog box, type a job name or select an existing name and press **Enter (Save)**.

### Step 3: Translating Steno Notes

After reading steno notes into the computer, the next step to produce a transcript is to translate the steno notes you have read onto your computer. The [Translate and Edit](#) function matches steno outlines in the note file to entries in the Personal Dictionary, the Update Area, if selected for use, and any selected case and job dictionaries. You can choose which dictionaries you want to use and then set the dictionary priority, which determines the order in which the dictionaries are applied during translation. [Translate options](#) allow you to customize certain features for each translation activity to meet your particular writing style and job needs.

You can translate notes from a file or translate while writing realtime (your steno machine connected to your computer and writing just to your CATalyst screen or sending to a litigation package such as [CaseViewNet](#), iCVNet or CaseViewNet Browser edition). Once translation starts, you can begin editing immediately.

#### Begin Translation

1. Press **Alt + u, t (Function/Translate & Edit)**.
2. At the Translate dialog box, select the steno note file you want to translate, the page layout you are using and select additional dictionaries if necessary.
3. Press **Enter (OK)** to begin Translate. If this is the first time you are translating a file, Case CATalyst prompts you to complete the Translate Wizard. Follow the prompts to select Translate options.
4. Press **Enter (OK)**. Once translation starts, you can begin editing the file.

### Step 4: Editing

Once you have read and translated your steno notes, the next step is to edit the translated text. The [Edit](#) function allows you to make changes to translated or typed text. Edit contains several tools and features, which help you make the necessary corrections. You can define untranslates, resolve conflicts, and make other necessary changes.

Using the Scan (F8) key, you can quickly move to the next untranslate or conflict. Untranslates are steno outlines that have not yet been defined in your dictionary. Conflicts are multiple words that display together when the steno outline has more than one definition.

You can also have partial untranslates. These are words which partially translate and display both text and steno on the screen. Mistranslates are words that translate but need to be redefined. Many translates, untranslates, and mistranslates are defined and placed into a dictionary so that the next time you translate a steno note file, text for those words displays on the screen.

A dictionary definition consists of steno outlines with text definitions that are contained in a file. When you define steno, all identical occurrences of the word in the file are changed or "globalled". [Global definitions](#) are placed into a dictionary for future translations.

Global definitions made in Edit are placed in the selected dictionary, the Update Area, if selected for use, and the global table. By default, Case CATalyst sends D-Defines to the Personal Dictionary. You can choose to place a job specific definition that you do not want in your Personal Dictionary into a Case or Job dictionary.

Because editing involves typing, it is often easier and faster to press a keyboard command than click a toolbar button. Editing instructions focus on using the keyboard. You can customize your keyboard assignments using the [Keyboard Map](#).

### Begin Editing

1. Press **Alt + u, e (Function/Edit)**.
2. Select the file you want to Edit and press **Enter (Open)**. [Command Summary Card](#) (Help, Command Summary Cards) are available for viewing and/or printing that show you the default editing commands.

### Step 5: Delivery

When transcript editing is complete, you are ready for delivery. Delivery includes printing your completed transcript. The [Print](#) function in Case CATalyst displays the Print dialog box where you can send the current file or selected portions of the file to the printer in either hard copy or a PDF (Portable Document File).

Delivery may also include creating an ASCII file of the completed text. ASCII is an acronym for American Standard Code for Information Interchange. In all ASCII files, formatting attributes such as bold, underline, italics, subscript and superscript text are removed. You can create the ASCII file on a thumb drive or on a hard drive. There are additional output formats when using the [Export](#) feature.

### Print a Job

1. Press **Alt + u, p (Function/Print)**.
2. In the Print dialog box, select the:
  - job you want to print
  - type of output - Draft, Final or [Compressed](#)
  - confirm print options for Draft, Final or Compressed
  - manual duplex (only needed if you do not have a duplex printer)
  - select [PDF options](#) if printing to the Stenograph PDF Printer
  - entire document or range of pages
3. Press **Enter (Print)** to begin printing.

### Step 6: Job Management

Backing up is the most important aspect of managing your jobs. The [Manage Jobs](#) function in Case CATalyst enables you to back up your jobs, creating an additional copy of your work which you can use for storage, transferring files to another system or safeguarding your files. You can also backup your entire user using the [Back Up User\(s\)](#) feature.

The Backup function compresses a copy of the selected files and saves them to a specified name with a .ZIP extension. You can also transfer backed up jobs to a thumb drive, another Case CATalyst system, or send Case CATalyst files electronically.

As a standard procedure, you should keep backup copies of your personal dictionary (at least two copies) and transcript files including subfiles such as notes, text, job dictionaries, etc. It is suggested that you backup your System Files case which contains Personal Dictionary, Index templates, Macros, Keyboard Maps, Layouts, Phonetic table, Power Define dictionary, and Steno Shortcut table. You should also keep backup copies of your Include files.

If you have Edge for Case CATalyst, you also have [Cloud Backup](#). Cloud Backup is a backup and restore service available in Case CATalyst. The service is exclusive to those who have Edge for Case Catalyst ("Edge"). Case CATalyst's Cloud Backup compresses and encrypts your files when uploading (backing up) and storing the files in the Cloud. Case CATalyst's Cloud Backup offers you a simple setup, an automatic pause during realtime and confidence that your CATalyst files are being backed up and are available to you in the event you need to restore them. CATalyst's Cloud Backup is built into your Case CATalyst software and backs up the files in the selected users/cases. Specific files types can be also be excluded. For example, if you don't want your .wav (audio) files backed up since audio files can be very large, you can exclude .wav files from being backed up to the cloud.

## Backup Files to removable media or hard drive

1. Press **Ctrl + b** (**Tools/Backup**).
2. Click the [Options](#) button to customize your backup.
3. On the left hand side of the dialog box, select the files you want to backup.
4. On the right hand side of the dialog box, select the destination and press **Enter** (**Save**).

## Step 7: Dictionary Management

It is important to maintain your Personal Dictionary. A well maintained Personal Dictionary improves the speed and accuracy of translation. The [Manage Dictionary](#) function allows you to create and modify any Case CATalyst dictionaries. You can insert, modify, and delete entries in your:

- [Personal Dictionary](#)
- [Case Dictionaries](#)
- [Job Dictionaries](#)
- [Update Area](#) (if selected to use)

You can also create a core list, spell check and print dictionary entries. Follow Stenograph's [guidelines](#) to help you successfully maintain your dictionary entries.

## Open a Dictionary

1. Press **Alt + u, d** (**Function/Dictionary**).
2. Select the dictionary you want to maintain and then press **Enter** (**Open**). The Personal Dictionary is stored in the System Files case.

## Read and Manage Notes

You must read your steno notes (transfer from your writing machine) your steno notes into Case CATalyst to translate them if you are not writing [realtime](#) (to yourself or clients). Depending on your steno machine, the [Read Notes](#) function in Case CATalyst enables you to copy your steno note files onto the hard drive of your computer with a USB cable, from a Data SD card or diskette; or using a direct cable connection.

The [Manage Notes](#) function allows you to review your steno notes, if desired and predefine steno strokes prior to translation for better results. You can make Personal, Case, and Job dictionary definitions.

### File - New - Read Notes

To transfer your steno notes files from your writing machine to Case CATalyst, you can select **File, New, Read Notes** (Alt + f, n, r), the [Read Setup](#) dialog box displays. You can also click the Read Notes icon on the Function toolbar or click Functions, **Read Notes** (Alt + u, r).

### Read Notes

Read Notes is a function in Case CATalyst that enables you to copy your steno note files from your writing machine to Case CATalyst. Depending on your steno machine, you can copy steno notes to the hard drive on your computer from via diskette, CompactFlash or SD Card, thumb drive, optical drive, direct serial cable or USB cable. See [Read Setup](#) for specific instructions on each method. The following steno machines are compatible with Case CATalyst:

- Luminex™
- Diamante®
- Fusion
- élan  
Includes élan Mira® and élan Cybra®
- Stentura  
Includes 200/400 SRT
- SmartWriter®
- Wave®
- Protégé®
- 200/400 SRT (Use Stentura option to Read notes)
- StenoRAM III, III+, Ultra
- Flash Writer
- Baron TX (Transcriptor X) version 4.4 or higher

You can set or change your [Read options](#) in Manage Jobs through Tools/Options/User Settings/Read Settings or in the Read Setup box each time you read notes onto your computer.

### Open Read Notes

- On the Function Bar, click the Read Notes  icon.
- From the Menu Bar, select **File/Read** or **Function/Read Notes**.
- Press **Alt + u, r (Functions, Read)**.
- Select **File, New, Read Notes (Alt + f, r)**.

## Read Setup

Read Setup determines the settings necessary for reading steno notes from your writing machine into Case CATalyst. Settings depend on your writer and your method for reading notes, such as USB cable or Data SD card. Depending on the selected method, fields in the Read Setup dialog box are unavailable when they are not applicable.

Read Setup options are customizable by user and remain until you change them. The Read Setup dialog box with the Read options is available each time you read steno notes. If you use the same method each time you read notes, such as USB or Data SD card and are the only user on your system, you can select to by-pass the Read Setup dialog box.

For steno machines not manufactured by Stenograph, refer to your vendor for more information about read settings. Additional information may also be available on the Stenograph Solution Center at <http://www.stenographsolutions.com/solution>.

Access Read Setup options:

- in Manage Jobs. Press **Alt + t, o, r, s (Tools/Options/Read/Settings)**.
- in Manage Notes. Press **Alt + t, o, r (Tools/Options/Read Settings)**.
- when reading notes, if the Option to remember settings has been previously selected to prevent the display of the Read Setup dialog box. Press **Alt + u, r (Function/Read Notes)**.

## Read Setup Options

Make a selection from the drop down list or check the box next to an option to select it. When finished with all your changes, select **OK**.

### Device

Select the steno machine used to create the note file or connected to your computer. Steno machines listed are Luminex, Diamante, Fusion, élan, Stentura, SmartWriter, Wave, Protégé, StenoRam III, III+, Ultra, FlashWriter and Baron TX.

### Method

Select one of the following methods for reading steno notes. Only methods applicable to the selected steno machine selected in the *Device* field are available for selection.

#### Direct (cable)

Read steno notes through a serial cable directly connected between your steno machine and your computer. You can read notes from a disk in the disk drive of the steno machine or read notes from the steno machine's memory, depending on your steno machine.

You cannot use the Direct (cable) option for the Luminex, Diamante®, élan Mira A3 or the Stentura Fusion. To read steno notes directly from these writing machines via USB cable, select **USB** as the Method.

#### Disk Drive

Read steno notes from a diskette or Data SD card onto your computer.

### **Backup Flash**

Read steno notes from the Luminex or Diamante® Backup SD card or a élan Mira CompactFlash card or Backup SD card. This option is only available when you select Luminex, Diamante® or élan Mira in the *Device* field.

### **USB**

Read steno notes from the steno machine to your computer via USB cable. This option is available when you select Luminex, Diamante®, élan, fusion or Protégé in the *Device* field. To connect the writer using a USB cable, you must be using Case CATalyst version 4.x or higher and, depending on your steno machine, have installed the Luminex, Diamante®, élan Mira or Stentura Fusion, Stentura Protégé USB driver on your computer. See your steno machine documentation for information about the installing the USB driver.

#### **Luminex/Diamante®/élan Mira A3/Stentura Fusion**

If you are connecting a Luminex, Diamante®, élan Mira A3 or Stentura Fusion, the Data SD card must be inserted in the Data SD slot on the steno machine to read via USB cable. Confirm selection, **Data SD card**, in the *Drive/Path* field. *When running Windows 10, you may need to set Case CATalyst to Run as Administrator in order for Windows to recognize the SD Card.*

#### **élan Cybra Student/Professional/Stentura Protégé,**

If you are connecting an élan Cybra Student, élan Cybra Professional or a Stentura Protégé, select the **RAM** option in the *Drive/Path* field.

### **Browse**

Read steno notes from a location on your computer other than the selected drive. For example, you may want to use this option if you have stored your steno notes in a location on your hard drive outside of Case CATalyst.

### **Drive/Path**

Select one of the following:

#### **The appropriate drive letter**

Read steno notes from a diskette, Backup SD card, Data SD card or Memory. *When running Windows 10, you may need to set Case CATalyst to Run as Administrator in order for Windows to recognize the Data SD or Backup SD Card.*

#### **Data SD**

Read steno notes from a Data SD card via USB cable.

#### **RAM**

Read steno notes from the writer's RAM via USB cable. Select this option if you are reading notes from an élan Cybra Student, élan Cybra Professional or a Stentura Protégé.

#### **Memory**

Read steno notes from the Wave's memory via USB cable.

### **Browse**

Identify the folder path to read steno notes from another location, such as a folder on your hard drive.

**Port**

When reading steno notes through a cable, select the appropriate COM port. For more information on COM or serial port, refer to the user guide for your computer.

**Automatically break files during Read**

Check this box to automatically break the steno note file into multiple note files during the Read process. In the Breaking Stroke field, enter the steno outline you use to designate a file break.

**Breaking Stroke**

If you do not turn your steno machine off during proceedings but write a stroke several times to indicate the start or end of files, you can have Case CATalyst recognize the separation stroke during the Read process and prompt you for a file name.

Type the steno outline, in this field, that you write on your steno machine to indicate the end or beginning of proceedings. You enter the steno outline once here. In the job, you must write this steno outline as least five consecutive times for Case CATalyst to create a file break. For example, you enter EPBD in the Breaking Stroke field. In the job, on your steno machine you write EPBD/ EPBD/ EPBD/ EPBD/ EPBD.

**Option**

Check this box to automatically use the current setting whenever you select to read notes. Case CATalyst bypasses the Read Setup dialog box when you select to read notes.

To deselect this feature, from Manage Jobs, press **Alt + t, o, r, s (Tools/Options/Read/Settings)**. Uncheck this box and then press **Enter (OK)**. When deselected, the Read Setup dialog box displays each time you select the Read Notes function.

**Advanced**

Display the [Advanced Read Options](#) dialog box where you can make additional Read settings.

**Read Notes to Case CATalyst**

When you select to read notes, the [Read Setup](#) dialog box displays so that you can set your Read options. Depending on your steno machine and method of connecting, some options are not available.

If you are using a Baron TX, reading from an élan Mira CompactFlash, élan Mira Backup card or a Luminex or Diamante® Backup SD card, refer to the appropriate topic for specific Read instructions:

- [Read from Baron TX](#)
- [Read from élan Mira CompactFlash or élan Mira Backup Card](#)
- [Read from Luminex or Diamante SD Backup Card](#)

**Read Your Steno Notes**

1. Prepare for reading notes. Depending on your steno machine, do one of the following:

**Serial Cable**

Connect the appropriate serial cable to the steno machine and the computer and turn On the steno machine. When using a USB to serial adapter to connect to a COM (serial) port on your computer, use the *Direct (Cable)* option.

**USB Cable**

Turn On the computer and steno machine. Connect the appropriate end of the USB cable to the steno machine and the computer.

### Diskette

Insert the disk into the disk drive of your computer.

### Data SD

Insert the Data SD card into the USB Flash Drive reader and insert the reader into a USB port on your computer. If you have an SD slot built into your computer, insert the Data SD card directly into the computer SD slot.

2. Press **Alt + u, r (Function/Read Notes)**. The Read Setup dialog box displays.
3. Select necessary [Read Setup](#) options.
4. When finished selecting options, press **Enter (OK)**. The Read [File Selection] dialog box displays with the following information. You can sort by clicking on a column heading.

### Job Name

Each job name indicates when the steno file is ended. On some steno machines, this may be when the steno machine is turned On and Off.

### Date

The start date and time of the steno note file determined by the clock on the steno machine.

### Job Dictionary

Indicates if there is a job dictionary associated with this steno note file. This option is only available for steno note files created on a steno machine that allows the user to make job dictionary entries, such as the élan Mira, Stentura Fusion, Stentura 8000, or 8000LX.

### Time File

Indicates if there is a timestamp file associated with this steno note file. This option is only available for steno note files created on a steno machine that writes a timestamp file.

### Strokes

Indicates the approximate number of steno strokes in the file.

### Audio

Indicates if there is an audio file associated with this steno note file. This option is only available for steno note files created on a steno machine that writes audio files, such as the élan Mira A3 and Stentura Fusion.

5. In the *Destination* section, select **Read Notes**.
6. Do any of the following:
  - a. Highlight a single file to read.
  - b. Highlight multiple files by holding the **Ctrl** key as you click files with the mouse.
  - c. Highlight consecutive files by clicking the first file, then holding **Shift** and clicking the last file.
  - d. Select all files by pressing **Ctrl + a**.
7. In the *Read Selected Files* section, do one of the following:

**Individually**

Read each selected file, along with the audio file if audio exists, into individual files, each with their own file name. Optionally, you can double click on a single file to automatically save it.

**All-In-One**

Read multiple files into one file. To read an audio file with a steno note file, you must select Individual. If you select multiple files that have an associated audio file, the following message displays: *When reading All in One, audio files will not be read with the steno.* Select one of the following options:

- Individual - read each selected file into its own file.
  - OK - read the selected files into one steno file without audio.
  - Cancel - stops the Read process and displays the File Selection dialog box.
7. The Reading Notes from dialog box briefly displays the status as the steno notes are read.
  8. The Read [Name and Save] dialog box displays. Make entries as necessary:

**Top Right Window**

The steno files you are naming.

**Bottom Right Window**

The steno notes contained in the selected files. Timestamps also display if your writer has the capability to generate timestamps. You can scroll through the entire note file.

**Look In**

Defaults to the current user. You can change the user by using the drop down arrow to browse for and select a different user. The folder that displays is where the note file is stored when it is read onto the hard drive.

**Center Window**

The existing Cases and files on your computer. If you want to place the steno notes into a particular Case, double-click the Case name.

**File Name**

Do one of the following:

**Save to a new file**

Type a name for the steno note file when it is stored on your hard drive. You can use upper and lower case letters, numbers and spaces in a file name. The following symbols are also valid characters: ' ~ ! @ # \$ % ^ & ( ) - \_ { }

Some characters are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , | = < > ? \*

**Save to an existing file**

Append or overwrite the new steno note file to an existing steno note file. Highlight the file to which you want to append or overwrite the new steno notes. The file name displays in the File Name field. Case CATalyst prompts you to append or overwrite.

Audio files can not be appended. When both the existing and the current steno note file have audio the audio files are not appended and audio is only available for the existing audio file. When two steno files have audio, it is recommended to read, translate and edit them individually. When the jobs are complete, you can merge the text files.

### **Files of type**

The type of subfile you are reading onto your hard drive. The default is a note file, .sgstn.

### **Cancel All Remaining Saves**

Check this box to cancel all remaining saves when you are reading multiple files or using the automatic break stroke and do not want to save the files.

9. Select **one** of the following:

#### **Save (Alt + s)**

Read and save the selected steno note file(s) onto the hard drive. If you selected an existing file name in the File Name field, a confirmation box displays prompting you to Append, Overwrite, or Cancel.

#### **Save and Edit Notes (Alt + e)**

Read and save the selected steno note file(s) onto the hard drive and then display the note file in [Manage Notes](#).

If you selected an existing file name in the File name field, a confirmation box displays prompting you to Append, Overwrite, or Cancel.

#### **Cancel (Esc)**

Do not read the selected steno notes and exit the Read [Name and Save] dialog box. A confirmation box displays. If you selected multiple files to save and want cancel the save for all of them, check the Cancel All Remaining Saves option.

## **Read Notes to PDF**

When reading steno notes, the Print to PDF option allows you to create an electronic copy of the selected note file or files. You may want to use this option if you use a paperless steno machine, such as the Luminex or Diamante®, and your jurisdiction requires a paper record. An SD card holds a large amount of files and the Print to PDF option provides a quick way to archive steno note files without having to read and name each one.

You can print individual files to PDF or combine several files into one PDF. Case CATalyst uses the steno note creation date and time to name the PDF files. When combining several steno note files into one PDF, Case CATalyst creates the PDF in date order listing the oldest steno note file first. The date and time of the first steno note file is used as the PDF file name. All PDF files created through Read Notes are stored in the My Documents folder on your computer. You can change the location for the files in the [Advanced Read](#) options.

When printed, the steno notes display in three columns. The beginning of each fold in the steno notes is highlighted. Timestamps, by default, are not included. You can change the number of columns that display and include timestamps by changing the settings in [Manage Notes Options](#).

If you are using a Baron TX, reading from an élan Mira Compact Flash, élan Mira Backup card or a Luminex or Diamante® Backup SD card, refer to the appropriate topic for specific Read instructions:

- [Read from Baron TX](#)

- [Read from élan Mira Compact Flash or élan Mira Backup Card](#)
- [Read from Luminex or Diamante® Backup SD card](#)

## Read Your Steno Notes

1. Do one of the following:

### Reading via serial cable

Connect the appropriate serial cable to the steno machine and the computer and turn the steno machine On. When using a USB to serial adapter to connect to a COM (serial) port on your computer, select this option.

### Reading via USB cable

Turn the computer and steno machine On. Connect the appropriate end of the USB cable to the steno machine and the computer.

### Reading via disk drive

Insert the diskette into the diskette drive of your computer.

### Reading via Data SD

Insert the Data SD card into the USB Flash Drive reader and insert the reader into a USB port on your computer. If you have an SD slot built into your computer, insert the Data SD card directly into the computer SD slot.

2. Press **Alt + u, r** (**Function/Read Notes**). The Read Setup dialog box displays.
3. Select necessary [Read Setup](#) options.
4. When finished selecting options, press **Enter (OK)**. The Read [File Selection] dialog box displays with the following information. You can sort by clicking on a column heading.

### Job Name

Each job name indicates when the writing machine is turned Off and On.

### Date

The start date and time of the steno note file determined by the clock on the writing machine.

### Job Dictionary

Indicates if there is a job dictionary associated with this steno note file. This option is only available for steno note files created on a writing machine that allows the user to make job dictionary entries, such as the élan Mira, Stentura Fusion, Stentura 8000, or 8000LX.

### Time File

Indicates if there is a timestamp file associated with this steno note file. This option is only available for steno note files created on a writing machine that writes a timestamp file.

### Strokes

Indicates the approximate number of steno strokes in the file.

### Audio

Indicates if there is an audio file associated with this steno note file. This option is only available for steno note files created on a writing machine that writes audio files.

5. In the *Destination* section, select **Print to PDF**.
6. Select the steno note file or files you want to read. Do any of the following:
  - a. Highlight the single file you want to read.
  - b. Highlight multiple files by holding the **Ctrl** key as you click files with the mouse.
  - c. Highlight consecutive files by clicking the first file, then holding **Shift** and clicking the last file.
  - d. Select all files by pressing **Alt + a**.
7. In the *Read Selected Files* section, do one of the following:

#### **Individual**

Read each selected file, along with the audio file if audio exists, into individual files, each with their own file name. Optionally, you can double click on a single file to automatically save it.

#### **All-In-One**

Read multiple files into one file.

To read an audio file with a steno note file, you must select Individual. If you select multiple files that have an associated audio file, the following message displays: *When reading All in One, audio files will not be read with the steno*. Select **one** of the following options:

- Individual - read each selected file into its own file.
  - OK - read the selected files into one steno file without audio.
  - Cancel - stops the Read process and displays the File Selection dialog box.
8. The Reading Notes from dialog box briefly displays the status as the steno notes are read. When finished, the Manage Jobs screen displays. Case CATalyst stores the PDF files in the My Documents folder on your computer, unless you have changed the destination location.

## **Read Baron TX Notes**

1. Be sure you connect your writing machine to the computer with a TX realtime cable and the writing machine is On.
2. Press **Alt + u, r (Function/Read Notes)**. The Read Setup dialog box displays.
3. Make the following entries:

#### **Device**

Select **Baron TX**.

#### **Method**

Case CATalyst automatically selects **Direct (Cable)**.

#### **Port**

Select the appropriate COM port on the Case CATalyst system for the realtime cable connection to the writing machine.

4. Press **Enter (OK)**. The Read From Baron TX dialog box displays.
5. Select one of the following and press **Enter (OK)**.

#### **Read All files into one Notes File**

Read multiple files into one file.

### Read Each File into a different Notes File

Read each note file into an individual file.

6. The Read [Name and Save] dialog box displays. In the File name field, type a name for the steno note file or select an existing file from the list to append to or overwrite.
7. Do one of the following:
  - Press **Alt + s (Save)** to save the note file.
  - Press **Alt + e (Save and Edit Notes)** to save the note file and then display it in [Manage Notes](#).

The Read [Name and Save] dialog box displays for each file, until you name all the files. If you selected an existing file name in the File name field, a confirmation box displays prompting you to Append, Overwrite, or Cancel.

## Read élan Mira Compact Flash/Backup SD Card

Depending on your élan Mira, the writing machine uses a CompactFlash or Backup SD card to store steno notes and timestamps for backup. You can read the steno notes from the CompactFlash or Backup SD card into Case CATalyst in the event the writer is not operable. This applies only to Case CATalyst.

### Read Your Steno Notes

1. Turn the élan Mira **Off**.
2. Do one of the following:
  - Remove the CompactFlash card and insert it into the PC card adapter. Depending on the type of PC card adapter you have, insert the PC card adapter into a PC card slot or USB port on your computer. If you have a CF slot built into your computer, insert the CompactFlash card directly into the CF slot.
  - Remove the Backup SD card and insert the Backup SD card into a USB Flash Drive reader and insert the reader into a USB port on your computer. If you have an SD slot built into your computer, insert the SD card directly into the SD slot on your computer.
3. Windows assigns a drive letter to the PC card adapter or USB Flash Drive reader. If a dialog box does not automatically display with the assigned drive letter on the title bar, use My Computer to identify the Removable Disk drive letter. If the drive dialog box displays, press ESC or Cancel to close. You will need to know the drive letter to set options in the Read Setup dialog box.

The file on the CompactFlash or Backup SD card is labeled: Steno.bak. To ensure steno note retrieval and continued usability in the élan Mira, do not modify this file in any way.

4. From anywhere in Case CATalyst, press **Alt + u, r (Function/Read Notes)**. The Read Setup dialog box displays.
5. Make the following entries:

#### Device

Select **élan**.

#### Method

Select **Backup Flash**.

### Drive

Select the appropriate drive letter.

### Automatically break files during Read

If you do not turn your writing machine off during proceedings but write a stroke several times to indicate the start or end of files, you can have Case CATalyst recognize the separation stroke during the Read process and prompt you for a file name. Check this box to automatically break the steno note file into multiple note files during read. In the *Breaking Stroke* field, enter the steno outline you use to designate a file break.

### Breaking Stroke

Type the steno outline, in this field, that you write on your writing machine to indicate the end or beginning of proceedings. You enter the steno outline once here. In the job, you must write this steno outline as least five consecutive times for Case CATalyst to create a file break. For example, you enter EPBD in the Breaking Stroke field. In the job, on your writing machine you write EPBD/ EPBD/ EPBD/ EPBD/ EPBD.

6. Press **Enter (OK)**. The Read [File Selection] dialog box displays.
7. In the *Destination* section, select one of the following:

### Read Notes

Read notes to your computer.

### Print to PDF

Read notes creating a PDF file of the selected note files.

8. Select the steno note file or files you want to read. Do any of the following:
  - a. Highlight the single file you want to read.
  - b. Highlight multiple files by holding the Ctrl key as you click files with the mouse. If more than one steno file has an associated audio file, the audio files **will not be combined**. If you have multiple steno files with audio that should be "one file," read as Individual, edit them separately and then combine the files for the final transcript.
  - c. Highlight consecutive files by clicking the first file, then holding Shift and clicking the last file.
  - d. Select all files by pressing **Alt + a**.
9. In the *Read Selected Files* section, do one of the following:

### Individual

Read each selected file, along with the audio file if audio exists, into individual files, each with their own file name. Optionally, you can double click on a single file to automatically save it.

### All-In-One

Read multiple files into one file.

To read an audio file with a steno note file, you must select *Individual*. If you select multiple files that have an associated audio file, the following message displays: *When reading All in One, audio files will not be read with the steno*. Select **one** of the following options:

### Individual

Read each selected file into its own file.

**OK**

Read the selected files into one steno file without audio.

**Cancel**

Stop the Read process and display the File Selection dialog box.

10. Depending on the selection in the *Destination* field, the following occurs:

**Read Notes**

The Read [Name and Save] dialog box displays. Do the following:

- a. In the File name field, type a name for the steno note file or select an existing file from the list to append to or overwrite. If you select an existing file name, a confirmation box displays when you Save the file, prompting you to Append, Overwrite, or Cancel.
- b. Do one of the following:
  - Press **Alt + s (Save)** to save the note file.
  - Press **Alt + e (Save and Edit Notes)** to save the note file and then display it in [Manage Notes](#).

**Print to PDF**

The Reading Notes from dialog box briefly displays the status as the steno notes are printed to PDF. When finished, the Manage Jobs screen displays. Case CATalyst stores the PDF files in the My Documents folder on your computer unless you have changed the destination location in the [Advanced Read](#) options.

## Read Luminex or Diamante Backup SD Card

In the event the Luminex or Diamante® writing machine is not operable at the time you want to read your steno notes from the writer and you cannot retrieve files from the Luminex or Diamante® Data SD card, you can retrieve files from the Backup SD card in Case CATalyst. The Luminex and Diamante® uses the Backup SD card to store steno notes, timestamps and audio, if available. **When running Windows 10, you may need to set Case CATalyst to Run as Administrator in order for Windows to recognize the Data SD or Backup SD Card.**

## Read Your Steno Notes

1. Turn the Luminex or Diamante® **Off**.
2. Remove the Backup SD card and insert the Backup SD card into the SD Card USB Flash Drive reader provided with the Luminex or Diamante® and insert the reader into a USB port on your computer.

If you have an SD slot built into your computer, you can insert the SD card directly into the SD slot on your computer, however, some internal SD card readers may not work. Stenograph recommends using only USB based card readers, like the IOGear USB Flash Drive reader provided with the Luminex and Diamante®.

Please note the Luminex SD Backup card is a micro card and requires a micro card slot on the SD card reader or built-in computer slot.

3. Windows assigns a drive letter to the USB Flash Drive reader. If a dialog box does not automatically display with the assigned drive letter on the title bar, use My Computer to identify the Removable

Disk drive letter. If the drive dialog box displays, press ESC or Cancel to close. It is necessary to know the drive letter for setting options in the Read Setup dialog box.

The files on the Backup SD card are labeled: xxxBackup.BIN. To ensure steno note retrieval and continued usability in the Diamante®, do not modify this file in any way.

4. From anywhere in Case CATalyst, press **Alt + u, r (Function/Read Notes)**. The Read Setup dialog box displays.
5. Make the following entries:

**Device**

Select **Luminex** or **Diamante**.

**Method**

Select **Backup Flash**.

**Drive**

Select the appropriate drive letter.

**Automatically break files during Read**

If you do not turn your writing machine off during proceedings but write a stroke several times to indicate the start or end of files, you can have Case CATalyst recognize the separation stroke during the Read process and prompt you for a file name. Check this box to automatically break the steno note file into multiple note files during read. In the *Breaking Stroke* field, enter the steno outline you use to designate a file break.

**Breaking Stroke**

Type the steno outline, in this field, that you write on your writing machine to indicate the end or beginning of proceedings. You enter the steno outline once here. In the job, you must write this steno outline as least five consecutive times for Case CATalyst to create a file break. For example, you enter EPBD in the Breaking Stroke field. In the job, on your writing machine you write EPBD/ EPBD/ EPBD/ EPBD/ EPBD.

6. Press **Enter (OK)**. The Read [File Selection] dialog box displays.
7. In the *Destination* section, select one of the following:

**Read Notes**

Read notes to your computer.

**Print to PDF**

Create a PDF file of the selected note files.

8. To select the steno note file or files you want to read, do any of the following:
  - a. Highlight the single file you want to read.
  - b. Highlight multiple files by holding the Ctrl key as you click files with the mouse.  
If more than one steno file has an associated audio file, the audio files **will not be combined**. If you have multiple steno files with audio that should be "one file," read as Individual, edit them separately and then combine the files for the final transcript.
  - c. Highlight consecutive files by clicking the first file, then holding Shift and clicking the last file.
  - d. Select all files by pressing **Alt + a**.

9. In the *Read Selected Files* section, do one of the following:

**Individual**

Read each selected file, along with the audio file if audio exists, into individual files, each with their own file name. Optionally, you can double click on a single file to automatically save it.

**All-In-One**

Read multiple files into one file.

To read an audio file with a steno note file, you must select *Individual*. If you select multiple files that have an associated audio file, the following message displays: ***When reading All in One, audio files will not be read with the steno.*** Audio files can not be merged or appended via Read. Select one of the following options:

**Individual**

Read each selected file into its own file.

**OK**

Read the selected files into one steno file without audio.

**Cancel**

Stop the Read process and display the File Selection dialog box.

10. Depending on the selection in the *Destination* field, the following occurs:

**Read Notes**

The Read [Name and Save] dialog box displays. Do the following:

- a. In the File name field, type a name for the steno note file or select an existing file from the list to append to or overwrite. If you select an existing file name, a confirmation box displays when you Save the file, prompting you to Append, Overwrite, or Cancel.
- b. Do one of the following:
  - Press **Alt + s (Save)** to save the note file.
  - Press **Alt + e (Save and Edit Notes)** to save the note file and then display it in [Manage Notes](#).

**Print to PDF**

The Reading Notes from dialog box briefly displays the status as the steno notes are printed to PDF. When finished, the Manage Jobs screen displays. Case CATalyst stores the PDF files in the My Documents folder on your computer unless you have changed the destination location in the [Advanced Read](#) options.

11. Reinsert the Backup SD card into the Luminex or Diamante®. The Luminex and Diamante® requires the Backup SD card in order to operate.

## Manage Notes

The Manage Notes function allows you to predefine steno strokes prior to translation for better results. You can make Personal, Case, and Job dictionary definitions. You can also [cut, copy and paste steno note](#) files. For example, it may be necessary to copy a portion of a note file to another file name when an attorney has an immediate request for an excerpt of a transcript; or an official court reporter may read in a day's worth of reporting into one job name, but only need to translate a small portion of the steno notes. You can highlight the portion of steno notes, copy and then paste them into another file name for production. When copying and pasting, the original steno file remains intact.

Additionally, using cut and paste you can break one steno note file into separate individual note files. This may be helpful when you only need to transcribe a portion of the note file. For example, you may have one large steno note file for the entire day in court but need to transcribe just one pretrial hearing.

Steno note files can also be [printed to paper or PDF](#). Officials may be required to submit their steno notes to the court and many reporters submit a PDF copy of their steno notes, rather than the actual steno note subfile. Printing from Manage Notes allows you to print the current note file to paper or PDF. Printing from Manage Jobs allows you to print [multiple note files to PDF](#) at one time.

The Status bar in Manage Notes, if selected to Show, indicates the total number of strokes in the file and the current stroke the cursor is on. It also displays certain keyboard options.

### Open Manage Notes

- On the Function Bar, click Manage Notes .
- From the Menu Bar, select **Function/Manage Notes**.
- Press **Alt + u, n**.

### File - New - Notes File

The Notes Files feature allows you to create a new steno file. In most cases this feature is used for excerpts or to split individual proceedings that may need to be transcribed separately such as a court calendar proceeding. You would open the original steno file source, mark (highlight) the appropriate steno, use the copy or cut commands for the appropriate steno, create a new steno file and paste the copied/cut steno in the new file name. Copying and pasting steno notes leaves the original file steno intact.

#### Creating a new steno file from an existing steno notes file:

1. Press **Alt + u, n (Function/Manage Notes)**. The Open Existing Document dialog box displays.
2. Select a note file and press **Enter (Open)**. The selected note file displays.
3. Locate the steno stroke where you want to begin the cut or copy.
4. To mark the entries, do one of the following:
  - Press **Ctrl + [ (Edit/Mark Begin)** to indicate the beginning of the selection. Move to the steno stroke where you want to complete the mark.
  - Click the steno stroke to indicate the beginning of the selection. Locate the steno stroke where you want to complete the mark. Press and hold **Shift**, while you click the last entry.

To unmark, use the **Up Arrow** or a movement command.

5. Do one of the following:

**Cut and remove the selected notes**

Press **Ctrl + x (Edit/Cut)** to remove the selected steno notes from the source file and place them on the clipboard for pasting.

**Copy the selected notes**

Press **Ctrl + c (Edit/Copy)** to keep the selected steno notes in the source file and place them on the clipboard for pasting.

**6. Create a new note file**

- a. Press **Ctrl + n (File/New/Notes File)**. The Create New Document dialog box displays.
  - b. Type a new name in the File name field and press **Enter (Open)**. Case CATalyst opens a blank note file.
  - c. Press **Ctrl + v (Edit/Paste)**.
7. Press **Ctrl + s (File/Save)** in the source file and in the destination file, if appropriate.

**Advanced Manage Notes Options**

Advanced Manage Notes options determine how steno notes print and what font is used for display. You can print steno notes from the Manage Notes feature by opening the notes file, selecting File and then Print. You can print your steno notes to a PDF file by selecting File and then Print notes to PDF.

Access the Advanced Manage Notes options:

- from Manage Jobs. Press **Alt + t, o, m (Tools/Options/Manage Notes)**.
- from Manage Notes. Press **Alt + t, o, m (Tools/Options/Manage Notes)**.

To make a change, click an option. Depending on the field, select a choice from the drop down box or type an entry. When finished with all your changes, select **OK**. The *Restore Default Settings* option returns all the Advanced Manage Notes Options to their original Case CATalyst default selection.

**Print Timestamps**

Select to include or remove timestamps when printing steno notes. Including timestamps when printing steno notes affects the character size to steno notes. This option does not affect transcript printing. To change the setting, from the drop down menu, select **Yes** to include timestamps or **No** to not include them. The default setting is No.

**Print columns per page**

Set the number of steno note columns when printing steno notes to paper or PDF. Increasing the number of columns per page decreases the size and readability of the steno notes. Type the number of desired columns per page. The default setting is three.

**Display/Print Font**

Customize the font display of steno notes in Manage Notes and printed steno notes. Click the  (Browse) button to display the Font dialog box where you can choose a font style and size. The font size of printed steno notes is not affected by this setting but is determined by the *Print columns per page* option. Although the Font Style selection box is displayed, those selections do not apply to the font selection. It is suggested you select a fixed (mono) spaced font so the steno characters line up correctly as they would on a steno paper tape or steno machine.

**Warn twice when exiting Manage Notes without saving changes Yes/No**

If you select to exit Manage Notes with unsaved changes to the note file, CATalyst will display an "Are you sure" message to exit without saving. If you do not want that extra warning when exiting without saving changes, select **No**. The default setting is Yes.

## Copy and Cut Steno Notes

You can copy or cut steno notes from one steno file to a new file or to an existing file. Keep in mind the timestamps associated with the steno file are also copied or cut. In the majority of cases, the Copy and Cut commands are used to create an excerpt that needs to be transcribed immediately for a decision or to create individual steno files from a calendar call. Many reporters use the Copy command to create an ordered transcript from a court calendar. Using the Copy command keeps the original court calendar steno file intact. A reporter might use the Cut command if they accidentally appended a realtime file to an existing steno file. Using the Cut command would allow the user to separate the appended file to a separate steno file.

### To copy/cut steno notes:

1. Press **Alt + u, n (Function/Manage Notes)**. The Open Existing Document dialog box displays.
2. Select a note file and press **Enter (Open)**. The selected note file displays.
3. Locate the steno stroke where you want to begin the cut or copy.
4. To mark the entries, do one of the following:
  - Press **Ctrl + [ (Edit/Mark Begin)** to indicate the beginning of the selection. Move to the steno stroke where you want to complete the mark.
  - Click the steno stroke to indicate the beginning of the selection. Locate the steno stroke where you want to complete the mark. Press and hold **Shift**, while you click the last entry.

To unmark, use the **Up Arrow** or a movement command.

5. Do one of the following:

### Cut and remove the selected notes

Press **Ctrl + x (Edit/Cut)** to remove the selected steno notes from the source file and place them on the clipboard for pasting.

### Copy the selected notes

Press **Ctrl + c (Edit/Copy)** to keep the selected steno notes in the source file and place them on the clipboard for pasting.

6. Do any of the following:
7. **Select a different location in the same file**
  - a. Move to the location in the steno note file where you want to copy the steno notes.
  - b. Press **Ctrl + v (Edit/Paste)**. Case CATalyst places the selection after the highlighted steno stroke.

### Select an existing note file

- a. Press **Ctrl + o (File/Open/Notes File)**. The Open Existing Document dialog box displays.
- b. Select a note file and press **Enter (OK)**. To select a note file within a case, first select the case.
- c. Move to the location in the steno note file where you want to place the steno notes.

- d. Press **Ctrl + v (Edit/Paste)**. Case CATalyst places the selection after the highlighted steno stroke.

#### Create a new note file

- a. Press **Ctrl + n (File/New/Notes File)**. The Create New Document dialog box displays.
  - b. Type a new name in the File name field and press **Enter (Open)**. Case CATalyst opens a blank note file.
  - c. Press **Ctrl + v (Edit/Paste)**.
8. Press **Ctrl + s (File/Save)** in the source file and in the destination file, if appropriate.

## Defining Steno in Manage Notes

You can open a steno note file and make dictionary defines prior to translation to reduce the amount of edit time. There may be times where reporters take jobs without connecting their steno machine to their computer during the job. The reporters then read their steno notes into Case CATalyst and make defines before starting translation. The results are a cleaner translation and less editing time.

#### To define steno outlines from your steno notes file:

1. Press **Alt + u, n (Function/Manage Notes)**. The Open Existing Document dialog box displays.
2. Select a note file and press **Enter (Open)**. The selected note file displays.
3. To locate a specific steno outline, you can use the Search command. Press **Ctrl + f** and in the Steno field, type the steno outline(s). If searching for multiple outlines use the forward slash (/) to separate steno outlines. You can type either a forward slash (/) or press the Spacebar to separate steno outlines. You can type the raw steno characters or type the sound based on your [Steno Shortcut Table](#). For example, if you were searching for the name "James" in steno, you might type SKWRAEUPLS or "jams" which will generate the steno SKWRAEUPLS.
4. Highlight the steno stroke you want define. If you are defining multiple strokes do one of the following to mark the steno:
  - Press **Ctrl + [ (Edit/Mark Begin)** to indicate the beginning of the selection. Move to the steno stroke where you want to complete the mark.
  - Click the steno stroke to indicate the beginning of the selection. Locate the steno stroke where you want to complete the mark. Press and hold **Shift**, while you click the last entry.
  - Hold **Shift** and use the cursor to highlight steno strokes.

To Unmark (deselect) the highlighted steno strokes, press **Ctrl + u (Unmark)**.

5. Select a dictionary. Do one of the following:

#### Personal Dictionary

Press **Ctrl + d** to make a D-Define and place the define into your Personal Dictionary.

#### Case Dictionary

Press **Ctrl + k** to make a K-Define and place the define into the Case Dictionary. This option is only available if the steno note file is located within a case.

#### Job Dictionary

Press **Ctrl + j** to make a J-Define and place the define into the Job Dictionary.

6. The Global dialog box displays. Make necessary entries.

7. **Steno**

The highlighted steno.

**Text**

Type the appropriate text definition. You can add format symbols at any point in the definition. Press **Alt + f** to display the list.

**FS (Alt + f)**

Displays the list of available [format symbols](#). You can insert a format symbol at any point in the text entry. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol you want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can also use [shortcut keys](#) to insert a format symbol.

To have the format symbol list always display, check the *Always Show Format Symbols* box.

**Global Type**

The type of global define you selected displays. You can change the type of define by using the arrow button to display a list from which to choose.

8. Press **Enter (OK)**.
9. When finished defining, press **Ctrl + s (File/Save)** to save the file.
10. Press **Ctrl + F4 (File/Exit)** to exit the Manage Notes function.

## Searching for Steno Strokes

When viewing your steno notes in the Manage Notes feature, you may want to search for a specific steno outline or outlines to [define](#) it before translation or to find the location in the steno notes file you need to [create an excerpt](#) or to separate a court calendar file where you didn't turn off your steno machine between proceedings.

1. From Manage Notes, press **Ctrl + f (Edit/Find)**. The Search Steno dialog box displays.
2. Make necessary entries:
3. **Search For**

Type the steno stroke or strokes you want to find. You can type either a forward slash (/) or press the Spacebar to separate steno outlines. For example, to search for a two stroke word, such as "guideline", you could type TKPWAOEUD -- then type / or press the Spacebar to finish with the second stroke, HRAOEUPB. When typing steno that starts with a final stroke, place a – (hyphen) before the first letter.

For more information about typing steno outlines in the Steno field, see the [Steno Shortcut Table](#).

**Direction**

Select one of the following:

**Forward**

Search forward in the steno note file. If Case CATalyst does not find the selected steno strokes, you are prompted to choose to continue to search from the beginning of the file.

To repeat the search for the same steno outlines, press **F3 (Edit/Search Forward)** to search forward in the file.

### Backward

Search backward in the steno note file. If Case CATalyst does not find the selected steno strokes, you are prompted to choose to continue to search from the end of the file.

To repeat the search for the steno outlines, press **Shift + F3 (Edit/Search Backward)** to search backward.

4. Press **Enter (OK)** to begin the search.

## Repeat Search in Manage Notes

Repeat Search Forward and Repeat Search Backward allow you to search the steno note file applying the current search parameters used with the Search command. You can use these features in Edit, Manage Dictionary, and Manage Notes.

- To repeat the search forward in the file, press **F3 (Edit/Repeat Search Forward)**.
- To repeat the search backward in the file, press **Shift + F3 (Edit/Repeat Search Backward)**.

## Move By Folds

Move By Folds is a Manage Notes feature that allows you to move the cursor through the steno notes file by a specified number of steno folds. A fold refers to an "image" of numbered steno paper where the "fold" of the paper was numbered. As reporters read through their steno notes on steno paper, the reporter could note the steno note fold number where they wanted to take action. Once the steno notes were read into CATalyst, the reporter could easily find the location in the steno notes file by noting the fold number and moving by a specific number of folds. If you use numbered steno paper, you can specify the number of strokes per fold and then indicate how many folds you want to move forward or backward in the file. To determine the number of strokes per fold, reference your paper notes.

## Search Steno Notes by Folds

1. In the current note file press, **Alt + e, m (Edit/Move By Folds)**. The Move By Folds dialog box displays.
2. Make necessary entries:
3. **Current Fold**

Identifies the fold in which your cursor is currently located.

### Movement

Select one of the following:

#### By Number of Folds

Type a number in the field to move by a specified number of folds.

#### To Fold Number

Type the specific fold to which you want to move your cursor. This works best when using numbered steno paper.

### Strokes Per Fold

Type the number of strokes you want Case CATalyst to consider as one fold. The default setting is 55 strokes.

### Direction

Select **Forward** to move the cursor forward in the note file. Select **Backward** to move the cursor backward in the note file.

4. Press **Enter (OK)** when finished.

## Scan For Tapemarks

Scan For Tapemarks and Scan Backward for Tapemarks is a Manage Notes feature that allows you to locate electronic tapemarks, also referred to as marks, hotspots or stenomarks. While you are writing on your steno machine, you can push a button or press a key to indicate an electron mark. Many reporters use the electronic mark for a note while writing, to check a spelling, etc. An electronic tapemark displays in the steno note file as: ( (open parenthesis) after the final Z. This is the only tapemark that displays, even when your steno machine is capable of making left and right tapemarks. In addition to Manage Notes, tapemarks are visible in Vertical Notes in Edit.

An undefined tapemark displays in the transcript text as / (. You can define tapemarks in Manage Notes, Manage Dictionary, or during Edit. To define a tapemark in a dictionary, in the Steno field type ( which will display as /( in the steno file and in the Text field type the text you want to display in the transcript. You can define the tapemark as a specific [Oops](#) format symbol which will be invisible in the transcript but you can [search](#) and/or [scan](#) for it or display all occurrences the Oops format symbol in a job by using the [Hotspot pane](#).

To Scan for tapemarks in Manage Notes, press **F8 (Edit/Scan For Tapemarks)**. You can also Scan backward in the note file by pressing **Shift + F8 (Edit/Scan Backward For Tapemarks)**.

To Scan backward for tapemarks in Manage Notes, press **Shift + F8 (Edit/Scan Backward For Tapemarks)**. You can also Scan forward in the note file by pressing **F8 (Edit/Scan For Tapemarks)**.

## Print steno notes

You can print your steno notes to a physical printer, to a PDF file or [print multiple steno note files](#) to a PDF file in the event your court, firm or instructor (if you are student) has requested them. In many cases, court officials request a copy of your steno notes for archival purposes. Court reporting instructors often request printed copies of steno notes as class assignments. Students and instructors may want to use the free TrueView® program for reviewing and printing steno notes as it will give information more consistent with viewing paper notes. The TrueView program can be used with Stenograph's Wave, Luminex and Diamante steno machines. To download TrueView, go to [www.stenograph.com](http://www.stenograph.com), Support, Download Center and then click Utilities & Links. TrueView comes with its own set of instructions.

### To print your steno notes from Manage Notes:

1. Highlight the steno note file you want to print and click the Manage Notes icon or select Function and then Manage Notes. The steno file displays.
2. To change the default print settings for steno notes, press **Alt + t, o, m**.
  - a) Do any of the following: To change the option for printing timestamps, double click the right column of the Print Timestamp option.
  - b) To change the number of steno notes columns that print on one page, highlight the number for the Print columns per page option and type a new number. The more columns printed per page decreases the size of the printed material.
  - c) To change the font style for viewing and printing steno notes, click the right column of the View/Print font option and then click the  button and select the font style you want to use. To maintain the steno character placement on a paper tape, be sure to select a fixed (mono) spaced font. Selecting a specific font size will affect the display of steno notes but does not

affect the printing of steno notes. The Font Style column does not apply to the steno notes font display or print.

- d) To save the changes, click **OK**. Go to Step 3.
- 3. To print your steno notes, press **Alt + f, p** (File, Print). Confirm the printer selection and click **OK**.
- 4. Close your steno notes file by pressing **Alt + f, c** (File, Close).

## Layout

The Case CATalyst Layout function allows you to set formatting values for the printed page. Layout refers to how the page looks when using Page View in Edit, realtime and when it is printed and includes parameters such as, paper size, margins, transcript lines per page, transcript box lines, and header and footers. Case CATalyst uses measurements in inches or centimeters, depending on your setting, to determine the layout settings.

When you translate a job or create a new job in Edit, you select a Layout to apply to the job. You can make layout [modifications](#) or apply a different layout to specific pages, sections or the entire file during Edit. Transcripts created in Case CATalyst version 11 and higher display the Layout name in Edit on the Status Bar. If you modify the Layout from Edit, an asterisk (\*) displays in front of the name.

Case CATalyst comes with five sample Layouts which you can use, copy, or modify. Layout files are automatically stored in the Layouts case in the System Files case. The sample Layouts include:

- Layout Sample 1 - 25 lines 9 pitch - similar to the NCRA recommendations for transcripts.
- Layout Sample 2 - 25 lines 10 pitch - similar to an official transcript.
- NY Court 25 Line - NY Supreme Court layout.
- Texas Layout 10 pitch - Texas layout.
- Texas Layout 9 pitch - Texas layout.
- CA layout - complies with California Minimum transcript format standards.

When you open the Layout function or choose to modify a layout from Edit, a window displays on the right side of the Case CATalyst screen with transcript or sample text to the left. Sample text displays when you open a layout from the Layout function. Sample text contains each type of paragraph style with a brief description.

### Layout Formatting Panes

The window contains three panes used to setup layout formatting values. If the window for layout values does not display on your screen, the display view may be too small. Maximize the Case CATalyst screen or manually enlarge the display by clicking and dragging the side of the Layout window. Measured values are in inches or centimeters depending on your Current Display Measurements [setting](#). Use the Left and Right arrows or the drop down box at the top of the pane to display the desired pane:

#### Paragraph Setup

The [Paragraph Setup](#) dialog pane contains margin, font, tab and punctuation settings for paragraph styles, such as colloquy, By Line, question and answer, and user defined. It also contains font and margin settings for each paragraph style.

#### Page Setup

The [Page Setup](#) dialog pane contains position settings for top and bottom margins, line numbers, timestamps, and the transcript box.

#### Headers & Footers

The [Header & Footers](#) dialog pane contains position and font settings for header and footer text and page number information.

### Open Layout Function

1. Do one of the following:
  - On the menu bar, select **File/Open/Layout**.
  - On the Function Bar, click the Layout  icon.
  - Press **Alt + u, e (Function/Edit)**.
2. The Open Existing Document dialog box displays. Type a new or existing layout name in the File name field or select a layout from the list. Layouts are stored in the Layouts case located in the System Files case.
3. Press **Enter (Open)**. Case CATalyst opens the selected layout with sample text. As a default, the Paragraph Style pane displays. Use the scroll bar as necessary to view all the fields.  
 To view or modify Page Setup or Headers & Footers values, click the down arrow in the right top corner of the setup screen to select from the list. You can also use the Left and Right arrows at the top of the box to display the desired pane.
4. Press **Enter (Apply)** to apply the changes. The sample text displays the current settings. Use the ruler elements and the Zoom feature to check the settings. You can also use Print Preview and [Print](#) to view the format.
5. Press **Ctrl + s (File/Save)** to save the file.

## Creating a New Layout

Case CATalyst layouts control the look and print of the transcript including the margins, transcript box (if needed), headers/footers, page numbers, timestamps, etc. You may need to create a new layout for a new client, jurisdiction or firm. When creating a layout, a sample page is displays with the various layout elements so you can see the changes as you make them.

You can create a new layout in several ways. You can open an existing layout that is similar to the layout you want to create, select Save As, give the layout a new name and then modify only the necessary elements of the layout. You can also, open an existing transcript in Edit, right click and select Modify Layout, modify the elements of the layout as necessary, apply the elements and then select the Format menu, select Save Layout As and give it a new name. Transcript you opened will now reflect the new layout settings. You can select the Layout feature, type a new name and make the necessary changes.

1. From anywhere in Case CATalyst, press **Alt + f, n, l (File/New/Layout)**. The Create New Document dialog box opens with the Layout case as the default location.
2. In the File Name field, type a name for the new layout and press **Enter (Open)**.
3. *The selected file does not exist. Would you like to create it?* message displays. Click **Yes** or press **Enter**.
4. The *Are you required to use minimum number of characters per line?* prompt displays. Do **one** of the following:
  - Click **Yes** or press **Enter** if you want to create a layout using the Characters Per Line Assistant. **Go to Step 5.**
  - Click **No** if you are not required to create a layout with a specific number of characters per line. The Layout function opens with a sample text file and default values for [Paragraph Setup](#), [Page Setup](#), or [Header & Footers](#). Use the scroll bar to view all the fields. **Go to Step 8.**

5. The new layout displays with the Characters Per Line Assistant dialog box displayed. The width of your current page size setting is displayed. Fill in the following fields:

- **How many characters do you want on a line?** Type the maximum number of characters you want on a line. Using the example above, the agency has required 58 characters per line so you would type 58.
- **How many characters per inch?** Type the number of characters you want per inch. The easiest way to determine the number of characters per inch is to lay a ruler down on a line of printed transcript that matches your requirement and count the number of characters that appear in an inch. The default value is set to 9 characters per inch but you can change it to whatever number you need. The most common number of characters per settings are 9, 9.5 and 10. Using the example above, the agency has required 9 characters per inch so you would leave 9.
- **What is your left margin in Inches?** Use a ruler on a printed transcript that matches your requirement and measure from the left edge of the transcript paper to your left most margin or type in the number if it has been specified. Once you answer the first three questions, your right margin is automatically determined.

Using the example above, let's say you measured your left margin at 1 inch from the left edge of the page.

6. Click **OK** or press **Enter**. A dialog box displays stating that all paragraph styles in your layout will be set to the following:  
(Using the example at the beginning of this topic, the following would be displayed.)  
Characters per line: 58  
Characters per inch: 9.00  
Left margin: 1.00 inches  
Right margin: 7.44 inches

Once your layout displays, review the first line indent, symbol position and continuation paragraph settings for each paragraph style along with other layout settings. Do you wish to continue?

7. Do **one** of the following:
- If the information looks correct, click **Yes** or press **Alt + y**. Your layout displays with the characters per line, inch and left and right margin settings. Go to Step 9.
  - If the information does not look correct, click **No** or press **Alt + n**. The Characters Per Line Assistant displays with your current setting values. Make any necessary changes and then click **OK** to continue.
8. Make necessary changes. If you want to use the Characters Per Line Assistant, press **Alt + o** and select the Characters Per Line Assistant. (Go back to Step 5 for instructions.) When finished, press **Enter** (Apply). The sample text displays the current settings. Use the ruler elements and the Zoom feature to check the settings. You can also use Print Preview and [Print](#) to view the format.
9. Press **Ctrl + F4 (File/Close)** to close and exit Layout. New Layouts created in Case CATalyst version 11 and higher display the Layout name in Edit on the Status Bar. If you modify the Layout from Edit, an asterisk (\*) displays in front of the name.

## Modify an Existing Layout

You may want to modify an existing layout because of new jurisdiction guidelines, new firm requirements or header/footer placement. Case CATalyst layouts control the look and print of the transcript including the margins, transcript box (if needed), headers/footers, page numbers, timestamps, etc. You can also modify an existing layout while you are [editing by using the Modify Layout](#) feature. The following instructions focus on opening an existing layout through the Layout function.

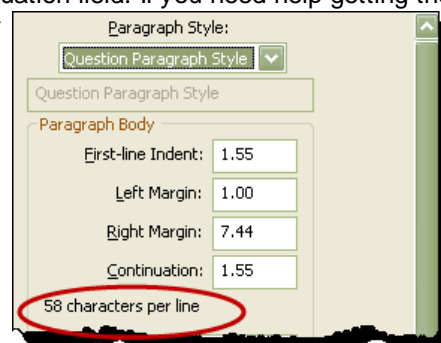

### Modifying an existing layout in the Layout function:

1. From anywhere in Case CATalyst, press **Alt + u, L (Function/Layout)**. The Open Existing Document dialog box displays.
2. Select the layout and press **Enter (Open)**. To select a layout from another user, in the Look in field choose the user folder and then select the layout.
3. The Layout function opens with sample text and the current values for [Paragraph Setup](#), [Page Setup](#), or [Header & Footers](#). Use the scroll bar to view all the fields. If you are required to create a layout based on characters per line, a Characters Per Line Assistant is available from the Format menu, Alt + o, [Characters Per Line Assistant...](#)
4. After making changes to settings, press **Enter (Apply)**. If you selected to apply changes to multiple paragraph styles, the Select Paragraph Styles dialog box displays. Select the paragraph styles you want the changes to apply to or press **Alt + a (Select All)** to select all paragraph styles and press **Enter**.
5. Make any additional changes as necessary. When finished, press **Enter (Apply)**. The sample text displays the current settings. Use the ruler elements and the Zoom feature to check the settings. You can also use Print Preview and [Print](#) to view the text with the current format.
6. Press **Ctrl + s (File/Save)** to save the file. To save the file under a different name, press **Alt + f, a (File/Save As)**. When the Save As dialog box displays, type a new name in the File name field or select an existing layout name and press **Enter (Save)**.
7. Press **Ctrl + F4 (File/Close)** to close and exit Layout.

## Characters Per Line Assistant

When a layout uses the characters per inch setting, the Paragraph Style tab of a layout displays the "characters per line" information immediately below the Continuation field. If you need help getting the Characters Per line setting exactly as required, a Characters Per Line Assistant is available on the Format menu in the Layout function. This feature may be helpful if you need to create a layout or modify an existing layout to have a specific number of characters per line when using a specific number of characters per inch. If you are modifying an existing layout, in order for the Characters Per Line Assistant to be active on the Format menu, your cursor focus needs to be in the sample transcript portion, not in the settings pane.

The Assistant displays a few questions, along with helpful information that can guide you through the steps to set your right margin based on your required characters per line.

For example, let's say you need to report a proceeding for an out of state reporting firm that requires 58 characters per line and 9 characters per inch. The out of state reporting firm has faxed you a sample transcript page so you can set up your layout to match their layout. You use the Characters Per Line Assistant to quickly and accurately set up the new layout.

#### How to use the Characters Per Line Assistant:

1. Do one of the following:
  - To create a new layout, click File, New, Layout (**Alt + f, n, l**) and type a new name for the layout and press **Enter**.
  - To open an existing layout, click File, Open, Layout (**Alt + f, o, l**) Position your cursor focus in the sample text section, press **Alt + o (Format menu)** and then select Characters Per Inch Assistant... Go to Step 4.
2. *The selected file does not exist. Would you like to create it?* message displays. Click **Yes** or press **Enter**.
3. The *Are you required to use minimum number of characters per line?* prompt displays. Do **one** of the following:
  - Click **Yes** or press **Enter** if you want to create a layout using the Characters Per Line Assistant.
  - Click **No** if you are not required to create a layout with a specific number of characters per line.
4. The new layout displays with the Characters Per Line Assistant dialog box displayed. The width of your current page size setting is displayed. Fill in the following fields:
  - **How many characters do you want on a line?** Type the maximum number of characters you want on a line. Using the example above, the agency has required 58 characters per line so you would type 58.
  - **How many characters per inch?** Type the number of characters you want per inch. The easiest way to determine the number of characters per inch is to lay a ruler down on a line of printed transcript that matches your requirement and count the number of characters that appear in an inch. The default value is set to 9 characters per inch but you can change it to whatever number you need. The most common number of characters per settings are 9, 9.5 and 10. Using the example above, the agency has required 9 characters per inch so you would leave 9.
  - **What is your left margin in Inches?** Use a ruler on a printed transcript that matches your requirement and measure from the left edge of the transcript paper to your left most margin or type in the number if it has been specified. Once you answer the first three questions, your right margin is automatically determined.

Using the example above, let's say you measured your left margin at 1 inch from the left edge of the page.

5. Click **OK** or press **Enter**. A dialog box displays stating that all paragraph styles in your layout will be set to the following:  
(Using the example at the beginning of this topic, the following would be displayed.)  
Characters per line: 58  
Characters per inch: 9.00  
Left margin: 1.00 inches  
Right margin: 7.44 inches  
  
Once your layout displays, review the first line indent, symbol position and continuation paragraph settings for each paragraph style along with other layout settings. Do you wish to continue?
6. Do **one** of the following:
  - If the information looks correct, click **Yes** or press **Alt + y**. Your layout displays with the characters per line, inch and left and right margin settings. Go to Step 8.
  - If the information does not look correct, click **No** or press **Alt + n**. The Characters Per Line Assistant displays with your current setting values. Make any necessary changes and then click **OK** to continue.
7. All your paragraph styles will have the same left and right margins. Be sure to review the positions for first line indent, symbol position (if applicable) and continuation paragraph settings for each paragraph style you use. In addition, be sure to review the position settings for other layout settings such as the box settings, timestamps, headers/footers, etc.
8. When finished, save and close your layout.
  - To create a new layout, click File, New, Layout (**Alt + f, n, l**) and type a new name for the layout and press **Enter**.
  - To open an existing layout, click File, Open, Layout (**Alt + f, o, l**) Position your cursor focus in the sample text section, press **Alt + o** and then select Characters Per Inch Assistant... Go to Step 4.

## Save Layout As

You may want to create a new layout or modify an existing layout because of new jurisdiction guidelines, new firm requirements or header/footer placement. Case CATalyst layouts control the look and print of the transcript including the margins, transcript box (if needed), headers/footers, page numbers, timestamps, etc. You can create a new layout by selecting the Layout function, typing a name and making the necessary adjustments. Or, if there is an existing layout with similar settings already, you can open the existing layout, and use the Save As feature. The Save As feature allows you to open an existing layout, select Save As, type a new name and make necessary changes. When you use the Save As feature and type a new name, you are in the new layout. Any changes you make and save are saved to the new layout name. *The original existing layout you opened remains untouched.* You can also modify an existing layout while you are [editing by using the Modify Layout](#) feature. The following instructions focus on opening an existing layout through the Layout function.

1. From anywhere in Case CATalyst, press **Alt + u, L (Function/Layout)**. The Open Existing Document dialog box displays.
2. Select the layout and press **Enter (Open)**. The Layout function opens with sample text and the current values for [Paragraph Setup](#), [Page Setup](#), or [Header & Footers](#). Use the scroll bar to view all the fields. The [Characters Per Line Assistant](#) is available if you need help determining settings for a layout with a specific number of characters on a line. To select a layout from another user, in the Look in field choose the user folder and then select the layout.

3. Make necessary changes. When finished, press **Enter (Apply)**. The sample text on the left side of the screen displays the current settings. Use the ruler elements and the Zoom feature to check the settings. You can also use Print Preview and [Print](#) to view the text with the current format.
4. To save changed, do one of the following:
  - To save the file with the current name, press **Ctrl + s** or click the Save () icon.
  - To save the file under a different name, press **Alt + f, a (File/Save As)**. When the Save As dialog box displays, type a new name in the File name field or select an existing layout name and press **Enter (Save)**. The original existing layout remains unchanged.
5. Press **Ctrl + F4 (File/Close)** to close and exit Layout.

## Print Layout Settings

Print all the values for a layout using the Print Layout Settings feature in the Layout function. The Transcript Layout Detail Report lists the current values for Paragraph Styles, Page Setup and Headers & Footers. Case CATalyst prints the full report.

### Print Layout Report

1. From anywhere in Case CATalyst, press **Alt + u, L (Function/Layout)**. The Open Existing Document dialog box displays.
2. Select a layout and press **Enter (Open)**. The Layout function opens with sample text and the current values for [Paragraph Setup](#), [Page Setup](#), or [Header & Footers](#). Use the scroll bar to view all the fields.

To select a layout from another user, in the *Look in* field choose the user folder, and then select the layout.
3. Press **Alt + o, y (Format/Print Layout Settings)**. The Print dialog box displays.
4. Select the printer and any other options and press Enter (OK) to print the report.

If you select to print the settings to the Stenograph PDF Printer, the Print to File dialog box displays. Select the location to which you want to save the PDF. Case CATalyst will suggest the name of layout\_layout.pdf as the default name of the PDF, although you can change the name.

## Page Setup

The Page Setup pane in Layout allows you to set formatting values that affect the way the text displays on the printed page. These settings include line numbers, top and bottom margins, timestamps, and transcript box style. Modify Page Setup values for the applied layout while Editing, using the [Modify Job Layout](#) feature.

### Page Setup Values

Make entries in the fields and then press **Enter (Apply)** to view the changes. Measured values are in inches or centimeters depending on your Current Display Measurements [setting](#). To save the changes to the layout, press **Ctrl +s (File/Save)**.

#### Line Numbers

##### Position

Type a number in the field to determine the horizontal position of the line numbers on the page. The position of line numbers is a measurement taken from the left edge of the paper in inches or centimeters, depending on your setting. It is typed in decimals. A typical position setting for 8 ½ by 11 inch paper is between .75 and 1.25, which is between ¾ and 1¼ inches.

If you are printing a box, the line numbers are usually to the left of the box. When line numbers are left of the box, the value entered here must be less than the number entered in the Left Position field for the Box.

### Frequency

Determines how often line numbers print on the page. The most common setting is to print line numbers on every line. Select the frequency:

- None
- Every line
- Every 5th Line
- Every 10th Line
- First Line Only

### Format

Determines the type of line number format. The most common format is 1, 2, 3. Select one of the following:

- 1, 2, 3 (numbers)
- a, b, c (lower case letters)
- A, B, C (upper case letters)
- i, ii, iii (lower case Roman numerals)
- I, II, III (upper case Roman numerals)

### Transcript Lines

Type the number of transcript lines to determine how many lines of transcript print on each page. This setting is usually between 24 and 28.

The vertical placement of the first transcript line is determined by the top margin. The amount of space between each transcript line is determined by the number of transcript lines and the top and bottom margins.

### Line Number Font

Set the font, font style, size and effect for the line numbers. Select Line Number Font to display the [Font dialog box](#).

## Paper Size and Margins

### Paper Size

Each paper size has preset Width and Height values. To use a paper size not listed, select Other and set the Width and Height values. Select one of the following paper sizes:

- Letter—8 ½ x 11 inch paper is commonly used for transcripts.
- Legal—8 ½ x 14 inch paper is commonly considered legal size.
- A4—A metric measurement usually used in the United Kingdom and Australia.

- Other—Set custom Width and Height values.

#### **Width**

The width of the selected paper size. These are preset values for all the paper sizes, except Other. When selecting Other, you must set a Width and Height value.

#### **Height**

The height of the selected paper size. These are preset values for all the paper sizes, except Other. When selecting Other, you must set a Width and Height value.

#### **Top Margin**

The distance from the top of the page the first transcript line prints. The position is a measurement taken from the top edge of the paper in inches or centimeters, depending on your setting. It is typed in decimals. A typical value for 8 ½ by 11 inch paper is 1.0 inch. To change the value, type a new number.

The vertical placement of the first transcript line is determined by the top margin. The amount of space between each transcript line is determined by the number of transcript lines and the top and bottom margins.

#### **Bottom Margin**

This setting determines how far down from the top of the page the last transcript line prints. The position is a measurement taken from the top edge of the paper in inches or centimeters, depending on your setting. It is typed in decimals. A typical value for 8 ½ by 11 inch paper is 10.0 inches. To change the value, type a new number.

The vertical placement of the first transcript line is determined by the top margin. The amount of space between each transcript line is determined by the number of transcript lines and the top and bottom margins.

#### **Use Characters Per Inch/Centimeters**

Check this box to specify the number of characters that print in one inch/centimeter. Enter a value in the *Characters Per Inch/cm* field. Stenograph strongly recommends you use a fixed (mono) spaced font when using this option. The following fixed space fonts are available:

- Provided by Stenograph - Arial Monospaced, Andale Mono and Letter Gothic
- Provided by Windows - Courier New

#### **Character Per in/cm**

If you checked the Use Characters Per Inch/Centimeters box, you must enter a value to determine the number of characters per inch/cm. The lower the number, the more space between each character and the fewer characters on a line. The higher the number, the less space between each character and the more characters on a line. Usually this setting in inches is 9.00 or 10.00. To change the numbers of characters per inch/cm, type the new number.

A quick way to determine the characters per inch. Use a ruler to determine the number of characters that display in an inch. Let's say you are using a standard letter size page (8.5 x 11). You set your left margin at 1.25 and your right margin at 1.0. Since your page measures 8.5 inches that means you have 6.25 inches available for you lines of text. If you set your characters per inch to 9, you'll have space for 56 characters per line. If you set your characters per inch to 10, you'll have space for 62 characters per line.

This field is only available when you select the *Use Characters Per Inch/Centimeters* option.

## Timestamps

Timestamps are automatically generated when writing realtime. You can specify whether they print or not and whether they print on the far right or left edge of the page. To print timestamps for every job, select a setting in the Frequency field. When printing a job, the [Print Options](#) allow you to select or deselect timestamps. Timestamp settings must be set in the layout in order to print timestamps.

### Position

Determine the horizontal position of the timestamps on the page. To change the setting, type a number in the field.

The position of the timestamp is a measurement taken from the left edge of the paper in inches or centimeters, depending on your setting. It is typed in decimals. When you print timestamps on the far left side, a typical setting for 8 ½ by 11 inch paper is between .30 and .50 inches. If you print timestamps on the far right side, a typical setting is between 7.30 and 7.80 inches.

### Separator

The symbol that separates the hours, minutes and seconds. To change the symbol, type a new symbol. The most common symbol used is the : (colon).

### Frequency

Determine how often timestamps are printed. The most common setting is to print numbers on every line. Select the frequency:

- None
- Every line
- Every 5th Line
- Every 10th Line

### Format

The format for the timestamps display. Select an option:

- 3:47PM (12-hour with AM/PM)
- 3:47 (12-hour)
- 15:47 (24 hour/Military time)
- 5:47:57PM (12-hour with seconds and AM/PM)
- 5:47:57 (12-hour with seconds)
- 15:47:57 (24-hour/Military time with seconds)

### Timestamp Font

Set the font, font style, size, and effect for the timestamps. A typical setting for font size is between 8 and 10. Select Timestamp Font to display the [Font dialog box](#).

## Box

The Box refers to the border that is sometimes printed around the transcript text. You can choose to not print a box or only print a particular side of the box.

### Style

The Style field refers to the type of line. Select a line type for each of the box sides: Left, Right, Top, and Bottom. Select one of the following:

- None
- 1 Line
- 2 Lines

### **Position**

This setting determines where the box line prints on the page. Type a number for the position of any box lines you are using: Left, Right, Top, and Bottom. If you are not printing a box, no entry is necessary. If you are only printing one of the box lines, an entry is only required for that line. Type a number for each box line:

#### **Left**

This setting is for the box line on the left side of the page. It is measured from the left edge of paper in inches or centimeters, depending on your setting and typed in decimals. Make sure this value is less than the value of a Left Margin field in paragraph styles. A typical setting for 8 ½ by 11 inch paper is between .80 and 1.40 inches.

#### **Right**

This setting is for the box line on the right side of the page. It is measured from the left edge of paper in inches or centimeters, depending on your setting and typed in decimals. Make sure this value is more than the value of a Right Margin field in paragraph styles. A typical setting for 8 ½ by 11 inch paper is between 7.20 and 8.15 inches.

#### **Top**

This setting is for the box line on the top of the page. It is measured from the top edge of paper in inches or centimeters, depending on your setting and typed in decimals. or about ¼ inch or .635 centimeters above the first transcript line. A typical setting for 8 ½ by 11 inch paper is between .30 and .80 inches.

#### **Bottom**

This setting is for the box line on the bottom of the page. It is measured from the top edge of paper in inches or centimeters, depending on your setting and typed in decimals. It is usually placed ¼ inch or .635 centimeters below the last transcript line. A typical setting for 8 ½ by 11 inch paper is between 10.00 and 10.80 inches.

### **Thickness**

This setting determines how thick the box line prints. The higher the number, the thicker the box line. Type a number for each of the box lines: Left, Right, Top, and Bottom. If you are not using a box, no entry is required.

## **Paragraph Setup**

The Paragraph Setup pane in the Layout function allows you to set formatting values that affect the selected paragraph style. These settings, such as paragraph margins and symbol formatting, determine how the paragraph displays on the Edit screen and printed page.

In Edit, use the [Modify Job Layout](#) feature to modify paragraph values for the applied layout. In addition, you can make changes to a single paragraph while Editing using the [Modify Current Paragraph](#) feature.

## About Paragraph Styles

Paragraph Styles contain the formatting information for particular elements of a transcript. Every CAT system has a structure for paragraph styles providing formatting information for Question, Answer, Colloquy, etc. Formatting information includes such elements as paragraph margins, line spacing, first and subsequent line indents, and ending paragraph punctuation. In Case CATalyst, for example, a Question paragraph style includes values for:

- the first line indent which is the text after Q
- left margin for carryover text
- right margin
- continuation when there is a subsequent paragraph within the Question
- symbol which is the Q
- symbol position
- ending punctuation

When you insert a Question (F4q) into the transcript, Case CATalyst formats it based on the above information.

Paragraph styles in Case CATalyst eliminate the need for Secondary Margin format symbols previously used in Case CATalyst 3.x and Premier Power. Where Colloquy was defined with Secondary Margin On and Questions and Answers were defined with Secondary Margin Off, in Case CATalyst you set the left and right margins for the Colloquy paragraph style and the left and right margins for the Question and Answer paragraph styles. Paragraph styles eliminate having to define strokes with the Secondary Margin format symbols.

Paragraph styles are set in the Layout function in the [Paragraph Setup](#) dialog pane. In addition to the paragraph styles provided with the Case CATalyst software, you can define up to 32 other paragraph styles to use in formatting your job.

## Paragraph Setup Values

Make entries in the fields and then press **Enter (Apply)** to view the changes. Measured values are in inches or centimeters depending on your Current Display Measurements [setting](#). To save the changes to the layout, press **Ctrl +s (File/Save)**.

### Paragraph Style

Select one of the following paragraph styles for which you want to set parameters. Click the down arrow to choose a paragraph style from the list.

#### Default Paragraph

Case CATalyst uses this paragraph style setting when determining the left, right, and center positions between margins for headers, footers, and page numbers. This setting applies when using the <Default Paragraph> format symbol. This paragraph style is generally used on include files or standard text files.

#### Question

This paragraph style determines the settings for a Question paragraph. These settings apply when using the <Question> format symbol.

### **Answer**

This paragraph style determines the settings for an Answer paragraph. These settings apply when using the <Answer> format symbol.

### **Colloquy**

This paragraph style determines the settings for a Colloquy paragraph. These settings apply when using the <Colloquy> format symbol.

### **By Line**

This paragraph style determines the settings for a By Line paragraph. These settings apply when using the <By-line> format symbol.

### **Parenthetical**

This paragraph style determines the settings for a Parenthetical paragraph. These settings apply when using the <Parenthetical> format symbol.

### **Centered**

This paragraph style determines the settings for a Centered paragraph. These settings apply when using the <Centered Paragraph> format symbol.

### **New Line Paragraph**

Case CATalyst defaults to the settings for this paragraph style when no other paragraph style is used. This paragraph style determines the settings for a New Line paragraph. These settings apply when using the <New Line Paragraph> format symbol.

### **Single Spaced**

This paragraph style determines the settings for a Single Spaced paragraph.

### **User Defined**

This paragraph style determines the settings for an additional paragraph styles you want to create. User Defined Paragraphs are, often times, used for special formatting such as quoted material. For example, you might create a User Defined Paragraph for quoted Qs and As when testimony is read in from another transcript/deposition or document. You can create up to 32 User Defined Paragraph styles. When you create a User Defined Paragraph in a page layout, a field displays immediately below the style. This allows you to type a description or name for the User Defined Paragraph. A descriptive name, such as Quoted material may help you quickly select the correct user defined paragraph.

Type a name/description for the paragraph style in the field below the User Defined Paragraph. For example let's say you name and configure User Defined Paragraph Style 1 for quoted material. You set the margins, punctuation, etc. You name the User Defined Paragraph Style 1 - *Quoted Material*. You saved and closed the layout. The next time you open the layout or use the Modify layout or Modify Current Paragraph command, you will see Quoted Material (1) listed in the Paragraph Style drop-down list instead of User Defined Paragraph 1. The number in the parenthesis refers to the number of the User Defined Paragraph style. You will use that number in parenthesis when making a dictionary entry that contains the paragraph style, selecting from the Format Symbol dialog box in Edit or using F4 e and inserting a user defined paragraph style. In other words, using the example above, if you were inserting Quoted Material (1) user defined paragraph into a transcript, you would press F4, e, 1.

## Paragraph Body

### First-line Indent

This is where text begins for the designated paragraph. It is the position of the first letter of the first word. The beginning position of text is a measurement taken from the left edge of the paper in inches or centimeters, depending upon your setting. It is typed in decimals. For example, ½ inch is .50. To change the setting, type a number in the field.

The First-line Indent for Question and Answer paragraph styles is the position of the first letter of the first word following the Q or A symbol.

### Left Margin

Controls the left margin for this paragraph text. The typical setting for 8 ½ by 11 inch paper is between 1.0 and 1.75 inches. It is typed in decimals. In inches for example, you set the Left Margin at 1.20, which is one inch and two tenths from the left edge of the paper.

The ability to set margins for each paragraph style eliminates the need for the Secondary Margin format symbol used in Case CATalyst 3.x.

### Right Margin

Controls the right margin for this paragraph text. The typical setting for 8 ½ by 11 inch paper is between 7.00 and 8.20 inches. It is typed as decimals. In inches for example, you set the Right Margin at 7.20, which is seven inches and two tenths from the left edge of the paper.

The ability to set margins for each paragraph style eliminates the need for the Secondary Margin format symbol used in Case CATalyst 3.x.

### Continuation

Determine the first line indentation when creating a continuation paragraph within this paragraph style. For example, you write a Question and then need to create a paragraph within a question. When you use the Continuation Paragraph (F4p) format symbol while in the question paragraph, Case CATalyst automatically creates a new paragraph and indents it according to the setting entered in this field.

### Line Spacing

Determine the spacing between transcript lines for this paragraph style, Double or Single. Most transcripts are double spaced.

### Alignment

Select how to display the body of the paragraph on the page within the set margins. The First-line Indent remains in the assigned position. Choose from the following:

- Left
- Right
- Centered on Margins
- Centered on Page

### Body Text Font

Set the font and font style, size and effect for this paragraph style. Select Body Text Font to display the [Font dialog box](#).

### Paragraph Symbol

#### Symbol

Type the symbol that appears in the transcript. If you use a period after the Q or A, type it along with the symbol. For example, "Q." or "A" Question and Answer symbols display in Edit in the [user selected](#) color.

The Symbol field does not apply to all paragraph styles.

#### Symbol Position

The horizontal position of the symbol in the transcript. A typical position for either Q or A is the same setting as the Left Margin. The range for 8 ½ by 11 inch paper is between 1.50 and 1.75 inches, which is 1½ to 1¾ inch from the left edge of the page.

#### Ending Punctuation

Type the ending paragraph punctuation. During translation, Case CATalyst uses this entry to automatically place punctuation at the end of this paragraph style when no other punctuation stroke is indicated.

Ending punctuation only applies during translation. When you change the ending punctuation for a paragraph style during Edit or in Layout, the change does not apply unless you re-translate.

#### Symbol Font

Set the font and font style, size and effect for the symbol. Select Symbol Font to display the [Font dialog box](#).

#### Continuation Symbol

The Continuation Symbol dialog box displays. In the *Continuation Symbol* field, type the symbol you want to display before every continuation paragraph for the selected paragraph style. There is an eleven character maximum. In the *Continuation Symbol Position* field, type the location for the symbol. When finished, press **Enter (OK)**.

A Continuation symbol generally applies only to Canadian layout.

### Define Tabs

Set the tab values for the current paragraph style. Select Define Tabs to display the Tab Locations dialog box. You can have up to ten tab settings for each paragraph style.

### For searching, this paragraph is a

Identify a User Defined Paragraph style as another style when searching. For example, you create a User Defined paragraph style for quoted Questions. Set the values in this field as a Question Paragraph Style. When searching in Edit for a Question, Case CATalyst stops on this paragraph style.

### Paragraph is Numbered

Check this box to number paragraphs for this paragraph style. Select **Details** to set Paragraph Number Options. You can only have one paragraph style numbered at a time. Paragraph numbering affects all the layouts for the user. Use the [Set Page/Paragraph Number](#) feature to reset paragraph numbering.

#### Details

Set Paragraph Numbered options. Click an option. Depending on the field, select a choice from the drop down box or type an entry. When finished with all your changes, select **OK**. The *Restore Default Settings* option returns all the Paragraph Numbered Options to their original Case CATalyst default selection.

#### Alignment

Set the position for the paragraph number to left or right justification before the paragraph.

#### Text Before

Paragraph numbers can include text such as [ ] so that the paragraph numbers display with surrounding brackets. Type the text, if any, that occurs before the number, such as [ .

#### Text After

Paragraph numbers can include text such as [ ] so that the paragraph numbers display with surrounding brackets. Type the text, if any, that occurs before the number, such as [ .

#### Number Position

Type the position of the paragraph number measuring from the left edge of the paper. Select the horizontal position where you want the paragraph number to display.

#### Number Font

Select the font style and point size for the paragraph number. Click the Browse button  to display the available font styles and sizes.

### Apply changed measurements and fonts to multiple Paragraph Styles

Check this box to apply margin, indent, tab and font values to multiple paragraph styles. For example, you want to change the right margin for question, answer, colloquy and parenthetical paragraph styles.

Make necessary changes and click **Apply**. The *Select Paragraph Styles to Change* dialog box displays. You can individually select paragraphs by clicking the appropriate paragraphs or click the Select All button (**Alt + a**) to select all the paragraphs. If you are modifying a layout while in Edit, Case CATalyst prompts you to select where to apply this change such as Entire Document, Only this page, etc. Once you select the option and press **Enter**, the *Select Paragraph Styles to Change* dialog box displays.

## Headers & Footers

The Headers & Footers screen in Layout contains settings for header, footer and page number positioning, font style, alignment, and page number format. There are 7 header/footer lines available plus a line for page number value. More than one header or footer can print on the same line by using different alignment options. You can modify header and footer values for any layout in the Layout function or for the applied layout while Editing, using the [Modify Job Layout](#) feature. To modify header/footer text from Edit, use the [Change Header Text](#) feature or header/footer format symbols. To modify the color of the header/footer text in Edit, use the [Color](#) feature. For additional information on how applying a layout containing headers and footers while editing and changing headers/footers via a format symbol work in a transcript, see [Understanding Header Changes and Layout Changes](#).

You can insert [fields](#) into header/footer lines. You can also associate an image with a header or footer line. Use Image Properties to adjust the size and horizontal placement of images on the line. Text and an image can use the same header line. Vertical and horizontal alignment values for text placement do not affect the placement of the image on the page. Stenograph recommends that placing an image on a header line which does not contain text you frequently change.

A PDF file is not a graphic file and cannot be opened or inserted as an image.

### Header and Footer Values

Make entries in the fields and press **Enter (Apply)** to view the changes. Measured values are in inches or centimeters depending on your Current Display Measurements [setting](#). To save the changes to the layout, press **Ctrl +s (File/Save)**.

#### Header Selection

Use the down arrow to display the list of headers and footers. Select one to create or modify.

#### Image/Remove Image

The Image button displays when the selected header line has no image associated with it. Use Image to associate a graphic with a header or footer. The Open File dialog box displays from which you can select a graphic. A PDF file is not a graphic file and cannot be opened or inserted as an image.

The Remove Image button displays once you associate an image with a header line. Use Remove Image to remove an image from the selected header line.

#### Image Properties

[Image Properties](#) allows you to modify the size and placement of an existing image on the page.

#### Header/Footer Text

Type the actual header, footer, or running header text. Header text displays in Edit in the [user selected](#) color.

When you are creating or modifying Page Number, click Insert Field to select a number format. The page number format displays in brackets, such as [!Page Number – 1,2,3...]. You can add words or symbols before or after the page number format. For example, adding Page before the page number format results in Page 23. Adding -A after the page number format results in 23-A. For example, if you want to display the current page number and the total number of pages in the file, you could format the page number as:

Page [!Page Number – 1,2,3...] of [!Total Pages in Document]

**Insert Field**

Insert a field to act as a placeholders for information that changes in the header/footer. The [Insert Field](#) dialog box displays. Use Insert Field to insert number formats when creating or modifying a page number on a header/footer line.

**Font**

Set the font and font style, size, and effect for the header or footer. The [Font dialog box](#) displays.

**Horizontal**

Set the horizontal position of the header, footer, or page number on the page. Case CATalyst uses the Default Paragraph information in the applied Layout to set the left, right and centered on margin alignment. Select one of the following:

**Exactly**

An exact number measured from the left edge of paper in inches or centimeters, depending on your setting, and typed in decimals. Type a number in the Position field. For example, for 1½ inches, type 1.5.

**Left Margin**

Flush with the Default Paragraph Style left margin.

**Right Margin**

Flush with the Default Paragraph Style right margin.

**Centered On Margins**

Based on Default Paragraph Style margins.

**Centered On Page****Centered On Box**

Based on the values of the left and right box line placements.

**Vertical Position**

Set the vertical position of the header, footer, or page number on the printed page. Select one of the following:

**Exactly # Inches/Centimeters from the top of page**

Type a number in the box.

**Top of Box**

Aligns with the same position as the top line of the box.

**Bottom of Box**

Aligns with the same position as the bottom line of the box.

**Running Header**

Case CATalyst places the first running header on transcript line one. When you select a second running header, Case CATalyst places it on the second transcript line.

## Insert an Image

1. Do one of the following:
  - In Edit, select **Alt o, l (Format/Modify Layout)**. Case CATalyst opens the applied layout.
  - Open the Layout function. Press **Alt + u, l (Function/Layout)**. In the Open Existing Document dialog box, select a layout and press **Enter (Open)**.
2. Select **Headers & Footers**.
3. In the *Header Selection* field, choose a header line to associate with the image and select **Image**. The Open File dialog box displays.
4. Make necessary entries:

### Look in

The current folder. If necessary, select another location.

### File name

The selected file to open. Click a file to select it or type the file name.

### Files of type

The type of image file that displays in the window. You can insert almost any type of graphic. Display all image types or filter the display by selecting a specific file type from the list, such as .bmp or .jpg (JPEG).

### Enable Preview

Display the image in the dialog box to preview it before insertion.

### File Info

Display the File Information dialog box showing additional information such as image format size, and resolution.

5. Press **Enter (OK)**. In the Image Placement and Size dialog box, make entries and press **Enter (OK)**. You can place the image anywhere on the page. If you do not set placement values before inserting the image, Case CATalyst places the image in the upper left corner of the page.
6. In the Page Layout pane, press **Alt + a (Apply)** to insert the image into the layout. Use Image Properties to modify the size or position of the image in the document. When you insert an image into a header or footer during Edit, the Apply this change to dialog box displays, prompting you to select the scope of the change.

## Modify an Image

1. Do one of the following:
  - In Edit, select **Alt o, l (Format/Modify Layout)**. Case CATalyst opens the applied layout.
  - Open the Layout function. Press **Alt + u, l (Function/Layout)**. In the Open Existing Document dialog box, select a layout and press **Enter (Open)**.
2. Select **Headers & Footers**.

3. In the *Header Selection* field, select the header line that contains the image you want to modify and select **Image Properties**. The Image Placement and Size dialog box displays.
4. Make necessary entries:

**Left**

Type a value to determine how far from the left side of the page you want to place the image. The position is a measurement taken from the left edge of the paper in inches or centimeters, depending on your setting. It is typed in decimals. For example, ½ half inch is typed, .5.

**Top**

Type a value to determine how far down from the top of the page you want to place the image. The position is a measurement taken from the top edge of the paper in inches or centimeters, depending on your setting. It is typed in decimals. For example one inch is typed, 1.0.

**Width**

Type a value to determine the width of the image. The measurement is in inches or centimeters depending on your setting. It is typed in decimals. For example 1¼ inch is typed, 1.25.

**Height**

Type a value to determine the height of the image. The measurement is in inches or centimeters, depending on your setting. It is typed in decimals. For example 3½ inches is typed, 3.5.

**Keep Aspect Ratio**

Check this box to maintain the image ratio of width to height. When you make a change in one of the Width or Height fields, Case CATalyst automatically determines the value for the opposite field. Type a value in one field and click in the opposite field or press Enter (OK).

If you check this box and make a change in both the Width and Height fields, Case CATalyst uses the value in the Height field to determine image ratio.

**Placement Preview Window**

On the right side of the Image Placement dialog box is a window that displays a preview of the image size and position on the transcript page. You can use your mouse in this window to resize or move the image.

To resize the image, move your cursor over the image until a line with arrows on each end displays. You can position the cursor so that the line is vertical to modify the height; horizontal to modify the width; or diagonal to modify both the width and height. Hold the mouse button down and move the cursor to modify the image size as desired. As you move the cursor, the values in the Width and Height field reflect the changes.

To reposition the image on the page, move your cursor over the image until a cross with arrows at the end of each line displays. Hold the mouse button down and move the image to the desired position. As you move the cursor, the values in the Left and Top field reflect the changes.

5. Press **Enter (OK)** to accept the changes in the Image Placement and Size dialog box.
6. In the Page Layout pane, press **Enter (OK)** to apply the changes to the layout. View the changes and make additional modifications as necessary. When you modify Image Properties of a header or footer during Edit, the Apply this change to dialog box displays, prompting you to select the scope of the change.

## Remove an Image

1. Do one of the following:
  - In Edit, select **Alt o, l (Format/Modify Layout)**. Case CATalyst opens the applied layout.
  - Open the Layout function. Press **Alt + u, l (Function/Layout)**. In the Open Existing Document dialog box, select a layout and press **Enter (Open)**.
2. Select **Headers & Footers**.
3. In the *Header Selection* field, select the header line that contains the image you want to delete and click **Remove Image**.
4. Press **Enter (OK)** accept the change. When you remove an image from Edit, the Apply this change to dialog box displays, prompting you to select the scope of the change.

## Understanding Header Changes and Layout Changes

Header/footer changes can be made through the layout or can be made while editing using the Change Header menu (default keyboard assignment Ctrl + h) item located on the Format menu, by using the Change Header command (F4 + h and then header number) in a keyboard map or if in Page View, double clicking the header.

When you [apply a layout](#) to a page or pages or [modify a layout](#) while editing, the headers and footers in the layout apply to the transcript pages. The headers and footers only apply to the locations you say when you select how to apply the layout – choices are Entire Document, Only this page, From this Page to the Next Layout change, From this Page to the End of this Section and From this Page to the End of the Document. For example, you apply a specific layout to your Appearance page or pages. The layout you select to apply has the text Appearances assigned to Header 1. The layout and Header 1 are applied to the transcript based on how you selected to apply the layout, i.e. Entire Document, Only this page, etc. Or another example might be that you selected the wrong layout at the time of translation. Let's say you selected the layout for a court transcript instead of the layout for a deposition. You now select to apply the deposition format that has the firm name as a footer. That layout including header/footer text is applied based on the scope you selected in the The Apply This change to: dialog box.

When you [change a header/footer](#) via a format symbol (Change Header via the menu or keyboard command), the text you type will override any other header/footer text that was/is in the layout for the same header/footer number. It applies until the next layout change and then stops. For example, you change Header 1 to read Deposition of Witness Name. Header 1 applies throughout the job until it reaches the next layout change. If you had included a Certificate page (with the Bring Layout option selected) that has Header 1 assigned to Certificate, the Witness Name header stops applying at the Certificate page.

In addition, when you put in a change header/footer format symbol, it applies until the next change header/footer format symbol within those pages with the same layout. For example, you put a header/footer change via the format symbol for direct examination text and then you put another header/footer change for cross examination text, the direct examination header/footer applies until the cross examination header/footer starts. The header/footers apply on the page they are found or in other words, where the header/footer change started.

However, in some instances you may have entered several header/footer format symbols in the job with different text, but realize you want the current header/footer text to apply from your current cursor location and override the other header/footer changes you previously made. In this event, in the Change Header/footer dialog box, you would select the Apply through to the next layout change option and the current header/footer will apply that text and will delete all the other change header/footer format symbols that follow it until the next layout change is encountered.

## Manage Jobs

Manage Jobs displays cases and files in the current user name. It is similar to your work area or desk showing jobs that have been completed, jobs that need to be edited/printed and important files that are needed to perform your tasks. A job usually corresponds to a single transcript or caption file. On the Manage Job screen, a job is represented as a single folder in [Icon View](#) or a text name in [Detailed List View](#). Each job contains varying subfiles which are other files related to the job such as a job dictionary or the steno notes. You can double click on certain subfiles to open the subfile in the associated Case CATalyst function or feature. Right clicking on subfiles displays a menu from which you can choose to perform additional actions. For example, double clicking on a steno note subfile (.sgstn) opens the Translate function with that subfile selected for translation. Right clicking on a steno note subfile and selecting Open, opens the subfile in the Manage Notes function. Not all subfiles have double click functionality.

You can put several jobs into a [case](#) to organize related information. The use of cases to organize your jobs is optional. For additional information about file structure and to view a list of all subfiles, see the [Case CATalyst File Structure](#) topic.

The Manage Jobs function displays all the job files in the current user name. Most of your job file maintenance is done through Manage Jobs. Use Manage Jobs to:

- View the contents of your user folder using icons or a detailed list.
- [Organize](#) your files or cases.
- Send files via [e-mail](#).
- Add, delete and change users.
- View [Job History](#) data.
- Set various user options.

### Access Manage Jobs

- On the Function bar, click the **Manage Jobs**  icon.
- From the Menu Bar, select **Function/Manage Jobs**.
- Press **Alt + u, j**.

## Selecting Files In Manage Jobs

On the Manage Jobs screen, there are several ways to select a job or file to perform a task such as backing up your dictionary, restoring a job, copying files, or opening a WordList. To select a job in a case, you must first open the case. If the job is located in another user folder, you must change to that user.

### Select Files

- Double click a subfile to automatically invoke the associated function. For example, if you double click a text file, the Edit function opens with the selected text file displayed. If you double click a steno note file, the Translate & Edit function opens.
- Highlight a subfile and then select **File/Open (Alt + f, o)** and select the correct associated function.

- Highlight the file and then select the appropriate feature from the Function Bar, Toolbar or drop-down menu.
- Highlight multiple files and then select the appropriate feature from the Toolbar or drop-down menu. You can select multiple files for backup, restore, delete, copy or move. To highlight:

**Multiple non-consecutive files**

Press and hold the **Ctrl** key while you click the desired files.

**Multiple consecutive files**

Click the first file, press and hold the **Shift** key and click the last file.

**All the files**

Press **Ctrl + a**.

- Select a feature from the Toolbar or drop-down menu and then select the file.

## Job Details Pane

The Job Details pane, by default, displays at the bottom of the Manage Jobs screen. Job Details pane displays all the associated subfiles of the selected file. If you are highlighting a Case, Job Details displays all the files in the case. You can move the Job Details pane to either side of Manage Jobs or leave it at the bottom of the screen. If you set the Job Details pane to auto hide, you will then see a Job Details "tab" so you can easily access Job Details when needed.

## File

The Manage Jobs File menu allows you to create new files and/or open existing files, start translation, print in addition to features that provide the ability to manage and send outgoing files via e-mail, view Job History data, import and export fields, access the User Root level and quickly create a Case. To access the File menu via the keyboard, press **Alt + f** and then press the underscored letter of the function you desire. The File menu is available in all functions and [contains actions](#) that are available in all functions.

## Quick Tran

Quick Tran allows you to start realtime translation bypassing any dialog box entries. For example, let's say you are an official court reporter and you want to break each calendar call into its own file. You can use Quick Tran to start a realtime session (first file for the day) and/or if you have already started realtime and want to start a new file quickly. Case CATalyst automatically uses the last realtime settings, including selected dictionaries and assumes *Writer* is selected in the Steno Source field of the Translate dialog box. By default, Case CATalyst assigns the file name using the two digit year, month and day followed by the hour, minute and seconds. For example: 080816\_140905 was created August 13, 2016 at 2:09:05 p.m. To customize the Quick Tran file naming convention, create a new naming formula in the Advanced Translate option, [Quick Tran filename format](#).

If you are writing realtime with a Diamante or élan Mira A3 WiFi connection and using the Quick Tran feature, you can have CATalyst automatically connect to the last WiFi writer by selecting the Auto Connect Last WiFi writer in the Translate, [Realtime settings](#).

If you select Quick Tran while in an active realtime file, Case CATalyst disconnects from the current realtime file and starts a new realtime file. **It is necessary to end the file on the writer to prevent the steno strokes from the current realtime file from being added to the new realtime file.** A new realtime file (tab) is started and the original realtime file remains open, allowing you to edit and save it. To change the default Quick Tran file name, use the [Rename](#) feature in Manage Jobs.

Access Quick Tran:

- at Manage Jobs, press **Alt + f, q (File/Quick Tran)** to start your first realtime file of the day. The first file and all subsequent files will use the last used translation settings (including selected dictionaries) and will name the file according to the Advanced Translate *Quick Tran filename format* option.
- while writing realtime, press **Alt + f, q (File/Quick Tran)** to start a new realtime file. The new file opens in a new tab with the default naming convention or if you modified the naming option, however you have modified the naming convention.
- in Edit, use a [keyboard command](#) assigned to Quick Tran or [macro](#) that invokes the Quick Tran command.

[Keyboard Map](#) Function: Quick Tran

## Zip & e-mail

The Zip & e-mail feature allows you to send zipped files of Case CATalyst transcript files, including subfiles, ASCII files and [PDF](#) files. The transcript files are sent in full page format. You may want to use the Zip & e-mail feature to send Case CATalyst files between a scopist and reporter, between a reporter and the firm or home office, or to send ASCII file to clients.

When you select Zip & e-mail, Case CATalyst prompts you to select the files to send and then opens your default e-mail package and opens a new e-mail message with the files attached. CATalyst opens your default e-mail package and opens a new e-mail with the selected file(s) attached. You must have an e-mail program installed and selected as your default e-mail program. Case CATalyst stores the zipped file in the Temp folder until the e-mail is sent. Once sent, Case CATalyst deletes the zipped files. The recipient of the zip file needs to use Case CATalyst's Restore feature or an unzipping program. For more information about setting an e-mail package as your default e-mail program, consult your Windows documentation.

## Zip and E-mail Jobs in Full Page Format

1. From Manage Jobs, press **Alt + f, z (Files/Zip & e-mail)**. The Select Files dialog box displays.
2. Make necessary entries:

### Show subfiles

Check this box to display subfiles with their file type extension. This list is useful when choosing individual subfiles for the selected file names.

Uncheck this box to display a separate window with a list of subfile types. This is useful when choosing the same subfiles for the selected file names.

### Copy from

Check the box next to each case or file you want to e-mail. Checking a case selects all the files contained in the case. Click the  icon to display the contents of the case. If you highlight a case or file before invoking the Zip and e-mail feature, it displays selected. To select all the cases and jobs for a user, check the box next to the user name.

The number of files and total file size for all jobs selected display below the window.

In the Select Files dialog box, you can use the mouse to click the box or Tab to the field where you can use the arrow keys to position the highlight on your selection and then press **Spacebar**.

### Subfile types

This window only displays when you uncheck the Show subfiles feature. Check the box next to each subfile type you want to select. To select all subfile types, check the All subfile types box. Subfile selection affects all the jobs you are selecting to e-mail.

### Include Support Info Files

Check this box to automatically send [exception 3](#) .dmp files stored in the Support Info Files case located within the System Files case. Case CATalyst only sends files not previously sent to Stenograph when the files were sent via Zip & e-mail.

### Options

Display the [Zip Options](#) dialog box where you can choose how to package the zipped files. You can place each job in a separate package or place all the jobs into a single package. When placing files into a single package, you can select to use a default package name. Zip Options do not affect the zip options set for Send'em e-mail. Press **Enter (OK)** in the Zip Options dialog box after making your selection.

### File name

Type a name for the .zip file.

3. Press **Enter (OK)**. If you use Microsoft Outlook or Outlook Express, the Choose Profile dialog box displays after Case CATalyst zips the files. Do **one** of the following:
  - If you only have one Profile, press **Enter (OK)**.
  - If you have multiple Windows User Profiles on your computer, select the e-mail program you want to use from the drop down list and press **Enter (OK)**. To have Case CATalyst always display the selected program in the Profile Name field, choose **Options** and select the option, *Set as default profile*.

For more information about Profiles, refer to your Microsoft Outlook or Outlook Express documentation.

4. Case CATalyst opens a new e-mail message with the selected files attached. Complete and send the e-mail message.

## Compress & e-mail

The Compress & e-mail feature allows you to e-mail transcript files in [Compress Print](#) format from within Case CATalyst. Before sending the files, you select the Compress Print configuration and build a concordance index, if necessary. Typically Compress & e-mail is used to send a client a Compress Print file. CATalyst opens your default e-mail package, opens a new e-mail with the selected file(s) attached. On Windows 7 and higher, you must have an e-mail program, such as Outlook or Thunderbird, installed and selected as your default email program.

The Compress & e-mail feature creates a PDF file of the Compress Print pages and then zips each file individually. A zip file contains one or more files, condensed into a single file for the purpose of electronic delivery or storage. To open a zipped file, use the Case CATalyst Restore feature or an unzipping program.

## Compress Print and E-mail

1. From Manage Jobs, press **Alt + f, c (Files/Compress & e-mail)**. The Select Files dialog box displays.
2. Make necessary entries:

### Show subfiles

Check this box to display subfiles with their file type extension. Only text files are available in Compress Print format.

### Copy from

Check the box next to each case or file you want to e-mail. If you highlight a case or file before invoking the Compress & e-mail feature, it displays selected. The number of files and total file size for all jobs selected display below the window.

Checking a case selects all the files contained in the case. Click the expand  icon to display the contents of the case. To select all the cases and jobs for a user, check the box next to the user name.

### Subfile types

This window displays when you deselect the *Show subfiles* option. Only text files are available for Compress Print.

### Compress Configuration

Select a Compress Print [configuration](#) from the drop down list to determine how the compressed transcript appears on the sheet.

### Build Concordance Index (if needed)

Include a [concordance index](#) when one does not already exist for the job.

### e-mail zipped PDF

Send the Compress Print PDF files in a zip format. The receiver will need to unzip (extract the) file before viewing it but will be a smaller attachment.

### e-mail PDF (not zipped)

Send the Compress Print PDF files without zip compression. The attached file will have a PDF extension and can be viewed with any PDF viewer.

3. Press **Enter (OK)**. The E-mail Attachment Status box display as Case CATalyst creates the Compress Print file in [PDF](#) format. When finished, the Zip Name dialog box displays.
4. Name the zip file for each file you compressed. Make necessary entries for each file and press **Enter (OK)**. When you select multiple files to compress and e-mail, Case CATalyst displays the next job in the *Job Name* field with a default suggestion in the Zip name field.

### Job Name

The name of the job selected to e-mail.

### Zip Name

Use the default name displayed or type a new name for the zip file and press **Enter (OK)**.

**Zip name same as job names for this e-mail**

Keep the Case CATalyst file name for the zip name. When compressing and e-mailing multiple files, Case CATalyst automatically assigns the zip file names without prompting you for each name in the *Zip Name* field.

5. Case CATalyst compresses the selected files.

If you use Microsoft Outlook or Outlook Express, the Choose Profile dialog box displays after Case CATalyst zips the files. Do **one** of the following:

- If you only have one Profile, press **Enter (OK)**.
- If you have multiple Windows User Profiles on your computer select the e-mail program you want to use from the drop down list and press **Enter (OK)**.

To have Case CATalyst always display the selected program in the Profile Name field, choose **Options** and check the box *Set as default profile*.

For more information about Profiles, refer to your Microsoft Outlook or Outlook Express documentation.

6. Case CATalyst opens a new e-mail message with the selected files attached. Complete and send the e-mail message. Case CATalyst stores the zipped file in the Temp folder until the e-mail is sent. Once sent, Case CATalyst deletes the zipped files.

To retrieve the zipped file, use the Case CATalyst Restore feature or an unzipping program. For more information about e-mailing, refer to the documentation for your e-mail program.

**Send 'em e-mail**

Send 'em e-mail is a Manage Jobs feature that allows the user to select specific files to always include with jobs zipped and e-mailed using the Send 'em e-mail feature. For example, a reporter wants the scopist to take advantage of the Global Suggest feature. The scopist needs the reporter's personal dictionary, phonetic table, job dictionary, any dictionaries used to translate the file, etc. The reporter can pre-select specific files that should always be sent to the scopist. Then, when sending a job, the identified files are automatically included in the zip file with the selected job. CATalyst opens your default e-mail package and opens a new e-mail with the selected file(s) attached. On Windows 7, you must have an e-mail program, such as Outlook or Thunderbird, installed on Windows 7 and selected as your default e-mail program.

The first time you use Send 'em e-mail, Case CATalyst prompts you through the Pre-set and Additional Pre-set file selection process. Pre-set files can include Personal Dictionary, Phonetic Table, Update Area, Wordlists and Job and Case dictionaries. Additional Pre-set files are any other files you want add to the zip file, such as your Conflict Database, Mistran Minder List, Prefix/Suffix Rules, etc. After initially selecting all your pre-set files, the next time you use Send 'em e-mail, all the preselected files are automatically included when you select the job. You can make changes to your Pre-set selection from the Send 'em e-mail dialog box.

**Select Files and Send 'em**

1. From Manage Jobs, press **Alt + f, s (File/Send 'em e-mail)**. The Send 'em e-mail dialog box displays.

If this is the the first time you are using the Send 'em e-mail feature, you must first select your Pre-set files:

**Send 'em Pre-set Files**

Check the box next to the files you always want to include when using Send 'em e-mail and then press **Enter (Next)**. Files remain selected until you change them.

- Personal Dictionary
- Phonetic Table
- Update Area (if selected for use)
- Wordlist (Personal + Case)
- Job/Case Dictionaries — includes any job and case dictionaries that were used to translate the job. Case CATalyst uses the Job dictionary information from the file's Job History.

### Send 'em Additional Pre-set Files

Check the box next to any other files to regularly include in the Send 'em e-mail zip file and then press **Enter (Next)**. Files remain selected until you change them.

2. In the Send 'em e-mail dialog box, select the job or jobs to e-mail. If you highlighted jobs in Manage Jobs before selecting Send 'em e-mail, the jobs are already selected.
3. Use the following options as necessary:

### View Files

Display the Selected Files for Zip where you can review the files selected for inclusion in the Send 'em e-mail zip file. Selected files that Case CATalyst is not able to locate are preceded by an \* and are not included in the Send 'em e-mail zip file. When finished viewing, press **Enter (Close)**.

### Options

Display the [Send 'em Zip Options](#) dialog box where you can choose how to package the zipped files. You can place each job in a separate package or place all the jobs into a single package. When placing files into a single package, you can select to use a default package name. Press **Enter (OK)** in the Send 'em Zip Options dialog box after making your selection.

Send 'em Zip Options do not affect the zip options set for Zip & e-mail.

### Pre-set Files

Display the Send 'em Pre-set Files dialog box where you can change your selection of Send 'em Pre-set and Additional Pre-set files. After making your changes in the Send 'em Pre-set Files dialog box, press **Enter (Next)** to display the Additional Pre-set Files dialog box. When finished making changes, press **Enter (Next)**. Case CATalyst remembers the changes.

4. Press **Enter (OK)**. In a few moments, your default e-mail package displays with the Send 'em e-mail zip file or files attached.

## E-mail File(s)

E-mail File(s) feature attaches the selected subfile or subfiles of the selected job or case to an e-mail. The subfiles are attached but not zipped. You can select individual subfiles or you can select a transcript which selects all the subfiles for that transcript. There can be many [types of subfiles](#) that make up a file/job and depending who the recipient is you may or may not want to send files that the recipient can't open. For example, if you are sending CATalyst files to your CATalyst scopist, the sending all file types might be useful. If you are e-mailing a client a copy of a transcript, they you most likely want to send the PDF or TXT (ASCII) file. You can also select to attach a case which selects all the subfiles for all the transcripts in the case. If you highlight a User Name, the E-mail Files(s) option is grayed out.

If you want to attach files to e-mail but want the files zipped, select [Zip & e-mail](#). You can also create a compressed PDF of the transcript and e-mail it (zipped or not) using [Compress & e-mail](#).

To use E-mail File(s):

1. At Manage Jobs, do any of the following to select files to attach:
  - a) To select a file that only has one subfile, highlight the file and go to Step 2.
  - b) To select an individual subfile from a file that has multiple subfiles, in the Job Details pane, highlight the subfile and go to Step 2.
  - c) To select multiple individual subfiles from files that have multiple subfiles, change your view to Detailed List View (View, Detailed List View) and then Show Subfiles (View, Show Subfiles). Select the subfiles you want to attach to the e-mail and go to Step 2..
  - d) To select individual subfiles and Manage Jobs is set to Detailed List View and Show Subfiles, highlight the subfiles you want to attach and go to Step 2.
  - e) To select a file or multiple files (and all the subfiles related to the file), highlight the file and go to Step 2.
  - f) To select a case (all the subfiles related to all the jobs in the case), highlight the case and go to Step 2.
2. Do one of the following;
  - a) With your cursor on the highlighted file or one of the highlighted files, right click and select E-mail File(s).
  - b) Press **Alt + f, m** (File, E-mail File(s)).
3. Your default e-mail package opens a new e-mail with the selected file or files attached. Complete the e-mail and click Send.

## RealTeam Ready

RealTeam Ready is available on File menu or by clicking the RealTeam Status icon (  ). [RealTeam](#) is Stenograph's simultaneous editing feature. RealTeam allows realtime editing (sharing of text, globals and audio) with one or more scopists/proofreaders while the reporter is writing realtime. All the RealTeam participants have access to the text and audio. Each RealTeam participant needs a [RealTeam login](#).

## RealTeam Invite

RealTeam Invite is available on the File menu or available on the RealTeam toolbar (  ) when a transcript is open (realtime or edit) and allows you to invite other participants to the RealTeam session. [RealTeam](#) is Stenograph's simultaneous editing feature. RealTeam allows realtime editing (sharing of text, globals and audio) with one or more scopists/proofreaders while the reporter is writing realtime. All the RealTeam participants have access to the text and audio. Each participant must have a [RealTeam Login](#) and needs to be [invited](#) to the RealTeam session.

## Create a Case

When you create a new case, Case CATalyst places it in the current user folder. A case is generally used for organizational purposes based on several jobs related to the same proceedings, the type of jobs, completed jobs (by month and/or year), non-transcribed jobs, etc. For example, let's say that you occasionally get called to work in court. You create a case named Court. The Court case displays along with your other cases. When you are called to work in court, you simply double click the Court case and create a new job name. All of your court transcripts are readily available in one location.

You can also create a case within a case by first opening the case in which you want to create the new case. For example, using the Court case in the previous paragraph, let's say you have an on-going trial. You could create a case within the Court case to hold the several days of transcripts for the on-going trial or you could simply have the individual files in the Court case. If you create a new case within the current case, the case displays along with job subfiles or other cases, if applicable.

If your job is in a case, while editing you can create [K-defines](#) (case defines) which go to the Case dictionary. When translating subsequent jobs in the case, the Case dictionary is automatically selected to help translate the current job. K-defining is a great way to save time for names and terminology that are case related. And K-defining may avoid selecting or merging job dictionaries together for the next job.

In addition to a case dictionary, you can also use a [case fill-in-field list](#). You can copy entries from your existing Fill-In-Field list or add entries directly to the list or while editing. If it is an on-going case, instead of going through all your Fill-In-Field entries to locate the correct firm, attorney, etc., you see only the entries currently being used in the current case.

To create a new case when you read files, write a realtime file, create a job dictionary, or when you

Import a file, click the New Case  icon in the dialog box.

## Create a New Case

1. In Manage Jobs, navigate to the folder where you want to place the new case.
2. Press **Alt + f, n, c (File/New/Case)**. A new case displays with the other cases on the Manage Jobs screen in alphabetical order. Case CATalyst highlights and labels the file, New Case. If your Manage Jobs display is set to Detailed List View, the New Case looks like the following:

 New Case

. If you are in icon view, the name of the case displays under the case icon

3. Simply type the Case name in the highlighted label area.
4. Press **Enter** or click a blank area on the screen. If you want to change the name, simply press F2 and rename the case.

## Print Notes to PDF

The Print Notes to PDF feature in Manage Jobs allows you to batch print [multiple steno notes files to PDF](#). For example, let's say you are an official reporter and are required to upload your steno notes to the network. Since many reporters and court houses have gone paperless, you can easily print your steno notes to PDF and upload the PDFs to the network.

By default, the steno notes display in three columns when printed. The beginning of each fold in the steno notes is highlighted. Timestamps, by default are not included. You can change the number of columns that print and include timestamps by changing the settings in [Manage Notes Options](#).

## History

Case CATalyst tracks and stores certain information about a job from the time you create it until it you delete it. Case CATalyst stores this information in a Job History file. Job history includes data such as job production status, editing and printing dates, translation statistics, Timer information, and backup times. Job history data may be useful when tracking job status, tracking your productivity progress, when you are working with a scopist and connection time for each receiving system when using CaseViewNet Cloud user connections.

There are eight possible tabs available in the Job History dialog box: [Summary](#), [Notes](#), [Read](#), [Translation](#), [Edit](#), [Print](#), [ASCII/Export Backup](#), [CVNet User List](#) and [Broadcast Captioning](#). Broadcast Captioning data applies only to CATalyst BCS jobs. The Summary and Notes tab display in the Job History dialog box once you create the job. If a note exists in the Job History file of a transcript, a note pad icon displays in Manage Jobs in the Misc column. Each of the remaining tabs display once data tracking begins for the related function. If no data exist for the tab, it does not display. For example, the Print tab displays after you print a file for the first time.

You can print data from the Job History subfile.

### View a Job History Subfile

1. In Manage Jobs, do one of the following:
  - Double click the Job History subfile.
  - Right click the job text or Job History subfile and select **History**.
  - Highlight the job text file and press **Alt f + h (File/History)**. If the History function is not available, you did not select a job.
2. In the History dialog box, click any tab to display the related data. Use the following options, as necessary:

#### **Print All**

Print the Job History data on all the tabs.

#### **Print Tab**

Print the Job History data for the tab currently in view.

3. Press **Esc (Close)** when finished.

## Job History Summary Data

The data contained on the Summary tab in the [Job History](#) dialog box includes the following information about the selected job:

### **Job Information**

#### **Current State**

Displays the state of the job based on specific actions taken in Case CATalyst or a user selected state for the job. To set the job state, click the down arrow and choose a status from the list. Job States are customizable in [Job State Options](#).

You can also select a job state from a limited list in the Edit, [History For](#) dialog box, available when closing an unsaved transcript.

#### **Created By**

The function through which the job was created, such as through Read, Realtime, or Import.

### **Creation Date**

The date and time the job was created on Case CATalyst. This information comes from the date on your computer.

### **Job Date**

The date the job was written, as determined during the Read process by obtaining information from the steno file or the date of the realtime file. You can change the job date. Type a new date and time in the field. Case CATalyst remembers the selection until you change it.

### **Due Date**

A user selected due date for the job or an automatically assigned due date when the Job History option, [Automatically Assign Due Date](#) is active. Check the *Due Date* box if necessary. Type a date in the field or click the down arrow to choose a date from the calendar. Case CATalyst remembers the selection until you change it.

### **Total Times**

#### **Tran**

The total time the job was open in Translate.

#### **Edit**

The cumulative time the job has been open in Edit.

### **PLO Selected at Creation**

The name of the page layout selected at the time of Translation or when creating the file in Edit.

### **Last Saved**

The last time the file was manually saved.

### **Number of Folios**

The number of folios in the job determined by the [Set Words Per Folio](#) option in Edit.

### **Number of Pages**

The number of pages in the job determined by the settings in the applied layout for the job.

## **Job History ASCII/Export Backup Data**

The data contained on the ASCII/Export Backup tab in the [Job History](#) dialog box includes the following information about the specified job:

### **Most Recent Export**

#### **Created By**

The user name where the original file is located.

#### **Date**

The date and time of the last ASCII or RTF/CRE export.

#### **Type**

The type of export.

**Export History**

The dates, times, and types of exports. When an ASCII file is created, ASCII plus the name of format displays. When an RTF/CRE file is created, Dictionary, Text, and Notes display.

**Backup History**

The dates and times of the backups (.zip files) created. Backup History also includes the name of the user who created the backup. Information about files backed up to the Cloud is available through the Cloud Backup function.

**Job History CaseViewNet User List**

When outputting to CaseViewNet via LAN (local area network) or Cloud/WAN (wide area network) connection, you can view connection information realtime by selecting View, CaseView Options, Connected Users... or selecting View, Panes, Connected Users... The CaseViewNet connected users information is available once realtime has ended on the CVNet User List tab in the job's Job History.

1. To view the CVNet User List, highlight the job, right click and select History.
2. In the Job History dialog box, click the CVNet User List tab. The Session number and the day, date and time the session started and ended displays at the top of the session information.
3. The following columns display:

**User**

Name of the client or connected device. If using CaseViewNet, it the name the client typed in on the CaseViewNet credentials dialog box. If using iCVNet, it is the name assigned to the iPad.

**IP Address**

The IP address that the device used to connect to the realtime session via a local area network or CaseViewNet Cloud.

### Organization

CaseViewNet's Login contains fields for Name, Organization and password (CaseViewNet). If the client filled in the Organization field, it displays here. If using an iPad, nothing displays in this column.

### Rights

This displays the connected user's rights at the time the session ends as to whether the client is able to save or not save the realtime file.

### Last Disconnect

This displays the last date and time that the device disconnected.

### Total Time Connected

The total time the device was connected to the CaseViewNet Cloud.

4. Do any of the following:
  - To see more information, use the scroll bar at the bottom of the screen to see move the display.
  - To print all the tabs' information, press **Alt + a** (Print All). The Print Setup dialog box displays allowing you to select the print options.
  - To print just the CVNet User List information, press **Alt + t** (Print Tab) and select any print options that you want. The CVNet User List information, by default, prints in Landscape orientation.
5. To close the job's History file, press **Enter** (OK).

## Job History Edit Data

The data contained on the Edit tab in the [Job History](#) dialog box includes the following information about the specified job:

### Most Recent Edit

#### Edited By

The user name where the file is located.

#### Session Date

The date of the most recent editing session.

#### Duration

The length of the most recent editing session.

**Type**

The status type of the Edit file: In Progress, Proofread, or Final.

**Job Dictionary**

The last job dictionary used in the most recent editing session.

**Edit History**

All the editing dates, times, and length spent in Edit. Case CATalyst lists the most nine most recent sessions.

**Other Edit Time**

Any cumulative editing time for files prior to the nine files displayed.

**Save History**

The dates and times the job was manually saved. It also includes the name of the user who edited the job on the specified date.

**Job History Notes Data**

The Notes tab in the [Job History](#) dialog box contains Case Prep information and any notes that you have manually entered about the job. You can type information about the job that you want as a reminder or delivery information. A note includes the date the note was made, the user name and the first line of the note in the upper part of the tab. You can highlight the first line of a note and the entire note will display in the Note section of the dialog box.

If you use [Case Prep](#) and create a [Heads-Up List](#), three notes are automatically created in the Job History subfile of the Case Prep Heads-Up List file. You will see the date the Heads-Up List was created, the user name and what transcripts were selected, the date, user name and what dictionaries were selected and the date, user and what Case Prep Options were selected. The first line displays and if you click a line, the detailed information displays in the Notes section. For example, let's say you created a Heads-Up List on Feb. 10, 2015 at 10 a.m. in Jan user, the following information would display in the first section of the Notes tab:

02/10/2015 10:00:26	Jan	Transcripts Used
02/10/2015 10:00:26	Jan	Dictionaries Used
02/10/2015 10:00:26	Jan	Case Prep Options

When clicking one of the lines in the first section, the Notes section displays the following information: Transcripts Used displays a list of transcripts/files analyzed along with path information, for example:

C:\CAT4\usr\Jan\SMP11172015.sgngl  
C:\CAT4\usr\Jan\TMP11162015.sgngl

Dictionaries Used displays a list of selected dictionaries with the path information, for example:  
Dictionaries Used:

C:\CAT4\usr\Jan\SMP11172015.SGDCT  
C:\CAT4\usr\Jan\TMP11162015.SGDCT  
C:\CAT4\usr\Jan\System Files\Personal Dictionary.sgdct

Case Prep Options displays the options selected, for example:  
Case Prep Options:

Identify Words and Phrases

Create Heads Up List

Show Steno in Heads-Up List Yes

Sort Frequency

Minimum Occurrences 3

Show briefs which have occurred in at least 1 jobs and been reminded at least 2 times

Suggest briefs for phrases: Yes

### **New Note**

Type a new note. For example, let's say that you want to keep track of when you send invoices to clients. So after you finish the job and send your invoice to the client you type a note with the date, amount and invoice number. Simply click the New Note button to display a new line with the current date, time, and user. The cursor moves to the Note field. You can type up to 906 characters.

### **Delete Note**

Remove a note from the list. Highlight the note and then click the Delete Note button. A delete confirmation message box displays.

### **Existing Notes**

Once you create a note, it displays in the top field. To modify an existing note, highlight the note. The text displays in the Note field. Press **Tab** to move the cursor to the Note field to modify the text.

### **Date**

The date and time the existing note was created.

### **User**

The user name where the note was created.

### **First Line of Note**

The first few words of the note display in this field so you can easily identify the contents.

## **Job History Print Data**

The data contained on the Print tab in the [Job History](#) dialog box includes the following information about the specified job:

### **Most Recent Print Session**

#### **Printed By**

The user name where the job is located.

#### **Date**

The date and time of the last printing.

#### **Type**

The status for the printed job based on Edit statistics: In Progress, Proofread, or Final.

#### **Number of Pages**

The number of pages printed.

#### **Number of Folio\_definitions**

The number of folios printed.

**Number of Words**

The number of words printed.

**Number of Words Per Folio\_definition**

The number of words contained in one folio.

**History**

Displays all the times the job printed. The print times list by date and time. History also includes the number of pages printed each time.

**Job History Read Data**

The Read tab displays in the Job History file when the file was created by reading in the steno file created on a steno machine. If the file was created via realtime, then the Translate tab displays and the Read tab will not display. The data contained on the Read tab in the [Job History](#) dialog box includes the following information about the specified job:

**Read History****Date**

The date and time the file was read.

**User**

The user name where the file is located.

**Job History Translation Data**

The [Job History](#) Translation tab contains information based on the most recent translation of the file. The Translation tab includes the following information about the specified job:

**Most Recent Translation****Translated By**

The user name where the file is located.

**Session Date**

The date and time the file was translated.

**Session Duration**

The length of time Translate and Edit was open.

**Translated From**

The file source of the job for translation: File (steno notes were read in from steno machine), Writer (steno machine was connected to the CATalyst for realtime writing) or Voice.

**Strokes Translated****Total Strokes**

The number of steno strokes in the file.

### Untranslates

The number of untranslates in the file.

### Conflicts

The number of conflicts in the file. Conflicts resolved with EZ Choice do not count as conflicts.

### Resolved Conflicts

The number of conflicts Case CATalyst resolved during translation with the translate commands such as Resolve Conflict Choice.

### Dictionaries Used

The list of dictionaries selected for translation at the time translation starts. The Personal Dictionary is always used for translation but is not listed because it is automatically used. Knowing what dictionaries were used for translation may help in troubleshooting unexpected translations. While in a job, you can also use the [Query Realtime Translations](#) feature to see what dictionary was used to translate the steno. For example, let's say you wrote a speaker identification stroke and it translated as the name of the attorney from the day before. If the previous day's dictionary was used to translate the current file, then you may know why the speaker identification translated as it did.

If the job was translated in a Case where there is a numberconversion file, the Dictionaries Uses heading changes to File Used and the numberconversion file along with the dictionaries selected for translation at the time translation started are listed.

### History

#### Date

The date and time for each occurrence if the file was translated up to the nine most recent translations.

#### Duration

The length of translation time.

#### Other Tran Time

If the file was translated more than the nine translations, the Other Tran Time displays the cumulative translation time prior to the nine translations listed.

### Options & Modes

Display the Last Used Translation Options dialog box which lists the translate options selected in the most recent translation. There is a Input tab and a Realtime tab.

Input tab shows the following sections and information:

- Options: which shows what translation options were selected for the last time the file was translated.
- Conflicts: what [conflict resolution](#) options were selected.
- Drag/Drop: if the [Drag/Drop](#) option is selected in the Options section, this displays what steno characters were selected to indicate letters you tend to "drop" or "drag" in steno outlines.
- Numbers, [Triggers](#) and [Conversions](#): options for handling numbers and punctuation when using Number Triggers and Number Conversion realtime commands.
- Show: displays the selected options such as [Phonetic Translation](#), [Translate Statistics](#) and [Timers](#).

- EZ Speakers Dictionary: displays the name of the [EZ Speakers Dictionary](#) that will be used when creating EZ Speakers during translation.
- Use Alternate User Settings for Edit: displays the name of the [Alternate User Settings](#) that will be used when starting translation.

Realtime tab show the following sections and information:

- Audio: showing whether [audio](#) was recorded, the input setting and auto pause information.
- Hold Strokes: showing whether [longest match](#) was selected along with number of seconds.
- Realtime Aids: displays whether [Brief It](#) and/or [Live Suggestions](#) features were selected.

### Timers

Display the [Timers](#) dialog box which lists the Timers and Timer Groups used in the job.

You can copy information from the Timers dialog box. It is necessary to copy information for each field, Timers, Timer Groups and Timers in Group separately.

1. Highlight one or more names. Place your cursor on the desired name and left click the mouse. To select additional names, hold **Ctrl** as you highlight. To highlight all the names in the field, place the cursor in the field, right click the mouse and then choose **Select All**.
2. Right click the mouse and select **Copy**.

## Job History Broadcast Captioning Data

If your e-key allows access to CATalyst BCS (Broadcast Captioning Suite), the Job History will display a Broadcast Captioning tab. The data contained on the Broadcast Captioning tab includes the following information about the specified CATalyst BCS captioning job:

### Most Recent Translation

#### Translated By

The user name where the file is located.

#### Session Date

The date and time the file was translated.

#### Session Duration

The length of time the Broadcast Captioning session was open.

#### Profile

The Profile used for translation.

### Strokes Translated

#### Total Strokes

The number of steno strokes in the file.

#### Untranslates

The number of steno outlines that did not find a dictionary match.

#### Conflicts

The number of conflicts in the file. Conflicts resolved with EZ Choice do not count as conflicts.

### Resolved Conflicts

The number of conflicts CATalyst BCS resolved during translation with translate commands such as Resolve Conflict Choice.

### Dictionaries Used

The list of dictionaries selected for translation at the time translation was started. The Personal Dictionary is always used for translation and does not list here.

### History

#### Date

The date and time for each occurrence the file was translated. For example, if you appended to the existing session, the date and time of that translation displays.

CATalyst BCS lists the nine most recent translations.

#### Duration

The length of translation time.

#### Other Tran Time

Any cumulative translation time prior to the nine translations displayed.

### Options & Modes

Displays the Last Used Caption Options dialog box which identifies the caption translate [options](#) used for the last translation of this file.

## Field Manager

The Field Manager feature allows you to view all the User Defined fields for the current user in one list. User defined fields allow you to create customized fields for information such as county, judge, witness names or any field you need in your job. You identify the specific name to represent the field in the current job. Additionally, you can set the [scope](#) for the definition to determine the availability of the field values for other jobs.

For example, let's say you create a COUNTY field which appears on all of your title pages. When you need to fill in the COUNTY field for a job, you want to be able to select from all the available county names in every job, so you set the scope to *User*. In another example, let's say you create a WITNESS field which appears on all your title pages. When you need to fill in the WITNESS field for a particular job, you certainly don't want to have to look through all the names of prior witnesses, you want to see only the available witness names in the current job or case. So for the WITNESS field, you set the scope to *Job* or *Case*.

You can modify the name, add values and set the scope for each individual User Defined field. You can also set the default scope for all new User Defined fields.

When you insert [User Defined](#) fields in the Field Manager, the fields are available for insertion in any job, include file, definition, etc. When you insert Field Values in the Field Manager, the values are available in a job when identifying a User Defined field and viewing the Select List.

You can combine the contents of one Field Manager list with another Field Manager list by exporting the entries from one list and importing them into another. For example, you start a job, create several fields and fill in the field values. The job has become part of several depositions regarding one case. You want all the field values available for all jobs in the case. You can export the fields from the job into the case.

## View User Defined Fields

1. From Manage Jobs, highlight the the job, Job History or Case History for which you want to view the User Defined fields.
2. Press **Alt + f, f (File/Field Manager)**. The Field List display in alphabetical order.
3. Each User Defined field displays on a line. A plus mark in front of the field name indicates there are field values for the User Defined field. Do any of the following:

### Insert Field Name

Press **Ctrl + i (Edit/Insert)** or **Alt + e, n (Edit, Insert Field Name)**. Case CATalyst inserts and highlights the new field using the default scope and assigns the label, Field#. Type the field name in the highlighted area and press **Enter**.

### Insert Field Value

Highlight a field name and press **Ctrl + i (Edit/Insert)** or **Alt + e, v (Edit/Insert Field Value)**. The Modify value dialog box displays. Type a value in the Text field and press **Enter (OK)**.

### Set Scope

Highlight a field name and press **Alt + e, s (Edit/Set Scope)**. The Scope for dialog box displays. Select the new scope for this User Defined field and press **Enter (OK)**.

#### Job

When the User Defined field scope is set to Job, the field values display only in this job. Field values for the field set to Job are stored in Job History file for that job. If you have a WITNESS field, you might want to set that field to a Job scope so the value of the WITNESS field only displays in this job.

#### Case

When the User Defined field scope is set to Case, the field values are display for all jobs in that Case. If you start another case, the previous field values do not display in the new case. Field values for a field set to Case are stored in the *casename\_case.sgxml*. If you have a DEFENDANT field, you might want to set that field to a Case scope so the values of the DEFENDANT field only displays in this case.

#### User

When the User Defined field scope is set to User, the field values display for all jobs and cases. Field values for a field set to User are stored in the *System\_Files\_case.sgxml*. If you have a COUNTY or DISTRICT field, you might want to set that field to a User scope so the values of the COUNTY or DISTRICT field displays in all jobs/cases.

### Set Default Scope

Set the default scope for all new User Defined fields created in the Field Manager. Press **Alt + e, d ((Edit/Set Default Scope)**. The Scope for "Default" dialog box displays. Select the new default scope and press **Enter (OK)**. Existing User Defined fields retain their current assignment.

### Modify

Rename a field name or value. Highlight the field name or field value and press **Ctrl + m (Edit/Modify)**. Type the new text and press **Enter**.

### Delete

Highlight one or several field names or field values and press **Delete**. Undo is not available. If you delete more than you want, exit the file without saving.

4. Press **Ctrl + s (File/Save)**.
5. Press **Alt + f, x (File/Exit)**.

## Export a Field Manager List

1. From Manage Jobs, highlight the job or Case History file that contains the Field Manager list you want to export and press **Alt + f, f (File/Field Manager)**. The Field List display in alphabetical order on a new tab.
2. Using Windows conventions, select the fields to export.
3. Press **Alt + f, e (File/Export Fields)**. The Export Field As dialog box displays.
4. Type a unique name in the File name field and press **Enter (Save)**.

## Import a Field Manager List

When importing a Field Manager list, Case CATalyst adds field names and values from the source list that do not exist in the destination list. If any field names or values from the source list match in the destination list, Case CATalyst automatically overwrites the existing name or values. The scope for all the importing entries is retained regardless of the default scope setting in the destination list.

1. From Manage Jobs, highlight the job or Case History file to which you want to import fields and press **Alt + f, f (File/Field Manager)**. The Field List display in alphabetical order on a new tab.
2. Press **Alt + f, i (File/Import Fields)**. The Import Fields dialog box displays.
3. Select the source file. Click the file to select it or type the file name. To locate the file in a different folder, use the drop down button in the Look in field. To locate a file in a location other than the Case CATalyst users level, use **Browse**.
4. Press **Enter (Open)**.

## User Root Folders

User Root Folders is a Manage Job feature that allows you to add or remove user root folders. In most cases, it is highly unlikely that you will need to change a user root unless you are a network administrator. A user root folder is the first hierarchical level in the Case CATalyst file structure that contains user names and files. When you install the Case CATalyst software with the default selections, Case CATalyst creates the user root, C:\CAT4\usr. If you install Case CATalyst on a different drive or location other than the default settings, your user root will reflect that location.

Case CATalyst requires at least one User Root folder exists. You cannot access the Case CATalyst software without a user root. If you attempt to start Case CATalyst without a user root, an error message displays, prompting you to create one.

## Add or Remove a User Root Folder

1. On the Manage Jobs toolbar, click the Up One Level,  icon until you reach the User Root level. The User Root level contains User Root icons and their folder path. For example, C:\CAT4\usr. The Up One Level icon is grayed out at this level.
2. Press **Alt + f, e (File/User Root Folders)**. The User Root Folders dialog box displays.
3. In the User Root Folders dialog box, use the following fields and options:

#### Folders

Lists the folders and files on your computer system. Browse for an existing folder and select a new location for a user root. As you open folders, the selection displays in the Chosen Folder field.

#### Chosen Folder

The selected folder for the new user root. This name displays in the User Root Folders field when you choose Add. Do **one** of the following to select a folder:

- Browse for and select a folder from the list in the Folders field to display in this field.
- Type the path for an existing folder.
- Type a path and a new folder name. The message: "The folder X:\name of folder does not exist. Would you like to create it?" Press **Enter (Yes)** to create the new user root.

#### User Root Folders

The current user root folders on your computer system.

#### Add/Remove

Do **one** of the following:

##### Add

Add the new user root folder displayed in the Chosen Folder field to the User Root Folders list.

##### Remove

Remove an existing user root folder from the User Root Folders list. Highlight a user root folder in the User Root Folders field and then press **Alt + r (Remove)**.

#### Suggest to remove inaccessible user roots

Check this box to have Case CATalyst suggest to remove user roots that exist in Case CATalyst but are not currently accessible. Leave this box blank if you do not want Case CATalyst to display a message regarding the inaccessible user roots.

For example, you have a notebook computer you use at the office and at home. User Roots may exist on drives that are only available when you are connected to the network at work. When you are not connected to the network at home, User Roots located on the network are not accessible.

4. Press **Enter (Save)** to save the changes.

## Refresh

The Refresh feature, F5, in Manage Jobs refreshes the display to include any changes you made to the screen. If you make a change and you do not immediately see the change reflected, press F5. Windows operating system also uses F5 to refresh the screen.

## Recently Saved Files...

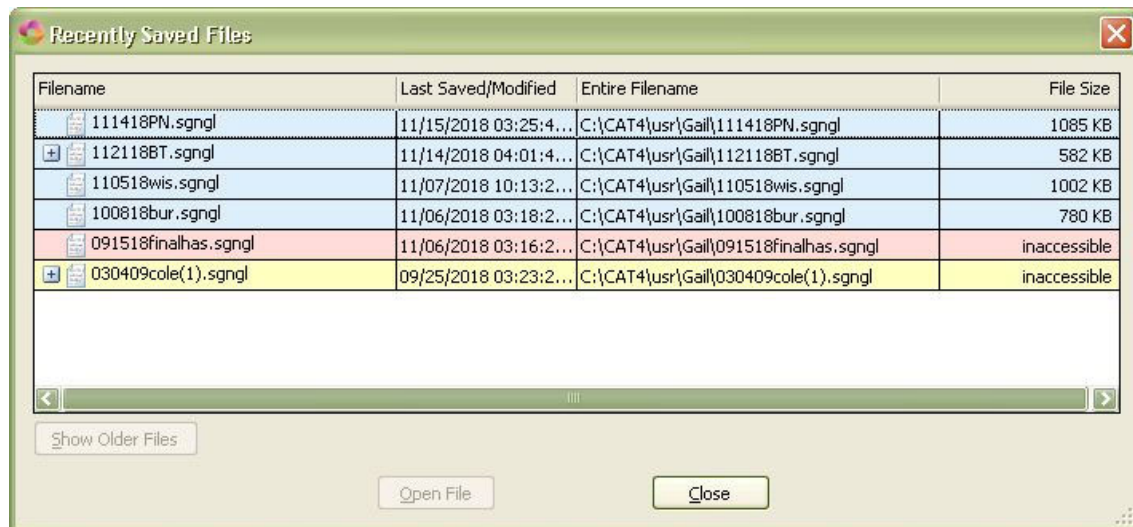

The Recently Saved Files (**Alt + f, y**) dialog box is available that lists the last 10 files you have saved! There are several scenarios where you go to find a file and you can't seem to locate it. Maybe you used Save As to save the transcript as a different name or to a different location? Or perhaps you used the break command in the file and you can't find the new file? Or were you accidentally working in your September folder and now it is November? It doesn't really matter -- what matters is that you can go to the Recently Saved Files dialog box and see the last 10 files that you saved.

CATalyst has several save features starting with the Auto Recover or Auto Save features and the AutoArchive case that saves a copy of the text file whether you saved the file or not when closing the file. The AutoArchive case keeps multiple versions of the text, caption file or dictionary. And the Recently Saved Files dialog box is an easy-to-read dialog box that lists all your recently saved files (transcript, caption file or dictionary) and shows the full path location of the file whether it is stored on the hard drive or an external drive.

**To access the Recently Saved Files dialog box:**

- click the Recently Saved Files icon (  ) on the toolbar.
- press **Alt + f, y** (File, Recently Saved Files).
- click the File menu and then select Recently Saved Files.

The dialog box opens displaying four columns and may display different colored backgrounds depending on the status of the file.

### Column Descriptions:

**Filename** - displays the file name along with the extension. Saved file extensions are text (.sgnfl), caption file (.sgcap) and dictionary (.sgdct). The most recently saved/modified file is listed first. If a plus icon () displays before the filename, it means there are additional versions of the file available. Click the  to display the available versions. For example, if you use the Auto Recover feature and have the Keep Auto Recover Files in Archive option selected, up to four versions of the file could be available in the AutoArchive case.

You can double click a file to open it. If you open a file in the AutoArchive case, the Recover dialog will display. See AutoArchive in Help for more information.

Background colors:

- Blue indicates the original file exists.
  - ✓ Double click a file on a "blue" line to open it in either Edit or Manage Dictionary.
  - ✓ A plus icon (⊕) indicates there are additional files in the AutoArchive case. Click the plus icon (⊕) to see the archived files. Double click an archived file to open it in the AutoArchive case. To recover the file from the AutoArchives case, follow the prompts.
- Red/pink indicates the file no longer exists or CATalyst cannot locate it. This can happen if you saved the file to an external drive and that drive is not attached or you moved or deleted the file after it was saved. You cannot access the file.
- Yellow indicates the original file no longer exists but archives of the file exist. You can click the plus icon (⊕) to see the archived files.
  - ✓ Double click an archived file to open it in the AutoArchive case. To recover the file from the AutoArchives case, follow the prompts
- White indicates a file is located in the AutoArchive case.
  - ✓ Double click an archived file to open it in the AutoArchive case. To recover the file from the AutoArchives case, follow the prompts

**Last Saved/Modified** - displays the last date and time the file was saved or modified.

**Entire Filename** - displays the entire path of the file location.

**File Size** - displays the size of the file. If a file no longer exists, "inaccessible" displays in the File Size column.

## Save and Load Alternate User Settings

Use the [Save and Load Alternate User Settings](#) from Manage Jobs to save an alternate user settings file after closing Edit or to load an existing alternate user settings file before opening Edit.

To access the Save Alternate User Settings feature from Manage Jobs, press **Alt + f, s (File/Save Alternate User Settings)**. To access the Load Alternate User Settings feature from Manage Jobs, press **Alt + f, L (File/Load Alternate User Settings)**.

## View

The View menu allows you to customize the display of files in Manage Jobs. You can display and hide columns, sort on columns, change fonts and switch between Icon and Detailed List view. You decide what you want to see and how you want to see it at Manage Jobs. See any of the following to customize your view at Manage Jobs.

[Detailed List View](#)

[Icon View](#)

[Show Columns](#)

[Sort By](#)

[Restore Default Columns](#)

[Manage Jobs Text and Heading Fonts](#)

[Restore Default Fonts.](#)

## Detailed List View

Detailed List View, () the default, in Manage Jobs displays cases and individual job file names as text with associated file data such as file size, number of pages in the job, and date of the last backup. Use [Show Columns](#) to customize the column display or you can right click on a column and select to hide it. You can sort a column in ascending or descending order, select Best Fit which sizes the column based on the length of text in the column. And lastly, if you want to get back to the default columns displaying, you can reset Manage Jobs to display the default columns.

When you select Show subfiles, the subfiles for each job display in a list below the job name. As an alternative, you can display job files and cases in [Icon view](#)

When AudioSync is used during translation, a musical note displays in the Manage Jobs Misc column. If a note exists in the Job History file of a transcript, a note pad icon displays in the Misc column. If AudioSync is used during translation and there are notes in the Job History file the musical note displays on top of the note pad icon.

### To View Cases/Jobs in Detailed List View:

1. From Manage Jobs, select **View/Detailed List View (Alt + v, d)**. The feature is active when the Detailed List View icon displays next to it.
2. From Manage Jobs, click the Detailed List View icon  on the Toolbar.
3. To display subfiles, select **View/Show/Show Subfiles (Alt + v, s, h)**. The feature is active when a check mark displays next to the menu option.

## Icon View

Icon View () in Manage Jobs cases, jobs and files as pictures. Icon view divided the Manage Jobs screen into two sections. The top section displays all the cases, job and settings files. The bottom section, displays all the subfiles of the highlighted case/job in a tree view display.

### To View Cases/Jobs in Icon View:

1. In Manage Jobs, select **View/Icon View (Alt + v, i)**. The feature is active when the  displays next to the menu option.
2. In Manage Jobs, click the Icon View icon  on the Toolbar.

## Show Columns

Show Columns allows you to customize the display of columns in Manage Jobs when using [Detailed List View](#). Columns are visible when a check mark displays next to the name in the Show Columns list.

To display the Show Columns list, press **Alt + v, c (View/Show Columns)**. Column options, such as show, hide and sort are also available on the right click menu when you position your cursor on a column name and right click.

## Column Selection

You must be in Detailed List View to see the columns. The display of certain columns changes depending on whether you select to [show](#) or hide the Subfiles.

**File Name**

The name of the file. This column displays only when Show Subfiles is On. You cannot hide this column.

**File size**

The size of the file in bytes. This column only displays when Show Subfiles is On.

**Job Date**

The date the job was written, as determined during the Read process by obtaining information from the steno file. You can change the job date. In Manage Jobs, highlight the file and press **Alt + f, h** (**File/History**). On the Job History Summary tab, type a new date and time in the *Job Date* field. Case CATalyst remembers the selection until you change it.

**Modified Date**

The last date and time there was a saved change to the file.

**Number of Subfiles**

Indicates the number of subfiles, if any, for the job. This column only displays when Show Subfiles is Off.

**Job Name**

The name of the job. This column only displays when Show Subfiles is Off. You cannot hide this file.

**File Type**

Indicates if the file is a Case, Settings, Steno, Text, Wordlist, etc. This column only displays when Show Subfiles is On.

**Job State**

A user selected status for the job. You can [change the job state](#) in Manage Jobs. You can also select from a limited number of job states in the Edit, [History For](#) dialog box.

**Last Backup Date**

The last backup date of the file.

**Pages**

The number of pages in the job.

**Folios**

The number of folios in a job.

**Misc**

If a note exists in the Job History file of a transcript, a note pad icon displays. A musical note displays when AudioSync is used during translation. If AudioSync is used during translation and there are notes in the Job History file, the musical note displays on top of the note pad icon.

**Due Date**

A user assigned due date for the job. To assign a due date, in Manage Jobs press **Alt t + d** (**Tools/Change Due Date**). On the Job History Summary tab, check the box in the *Due Date* field if necessary. Type a date in the field or click the down arrow to choose a date from the calendar.

## Adjust Column Widths

The width may need adjusting after selecting to Show the column on the screen. Do either of the following to manage column widths:

- Place the cursor on the line dividing the column headings and hold the mouse button down. Move the line left or right to the desired position. Release the button.
- Place the cursor on the column heading. Use the right click menu and select **Best Fit** to have Case CATalyst automatically size the column.

## Change the Display Order of Columns

Click the desired column heading and hold the left mouse button. Drag the heading to a new location on the column heading bar and release the button. Red arrows will display where the

column will display once you release the mouse button. For example, instead of having the File or Job Name column display first, you can move the columns to have the Job date display first.

## Show Hidden Columns

Display the Column Chooser dialog box to view the names of columns currently not displayed on the Manage Jobs screen. To add a hidden column to the screen, click and hold the left mouse button on the selected name and drag it to the desired location on the column heading bar and release the button. The width of the column may need adjusting after adding it to the screen.

## Sort By

Sort By allows you to select how you want to sort jobs on the Manage Jobs screen and set the list for ascending or descending order. In Detailed List View, you can select the column in which to sort by and then choose ascending or descending order. When sorting the Job Name column, cases always display first either ascending or in descending order followed by jobs in the selected order.

## Set Sorting Priority

1. From the Manage Jobs screen, press **Alt + v, b** (**View/Sort By**). The Sort By menu displays. Click one of the sorting options to select it. A check mark indicates your selection. The menu closes.
2. From the Sort By menu, click **Ascending Order** to determine the sort order. A check mark next to Ascending Order indicates an ascending list depending on the column. For example, if the Job Name column has focus, the case/jobs would be displayed alphabetical order. No check mark indicates descending order.

Optionally, you can click a column heading to select the column for sort priority. The arrow indicates ascending or descending sorting order. Click the heading again to change the sorting order. For example, let's say you want to sort the jobs in ascending order. When the arrow is pointing upward, the column is sorted in ascending order.

Job name ↑

## Restore Default Columns

Restore the display of columns on the Manage Jobs screen to the default selection. Press **Alt + v, t** (**View/Restore Default Columns**). If you had hidden/removed some columns from the Detailed List View screen, you can restore all the default columns using the Restore Default Columns feature.

## Manage Jobs Text and Heading Fonts

You can select the font type, style and size for the case/job names and column heading text in Manage Jobs. For example, let's say that you want the job names and information larger so it is easier to see. You can select a larger font size or perhaps a different font style to see what you like. To modify the font:

1. In Manage Jobs, press **Alt + v** (**View**) and select any of the following:
2. Press **Alt + v** (**View**) and select either of the following:

### Change Body Text

Press **Alt + v, x** (**View/Text Font**).

### Change Heading Text

Press **Alt + v, h** (**View/Heading Font**).

3. The Font dialog box displays. Select the desired font, font style and font size and press **Enter** (**OK**).

Use the *Restore Default Fonts* feature to return both the table body and heading text to the default font type, style and size. Press **Alt + v, o** (**View/Restore Default Fonts**).

## Restore Default Fonts

Use the Restore Default Fonts feature to return both the case/job text and/of column heading text to the default font type, style and size. Press **Alt + v, o** (**View/Restore Default Fonts**). If you have modified the font for Manage Jobs display text, you can set the font type, style and size back to the original settings.

## Tools

Manage job files from the Manage Job Tools menu. You can [search](#) for a specific steno outline in dictionaries or text across transcripts, you can search for [jobs that are due](#), prepare for upcoming jobs with [Case Prep](#), copy, move, [e-mail](#) and back up files; [create job reports](#); and access various Case CATalyst options. In addition to the [Backup](#) feature, [Send'em](#) allows you to select specific files to always include in a back up for e-mailing. The [Finish 'em](#) feature allows you to perform multiple Case CATalyst printing and exporting finalizing actions at one time. You can [backup your entire user](#) or [restore your entire user](#) when setting up a new computer. If you are using CATalyst's Cloud Backup, you can use the [Cloud Back Up Now](#) feature to ensure a job gets backed up before shutting down your computer.

You can also change the [color of your cases](#). For example, let's say that you report different types of work and you have created cases for depositions, court transcripts when you fill in for an official and CART work. You can change the color for the different cases to make it easier to identify.

You also have access to the [All Options](#) dialog box that allows you to see and change your options for different functions all in one dialog box. You also have the [Options](#) menu that allows you to select a specific option to change.

## Auto Logon

The Auto Logon feature allows you to automatically sign in to your user when Case CATalyst starts. Auto Logon eliminates the need to select your user name each time you start Case CATalyst. For example, if you are the only user in Case CATalyst, you most likely will want to set Auto Logon to automatically start CATalyst in your user name. If you are a scopist and have several user names (ones for each reporter you scope for) you probably don't want to set Auto Logon to a particular user. You must be in the user you want when you select the Auto Logon feature.

### Set Auto Logon

1. Verify you are in the user you want to select or deselect for Auto Logon. If you are not in the correct user, press **Alt + t, u**. (**Tools/User Level**) and select the user.
2. From Manage Jobs, press **Alt + t, l** (**Tools/Auto Logon**). The Auto Logon dialog box displays.
3. Do **one** of the following:

#### Select Auto Logon

Click the button for the option, Always start Case CATalyst with user: *current user name*.

#### Deselect Auto Logon

Click the button for the option, *Choose user at startup*.

4. Press **Enter (OK)**.

## Back

Back is a Manage Jobs feature that moves you backward in the sequence of folders you displayed. In

Manage Jobs, press **Alt + t, k** (**Tools/Back**) or click  on the toolbar.

## Backup

Use the Backup feature to archive completed jobs, important files such as your Personal Dictionary, UserSettings, Macros, etc., or no-write jobs. You can also transfer jobs to another Case CATalyst system or send Case CATalyst files electronically. The Backup feature [compresses](#) selected files and saves them in either individual zip files or in one zip file. For example, let's say that every Friday, you back up all of your important files such as your Personal Dictionary, UserSettings, Include Files, Macros, etc. Since you back up all the files into one file, you have created a default name, My System Files and have selected to have the date as part of the name. But when you back up files that you have completed, you back up the files to individual files which automatically uses the name of the file as the name of the zip file. You can select Single (all files are backed up to a single zip file) or individual zip files (each file is backed up to a separate file) in Backup [Options](#). Each time you backup a file, Case CATalyst records the backup date in the Job History file. The Backup Options also have options for backing up audio files and auto selection of specific subfiles.

To backup an entire user to restore on a new computer or for archiving purposes, you can use the [Backup User\(s\)](#) / [Restore User\(s\)](#) features.

[Cloud Backup](#) is a simple, secure way to store your files in the Cloud and is exclusive to those that have Edge for Case CATalyst.

You may want create your backup on an external hard drive or online backup separate from your computer. As a standard procedure, you should keep backup copies of:

- Personal Dictionary (at least two copies in different locations) and any case or job dictionaries.

- Completed Jobs (Case CATalyst does allow manual backup of open files in Edit.) If using CATalyst's Cloud Backup, Cloud Backup is automatically pauses when writing realtime and won't backup open jobs until they are closed.
- Include Files
- Keyboard Maps
- Layouts
- Macros
- System files such as Conflict database, Index templates, Phonetic table, Power Define dictionary, and Wordlists
- UserSettings and UserLayout files.

## About Compressed Backup (.ZIP) Files

The Case CATalyst Backup feature compresses files as they are written to the destination drive. On average, the files are compressed up to 80%. File compression on audio files depends on the audio codec you selected for AudioSync. Some codecs (GSM 6.10 8000Hz and ADPCM 8000Hz) are already compressed and the backup file compression will have little affect on their file size. Audio codec, such as PCM 8000Hz or higher, are not compressed audio files.

Case CATalyst compresses the job or multiple jobs and subfiles you select for backup. You can choose to save them as individual backup files or package all the jobs and subfiles you selected into one backup file name. All backup files have a .ZIP extension.

When jobs and subfiles are backed up into individual files, the number of compressed (.zip) backup files equals the number of jobs or subfiles selected. If subfiles for a job, such as a note file and a text file have the same file name they are saved together in one backup with the job file name and a .ZIP extension.

When all the jobs and subfiles selected are backed up into one package, you assign a name to the backup. For example, you could name the backup 062116 for the date the backup was created. You can also use a default backup name, which can be modified. To change the default backup name see [Backing Up Job Files](#).

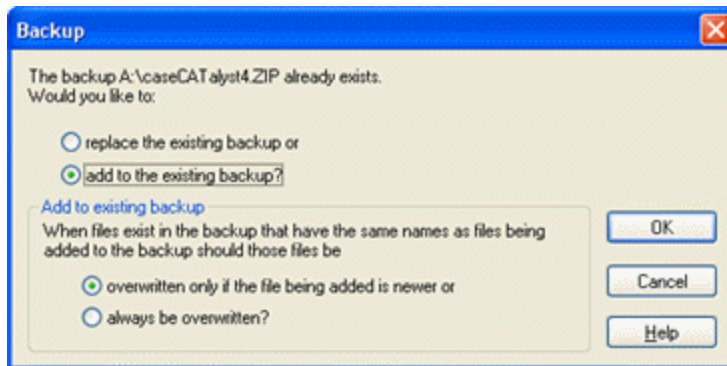

You can also backup entire users by using the [Back Up User\(s\)](#) feature which is available from Manage Job's Tools menu and the right click menu. You can select one or more users to back up to separate files (each user in a separate zip file) or back up all the selected users to one backup file. All files in the selected user(s) will be backed up, you cannot select individual user files when using the Backup User(s) feature. To restore a User, use the [Restore User\(s\)](#) feature.

You can back up files to your computer hard drive, an external hard drive, USB removable drive or online backup. Backed up files can also be written to CD for storage. Files are uncompressed when you use the Restore function in Case CATalyst, or any PKUNZIP compatible application.

## Backup Messages

The following backup messages may display when you backup your files using the Backup feature:

### Message

## Action

You selected an existing backup name (.ZIP) file. Choose **one** of the following:

### Replace the existing backup file

Remove the contents of the existing backup and replace it with the jobs currently selected for backup.

When backing up the Personal Dictionary, using this option, the Personal Dictionary should be the only file selected for the backup. Stenograph suggests you name this backup, *Personal Dictionary*. The next time you backup your Personal Dictionary, select *Personal Dictionary.ZIP* for the backup name and then select to replace it when prompted.

### Add to the existing backup

Add the selected jobs for backup to the existing backup name. You might use the *Add to the existing backup* option when updating your System Files backup. When you add to the backup name, you must also select an appropriate action from the *Add to existing backup* section of the message. The selected action affects all the existing jobs of the same name. Case CATalyst does not prompt you to overwrite each individual file. Choose **one**:

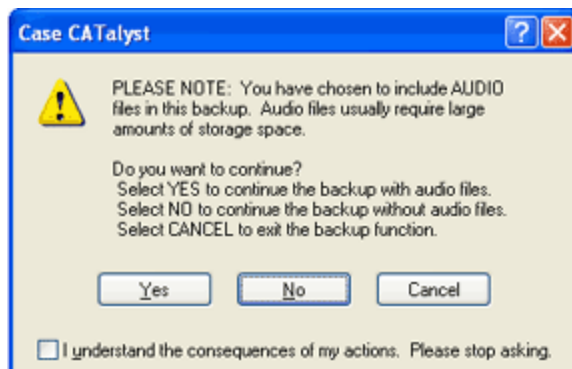

#### Overwrite only if the file being added is newer

Only replace the existing jobs with the currently selected job of the same name if the currently selected job has a more current date.

#### Always be overwritten

Automatically replace the existing jobs with the currently selected jobs of the same name.

## Message

**Action**

You are backing up at least one file that has an associated audio (.wav) file and you have the *Warn before backing up audio files* option turned On.

Wave files generally take a large amount of storage space. Case CATalyst gives you the option to do one of the following:

**Yes**

Continue with the Backup, including any audio (.wav) subfiles associated with the selected files.

**No**

Backup the selected files, but do not include the audio subfile.

**Cancel**

Perform no backup action and exit the Backup feature.

**Message**

*Insert disk 2 of the backup set?*

**Action**

You are backing up to a single diskette, and there is not enough disk space to store all the files on the single diskette. Choose **one** of the following:

**Yes**

You have additional disk formatted and available.

**No**

You do not have additional diskettes. Cancel the backup. A warning message displays informing you that to continue the cancel makes the backup set unusable.

**Message**

*Canceling a backup that spans multiple disks will make the entire backup set unusable! Are you sure you want to cancel?*

**Action**

You are backing up to an existing backup when Case CATalyst prompts you to insert an additional diskette and you select Cancel. Choose **one** of the following:

**No**

Continue with the backup.

**Yes**

Cancel the backup. If you select Yes to cancel, the entire backup set is unusable and the previously backup up information on the disk is not retrievable.

**Message**

*Not enough room on floppy to create any portion of the zip file. Please use a different disk.*

### Action

You selected a disk that is full or has less than 512 bytes available. Choose **one** of the following:

#### OK

Replace the current disk with a new one and then select OK.

#### Cancel

Cancel the backup. If you selected to back up several files and selected the backup option to name each file separately, you will need to Cancel for each file that Case CATalyst is not able to write to the disk.

### Message

*This disk already has a file with the name A:\file name.ZIP. Would you like to overwrite the file on this and all subsequent disks?*

### Action

The current backup extends to more than one disk and you have selected to overwrite the existing backup and you insert a disk with a backup of the same name. Choose **one** of the following:

#### Yes

Proceed to overwrite the existing backup with the currently selected files.

#### No

The following message displays:

*The disk contains a backup that you have selected not to overwrite. Please insert a different disk.*

Choose **one** of the following:

#### OK

Insert a different disk and press **OK** to continue the backup.

#### Cancel

Cancel the backup.

### Message

*An error occurred while accessing the selected target. Please make sure that the disk is properly inserted in the drive, it is not write protected, and that the selected file is not in use.*

### Action

You are backing up to an existing backup and the current disk in the drive is write protected or you cannot access the job you are trying to backup. Do the following:

1. Check the current diskette in the drive and make sure it is not write protected. Reinsert the diskette and select **Retry**.
2. Make sure all the jobs you backing up are closed and not in use by another program, then select **Retry**.
3. Insert a different diskette in the drive and select **Retry**.

4. If the previous steps do not work, select **Cancel** to exit the backup. If you select Cancel, all the previous backup information in this backup is lost and is unrecoverable.

### Message

*Files cannot be added to a backup that spans multiple disks. Would you like to delete the existing backup?*

### Action

You selected an existing backup name and the original backup extended beyond one disk. Choose **one** of the following:

#### OK

Erase the entire existing backup and create a new backup on the same disk. If the new backup resides on one disk, the remaining disks of the original backup are useless.

#### Cancel

Cancel the backup.

### Message

*The following file(s) cannot be backed up: file name Check to make sure the file(s) are not in use.*

### Action

You selected to backup a file that is currently in use by another program. Press **Enter (OK)** to close the message box. Close the file and backup again.

## Backup Job Files

The Backup feature compresses the job files for storage. To back up Case CATalyst files:

1. From Manage Jobs, press **Ctrl + b (Tools/Backup)**. You can highlight the job or jobs before selecting Backup. The Backup dialog box displays.
2. Make necessary entries:

### Show subfiles

Check this box to display subfiles with their file type extension. This list is useful when selecting individual subfiles for backup.

Uncheck this box to display a separate window with a list of subfile types. This is useful when backing up the same subfiles for all the selected jobs.

### Copy from

Check the box next to each case or file you want to backup. Checking a case selects all the files contained in the case. Click the  icon to display the contents of the case. If you highlight a case or file before invoking the Backup feature, it displays already selected. To backup all the cases and jobs for a user, check the box next to the user name.

The Status bar at the bottom of the screen displays the number of files and total file size for all jobs selected to backup.

In the Backup dialog box, you can use the mouse to click the box or Tab to the field where you can use the arrow keys to position the highlight on your selection and then press **Spacebar**.

### Subfile types

This window only displays when you uncheck the Show subfiles feature. Check the box next to each subfile type you want to backup. To backup all subfile types, check the All subfile types box. Subfile selection affects all the jobs you are backing up.

### Save in

The location for storing the backup file. Files for the current folder display in the window below this field. To select a location different than the default, click the arrow button to browse. Use any of the other icon tools as needed:

Return to last folder

Up one folder level

Create new folder

Change view menu

### File name

This field displays when you select the option to back up your files into a single package. Do **one** of the following:

- Accept the default file name.
- Change the default file name. Select Options to display the Backup Options dialog box.
- Type a new name for the backup file.
- Select an existing backup file from the list in the window.

If you backup the file on your system and the file name you enter is the same as the name of a folder on your system, Case CATalyst opens the folder instead of saving the file. Include the .zip extension in the file name to have Case CATalyst recognize the name as a file. For example, Anderson030202.zip.

### Save as type

The default backup type is .ZIP. The .ZIP extension indicates a compressed file.

### Options

Display the [Backup Options](#) dialog box where you can choose how to backup the selected files. Press **Enter (OK)** after your selection.

Backup Options do not affect the zip options set for Zip & e-mail, Send'em e-mail or Send'em Backup.

3. Press **Enter (OK)**. The Manage Jobs window displays when the back up is complete. [Backup messages](#) may display in certain situations, such as when an existing file name is used. Follow the backup message instructions as necessary.

## Case Prep

The Case Prep feature is available from the Manage Jobs' Tools menu. Case Prep makes it easy to prepare for your next job. Whether you need to prepare for an ongoing job that you haven't reported on for a while or you are being sent on a job in which you need to fill in for, Case Prep makes it easy and quick to find words that are not defined or are defined in your dictionaries by comparing previous transcripts and/or ASCII, PDFs, PTX (e-Transcript format), .ecl (Eclipse native files) and XMEF (TextMap format) files to your dictionaries. Instead of being surprised on the job of names and terminology, let Case Prep identify words and phrases for you from previous files. The Case Prep feature allows you to select one or more transcript files (.sgnfl), ASCII files (.txt), PDFs, PTX, .ecl and/or XMEF files to compare against one or more dictionaries.

For example, let's say that you are filling in for another reporter who has been reporting a three month trial with two other reporters. You contact the reporters and ask for previous transcripts as ASCIs, PDFs, native CATalyst files, etc. Once you get the transcripts, you run Case Prep on the transcripts against your dictionaries and you can get a list of words that are not defined in your dictionary, a list of words and/or phrases you might want to brief, etc. You can quickly enter dictionary entries using the list in [Dictionary Builder](#) and/or review the [Heads-Up list](#) for possible briefs. In a very short time, you are well prepared to fill in for the reporter.

Case Prep can create a list of words that are in the selected files but not in the comparing dictionaries, a list of phrases that you might want to brief or both words and phrases. You can also specify how many times a word or phrase must appear in the files before displaying in either list along with how you want the list sorted, frequency, defined and undefined words or by phrases. You can select to create a Dictionary Builder file and/or a Heads-Up List. The last selected options, not selected files or dictionaries, are remembered the next time you select Case Prep. The selected files, dictionary and options information used to create the Heads-Up List is written to the Notes tab of the Heads-Up List's [Job History](#) subfile. To view the information, in Manage Jobs right click the Case Prep file name and select History or double click the Job History subfile associated with the Case Prep file, then click the Notes tab.

Phrases are generated from transcripts (.sgnfl, .sgcap, and ASCII ) files which may or may not have underlying steno. CATalyst will find most of the phrases although line numbers and page breaks may interfere in finding all phrases. The following guidelines are used:

- Case Prep uses Brief It's Max Words Per Brief setting to determine the maximum number of words in a phrase.
- Hyphenated words count as one word in a phrase.
- Phrases that are not defined in a dictionary are checked against the [caseprepexcludelist.txt](#) and [CommonWords.txt](#) files. If all of the words in the phrase are in either list, the phrase does not display in the Heads-Up List.

### Dictionary Builder List:

The Dictionary Builder List displays words that are not found in the selected dictionaries. Phrases may also display depending your Case Prep options. The list displays immediately after running Case Prep and displays occurrence headings for words and phrases based on the number of times the word or phrase appeared in the selected files. For example, if words or phrases appear more than 50 times in the selected files, the words and phrases will be listed under the //Occurred more than 50 times heading. If words or phrases only appeared 6 times in the selected files, the words or phrases will be listed under the //Occurred between 5-9 times heading.

You can quickly review the list, remove entries you don't want/need, cycle capitalization of entries and select to undo any changes that you make. You can then select the Start Dictionary Builder option, select a dictionary to use Dictionary Builder to create dictionary definitions for the words. When the Start Dictionary Builder option is selected, clicking OK will open the selected dictionary and start the [Dictionary Builder](#) feature. You can then build a dictionary using the words/phrases from Case Prep and your steno machine. If you simply click OK without selecting the Start Dictionary Builder option, the list is automatically saved to the Dictionary Builder case in your System files case. The list is automatically named Case Prep followed by the date and time. For example, Case Prep 2015-01-22 07.46.

If you selected to create a Heads-Up List along with the Dictionary Builder List, the Heads-Up List will automatically open and display in Edit and the Dictionary Builder dialog box displays in the forefront. For step by step instructions, see [Dictionary Builder List](#).

### Heads-Up List

You can also use the Case Prep feature to create a Heads-Up List. The Heads-Up List displays defined and undefined words and/or phrases based on the selected files selected compared to the dictionaries selected and the options you selected in the Case Prep Options. Case Prep can show brief suggestions for phrases in the Heads-Up List when the *Suggest briefs for phrases* option has been selected. You can have Case Prep show brief suggestions from the phrases to prepare you for the upcoming job. And, of course, you can always use the Suggest a brief feature also.

When selecting to create a Heads-Up List and selecting to analyze .sgnpl/.sgcap files, Case Prep can also include previously suggested Personal Briefs and/or Reminders and Used Briefs in the Heads-Up list. If you select to include Personal Briefs and/or Reminders/Used briefs in the Heads-Up List, they are reported in their own section of the list with designations for the type of briefs. Let's say that you are called on a job that you had previously reported. You can now show personal briefs that were suggested in the previous transcript along with reminders and briefs you used during that job, so you are familiar with briefs from the previous jobs.

You can create a Heads-Up List along with a Dictionary Builder List or create either of the lists individually. When creating a Heads-Up List, a .sgnpl file automatically opens in a three column newspaper display. For step by step instructions, see [Heads-Up List](#).

If the Case Prep icon is not displaying on a toolbar, it can be added to any toolbar by right clicking on a toolbar and selecting Customize. In the [Customize dialog box](#), click the Commands tab, locate the Case Prep menu item and drag the Case Prep icon to the desired toolbar.

### To use Case Prep, do the following:

1. In Manage Jobs, select Tools and then Case Prep.
2. At the Select transcript/ASCII files to Compare dialog box, press **Alt + a** (Add...) to select the transcript/ASCII files you want to compare to selected dictionaries. If you were in a case when you selected Case Prep, the Open dialog box defaults to the case. Use Windows selection commands to select as many transcript/ASCII files you want.  
If you selected a file or files you didn't want, highlight the file in the list and press **Alt + r** (Remove...) to remove the file(s) from the list. Press **Alt + n** (Next) to continue.
3. At the Dictionary selection dialog box, press **Alt + a** (Add files...) to select the dictionaries you want to use to compare with the selected files. Select the dictionaries in the order you would use to translate or after selecting the dictionaries, reorder them in the priority you want. To change the order of dictionary priority, highlight a dictionary and use the up/down arrows in the upper right hand corner to move the dictionary to a higher or lower priority. **Your Personal Dictionary (and Update Area if used) are automatically selected and, by default, will be the lowest priority (just like when you translate).**  
If you selected a dictionary or dictionaries you didn't want, highlight the dictionary in the list and press **Alt + r** (Remove File) to remove the dictionary from the list. Press **Alt + n** (Next) to continue.

4. At the Options dialog box, do the following:  
The last selected options are remembered the next time you select Case Prep.
  - a. In the List section, select **one** of the following:
    - i. To build a list of words found in the selected transcript/ASCII files that are not found in the dictionaries, select the Words not found in dictionaries option.
    - ii. To build a list of phrases found in the selected transcript/ASCII files that you might want to brief, select the Phrases you might want to brief option.
    - iii. To build a list of words found in the selected transcript/ASCII files that are not found in the dictionaries and phrases that you might want to brief, select the Both option.
  - b. In the Create List section, do the following:
    - i. Select [Create Dictionary Builder List](#) for a list of undefined words/phrases in the selected files.
    - ii. Select [Create Heads-up List](#) for a list of undefined/defined words/phrases in the selected files.
    - iii. Select [Create an Alphabetical \(A-Z\) List](#) for an alphabetical order list of words/phrases in the selected files.
  - c. In the Sort list(s) by section, select one of the following:
    - i. To display the list of words or phrases based on the how often they occurred in the transcript/ASCII files, select Frequency. The most frequently occurring words or phrases will be listed first.
    - ii. To display the list of words first and then phrases, select the Words then phrases option.
    - iii. To display the list of phrases first and then words, select the Phrases then words option.
  - d. In the Report words or phrases that occur at least X times field, type the number of times a word or phrase must appear in the transcript/ASCII file before it shows on the list. The default setting is 3. Valid numbers are 1 – 99.
5. Press **Alt + n** (Next) to continue.
6. At the Transcript/ASCII files and Dictionary Confirmation dialog box, review the selected transcript/ASCII files, selected dictionaries and options you selected. To change anything, click the Change button next to the item you want to change. To build the list, click Finish.
7. The Case Prep dialog box displays with the progress. When finished, the list displays based on the options you selected. If, in the list you see two forward slashes followed by words, it means the following words couldn't be written using the selected dictionaries because the steno for the word(s) conflict with higher priority steno outlines found in another selected dictionary. Do any of the following:
  - a. To remove a word or phrase, highlight the word or phrase and press **Alt + r** (Remove).
  - b. To change the case of a word or phrase, highlight the word or phrase and press **Alt + c** (Cap) to cycle through the capping options.
  - c. To reverse any of the changes you made (removing a word or phrase or capping), press **Alt + u** (Undo All) to undo all the changes. **The list of words and/or phrases is saved. You now have two choices. You may either click OK or use the saved list at a later time OR you may open/create a dictionary and start [Dictionary Builder](#).**
  - d. To open/create a dictionary and start Dictionary Builder to define the words in the list, select the Start Dictionary Builder option.

- i. In the Using field, the Case or Personal Dictionary is selected by default. If you are in a Case when starting Case Prep, the Case Dictionary will be selected by default. If you are in the root of your user when starting Case Prep, your Personal Dictionary will be selected by default. To change the dictionary, click the down arrow. The following options display:
    1. Case and/or Personal Dictionary.
    2. All dictionaries selected for the comparison.
    4. Other. If you want to select a different dictionary or create a new dictionary, click the **Browse** button. In the Select Dictionary dialog box, select a dictionary or type a new dictionary name and click Save.
  - e. Click **OK** to continue.
8. One of the following occurs:
- a. If you just clicked **OK**, the Case Prep feature closes and a dialog box displays the name of the list created and that it is available in the Dictionary Builder folder located in your System Files case.
  - b. If you selected to start the Dictionary Builder option, the selected dictionary opens with the Dictionary Builder feature active. Make sure the writer option is correct, your steno machine is turned on and write a stroke to establish a connection and then click **OK** to begin.

## Dictionary Builder List

Use the [Case Prep](#) feature to create a Dictionary Builder List. Using Case Prep to create a Dictionary Builder List allows you to quickly and easily prepare for your next job. Using Case Prep you can compare words define and not defined in previous transcripts to create a list in which you can easily use the [Dictionary Builder](#) feature to create dictionary entries. Instead of being surprised on the job of names and terminology, let Case Prep identify words and phrases for you from previous transcripts, ASCII, PDF, PTX or XMEF files and have your dictionary prepared. The Dictionary Builder List displays words found in selected files that are not found in the selected dictionaries. Phrases may also display depending your Case Prep options. The Dictionary Builder List uses the [CommonWords.txt](#) and [caseprepexclude.txt](#) files when creating the list. The list displays occurrence headings for words and phrases based on the number of times the word or phrase appeared in the selected files. For example, if words or phrases appear more than 50 times in the selected files, the words and phrases will be listed under the //Occurred more than 50 times heading. If words or phrases only appeared 6 times in the selected files, the words or phrases will be listed under the //Occurred between 5-9 times heading.

You can quickly review the list and select the Start Dictionary Builder option, select a dictionary to use Dictionary Builder to create dictionary definitions for the words. When the Start Dictionary Builder option is selected, clicking OK will open the selected dictionary and start the Dictionary Builder feature. If you simply click OK without selecting the Start Dictionary Builder option, the list is automatically saved to the Dictionary Builder case in your System files case. The list is automatically named Case Prep followed by the date and time. For example, Case Prep 2015-01-22 07.46.

If you selected to create a Heads-Up List along with the Dictionary Builder List, the Heads-Up List will automatically open and display in Edit and the Dictionary Builder dialog box displays in the forefront.

Dictionary Builder List guidelines:

- Number/word combinations (for example, ES6 or Com2Us) are included in the Case Prep list. However, numbers followed by 's' (i.e. 60s, 80s, etc.), money, time and ordinals are excluded from the list.
- If untranslated steno outlines are found in the selected files, Case Prep will include the slash before the steno outline (for example, /STPHAO). Please note that when Case Prep is not able

to distinguish between steno outlines and text, there may be times when a slash will not display before a potential steno outline. ,

- If there are conflicts in the selected transcript, Case Prep will process single words in a conflict as individual words when comparing them to the dictionaries.
- If words appear in the selected files in different cases (upper case, initial capped and lower case), Case Prep will show all cases of the word as long as no form of that word is found in the dictionary or in the CommonWords.txt file. The CommonWords.txt file is located in the System Files case and is also used with the [Brief It](#) feature.
- If a word is not found in the dictionary but is found in the CommonWords.txt file (all capped, initial capped or lower case), the word will not display in the Dictionary Builder List. You can modify the CommonWords.txt file although it is also used for Brief It and the Heads-Up List.
- Hyphenated words are handled as follows when the Words found/not found in dictionaries option is selected:
  - All selected dictionaries are searched to see if the hyphenated words is defined, if it is, the hyphenated word will not appear in the Dictionary Builder List.
  - If both of the individual words are defined in the selected dictionaries, neither word displays in the Dictionary Builder List.
  - If only one of the hyphenated words is defined in the dictionary and at least one of the words is not in the CommonWords.txt file, the hyphenated words display in the Dictionary Builder List.
  - If neither word is defined in the selected dictionaries, and at least one of the words is not in the CommonWords.txt file, the hyphenated words display in the Dictionary Builder List.

#### To use create a Dictionary Builder List:

1. In Manage Jobs, select Tools and then Case Prep.
2. At the Select transcript/ASCII files to Compare dialog box, press **Alt + a** (Add...) to select the transcript/ASCII files you want to compare to selected dictionaries. If you were in a case when you selected Case Prep, the Open dialog box defaults to the case. Use Windows selection commands to select as many transcript/ASCII files you want.  
If you selected a file or files you didn't want, highlight the file in the list and press **Alt + r** (Remove...) to remove the file(s) from the list. Press **Alt + n** (Next) to continue.
3. At the Dictionary selection dialog box, press **Alt + a** (Add files...) to select the dictionaries you want to use to compare with the selected files. Select the dictionaries in the order you would use to translate or after selecting the dictionaries, reorder them in the priority you want. To change the order of dictionary priority, highlight a dictionary and use the up/down arrows in the upper right hand corner to move the dictionary to a higher or lower priority. **Your Personal Dictionary (and Update Area if used) are automatically selected and, by default, will be the lowest priority (just like when you translate).**  
If you selected a dictionary or dictionaries you didn't want, highlight the dictionary in the list and press **Alt + r** (Remove File) to remove the dictionary from the list. Press **Alt + n** (Next) to continue.
4. At the Options dialog box, do the following:  
The last selected options are remembered the next time you select Case Prep.
  - a. In the List section, select **one** of the following:

- i. To build a list of words found in the selected transcript/ASCII files that are not found in the dictionaries, select the Words not found in dictionaries option.
    - ii. To build a list of phrases found in the selected transcript/ASCII files that you might want to brief, select the Phrases you might want to brief option. Phrases are generated from transcripts and are not generated from ASCII files. When selected, Frequency is automatically selected in the Sort lists (by) section.
    - iii. To build a list of words found in the selected transcript/ASCII files that are not found in the dictionaries and phrases that you might want to brief, select the Both option.
  - b. In the Create List section, do the following:
    - i. Select Create Dictionary Builder List for a list of undefined words/phrases in the selected files.
    - ii. Select [Create Heads-up List](#) for a list of undefined/defined words/phrases in the selected files.
  - c. In the Sort list(s) by section, select one of the following:
    - i. To display the list of words or phrases based on the how often they occurred in the transcript/ASCII files, select Frequency. The most frequently occurring words or phrases will be listed first.
    - ii. To display the list of words first and then phrases, select the Words then phrases option.
    - iii. To display the list of phrases first and then words, select the Phrases then words option.
  - d. In the Report words or phrases that occur at least X times field, type the number of times a word or phrase must appear in the transcript/ASCII file before it shows on the list. The default setting is 3. Valid numbers are 2 through 99.
5. Press **Alt + n** (Next) to continue.
6. At the Transcript/ASCII files and Dictionary Confirmation dialog box, review the selected transcript/ASCII files, selected dictionaries and options you selected. To change one or more of your selections, click the Change button next to the item you want to change. To build the list, click Finish.
7. The Case Prep dialog box displays with the progress. When finished, the following displays:
  - a. If you selected to build a Heads-Up List, the list is opened in Edit in a 3-column format based on the options you selected. If you selected to create a Dictionary Builder List also, the Heads-Up List opens in the background.
  - b. If you selected to build a Dictionary Builder List, the Dictionary Builder List dialog box displays.
    - i. Two forward slashes followed by words indicates the following words couldn't be written using the selected dictionaries because the steno for the word(s) conflict with higher priority steno outlines found in another selected dictionary. Do any of the following:
      - To remove a word or phrase, highlight the word or phrase and press **Alt + r** (Remove).
      - To change the case of a word or phrase, highlight the word or phrase and press **Alt + c** (Cap) to cycle through the capping options.
      - To reverse any of the changes you made (removing a word or phrase or capping), press **Alt + u** (Undo All) to undo all the changes. **The list of words and/or phrases is saved. You now have two choices. You may either click OK and use the saved list at a later time OR you may open/create a dictionary and start [Dictionary Builder](#).**

- c. To open/create a dictionary and start Dictionary Builder to define the words in the list, select the Start Dictionary Builder option.
    - i. In the Using field, the Case or Personal Dictionary is selected by default. If you are in a Case when starting Case Prep, the Case Dictionary will be selected by default. If you are in the root of your user when starting Case Prep, your Personal Dictionary will be selected by default. To change the dictionary, click the down arrow. The following options display:
      - 1. Case and/or Personal Dictionary.
      - 2. All dictionaries selected for the comparison.
      - 4. Other. If you want to select a different dictionary or create a new dictionary, click the **Browse** button. In the Select Dictionary dialog box, select a dictionary or type a new dictionary name and click Save.
  - d. Click **OK** to continue.
8. One of the following occurs:
- a. If you just clicked **OK**, the Case Prep feature closes and a dialog box displays the name of the list created and that it is available in the Dictionary Builder folder located in your System Files case.
  - b. If you selected to start the Dictionary Builder option, the selected dictionary opens with the Dictionary Builder feature active. Make sure the writer option is correct, your steno machine is turned on and write a stroke to establish a connection and then click **OK** to begin.
  - c. If you selected to create a [Heads-Up List](#), you can review the list and close the file when you are finished.

## Heads-Up List

Use the [Case Prep](#) feature to create a Heads-Up List. Case Prep makes it easy to prepare for your next job. It might be an ongoing job that you need to fill in for or a job that you haven't reported on in a while. Case Prep makes it easy and quick to find words that are not defined or are defined in your dictionaries by comparing previous transcripts and/or ASCII files to your dictionaries. Instead of being surprised on the job of names and terminology, let Case Prep identify words and phrases for you from previous transcripts or ASCII files. The Heads-Up List displays defined and undefined words and/or phrases based on the selected transcript/ASCII files selected compared to the dictionaries selected and the options you selected in the Case Prep Options.

You can create a Heads-Up List along with a [Dictionary Builder List](#) or create either of the lists individually. When creating a Heads-Up List, a .sngl file automatically opens in a three column newspaper display. The Heads-Up List displays words and/or phrases based on your selections on the Case Prep Options dialog box. Words found in any of the selected dictionaries are boldfaced and display the shortest, most used steno outline match immediately following the word if the *Include steno definitions in Heads-Up List* option is selected. If the Create Heads-Up List is selected, the *Include steno definitions...* option is selected by default. If you deselect the Create Heads-Up List, the *Include steno definitions...* option is grayed out. If you need to locate in which dictionary the steno outline is found, use the Query Realtime Translations command on the word or phrase. Words not found in any of the selected dictionaries display only the word. You can use the Suggest A Brief command to generate a brief for words or phrases. Common/frequent phrases display according to your selection. Phrases are generated from selected files.

Case Prep can show brief suggestions for phrases in the Heads-Up List. A *Suggest briefs for phrases* option is in the Case Prep Options dialog box under the Create Heads-Up List section. When the *Suggest briefs for phrases* option is selected, the Heads-Up List Brief It pane will display briefs for phrases when available. Now that you have generated phrases from multiple sources, you can have Case Prep show brief suggestions from the phrases to prepare you for the upcoming job. And, of course, you can always use the Suggest a brief feature also.

When selecting to create a Heads-Up List and selecting to analyze **.sgnlg/.sgcap** files, Case Prep can also include previously suggested Personal Briefs and/or Reminders and Used Briefs in the Heads-Up list. If you select to include Personal Briefs and/or Reminders/Used briefs in the Heads-Up List, they are reported in their own section of the list with designations for the type of briefs. During the Case Prep file selection and options, if you have selected at least one **.sgnlg/.sgcap** file and selected to create a Heads-Up List, once you click Next on the Case Prep Options dialog box, the Case Prep Briefs dialog box displays. Let's say that you are called on a job that you had previously reported. You can now show personal briefs that were suggested in the previous transcript along with reminders and briefs you used during that job, so you are familiar with briefs from the previous jobs.

The Heads-Up List is automatically saved in the location where you started Case Prep and named Case Prep followed by the case name or user name in brackets and then the current date and time. For example, Case Prep [FishBowl] 2015-01-21 13.38 indicating the name of the Case is FishBowl and you started Case Prep in the FishBowl case. Or another example, Case Prep [Susan] 2015-01-21 13.38 indicating the Case CATalyst user name and you started Case Prep in the root of the Susan user name.

When creating the Heads-Up List, Case Prep uses the [caseprepexcludelist.txt](#) and [CommonWords.txt](#) files located in the System Files case for analysis. Both files can be modified by adding or deleting words. An Add to Case Prep Exclude List option has been added to Edit's Tools menu and to the right click menu. When Case Prep analyzes the selected transcripts/ASCII files and dictionaries, the following rules apply:

- If Case Prep determines a capitalized word is not likely a proper noun (starts a sentence), the word will be looked up as lower case in both the dictionary and the exclude list. If a word is not found in the dictionary but is found in the CommonWords.txt file (all capped, initial capped or lower case) or Case Prep Exclude List, the word will not display in the Heads-Up List.
- Words that end in an apostrophe will be looked up in the dictionary as the root word only.
- Words that end in a suffix will first be looked up in the dictionary as is, if a match is found the word displays in the defined section of the Heads-Up List unless the word is in the exclude list. If the word isn't found in the dictionary with the suffix, the root word will be looked up in the dictionary and exclude list. If a match isn't found, the word with the suffix will be displayed in the Heads-Up List.
- All words found in the CommonWords.txt file are excluded from the Heads-Up List whether the word appears in lower case, initial cap or all caps.
- Phrases are generated from transcripts (.sgnlg) or caption (.sgcap) files whether there is underlying steno outlines or not.
- Case Prep recognizes a Bates number that starts with text and is followed by at least 4 numbers. If the text before the numbers matches, Case Prep will put up to three occurrences of the Bates numbers in the Heads-Up List. The reported Bates numbers will be listed under the occurrence heading based on the number of times the Bates number prefix appeared in the selected files.
- Whether the *Include steno definition...* option is selected or not, the Heads-Up List will display defined words, followed by a blank line and then undefined words under the appropriate occurrence heading.

- Case Prep recognizes a Bates number that starts with text and is followed by at least 4 numbers. If the text before the numbers matches, Case Prep will put up to three occurrences of the Bates numbers in the Heads-Up List. The reported Bates numbers will be listed under the Occurrence heading based on the number of times the Bates number prefix appeared in the files.
- Hyphenated words are handled as follows when the Words found/not found in dictionaries option is selected:
  - All selected dictionaries are searched to see if the hyphenated words is defined, if it is, the hyphenated words display in the Heads-Up List.
  - If both of the individual words are defined in the selected dictionaries but are not in the caseprepexcludelist.txt or CommonWords.txt files, the hyphenated words display in the Heads-Up List.
  - If only one of the hyphenated words is defined in the dictionary and at least one of the words is not in the caseprepexcludelist.txt or CommonWords.txt files, the hyphenated words display in the Dictionary Builder List.
  - If neither word is defined in the selected dictionaries and are not found in the caseprepexcludelist.txt or the CommonWords.txt files, the individual words and hyphenated words display in the Heads-Up List.

#### To create a Heads-Up List:

1. In Manage Jobs, select Tools and then Case Prep.
2. At the Select transcript/ASCII files to Compare dialog box, press **Alt + a** (Add...) to select the transcript/ASCII files you want to compare to selected dictionaries. If you were in a case when you selected Case Prep, the Open dialog box defaults to the case. Use Windows selection commands to select as many transcript/ASCII files you want.  
If you selected a file or files you didn't want, highlight the file in the list and press **Alt + r** (Remove...) to remove the file(s) from the list. Press **Alt + n** (Next) to continue.
3. At the Dictionary selection dialog box, press **Alt + a** (Add files...) to select the dictionaries you want to use to compare with the selected files. Select the dictionaries in the order you would use to translate or after selecting the dictionaries, reorder them in the priority you want. To change the order of dictionary priority, highlight a dictionary and use the up/down arrows in the upper right hand corner to move the dictionary to a higher or lower priority. **Your Personal Dictionary (and Update Area if used) are automatically selected and, by default, will be the lowest priority (just like when you translate).**  
If you selected a dictionary or dictionaries you didn't want, highlight the dictionary in the list and press **Alt + r** (Remove File) to remove the dictionary from the list. Press **Alt + n** (Next) to continue.
4. At the Options dialog box, do the following:  
The last selected options are remembered the next time you select Case Prep.
  - a. In the List section, select **one** of the following:
    - i. To build a list of words found in the selected transcript/ASCII files that are not found in the dictionaries, select the Words not found in dictionaries option.
    - ii. To build a list of phrases found in the selected transcript/ASCII files that you might want to brief, select the Phrases you might want to brief option. Phrases are generated from

transcripts and are not generated from ASCII files. If you select this option, Frequency is automatically selected in the Sort lists (by) section.

- iii. To build a list of words found in the selected transcript/ASCII files that are not found in the dictionaries and phrases that you might want to brief, select the Both option.
- b. In the Create List section, do the following:
- i. Select [Create Dictionary Builder List](#) for a list of undefined words/phrases in the selected files.
  - ii. Select Create Heads-up List for a list of undefined/defined words/phrases in the selected files.

When this option is selected, the *Include steno definition* option in Heads-Up List option is available along with the *Suggest briefs for phrases* option. If you want the steno for define words to display next to the word, select *Include steno definition* option. If you are sharing this file with another reporter and you do not want the steno outline to display, deselect this option. If you want briefs for phrases to display in the Brief It pane, select the *Suggest briefs for phrases* option. If you selected at least one .sgnfl or .sgcap file for analysis, the Case Prep - Briefs dialog box displays. If you want to see any Personal Briefs and/or Reminder/Used briefs that appeared in the selected .sgnfl/.sgcap files, select the *Report Briefs in Heads-Up List* option. **You will not see the Case Prep - Briefs dialog box if you did not select at least one .sgnfl or .sgcap file for analysis.**

    - a) Select *Personal Briefs and Reminders/Used* option if you want the Heads-Up List to display any Personal Briefs and Reminder/Used briefs that displayed in the selected .sgnfl and/or .sgcap files. If you select to include Personal Briefs and/or Reminders/Used briefs in the Heads-Up List, they are reported in their own section of the list with designations for the type of briefs. When finished selecting options, click **Next** to continue.
    - b) Select *Personal Briefs* option if you only want to see Personal Briefs that displayed in the selected .sgnfl and/or .sgcap files.
    - c) Select *Reminders/Used* option if you only want to see Reminders/Used briefs that displayed in the selected .sgnfl and/or .sgcap files.
    - d) At the *Minimum # of jobs a brief must appear in to be included in the Heads-Up List:* option, type the minimum number of jobs that a brief must appear before it is reported in the Heads-Up List.
    - e) At the *Minimum # of times a brief must be suggested or reminded/used:* option, type the minimum number of times a brief must have been suggested or reminded/used before it is reported in the Heads-Up List.
- c. In the Sort list(s) by section, select one of the following:
- i. To display the list of words or phrases based on the how often they occurred in the transcript/ASCII files, select Frequency. The most frequently occurring words or phrases will be listed first.
  - ii. To display the list of words first and then phrases, select the Words then phrases option.
  - iii. To display the list of phrases first and then words, select the Phrases then words option.

- d. In the Report words or phrases that occur at least X times field, type the number of times a word or phrase must appear in the transcript/ASCII file before it shows on the list. The default setting is 3. Valid numbers are 2 – 99.
5. Press **Alt + n** (Next) to continue.
6. At the Transcript/ASCII files and Dictionary Confirmation dialog box, review the selected transcript/ASCII files, selected dictionaries and options you selected. To change one or more of your selections, click the Change button next to the item you want to change. To build the list, click Finish.
7. The Case Prep dialog box displays with the progress. When finished, the following displays:
  - a. The Heads-Up List, the list is opened in Edit in a 3-column format based on the options you selected. If you selected to create a Dictionary Builder List also, the Heads-Up List opens in the background. If you selected to see Personal Briefs and Reminder/Used Briefs, at the end of the Heads-Up List the Personal Briefs and/or Reminders/Used information is listed. No analysis is performed on your dictionaries. It lists what shows in the brief it pane of the selected .sgnfl and/or .sgcap files. If you are using someone else's files, this information may not be helpful or may conflict with your own dictionaries. The heading for the Personal Briefs and/or Reminders/Used displays as follows:

**Briefs:**

[Type:P/R/U], word, steno  
[Docs/occurrences]

[P] for personal, [R] for reminder or [U] for used brief will precede the brief word, followed by the steno and then how many documents the brief appeared in and how many times the brief appeared. For example, let's say you have the following in your Heads-Up List: [P] it would have been /TWOUEFB 2/6. That indicates that the Personal Brief "it would have been" with the steno TWOUEFB appeared in two transcripts and appeared/was reminded a total of six times in the selected .sgnfl/lsgcap files. Examples of how each type brief may appear in the Heads-Up List:

**Personal Briefs:**

[P] to the best of my knowledge  
/TAOEUPBLG [2/23]  
[P] I'm sorry /AOEUPLS [2/13]  
[P] a lot of /HRAOF [2/12]  
[P] I'm not sure /AOEUPLTS [2/11]

**Reminders:**

[R] sitting here today /SH\*T [1/10]  
[R] at any time /T-PBT [1/6]  
[R] you know /UPB [1/5]  
[R] but /FWU [1/3]  
[R] did he say /TKES [1/3]

**Used Briefs:**

[U] SEBP /S\*EB [1/2]  
[U] sewer tributary /SWR\*T [1/2]  
[U] as-needed /AO\*ED [1/1]  
[U] British Columbia /PWR\*EURB [1/1]  
[U] idea or concept /AO\*EUD [1/1]

- b. If you selected to build a Dictionary Builder List, the Dictionary Builder List dialog box displays.
  - i. Two forward slashes followed by words indicates the following words couldn't be written using the selected dictionaries because the steno for the word(s) conflict with higher priority steno outlines found in another selected dictionary. The list of words and/or phrases is saved. You now have two choices. You may either click OK or use the saved list at a later time OR you may open/create a dictionary and start [Dictionary Builder](#).

- c. To open/create a dictionary and start Dictionary Builder to define the words in the list, select the Start Dictionary Builder option.
  - d. Click **OK** to continue.
8. One of the following occurs:
- a. If you just clicked **OK**, the Case Prep feature closes and a dialog box displays the name of the list created and that it is available in the Dictionary Builder folder located in your System Files case.
  - b. If you selected to start the Dictionary Builder option, the selected dictionary opens with the [Dictionary Builder](#) feature active. Make sure the writer option is correct, your steno machine is turned on and write a stroke to establish a connection and then click **OK** to begin.
  - c. The Heads-Up List displays in Edit. Words found in dictionaries are boldfaced with the shortest steno stroke match displaying immediately following the word. Do any of the following:
    - i. Highlight a word and use Query Realtime Translation to locate the dictionary in which the shortest stroke can be found if multiple dictionaries were selected.
    - ii. Highlight a word or phrase and use the Suggest A Brief command to generate a brief for the word or selected phrase. The brief displays in the Brief It pane. You can print the contents of the Brief It pane by clicking the Printer icon on the Brief It pane title bar. You can also right click a brief, select Send to Case Cat Scratch and the brief will be added to the Steno Text section of the Cat Scratch pane and is available as a reminder for your next job.
    - iii. Highlight a word or phrase and use the Text to Dict Define command to define any undefined words or phrases to your Personal, case, job or other dictionary. If find yourself using this command often, you can assign it to a key combination in a keyboard map.
    - iv. Need a reminder for a word and steno, you can highlight the word and steno outline, right click and select Send to Case Cat Scratch to copy the word and steno to the text section of the Cat Scratch pane for your next job.
    - v. Highlight a word, right click and select Send to Case Prep Exclude List to prevent the word from displaying in a Heads-Up List in the future.
    - vi. Display the Brief It pane to see brief suggestions for phrases if the option was selected. You can then right click and define the suggestions to a dictionary.
9. When finished, close the Heads-Up List. The Heads-Up List is saved in the location where Case Prep was started. The file is named Case Prep followed by the case or user name in brackets then by the current date and time. For example, Case Prep [FishBowl] 2015-01-22 07.52 indicating the name of the case is FishBowl and you started Case Prep in the FishBowl case. Or another example, Case Prep [Susan] 2015-01-21 13.38 indicating the Case CATalyst user name and you started Case Prep in the root of the Susan user name. If you made any changes to the file, you will be prompted to save the file when closing it. The selected files, dictionary and options information is written to the Notes tab of the Heads-Up List's [Job History](#) subfile. To view the information, in Manage Jobs right click the Case Prep file name and select History or double click the Job History subfile associated with the Case Prep file, then click the Notes tab.

## Alphabetical (A-Z) List

Use the [Case Prep](#) feature to create an Alphabetical (A-Z) List. Case Prep makes it easy to prepare for your next job. It might be an ongoing job that you need to fill in for or a job that you haven't reported on in a while. Case Prep makes it easy and quick to find words that are not defined or are defined in your dictionaries by comparing previous transcripts and/or ASCII files to your dictionaries. Instead of being surprised on the job of names and terminology, let Case Prep identify words and phrases for you from previous transcripts or ASCII files. With the Alphabetical (A-Z) List option, the most common words and phrases generated by the Case Prep feature will be listed in Alphabetical order in addition to or instead of the occurrence count generated by the Heads-Up list. Having an alphabetical lists may help you find specific words and phrases more quickly during your Case Prep review process.

You can create an Alphabetical (A-Z) List and [Heads-Up List](#) along with a [Dictionary Builder List](#) or create any of the lists individually. When creating an Alphabetical (A-Z) List, a .sgnfl file automatically opens in a three column newspaper display.

The Alphabetical (A-Z) List is automatically saved in the location where you started Case Prep. The Alphabetical List will have a file name formatted as: *Case Prep [Location] YYYY-MM-DD HH.MM\_A-Z.sgnfl*. The file name format tells you it is a Case Prep created file, where the file is located, the date and time the file was created and that it is an Alphabetical List.

To use Case Prep and generate an Alphabetical list of words and phrases do the following:

1. From Manage Jobs, select **Tools, Case Prep...**
2. Add the source files you'd like Case Prep to analyze and then click **Next**.
3. Add the dictionaries you'd like Case Prep to use during its analysis and then click **Next**.
4. On the Case Prep - Options screen check the **Create an Alphabetical (A-Z) List of words and phrases** option.
  - a. Like the Create Heads-Up List for defines and undefined words/phrases option, you can select to include steno definitions and/or suggest briefs for phrases in the Alphabetical List.
  - b. The Sort List(s) by: option does not apply to the Alphabetical List. Words and phrases will be listed according to their order alphabetically.
5. Click **Next**.
6. The Case Prep - Briefs screen will display if you selected to create a Heads-Up List on the Case Prep - Options screen and you selected at least one .sgnfl or .sgcap file to analyze. If you did not, the Case Prep - Source Files and Dictionary Confirmation screen will display. In short, the Case Prep - Briefs screen options are not applicable to the Alphabetical List.
7. After you confirm the file selections and option choices on the Case Prep - Source files and Dictionary Confirmation screen, click **Finish**.

After Case Prep has analyzed the selected files and dictionaries, you will be presented with an Alphabetical List. You may also receive a Heads-Up List and a Dictionary Builder List depending on your Case Prep option selections.

Alphabetical List		
<b>A</b> Alternatt /ALTALT alternates /ALT/THAEUTS  <b>B</b> Barbosa /PW-RB Bardsley /PW-RDZ Blackstone /PW-RABG/STOEPB  <b>C</b> C /R/1 Cabrillo /KAPWREU/0 California /KAL Canby /KAP/PWEU city of Tulare Corporal corporal /KORP Corporal Jackson /K-PBLG corporal Jackson Corrensa court reporter /KROERT	Highway Hispanic /HEUSPAPSEUBG Hospital House  <b>I</b> impartial /EUP/PARBL  <b>J</b> Jackson /SKWRABG/GOPE Jeffrey /SKWREFR Jeffrey /SKWREFRAGE Jeffrey Barbosa /SKWR-B Jeremy Jeremy Jones Jess Jesse /SKWREUS Jesse Barbosa /SKWREUB Jesus /HAEUSUS Jones /SKWROEPBS Joseph /SKWROES/SEUE	Officer Jones /TP-PBLG officer Yndian oleander oleander bushes oleanders  <b>P</b> Paige Paige overpass People Police  <b>R</b> R /R recesses /RACE/SEIES  <b>S</b> S /S-RBGS/ RBGS Sergeant Sergeant House skinned /SKWEPBLD Stanford /STAPB/TPOEBD

### caseprepexcludelist.txt

The CasePrepExcludeList.txt file is automatically created the first time you run [Case Prep](#). The file contains common words that you most likely would not want to reported in a [Heads-Up List](#). You can open this file by locating it in your System Files case and double clicking the CasePrepExcludeList file. The file will open in Notepad. You can add, delete or modify the contents of the file. You can also add words to the CasePrepExcludeList while editing. The Add to Case Prep Exclude List option is available on the Tools menu and the right click menu.

## Change Due Date

Case CATalyst automatically assigns a projected due date to the job during translation when the Job History option, [Automatically Set Due Date](#) is active. The Change Due Date feature allows you to change the automatically projected due date for the job or to manually assign a completion date.

For example, let's say on average you have five days to complete and finalize your transcript. You set the Automatic Set Due Date option to be Yes and then set the Number of days from job date to 5. You set the Number of Days before Due Date to Report Job as Due option to 4. Each day you start CATalyst, you use the Search Due Jobs feature. One day before the job is due, it displays in the Search Due Jobs Results pane. There is also an option to display the Search Due Jobs Results pane upon starting CATalyst so you are always aware of jobs that are due.

Due dates are not automatically assigned to a job that contains a steno note file without a text subfile because the due date is automatically assigned during translation. Using the Change Due Date feature, you can manually assign a due date or completion date to a steno note only file. If you change the [Job State](#) from *Due* to the completion state, *Done*, for a steno note only file, the file no longer displays as *Due* in the Search Due Jobs pane but continues to show *Due* in Manage Jobs. It is necessary to set the Due Date to *None* to prevent it from displaying as *Due*.

Due Dates display in Manage Jobs in Detailed List view with the Due Date column selected to show. In Icon View, the Due Date is visible on the Job History Summary tab of the file.

## Change the Due Date

1. In Manage Jobs, do one of the following:

**Select a single job**

Highlight the job.

### Select multiple specific entries

Press and hold **Ctrl** while you click multiple entries to highlight.

### Select multiple consecutive group of entries

Click to highlight the first entry. Press and hold **Shift**, while you click the last entry. Case CATalyst highlights all the entries in-between for selection.

2. Press **Alt + t + g (Tools/Change Due Date)**. The Job History dialog box displays.
3. On the Job History Summary tab, check the **Due Date** box if necessary and do one of the following:
  - Type a date in the field, click the down arrow to choose a date from the calendar or select **Today**.
  - Select **None** to remove a due date.
4. Press **Alt + c (Close)** to save the selection and close the dialog box.

## Change Job State

Case CATalyst automatically assigns Job States when certain actions are performed on the job file. For example, when you save and exit a realtime file, Case CATalyst automatically assigns the Job State, *Translated*, to the file. Change Job State allows you to manually set a production status for a selected job.

If you change the Job State from *Due* to the completion state, *Done*, for a steno note only file, the file no longer displays as *Due* in the Search Due Jobs pane but continues to show *Due* in Manage Jobs. It is necessary to [change the Due Date](#) to *None* to prevent files from displaying as *Due*.

Due dates are not automatically assigned to a job that contains a steno note file without a text subfile because the due date is assigned during translation. Using the Change Due Date feature, you can manually assign a due date or completion date to a steno note only file. If you change the [Job State](#) from *Due* to the completion state, *Done*, for a steno note only file, the file no longer displays as *Due* in the Search Due Jobs pane but continues to show *Due* in Manage Jobs. It is necessary to set the Due Date to *None* to prevent it from displaying as *Due*.

Job State [options](#) provide the ability to modify job state names, add customized job states, select folder colors and assign job states to selected functions and features.

## Set the Job State for a Single Job

1. In Manage Jobs, highlight the job and press **Alt t + s (Tools/Change Job State)**.
2. One of the following occurs:
  - In Detailed List View, a drop down list displays in the Job State column. Choose a status from the list.
  - In Icon View, the Job History dialog box displays. On the Summary tab, in the *Current State* field, click the down arrow and choose a status from the list.
3. Press **Alt + c (Close)**.

Case CATalyst remembers the assignment until you perform another action that automatically changes it or until you manually change it. When exiting Edit, you can select an editing Job State from the [History For](#) dialog box.

### Set the Job State for Multiple Jobs

1. In Manage Jobs, do one of the following:

#### Select specific entries

Press and hold **Ctrl** while you click multiple entries to highlight.

#### Select a consecutive group of entries

Click to highlight the first entry. Press and hold **Shift**, while you click the last entry. Case CATalyst highlights all the entries in-between for selection.

2. Press **Alt + t + s (Tools/Change Job State)**. The Job History for Selected Files dialog box displays.
3. In the *Current State* field, select a Status from the drop down list.
4. Press **Alt + c (Close)** to save and close the dialog box. All of the selected jobs reflect the Job State change.

Case CATalyst remembers the assignment until you perform another action that automatically changes it or until you manually change it. When exiting Edit, you can select an editing Job State for the job from the [History For](#) dialog box.

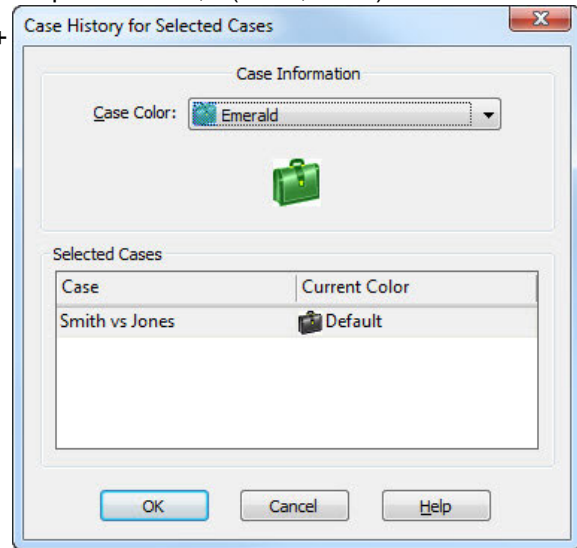

### Change Case Color

A Change Case Color option is available from Manage Jobs' Tools (**Alt + t**) menu or via the right click menu when you are highlighting a Case. For example, let's say you are an official reporter and you want to organize your files by pre-trials, criminal cases, civil cases, etc. You could create a case for each type of job and then change the color of the case for easy recognition. As another example, let's say you are a deposition reporter. You could change case colors for particular on-going cases, for completed jobs or for different agencies.

You can highlight one or more cases and select a color from the list. If more than one case is selected at a time, all selected cases will have the same color assignment. If you tend to have cases inside of cases, you can change the color of cases inside cases also. This option will be grayed out if the cursor is not on a Case. Although you can select the System Files case and select a different color, Case CATalyst's System Files' case color will not change.

To change a case(s) color:

1. At Manage Jobs, highlight a case or several cases and press **Alt + t, I** (Tools, Color).
2. In the Case History for Selected Cases, press **Alt + c** or click the down arrow to display the list of available colors. Click a color to see an example. The Selected Cases section displays what cases will be affected by the color change.
3. When finished, press **Enter** to accept the selected color.

## Copy Job Files

The Copy command makes a copy of a selected file or multiple files so that they exist in two locations. Use the Copy command from the menu bar, right click menu or click and drag the file from one location to another.

You can copy files within Case CATalyst and to locations outside of Case CATalyst including Windows Explorer. Case CATalyst also allows you to copy files from Windows Explorer into Case CATalyst. Depending on your Windows 7 security settings, it might be possible to copy a Case CATalyst file to Windows Explorer but not copy a file from Windows Explorer into Case CATalyst. This limitation is a result of your Windows Operating System settings.

Within Case CATalyst, you can use click and drag to [move](#) a file or subfile to another location in your user. You can drag and drop files to another program that accepts compatible files, such as Notepad or Outlook. For example, you can click and drag an ASCII file in Case CATalyst and drop it on Outlook. Outlook opens an e-mail and attaches the ASCII. You can copy files from other locations into Case CATalyst but if the file type isn't compatible, CATalyst will not be able to open the file.

When you select to Copy, Move or Restore files from Manage Jobs, if you select to overwrite an existing file, a copy of that file (with all the subfiles) is sent to the Windows Recycle Bin. If you select to click and drag a file from Windows into Manage Jobs and overwrite an existing file, a copy of the file is sent to the Recycle Bin. If you are copying, moving, restoring or dragging files to a network drive or removable drive, a copy of the overwritten file **will not** be sent to a Recycle Bin since one does not exist in those two scenarios. If you select an existing file name when translating and you select to overwrite the existing file, CATalyst has always sent the SGSTN (steno) subfile to the Recycle Bin. CATalyst will now send a copy of the SGNGL (text) subfile, if applicable, to the Recycle Bin. NOTE: This feature is not available when copying, moving, restoring or dragging files to a network drive or removable drive.

**Important:** Microsoft ended Windows Vista support as of April 2017. Case CATalyst is no longer supported when running Windows Vista.

## Copy Files Using the Copy Command

1. From Manage Jobs, press **Ctrl + c** (Tools/Copy). You can highlight the job or jobs before selecting Copy. The Copy dialog box displays.
2. Make necessary entries:

### Show subfiles

Check this box to display subfiles with their file type extension. This list is useful when selecting individual subfiles for copying.

Uncheck this box to display a separate window with a list of subfile types. This is useful when copying the same subfiles for all the selected jobs.

### Copy jobs from

Check the box next to each case or file you want to copy. You can only copy certain files in the System Files case, such as the Personal Dictionary, to a different user folder.

Checking a case, selects all the files contained in the case. Click the  icon to display the contents of the case. If you highlight a case or file before invoking the Copy feature, it displays selected in the Copy dialog box. To copy all the cases and jobs for a user, check the box next to the user name.

Checking a text file (.sgnfl) automatically selects the associated Job History subfile (*filename.sgxml*). You can uncheck the associated Job History subfile if you do not want to copy it along with the text subfile. The Job History file contains the job creation date, job status, translation information and other information.

The lower left-hand corner of the dialog box displays the total number of subfiles selected to copy.

In the Copy dialog box, you can use the mouse to click the box or Tab to the field where you can use the arrow keys to position the highlight on your selection and then press **Spacebar**.

### Subfile types to copy in each job

This window only displays when the Show subfiles feature is not selected. Check the box next to each subfile type you want to copy. To copy all subfile types, check the All subfile types box. Subfile selection affects all the jobs you are copying.

### Copy files to

The destination folder and case for the copied files. The default folder is the current user. To select a different user folder or case, click the user or case name. Confirm the destination in the Copy files to field at the top of the dialog box.

If you select to copy a single file to the same location as the source file, you must type a new name in the Job name field.

### Keep case structure

Check this box when copying individual or multiple files and you want to use the retain the same path structure. For example, you have a case named, "Arbitrations" with a job inside the case named Larson 040402. You want to copy Larson 040402 to another reporter's folder. With Keep case structure selected, Case CATalyst creates a case name Arbitrations with the file named Larson 040402 in the other reporter's folder. If you do not select Keep case structure, only the file Larson 040402 copies to the reporter's folder.

### Job name

Rename a single file you are copying. Type a new file name.

### Browse

Select a destination location not displayed, such as a thumb drive located in the E:\ drive of the computer. Copying a file is not the same as backing up the file.

3. Press **Enter (OK)**. If the same subfiles already exist in the destination folder, the Confirm File Replace dialog box prompts you to replace the existing files or cancel.
4. The Manage Jobs window displays when the copy is complete.

## Copy List View to Clipboard

When Manage Jobs' is set to display in Detailed List View, you can mark one or more jobs to copy the view information to the Windows clipboard. To copy all the jobs view information at Manage Jobs when displayed in Detailed List View, press **Ctrl + a**. You can then paste the information into other programs, such as Microsoft Excel for tracking and billing. Case CATalyst copies information from the columns (not transcripts or files) currently selected to Show.

You can [show or hide columns](#) so that you only copy the information you need. For example, let's say you want to see the file name, the date of the job, the status and the due date. You can show all other columns, highlight the jobs and then use the Copy List View to Clipboard and paste the information into an Excel file for archiving. Then if you want more information on a daily basis, you can show more columns for more information.

If you use CATalyst's case feature to organize your files, you will need to display the contents of the case to copy specific file information.

Although Copy List View to Clipboard is available when Manage Jobs is set to Icon view, this feature was designed to be used with Detailed List View to copy more information than just the file names.

## Copy List View Information

1. In Manage Jobs, highlight the files to copy the view information for the highlighted files.
2. Select **Tools/Copy List View to Clipboard**.
3. Open the program to which you want to copy the information and use the Paste command to insert the data.

## Create Job Report

The Create Job Report feature is designed to reduce the amount of manual input required for creating a job report, also referred to as a job sheet. Many reporters create a report for each transcript at the request of their firm, the court or for their own purpose when archiving the transcript. A job report usually contains information about the transcript such as dates, location, participants, appearance data and number of pages in the job. The information in the job report varies depending on the purpose or requirements.

For example, let's say when you complete a transcript, you need to turn in to the firm or court a file that contains the date of the proceedings, the plaintiff and defendant information, date of the proceedings, the date of delivery for the transcript, what files were needed (i.e. PDF, ASCII, PTX), appearance fee (if needed), transcript page rate, etc. You can create a Job Report or several Job Reports (based on who the report is designed for) and use the same fields you use in the transcript and they will automatically fill in for you when you use the Create Job Report feature. No more worrying about spelling names correctly, selecting the correct [attorney name](#), [how many pages are in the file](#), [determining the cost](#) by using calculation formula fields, etc. Let CATalyst do the majority of the work for you.

Creating a job report requires that you first create a job report template using the same fields that exist in the transcript. You can use Fields such as Creation Date, Firm1, Attorney1 and Witness along with Scanstops, format symbols, conflicts and any other text or formatted information in the job report template. Once you create a job template, you can use the Create Job Report feature to generate a job report, having Case CATalyst fill in the fields for the current transcript.

The job report is saved as a Case CATalyst text file using the transcript file name followed by \_JobReport. For example, 021009 Steinbach\_JobReport.sgngl. If you create a job report for a job that has an existing job report, Case CATalyst creates another job report. The job report is saved using the transcript file name followed by the next sequential number and then "JobReport." For example, 021009 Steinbach\_1\_JobReport.sgngl. Case CATalyst does not create a job report of a job report.

You can create and print a job report using the [Finish 'em](#) feature. If a job report already exists for a selected transcript, Finish 'em uses the existing job report with the latest date and time and does not create another job report.

The System Files case contains a Job Report Templates case where you can store the job report templates. Using the Job Report Templates case is a convenient way to organize the files, but it is not required that you store the templates in this case.

### Create a Job Template

1. In Case CATalyst, open a new text file. Press **Alt + f, n, t (File/New/Text)**. The Create New Document dialog box displays.
2. In the *File name* field, type a name for the job report template.
3. In the *Layout Name* field, select the layout to use for the report.
4. Press **Enter (Open)**. Case CATalyst opens the new file with the selected file name.
5. Type text, insert fields, conflicts, Scanstops and any other necessary information.

If you currently have a job report template in a word processor, you may be able to copy and paste the text from the file into the Case CATalyst job report template and modify the information. If you have an existing Case CATalyst text file you currently use for a job report template you can modify the existing file.

6. Save the file to the Job Report Templates case. Press **Ctrl + s (File/Save)**. The Save Copy As dialog box displays.
7. Navigate to the Job Report Templates case located in the System Files case.
8. Press **Enter (Save)**.

### Create a Job Report

1. Do one of the following:
  - In Manage Jobs, highlight the transcript for which you want to create a job report.
  - Open the transcript for which you want to create a job report.
2. Press **Alt + t, j (Tools/Create Job Report)**. The Create Job Report dialog box displays.
3. Make necessary entries:

#### Template

The path for the most recent job report template selected displays. Click the Browse  button to select a different job report template. The Open dialog box displays. By default, the contents of the Job Report Templates case displays. Select the job report template you want to use.

#### Print Job Report (will prompt if incomplete)

Check this box to print the job report. When you select this option and there are fields without values or unresolved conflicts in the job report, Case CATalyst prompts you with a message after you select OK to create and print the job report. Select Yes to print the job report with missing values. Select No to open the job report for review. Save and close the file when finished making changes. Manually select to print the job report from Manage Jobs.

4. Press **Enter (OK)** to create and, if applicable, print the job report. The job report opens and automatically scans to the first empty field, untranslate or Scanstop. Once you have finished editing, you can print the job.

If you selected to print the job report, the Print dialog box displays. Confirm the desired printer and press **Enter (Print)**. To open the job report, double click the file name in Manage Jobs. If there are fields without values or unresolved conflicts in the job report, Case CATalyst prompts you with a message to continue printing or to first review the job report. Select **Yes** to print the job report with missing values. Select **No** open the job report for review. Save and close the file when finished making changes. Manually select to print the job report from Manage Jobs.

## Delete Job Files

The Delete command removes files from the current location and sends them to the Windows Recycle bin. If you delete a file or subfiles from Manage Jobs, you can go to the Windows Recycle bin and restore them as long as you have not emptied your Recycle bin. Once you have archived completed jobs and/or jobs that were not transcribed, you may want to delete the jobs from your Manage Jobs area to make it easier to find current jobs.

In addition, when you select to Copy, Move or Restore files from Manage Jobs, if you select to overwrite an existing file, a copy of that file (with all the subfiles) is sent to the Windows Recycle Bin. If you select to click and drag a file from Windows into Manage Jobs and overwrite an existing file, a copy of the file is sent to the Recycle Bin. If you are copying, moving, restoring or dragging files to a network drive or removable drive, a copy of the overwritten file **will not** be sent to a Recycle Bin since one does not exist in those two scenarios. If you select an existing file name when translating and you select to overwrite the existing file, CATalyst has always sent the SGSTN (steno) subfile to the Recycle Bin. CATalyst will now send a copy of the SGNGL (text) subfile, if applicable, to the Recycle Bin. NOTE: This feature is not available when copying, moving, restoring or dragging files to a network drive or removable drive.

## Delete Case CATalyst Files

1. From Manage Jobs, do **one** of the following:
  - Highlight the files you want to delete and then press **Del**. The Delete dialog box displays with the selected files checked for deletion.
  - Select **Alt + t, d (Tools/Delete)**. The Delete dialog box displays.
2. Make entries as necessary:

### Show subfiles

Check this box to display subfiles with their file type extension. This list is useful when selecting individual subfiles for copying.

Uncheck this box to display a separate window with a list of subfile types. This is useful when copying the same subfiles for all the selected jobs.

### Delete jobs from

Check the box next to each case or file you want to delete. Checking a case, selects all the files contained in the case. Click the  icon to display the contents of the case. If you highlight a case

or file before invoking the Delete feature, it displays selected. To delete all the cases and jobs for a user, check the box next to the user name.

Deleting a case deletes all the jobs and subfiles within that case. If you do not want to delete all the jobs in a case, deselect any jobs or subfiles you do not want to delete.

In the Delete dialog box, you can use the mouse to click the box or Tab to the field where you can use the arrow keys to position the highlight on your selection and then press **Spacebar**.

### Subfile types to delete in each job

This window only displays when the Show subfiles feature is not selected. Check the box next to each subfile type you want to delete. To delete all subfile types, check the All subfile types box. These selections affect all jobs you are deleting.

3. Press **Enter (OK)**. A message displays prompting you to confirm the deletion. The Manage jobs window displays when the delete is complete. If you attempt to delete a file that is currently in use, a message displays informing you the file cannot be deleted.

## Delete User

Delete User is a Manage Jobs feature that removes the selected user name and all jobs in the selected user from the hard drive. For example, let's say you are a scopist for several reporters. One of your long standing reporters has retired so you no longer need her user name and files on your computer. You could do a [backup user](#) and then delete the user name (including all the reporter's files) from your hard drive.

The Delete User command is only available at the User level (  ) and **you must be logged off the user you want to delete**. If the CATalyst title bar displays the User Name you are trying to delete, it is necessary to access another user name and then return to the User level to delete the original user you wanted to delete.

### Delete a User

1. Select **Tools/Users Level**. The Users Level displays.
2. Click the user you want to delete and select **Tools/Delete User** or right click and select Delete User from the menu. The Delete dialog box displays.
3. Confirm the selected user to delete and press **Enter (OK)**. The warning message: *Do you want to delete the selected user?* displays.

**CAUTION: Deleting a user removes all jobs in the user name from the hard drive.**

4. Press **Enter (Yes)**. If files still exist in the User folder, the Confirm Multiple File Delete dialog box displays.
5. Press **Enter (Yes)**. Case CATalyst deletes the user and all jobs in the user name.

## Dictionary Verify

Dictionary Verify checks the dictionary for errors and reports any errors found. If you receive an "invalid entries" message due to mismatched dates, you can correct the problem using [Dictionary Options](#). After reviewing and selecting the dictionary verify options, run Dictionary Verify on the dictionary again. Be sure the dictionary is closed before running Dictionary Verify.

The Dictionary Verify information is stored in a text file named *dictionaryname\_Verify.txt*.

## Verify a Dictionary

1. In Manage Jobs, highlight the dictionary to verify.
2. Press **Alt + t, v (Tools/Dictionary Verify)**. Case CATalyst generates a report.  
  
If you run Dictionary Verify to correct errors due to mismatched dates, a confirmation dialog box displays to confirm your correction choice based on your selection in Dictionary Options. Press **Enter** to continue.
3. Depending on the size of the report, the file opens in Notepad or WordPad. You can print the file by selecting **File/Print**. Press **Alt + F4** to exit the report.
4. If errors, other than mismatched dates are reported, open the dictionary and modify or delete the entries listed.

## Finish 'em

Finish 'em allows you to perform multiple Case CATalyst printing, exporting, backup and e-mail finalizing actions at one time. You can select transcript, dictionary and steno note files to print to PDF, print transcripts to printers, export to RTF/CRE and ASCII, backup and e-mail the Finish 'em files. For example, for every job you need to print a transcript, print to PDF for electronic delivery, print your steno notes to PDF with your digital signature for archiving, export the job dictionary and steno notes to RTF/CRE and export the transcript to ASCII to deliver and archive your files. Using Finish'em, you can perform these tasks all at one time. The [Finish 'em Options](#) dialog box allows you to customize how Finish 'em works for you.

If you have varying delivery and archiving requirements for different clients or jurisdictions, you can save your Finish 'em selections to a settings file that you can quickly load. For example, you work for different clients with different file format requirements for delivery. For each client, you select the Finish 'em print and export options and save them to a settings file. When you need different client settings, select the saved settings file from your saved list.

Finish 'em automatically changes the selected job(s) Job State to *Done*. If you do not want Finish 'em to change the job state to Done or want another job state assignment, you can change Job State settings and assignments in [Job State options](#).

**NOTE:** When using Finish 'em's Backup and/or e-mail feature, the Finish 'em created file must be in the same location as the selected transcript in order for the selected subfile to be included in the Backup and/or e-mail attachment. For example, let's say you have Finish 'em create an ASCII and selected *Same as File* as the save location. You also have selected Finish 'em's e-mail feature and selected the ASCII (txt) subfile type. Finish 'em creates the ASCII, opens your default e-mail package with the txt subfile attached. If you want to create an ASCII in a different location, use Finish 'em's Export to ASCII Additional Settings File feature to create an ASCII in the same location as the selected transcript and in the other location.

## Finish 'em Setting Files

1. From Manage Jobs, press **Alt + t, f (Tools/Finish 'em)**. The Finish 'em dialog box displays.

2. Check the box next to each case or file to include in Finish 'em. Click the  icon to display the files in the case. Checking a case selects all the files contained in the case. If you highlight a case or file in Manage Jobs before invoking the Finish 'em feature, it displays already selected. The Status bar at the bottom of the screen displays the number of files selected.

#### Show subfiles

Check this option to display all subfiles with their file type extension in the window. This allows you to select individual subfiles. For example, the job, 1-31-2011 JS, consists of four subfiles. It displays in the list four times once for each of the different subfile type extensions.

Uncheck this option to display the file name with subfile types in a separate window. The appropriate subfile is automatically selected for the job based on the Finish 'em option selected. A job often contains more subfiles than display in this dialog box. Only subfiles that are appropriate for Finish 'em actions (steno note, transcript and dictionary subfiles) display.

3. The right side of the dialog box displays the current actions for the settings file displayed in the *Currently Loaded* field. Do any of the following:

#### Select Finish 'em Actions

On the right side of the dialog box, highlight a field (see field explanations below) and set the value. Field descriptions display below the settings box. Use *Save Settings* to save your selections to a file for future use.

#### Load A Saved Settings File

Do either:

- Select a saved Finish 'em settings file from the drop-down list and click **Load Now**. The drop-down list is populated with the available saved settings files in the Finish Em Settings case located in the System Files case.
- Select a saved Finish 'em settings file from a different location. Click **Load Settings** and navigate to the location of the file. Select a settings file and press **Enter (Open)**.

#### Use Default Settings File

Use the default settings file which is automatically loaded when Finish 'em opens. Finish 'em [options](#) allow you to assign a default settings file. If no file is assigned, the settings used in the last Finish 'em session (Last Finish 'em) is used.

#### Save Current Settings

Save your current Finish 'em actions to a settings file. In the Save As dialog, type a file name in the *File Name* field and press **Enter (Save)**. Saved settings files are available in the Load Now drop-down list.

4. Press **Enter (OK)** to run Finish 'em and close the dialog box. Finish 'em [options](#) determine if files with the same name as existing files are overwritten.

## Finish 'em Preferences

### Print to PDF

## Notes

Select **Yes** to print the selected steno notes to PDF. Steno notes, by default, print three columns to a page with the beginning of each fold highlighted. Timestamps, by default, are not included. To change the number of columns and/or include timestamps, change the settings in [Manage Notes Options](#).

## Transcript

### Final/Draft/Compressed

Select Final, Draft and/or Compressed. Each one of the choices has additional options. Choose the range of pages to print, **Entire File**, **Last Page**, **Last X Pages**. Select **None** to prevent printing to PDF. Current [Print options](#) selected in the Print dialog box for Final and Draft apply to the PDF.

### Options

The *Options* field is available once you select a printing range. Choose one of the following:

#### Standard PDF

Print the transcript to PDF. Attachments are not included.

#### With Attachment

Include [attachments](#), if applicable, with the PDF. Attachments display in the Bookmark pane under the Exhibit heading and in the Attachment pane, often identified by a paper clip icon. In the Bookmark pane, click the plus sign next to the Exhibit heading to display the list of attachments. A client can double click an attachment indicator in the PDF to move the display to the area of the file where the attachment is located. Double click the Open heading under the attachment name to open the attachment for viewing. In the Attachment pane, click an attachment in the Attachment pane to open the file for viewing. To view attachments, the program associated with the attachment file type must be installed on the computer. For example, if the attachment is a Microsoft Word document, you must have Microsoft Word installed on your computer.

If you encrypt the PDF by requiring a password or restricting the printing or copying of text in the PDF, the attachments are only available for viewing from the Attachment pane. The Open option in the Bookmark pane does not display the file.

#### PDF/A

Print the transcript in PDF/A compliant format. PDF/A format creates the PDF with certain ISO 19001 standards for long term storage, such as requiring embedded fonts and graphics but disallowing audio, video, attachments, digital encryption and digital signatures. These parameters allow the document to always be viewed, unaltered in it's original format, using an appropriate PDF viewer such as Adobe Reader.

Federal jurisdictions may require transcripts submitted in a PDF/A format for archiving purposes.

### Configuration

If you selected to print a compressed version of the file, the compressed print *Configuration* field. Compressed. Choose a saved compressed print [configuration](#) from the list.

### Build Concordance

The Build Concordance field is available when you select Compressed print to PDF. Select Yes to Build a Concordance Index for the selected file. The all word index is built only if one does not already exist.

### Job Report

Select **Yes** to create a [job report](#) for the transcript. The *Template* field displays. Use the Browse button to locate the job report template you want. If the create job report option has previously been selected, Case CATalyst remembers the last used job report template. When a job report already exists for a selected transcript, Finish 'em uses the existing job report with the latest date and time and does not create a new job report or a job report of a job report.

### Final/Draft

Set Final and Draft print settings for the Job Report. Select **Yes** to print the Job Report. Current [Print options](#) selected in the Print dialog box for Final and Draft apply.

### Sign/Encrypt PDF

Select **Yes** to digitally sign (different than an electronic version of your signature) a PDF document. To use the Sign/Encrypt PDF option, a digital signature must be available on your computer system. Purchase a [digital signature](#) (certificate) from a certifying authority. A digital signature from a certifying authority allows anyone to verify the authenticity of your digital signature. A digital signature is not available through Stenograph.

### PDF Properties

The *PDF Properties* field is available when you select to use a digital signature. If you previously used a digital signature, the name of the digital signature displays. To view the Signing Options, click the **Browse** button. If this is the first use, the PDF Output Options automatically displays.

Set necessary options.

### Signing Options

#### Certificate

Select the name of the digital signature certificate with which you are signing. Digital signatures available on your computer system display in the drop-down box. A digital signature is not available through Stenograph.

#### Reason for Signing

Type the purpose of your digital signature. (optional)

#### Your Location

Type the name of your location. (optional)

### Encryption Options

#### Password

Type a password if you want to require the client to know the password in order to print or copy text and graphics. This is an optional field.

#### Allow Printing

Check this box to allow printing. Deselect the option to restrict printing.

**Allow Copying (of text and graphics)**

Check this box to allow the text and graphics to be copied. Deselect the option to restrict copying.

**PDF Save Location**

Determine the save location for the printed PDF file. Choose one:

**Same as File**

Save the PDF to the same folder in which the original files you are printing are located.

**Other**

Save the PDF to the location specified in the PDF Save Location field. The default is the current user folder. To change the location, click the Browse button in the *PDF Save Location* field to display the Browse For Folder dialog box. Navigate to the desired location and press **Enter (OK)**. The path displays in the PDF Save Location field.

**Print to Printer****Printers**

Select a printer from the list of all installed printers on your computer.

**Final/Draft**

Set Final and Draft print settings. Choose the number of copies, **1 - 10**. Select **None** to prevent printing the transcript. Except for the printer selected in the *Printers* field, all current [Print options](#) set in the Print dialog box for Final and Draft apply.

**Compressed**

Set the Compressed print setting by selecting an option from the list. Select **None** to prevent printing in Compressed format.

**Configuration**

The *Configuration* field is available when you select to print Compressed. Select a compressed print [configuration](#) from the list. Saved configurations display in the list.

**Export to RTF/CRE****Transcript**

Select **Yes** to export the selected transcripts in RTF/CRE format. Case CATalyst uses the job file name when exporting the file and adds *\_t.rtf*. For example, you export the Collins transcript to RTF format. The resulting file name is *Collins\_t.rtf*.

**Notes**

Select **Yes** to export the selected steno notes in RTF/CRE format. Case CATalyst uses the steno note file name when exporting the file and adds *\_s.rtf*. For example, you export the steno notes for the Collins job to RTF format. The resulting file name is *Collins\_s.rtf*.

**Dictionary**

Select **Yes** to export the selected dictionary in RTF/CRE format. Case CATalyst uses the dictionary file name when exporting the file and adds *\_d.rtf*. For example, you export the job dictionary for the Collins job to RTF format. The resulting file name is *Collins\_d.rtf*.

#### RTF/CRE Save Location

Select the location to which you want to save the RTF/CRE file. The default is the current user folder. To change the location, click the Browse button and navigate to the desired folder.

### Export to ASCII

#### Transcript

Select **Yes** to export the transcript file to [ASCII](#) format. The ASCII setting field displays when you select Yes. The Additional Settings allow you to export the ASCII to two different formats.

##### ASCII Settings

Choose one of the following:

- Select **Current** to use the current ASCII settings.
- Select a saved, if applicable, ASCII settings file from the list.

##### Additional Settings File

Choose one of the following:

- Select **None** to use only the ASCII format selected in the *ASCII Settings* field.
- Create an additional ASCII file in another ASCII format. Save ASCII settings display in the list.

When creating an ASCII in two different formats, the file name for the first ASCII uses current file name and the second ASCII uses the file name plus *\_1*. For example, *Collins\_1*.

#### ASCII Save Location

Choose one of the following:

- Select **Same As File** to save the file to the same location as the job.
- Select **Other** to save the file to a different location. In the *ASCII Save Location* field click the Browse button and navigate to the desired folder. Case CATalyst remembers the setting until it is changed.

**NOTE:** When using Finish 'em's Backup and/or e-mail feature, the Finish 'em created file must be in the same location as the selected transcript in order for the selected subfile to be included in the Backup and/or e-mail attachment. For example, let's say you have Finish 'em create an ASCII and selected *Same as File* as the save location. You also have selected Finish 'em's e-mail feature and selected the ASCII (txt) subfile type. Finish 'em creates the ASCII, opens your default e-mail package with the txt subfile attached. If you want to create an ASCII in a different location, use Finish 'em's Export to ASCII Additional Settings File feature to create an ASCII in the same location as the selected transcript and in the other location.

### Export To CaseViewNet

If you have an active CaseViewNet certificate, the Export to CaseViewNet option displays. Select **Yes** to export the transcript in CaseViewNet format.

### Transcript

Select **Yes** to export the transcript file to CaseViewNet. The transcript is considered final and can be synchronized with the original CaseViewNet file.

### CVNet Save Location

- Select **Same As File** to save the file to the same location as the job.
- Select **Other** to save the file to a different location. In the *CVNet Save Location* field click the **Browse** button and navigate to the desired folder. Case CATalyst remembers the setting until it is changed.

## Backup Options

### Back Up Files

Select **Yes** to create a backup of selected files. To set backup options, click **Options** in the bottom of the dialog box. Make entries for the backup zip in the Finish 'em dialog box.

If you enter an existing file name for the backup file, Finish 'em Backup uses the existing name and adds the next consecutive number. For example, you have a Finish 'em backup file, "12-12-2011 Skaare.zip." You select to backup the 12-12-2011 Skaare file again. Finish 'em creates the file, "12-12-2011 Skaare\_1.zip. Finish 'em Backup will never overwrite an existing file name.

### Currently Selected Subfiles

Choose the subfiles to include in the backup. Select one of the following:

- **Entire Job** - back up all the subfiles in the job.
- **Selected Subfile Types** - Select the individual subfiles back up. Click Additional File Types to display more subfile types that can be associated with a job. Case CATalyst recognizes an ASCII with a 'txt' extension. If you create an ASCII with an extension other than 'txt', Case CATalyst will not recognize it as an ASCII and will not back it up if the ASCII subfile option is selected.

### Backup Save Location

Select the location for the Finish 'em backup file. The default is the current user directory. To choose another location, click Browse and navigate to the desired directory.

## E-mail Options

### E-mail Files

Select Yes to e-mail the selected file or files or specific subfiles. Once Finish 'em is complete, your default e-mail package will open a new e-mail with the designated files attached. If you do not have a default e-mail package set up, a message will display. On Windows 7, you must have an e-mail program, such as Outlook or Thunderbird, installed on Windows 7 and selected as your default e-mail program. Case CATalyst recognizes an ASCII with a 'txt' extension. If you create an ASCII with an extension other than 'txt', Case CATalyst will not recognize it as an ASCII and will not attach it to the e-mail if the ASCII subfile is selected.

### Recipients

You can type the names of the e-mail recipient(s) prior to starting Finish 'em. The recipient names will display in the To field of the e-mail. Type the full e-mail address of the recipient. To include multiple recipients, separate e-mail addresses with a semi-colon.

### Reporter Suite Invoice ID

Reporter Suite (<https://www.reportersuite.com>) is a third party application that allows users to manage reports, invoices, payees, expenses and time tracking from almost any device with an internet connection. At the time of this release, Reporter Suite's offering is limited to federal reporters. A state, freelance, proofreader and scopist version will be released soon. For more information about Reporter Suite, please see their web site.

If you use Reporter Suite, you can click the Click Here to go to Reporter Suite. Copy the Invoice ID, return to the

Finish 'em dialog and paste it into the Reporter Suite Invoice ID field. If you do not know how to get the Invoice ID, please contact Reporter Suite for assistance. Select what file/subfiles you want to attach to the e-mail. Once you click OK to start Finish 'em, the e-mail opens in your default e-mail package with the selected files attached and the following text in the body of the e-mail:

You can view, print, download and pay your invoice by [clicking here](#).

The link connects the recipient to their invoice in Reporter Suite. All other Finish 'em functions work the same as before.

### Click Here to go to Reporter Suite

Directs you to [www.reportersuite.com](https://www.reportersuite.com) site.

### Currently Selected Subfiles

Choose Entire Job (all subfiles associated with the selected job) or Selected Subfile Types to be e-mailed. If you choose Selected Subfile Types, you can select or deselected individual subfiles by double clicking the right-hand column to toggle the value between Yes and No. Finish 'em e-mail attaches the selected file(s) or selected subfiles of the select file and attaches them to the e-mail. Please note that not all subfiles associated with a job may display in the left side of the dialog box.

**NOTE:** When using Finish 'em's Backup and/or e-mail feature, the Finish 'em created file must be in the same location as the selected transcript in order for the selected subfile to be included in the Backup and/or e-mail attachment. For example, let's say you have Finish 'em create an ASCII and selected *Same as File* as the save location. You also have selected Finish 'em's e-mail feature and selected the ASCII (txt) subfile type. Finish 'em creates the ASCII, opens your default e-mail package with the txt subfile attached. If you want to create an ASCII in a different location, use Finish 'em's Export to ASCII Additional Settings File feature to create an ASCII in the same location as the selected transcript and in the other location.

## Finish 'em Options

**Always overwrite existing files with the same name**

Select **Yes** to overwrite files that exist in the current Finish 'em session which are the same file type and have the same file name of existing files. For example, you create an ASCII file for the selected transcript. Later you make edits to the transcript and export the transcript to ASCII again. Case CATalyst automatically overwrites the existing ASCII.

Your selection in this field does not affect Job Report files.

#### **Warn before overwriting**

Select **Yes** to display a message with a list of files that will be overwritten. Select **No** to automatically overwrite existing files with the same name without a warning message. This field is only available when the *Always overwrite existing files with the same name* option is set to Yes.

#### **Add Text to Compressed PDF Filename**

When creating a compressed print PDF of a transcript, you can select to add text to the end of the filename to easily identify that it is a compressed version of the transcript. This may be helpful when creating a full size and a compressed print PDF of the same transcript. If this option is set to No and you select to create both a full size transcript and compressed print PDF of the same transcript, one PDF will be named filename.pdf and the second one will be named filename\_1.pdf. When Yes is selected, the *Add text to end of filename* option is available for you to customize the extension.

#### **Text to Add to End of Filename**

Finish 'em will automatically add \_compressed to the end of a Compressed Print PDF if the *Add Text to Compressed PDF Filename* option is set to Yes. If the Add Text to Compressed PDF Filename option is set to No, this field is not available.

#### **Always Load Finish 'em Settings**

Select a Finish 'em settings file as the default that loads when you open Finish 'em. Finish 'em automatically applies the settings in this file to the current session unless you make changes for the current session or load a different settings file. Select a Finish 'em settings file from the drop-down list or use **Browse** to select a file from another location. Select *Last Finish 'em* to apply the settings from the last Finish 'em session to the current session. This selection is always in the list.

#### **Backup Options**

Backup Options allow you to customize how the Finish 'em Backup "packages" the selected files. The default is to back up the files into separate zip packages and never include audio files. Finish 'em backup options affect only files selected for Finish 'em.

Make changes and select **OK** when finished.

#### **Back Up Selected Job**

Choose whether to have Finish 'em back up the selected files in Separate Zip Files (each selected job is placed in its own zip file) or back up the selected files into one zip file name (Single Package). When selecting Single Package, the Default Package Name and Add Date to Zip File Name options are available. The default setting is Separate Zip Files.

#### **Default Package Name**

The selected files will be placed in one zip file name. You can type a default zip name that will be suggested each time you back up files to one zip file name or you can leave the field blank and type a package name each time you back up in Finish 'em.

### Add Date (YYYY-MM-DD) to file name

Select Yes to add the current date to the single package zip file name. If a default package name is used, the date is automatically added to the end of the package name. If a default package name is not used, the current date is the suggested package name.

### Back Up Audio Files

Audio files by nature are very large. Once the transcript is finalized, you may not want to keep a copy of the audio file. Select Never to never include an audio subfile in a Finish 'em backup produced zip file. Select Always to have Finish 'em always include the audio subfile of a selected job. The default setting is Never.

If you select Never, both the Audio (.wav) and Audio (opus) (.opus) items are grayed out in the list of subfiles and are not selectable and will not be selected if the Entire Job option is selected.

### E-mail Audio Files

Choose whether or not audio subfiles are attached to an e-mail when Entire Job or if the Audio subfile is selected and there is a Audio (WAV) file for the selected files. It is important to note that many e-mail packages have an attachment file size limitation. In most cases, audio subfiles are too large for e-mail attachments. The default setting is No.

If you select No, both the Audio (.wav) and Audio (opus) (.opus) items are grayed out in the list of subfiles and are not selectable and will not be selected if the Entire Job option is selected.

## Finish 'em Options

Finish 'em allows you to perform multiple Case CATalyst printing, exporting, backup and e-mail finalizing actions at one time. You can select transcript, dictionary and steno note files to print to PDF, print transcripts to printers, export to RTF/CRE and ASCII, backup and e-mail the Finish' em files. For example, for every job you need to print a transcript, print to PDF for electronic delivery, print your steno notes to PDF with your digital signature for archiving, export the job dictionary and steno notes to RTF/CRE and export the transcript to ASCII to deliver and archive your files. Using Finish'em, you can perform these tasks all at one time. The [Finish 'em Options](#) dialog box allows you to customize how Finish 'em works for you.

### To modify Finish 'em Options:

1. At Manage Jobs, press **Alt + t, f** (Tools, Finish 'em).
2. In the Finish 'em dialog box, press **Alt + p** to display the Finish 'em Options dialog box

### Always overwrite existing files with the same name

Select **Yes** to overwrite files that exist in the current Finish 'em session which are the same file type and have the same file name of existing files. For example, you create an ASCII file for the selected transcript. Later you make edits to the transcript and export the transcript to ASCII again. Case CATalyst automatically overwrites the existing ASCII.

Your selection in this field does not affect Job Report files.

### Warn before overwriting

Select **Yes** to display a message with a list of files that will be overwritten. Select **No** to automatically overwrite existing files with the same name without a warning message. This field is only available when the *Always overwrite existing files with the same name* option is set to Yes.

### Add Text to Compressed PDF Filename

When creating a compressed print PDF of a transcript, you can select to add text to the end of the filename to easily identify that it is a compressed version of the transcript. This may be helpful when creating a full size and a compressed print PDF of the same transcript. If this option is set to No and you select to create both a full size transcript and compressed print PDF of the same transcript, one PDF will be named filename.pdf and the second one will be named filename\_1.pdf. When Yes is selected, the *Add text to end of filename* option is available for you to customize the extension.

#### Text to Add to End of Filename

Finish 'em will automatically add *\_compressed* to the end of a Compressed Print PDF if the *Add Text to Compressed PDF Filename* option is set to Yes. If the Add Text to Compressed PDF Filename option is set to No, this field is not available.

### Always Load Finish 'em Settings

Select a Finish 'em settings file as the default that loads when you open Finish 'em. Finish 'em automatically applies the settings in this file to the current session unless you make changes for the current session or load a different settings file. Select a Finish 'em settings file from the drop-down list or use **Browse** to select a file from another location. Select *Last Finish 'em* to apply the settings from the last Finish 'em session to the current session. This selection is always in the list.

### Backup Options

Backup Options allow you to customize how the Finish 'em Backup "packages" the selected files. The default is to back up the files into separate zip packages and never include audio files. Finish 'em backup options affect only files selected for Finish 'em.

Make changes and select **OK** when finished.

#### Back Up Selected Job

Choose whether to have Finish 'em back up the selected files in Separate Zip Files (each selected job is placed in its own zip file) or back up the selected files into one zip file name (Single Package). When selecting Single Package, the Default Package Name and Add Date to Zip File Name options are available. The default setting is Separate Zip Files.

##### Default Package Name

The selected files will be placed in one zip file name. You can type a default zip name that will be suggested each time you back up files to one zip file name or you can leave the field blank and type a package name each time you back up in Finish 'em.

##### Add Date (YYYY-MM-DD) to file name

Select Yes to add the current date to the single package zip file name. If a default package name is used, the date is automatically added to the end of the package name. If a default package name is not used, the current date is the suggested package name.

#### Back Up Audio Files

Audio files by nature are very large. Once the transcript is finalized, you may not want to keep a copy of the audio file. Select Never to never include an audio subfile in a Finish 'em backup produced zip file. Select Always to have Finish 'em always include the audio subfile of a selected job. The default setting is Never.

If you select Never, both the Audio (.wav) and Audio (opus) (.opus) items are grayed out in the list of subfiles and are not selectable and will not be selected if the Entire Job option is selected.

### E-mail Audio Files

Choose whether or not audio subfiles are attached to an e-mail when Entire Job or if the Audio subfile is selected and there is a Audio (WAV) file for the selected files. It is important to note that many e-mail packages have an attachment file size limitation. In most cases, audio subfiles are too large for e-mail attachments. The default setting is No.

If you select No, both the Audio (.wav) and Audio (opus) (.opus) items are grayed out in the list of subfiles and are not selectable and will not be selected if the Entire Job option is selected.

## Forward

Forward is a Manage Jobs feature that moves you forward in the sequence of folders you most recently displayed. In Manage Jobs, press **Alt + t, w (Tools/Forward)** or click  on the toolbar.

## Move Job Files

The Move command, removes the file from the current location and places it in a different location, either to a new name or to a different user or case, so that the job exists only in the newly selected location. When you use the drag and drop method to move a file, you will be prompted with an "are you sure" message. To disable the message and always move the file, change the setting of the Warn before moving files using click and drag option in the [Job Manager Warnings](#) options.

Within Case CATalyst, you can use click and drag to copy or move a file or subfile to another location in your user. When moving or copying subfiles from Job Details, such as a subfile to a case, the result always copies the file to the new location. Use the [Copy](#) command to copy files to programs outside of Case CATalyst.

when you select to Copy, Move or Restore files from Manage Jobs, if you select to overwrite an existing file, a copy of that file (with all the subfiles) is sent to the Windows Recycle Bin. If you select to click and drag a file from Windows into Manage Jobs and overwrite an existing file, a copy of the file is sent to the Recycle Bin. If you are copying, moving, restoring or dragging files to a network drive or removable drive, a copy of the overwritten file **will not** be sent to a Recycle Bin since one does not exist in those two scenarios. If you select an existing file name when translating and you select to overwrite the existing file, CATalyst has always sent the SGSTN (steno) subfile to the Recycle Bin. CATalyst will now send a copy of the SGNGL (text) subfile, if applicable, to the Recycle Bin. NOTE: This feature is not available when copying, moving, restoring or dragging files to a network drive or removable drive.

## Move Files Using Drag and Drop

1. Position your cursor on the file to move. Click and hold the left mouse button.
2. To select multiple files not consecutively listed, hold Ctrl and click the desired files. To select sequential files, hold Shift and click the first and last file. At the *Are you sure you want to move...* message, do one of the following:

### Yes

Moves the file to the new location.

### No

Cancels the move.

3. Move your cursor to the new location and release the button. Choose to **Move** the file.

## Move Files Using the Copy Command

1. From Manage Jobs, press **Ctrl + m (Tools/Move)**. You can highlight the job or jobs before selecting Move. The Move dialog box displays.
2. Make necessary entries:

### Show subfiles

Check this box to display subfiles with their file type extension. This list is useful when selecting individual subfiles to move.

Uncheck this box to display a separate window with a list of subfile types. This is useful when moving the same subfiles for all the selected jobs.

### Move jobs from

Check the box next to each case or file you want to move.

Checking a case, selects all the files contained in the case. Click the  icon to display the contents of the case. If you highlight a case or file before invoking the Move feature, it displays selected in the Move dialog box. To move all the cases and jobs for a user, check the box next to the user name.

Checking a text file (.sgnfl) automatically selects the associated Job History subfile (*filename.sgxml*). You can uncheck the associated Job History subfile if you do not want to copy it along with the text subfile. The Job History file contains the job creation date, job status, translation information and other information.

The Status bar at the bottom of the screen displays the total number of subfiles selected to move.

In the Move dialog box, you can use the mouse to click the box or Tab to the field where you can use the arrow keys to position the highlight on your selection and then press **Spacebar**.

### Subfile types to move in each job

This box only displays when the Show subfiles feature is not selected. Check the box next to the each subfile type you want to move. To move all subfile types, check the All subfile type box. These selections affect all jobs you are moving.

### Move jobs to

Indicates the destination folder and case for the moved files. The default folder is the current user. To select a different user folder or case, click the user or case name.

If you select to move a single file to its original location, you must type a new name in the Job name field.

### Keep case structure

Check this box when moving individual or multiple files and you want to use the retain the same path structure. For example, you have a case named, "Arbitrations" with a job inside the case named Larson 040402. You want to copy Larson 040402 to another reporter's folder. With Keep case structure selected, Case CATalyst creates a case name Arbitrations with the file named Larson 040402 in the other reporter's folder. If you do not select Keep case structure, only the file Larson 040402 copies to the reporter's folder.

### Job name

Rename a single file that you are moving. Type a new file name.

### Browse

Select a destination location not displayed, such as a thumb drive located in the E:\ drive of the computer.

3. Press **Enter (OK)**. If the same subfiles already exist in the destination folder, the Confirm File Replace dialog box prompts you to replace certain files, all the files, or cancel.
4. The Manage jobs window displays when the move is complete.

## Rename

Rename is a Manage Jobs feature that allows you to rename Case CATalyst cases, job files and users. You can use upper and lower case letters, numbers and spaces in a user name. The following symbols are also valid characters: ' ~ ! @ # \$ % ^ & ( ) - \_ { } Some characters are reserved by the operating system and used to perform system functions. They cannot be used in a user name. These characters include: " / \ [ ] : ; , | = < > ? \*

### Rename a Case or Job File

1. In Manage Jobs, highlight the case or job file you want to rename. You cannot rename system files or subfiles. If the case is located within a case, double-click the initial case and then highlight the case you want to rename. If the job is in a case, double click the case and then highlight the job.
2. Press **F2 (Tools/ Rename)**.
3. Type a new name in the highlighted label area.
4. Press **Enter** or click a blank area on the screen.

### Rename User at User Level

1. Press **Alt + t, s (Tools/Users Level)**. The Users Level displays.
2. Click the user for which you want to change the name and press **F2**.
3. Type a new name and press **Enter**. The new name displays.

### Rename Current User in Manage Jobs

1. Close any open Case CATalyst files.
2. Click the user in the subfiles window and press **F2**.
3. Type a new name and press **Enter**. The new name displays along with the following message: "The folder structure has changed and the current folder is no longer valid. You will now be returned to the first valid folder higher in the structure."
4. Click **OK** in the message. Case CATalyst displays the User level.

5. Select a user.

## Restore

The Restore feature decompresses or "unzip" jobs that have been backed up in Case CATalyst. Although Case CATalyst uses a "zip" compression routine, you cannot use the Case CATalyst Restore function to "unzip" other zipped files. The following error message displays if you attempt to unzip non-Case CATalyst .zip file: "Archive was not created by Case CATalyst. Use the original compressing software to extract its contents."

When you use the Restore feature to restore a UserSettings file, the existing UserSettings file is overwritten, even if it is currently open and in use. The settings in the restored UserSettings file are immediately applied and used.

Case CATalyst 3.0 files must be imported for use in Case CATalyst. When you select to restore Case CATalyst 3.0 files, Case CATalyst prompts you with the option to import the files using the current Import options. If you are importing a Case CATalyst 3.0 file with an audio link, you must use the Import feature directly. Do not import these files through the Restore feature. All restored Case CATalyst 3.0 files retain case information when imported regardless of the Import settings.

## Restore Case CATalyst Files

1. If you are restoring files from external media (thumb drive, memory card, external hard drive, etc.) connect the media to your computer. In some cases (e.g. memory card) you may need to place the media in a reader and make sure the reader is connected to your computer).
2. From Manage Jobs, press **Ctrl + r (Tools/Restore)**. The Open dialog box displays.
3. The Open dialog box displays showing Backups (\*.zip file types). Locate and select the compressed file from which you want to restore files. You can select multiple files to restore. If you select multiple zip files to restore, once the first zip file is restored, the next zip file displays in the Restore dialog box.  
If you are restoring from a diskette, make sure you navigate to the disk drive to select the backup file or files.
4. Press **Enter (Open)**. The Restore dialog box displays.  
If you are restoring from a multiple disk backup, Case CATalyst prompts you to insert the last disk of the backup first when you select Open.
5. Make necessary entries:

### Show subfiles

Check this box to display subfiles with their file type extension. This list is useful when selecting individual subfiles for restoring.

Uncheck this box to display a separate window with a list of subfile types. This is useful when restoring the same subfiles for all the selected jobs.

### Restore files from

Check the box next to each case or file you want to restore. Checking a case, selects all the files contained in the case. Click the  icon to display the contents of the case. To restore all the cases and jobs in the backup, check the box next to the backup file name. The Status bar at the bottom of the screen displays the total number of jobs selected to restore.

In the Restore dialog box, you can use the mouse to click the box or Tab to the field where you can use the arrow keys to position the highlight on your selection and then press **Spacebar**.

### Subfile types to restore in each job

This window only displays when you uncheck the Show subfiles feature. Check the box next to each subfile type you want to restore. To restore copy all subfile types, check the All subfile types box. Subfile selection affects all the jobs you are restoring.

### Restore files to

Indicates the folder to which the files are restored. The default folder is the current user. To select a different user folder or to select a case, highlight the file name in the list below the Restore files to field.

### Keep case structure

When you backup files, Case CATalyst remembers the original location of the files. Check this box to restore the backup files to their original location. For example, you backup the SMITH file located in the 10-2009 case. When the scopist restores the backup, a 10-2009 case is created and the SMITH file restored to the 10-2009 case. This option is checked by default. Uncheck the box not restore files to their original location. The selection is remembered until changed.

### Choose File

Select a different .zip file from which to restore files. The Open dialog box displays.

### Browse

Search to select a different restore to location.

6. Press **Enter (OK)**. If you selected multiple files to restore, Case CATalyst displays the Restore dialog for each file selected.

If the same subfiles already exist, Case CATalyst prompts you to Overwrite or Skip. When you Overwrite the files, **all** subfiles with the same name are overwritten by the jobs being restored.

If you select a Case CATalyst 3.0 backup file to restore, Case CATalyst displays the message: *Backup files are CATalyst 3.0 files and will need to be imported for use in CATalyst. Import now?* Choose **Yes** to import the selected files, **No** to restore the files or **Cancel** to cancel the restore.

## Back Up User(s)

The Back Up User(s) feature is available from Manage Job's Tools menu and the right click menu. You can select one or more users to back up to separate files (each user in a separate zip file) or back up all the selected users to one backup file. All files in the selected user(s) will be backed up, you cannot select individual user files when using the Backup User(s) feature. To restore a User, use the Restore User(s) feature.

To backup individual files or settings files, use the [Backup](#) feature.

To back up all files in a user, do the following:

1. From the Manage Jobs Tools menu or right click menu, select Back Up User(s). The Back Up User(s) dialog box displays.
2. In the Copy from section, select the user(s) you want to back up. You can only select an entire user, selection of individual files is prevented. **The current user is selected by default.**
3. To set the Back Up User(s) options, press **Alt + o**. Do any of the following and when finished, click OK. (Back Up User(s) Options settings are separate from the Backup Options settings.)
  - In the Back Up Selected User(s) field, select Separate Zip Files to back up **each selected** User into a separate backup file or Single Package to backup **all selected** User(s) into one backup

file.

If you select Separate Zip Files, each zip file will be named the UserName.zip.

If you select Single Package, you can specify a Default Package Name and/or to add the date to the Zip File Name.

- In the Back Up Audio Files field, select whether to back up all audio files found in each selected user. The default setting is Never. Other available options are Always and Warn Me.
  - In the Auto-select Steno X-ray files (.sgxry .sgxr2) field, select whether to back up all Steno X-ray files found in each selected user. The default setting is Never. Always is the other option.
  - In the Auto-select Index log files (.sglog) field, select whether the Index Log subfile (.sglog) is automatically selected when backing up User(s). The default setting is Never. Always is the other option.
4. In the Save in: section, navigate to the storage location for the backed up User(s).
  5. To begin the backup, press **Enter** (Save).

## Restore User(s)

The Restore User(s) feature is available from Manage Job's Tools menu and the right click menu. The Restore User(s) feature restores entire user backups created by the Backup User(s) feature to the selected User Root and always retains the structure of the user. Restore User(s) restores all the files in the selected user backup, you cannot select individual files. The Restore User(s) function is a great way to transfer your existing user to a new computer or for archiving all of your user files. Use the Restore User(s) function when the user backup was created by the Backup User(s) feature. If you want to restore files backed up using [Backup](#), use the [Restore](#) feature.

**To restore a user from a Backup User(s) zip, do the following:**

1. If you are restoring user backup from external media (thumb drive, memory card, external hard drive, etc.) connect the media to your computer. In some cases (e.g. memory card) you may need to place the media in a reader and make sure the reader is connected to your computer).
2. From the Manage Jobs Tools menu or right click menu, select Restore User(s). The Open dialog box displays all Backups (\*.zip file types) at the current location.
3. In the Open dialog box, navigate to the location of the backed up user file, select the zip file and click **Open**.
4. In the Restore User Files from section, select the users you want to restore. You can only select a user, selection of individual files is prevented. **All users in the backup are selected by default.**
5. Do any of the following and when finished, click **OK**.
  - To view all the files in a User backup, click the **View Files...** button. The backed up User filenames (including path) display. When finished viewing the files, click OK.
  - To select another User backup, click the **Choose File** button. Navigate to the location of the backed up user file, select the zip file and click OK.
  - Click the **Browse** button to restore the user files to a location other than the user roots listed within the dialog box. It is recommended that you restore the user to another User Root and not to your desktop or documents folder.
  - Click **Cancel** to abort the restoring of user files.
6. To begin the restore, press **Enter** (OK). If the selected user doesn't already exist in the specified user root, the Restore User will create the user.

If you select one or more User backup and regular backup zip files, the following message displays:

Do one of the following:

- Press **Enter** to continue with the restore function. CATalyst will switch between the Restore (individual files) and Restore User(s) functions.
- Click **No** to display the Open dialog box allowing you to select User backup files.
- Click **Cancel** to abort the Restore User(s) feature.

If you select one or more regular backup zip files, the following message displays:

Do one of the following:

- Press **Enter** to switch to the Restore feature to restore individual files.
- Click **No** to display the Open dialog box allowing you to select User backup files.
- Click **Cancel** to abort the Restore User(s) feature.

If you select Choose File in the Restore User(s) dialog box and select a regular backup files, the following message displays:

Do one of the following:

- Press **Enter** (OK) and then select **Choose File** and select a User Backup.
- To restore a regular backup file, press **Enter** (OK), click **Cancel** and then select the Restore feature.

## Cloud Back Up Now

The Cloud Back Up Now command is available from Manage Jobs' Tools menu or by right clicking in Manage Jobs. Cloud Back Up Now allows you to select a file and immediately back it up to the cloud. For example, let's say that you just finished a realtime job and you have to pack up and go to another deposition, which means you are going to close Case CATalyst and turn your computer off. Instead of waiting until you turn your computer back on for Cloud Backup to find your file and back it up, you can select your realtime job and select Cloud Back Up Now to make sure the file is backed up. While you are packing up your writer and other equipment, your file is being backed up before you leave. Once the file is backed up, you can close Case CATalyst and turn off your computer with the confidence the file is backed up to the Cloud. Remember, uploading (back up) speed, regardless of what program you are using, is typically 2 - 3 times slower than downloading speed. The quality of your internet connection and file size also affects the uploading speed.

Cloud Backup will release a file that is currently being backed up when the Cloud Backup Service is paused either from the Cloud Backup dialog box or the Windows System Tray service. Once Cloud Backup is paused, you can move, rename or delete the file. When you select to resume, Cloud Backup will continue backing up all files that are new or have changed including the entire file that was released when you paused the service.

### Things to know:

- When you select a subfile and then Cloud Back Up Now, the subfile is backed up even if it is an [excluded extension type](#).
- When you select a file (job) and select Cloud Back Up Now, excluded file types (extensions) will not be backed up.
- When you select a case or user and then Cloud Back Up Now, Cloud Backup will backup up cases and files that were modified since the last Cloud Backup. Excluded users, cases and excluded file types (extensions) will not be backed up.
- If you keep selecting a job or case to backup and something isn't backing up, check your excluded file extensions settings (Cloud Backup, Settings, Exclude Extensions...) and/or your excluded users/cases settings (Cloud Backup, Settings, Select Users/Cases...) to see if any of the selected job's subfiles have been excluded and/or the selected case or user has excluded cases within it. Excluded users or cases are designated by the red circle with the slash in the middle.

### To use Cloud Back Up Now:

1. At Manage Jobs, highlight a case, file or subfile that you want to back up immediately.
2. Press **Alt + t, n** (Tools, Cloud Back Up Now).
3. When the file is backed up, the *Cloud Back Up Now Completed* message displays.

If you have used approximately 90% of your Cloud storage space and you select the Cloud Back Up Now command, the following message displays:

*You are nearly out of storage space in the Cloud.*

*X GB of X GB used.*

Click **OK** or the message will close in 15 seconds if no action is taken.

If you are out of your Cloud storage space and you select the Cloud Back Up Now command the following message displays:

*Unable to Back Up to the Cloud.*

*You are out of storage space in the Cloud.*

*X GB of X GB used.*

*Please call Stenograph to upgrade your storage: 800-323-4247.*

## Search

Search in Manage Jobs allows you to locate files or specific subfiles in the Manage Job function. The search includes files and subfiles located within a case. Search results display in a dialog pane.

### Search Manage Jobs

1. Press **Ctrl + f (Tools/Search)**. The Search for Files dialog box displays.
2. Make necessary entries:

#### Search For

Type the name of the file to locate. You can use asterisks as wildcard characters in the search. For example, you have a file named Kari Hayes 020504. To find the file, you might use the criteria: \*Kari or Kari \* to locate the job. Using \* Kari \* would not locate the job. The Whole Word option selection may also influence finding a particular file by name.

#### Search Filter

Limit the search by the type of subfile. Use the drop down box to select a subfile type or choose to search all subfiles.

#### Search In

Displays the location of the search. The default is the current user. To change the location, use the Available Files Window to navigate to a specific user or location.

#### Available Files Window

Select the location where you want to search. The location displays in the Search In field. You can navigate to a specific location by using the scroll bar to the user and/or case. To search cases from the selected location, check the Look in Cases option.

#### Look in Cases

Check this box to search cases within the selected location.

#### Whole Word

Check this box to search only for the whole words that match the text typed in the Search For field. If you do not select Whole Word, the search finds the word both as is stands alone and as part of another word.

3. Press **Enter (OK)**. The results of the Search display in the Search For Files dialog pane at the bottom of the screen. You can double click a subfile to open it in the associated function.

## Search File Contents

Search File Contents is a Manage Jobs feature that allows you to search for text in every transcript or steno and text in every dictionary in the current user, current case or all users. The results display in a dialog pane with the transcript or dictionary name and relevant transcript or dictionary information. Double clicking an entry opens the transcript or dictionary to the indicated location or entry.

### Search File Contents

1. From Manage Jobs, press **Ctrl + Shift + f** (**Tools/Search File Contents**). The Search File Contents dialog box displays.
2. Make necessary entries:

#### File Type

Select to search for **Dictionary (.sgdct)** or **Transcript (.sgnpl)** file types. The File Type selected determines the available search options.

#### Search For

##### Text

Search dictionaries or transcripts by text. Type the text in the field. Include any format symbols (**Alt + f**), fields (**Alt + d**) or [extended characters](#) as necessary.

##### Steno

Search dictionaries by steno. You can type either a forward slash (/) or press the Spacebar to separate steno outlines. For example, to search for a two stroke word, such as "guideline", you could type TKPWAOEUD -- then type / or press the Spacebar to finish with the second stroke, HRAOEUPB. When typing steno that starts with a final stroke, place a – (hyphen) before the first letter. For example, if you were searching for "much" you would type -FP. For more information about typing steno outlines in the Steno field, see the [Steno Shortcut Table](#).

#### Entry Type

Search by entry type. Selecting an entry type filters the search so that only entries with the entry type selected display. Click the arrow to display a list of available entry types.

Select **one** Search For type:

##### Conflict

The first entry that contains a conflict end format symbol.

##### Scan stop

The first entry that contains a scan stop begin or end format symbols.

##### Numbers

The first entry that contains numbers.

##### All Capped

The first entry that contains all capped text.

##### Contains capped

The first entry that contains at least one capital letter.

**Phrase**

The first entry that contains two or more words separated by a space.

**Contains punctuation**

The first entry that contains punctuation.

**Contains format symbol**

The first entry that contains a format symbol.

**Unused Entries**

The first entry not used during translation. A "0" (zero) displays the Usage count column for an unused entry.

**Contains Fields**

The first entry that contains a field.

**Repeated Stroke Entries**

All entries that contain repeated steno outlines, such as STPHAO/STPHAO and STPHAO/STPHAO/STKPWHR.

**Auto Includes**

All entries that begin with @.

**AccelerWriter**

All entries that begin with &&.

**Number Conversion**

All entries that contain the {Number Conversion} translate command.

**Number Trigger**

All entries that contain the {Number Trigger} translate command.

**Numerical Words**

All entries that contain a word number including hundred, thousand, million, etc.

**Speaker Entries**

All entries that contain a <Colloquy> format symbol and a colon and all entries defined with the <By-line> format symbol.

**One stroke**

All one stroke entries.

**Two strokes**

All two stroke entries.

**Three strokes**

All three stroke entries.

**Four strokes**

All four stroke entries.

**Five strokes**

All five stroke entries.

**6 or more steno strokes**

All entries that contain six or more steno outlines.

**2 or more steno strokes**

All entries that contain two or more steno outlines.

**3 or more steno outlines**

All entries that contain three or more steno outlines.

**FS**

Search the text for a format symbol or add a format symbol to your text search. Select **FS** and double-click a symbol from the list to select it.

**Insert Field**

Search the text for a field or add a field to your search. Select Insert Field and double-click a field from the [Insert Field](#) dialog box.

**Wildcard Text**

The Wildcard Text option is only available when searching a transcript. Search for specific text with unknown characters. Type the text for the search in the *Text* field. Use the following:

- Use a ? (question mark) in a word or phrase for a single unknown character. For example, you want to find all occurrences of "Peterson and Petersen" to confirm they are all spelled the same. You select **Wildcard Text** and in the field you type: **Peters?n** since the only unknown character is either the "o" or the "e". All files that contain either Peterson or Petersen will be listed.
- Use an \* (asterisk) in a word or phrase for an unknown number of characters following the asterisk. For example, you want to find all the transcripts for a particular witness' name but you can't remember the exact spelling but you know it starts with "Wood" so you could select **Wildcard Text** and in the field type: **Wood\***. The results would list all files containing names/words starting with "Wood".

**Regular Expression**

The Regular Expression option is only available when searching a transcript. Search based on a specific text string. When Regular Expression is selected, a list of default expressions displays in the dialog box. Double click an expression to insert it into the *Text* field. Refer to the Regular Expression Default List for details on each regular expression default formula.

**Regular Expression Default List**

- **Acronyms** – searches for any occurrence that begins a word with a character followed by a period. There must be at least "character period character period" in order for it to be considered a match.
- **Alnum** – searches for any capital or lower case alpha/numeric character individually or part of a group.

- **Alpha** – searches for any capital or lower case alpha character individually or part of a group.
- **Digit** – searches for any numeric character individually or part of a group.
- **Contractions** – searches for any word that begins with one or more alpha characters which are followed by an apostrophe and one or more characters follow the apostrophe and end the word.
- **Dates** – searches for all occurrences of dates with the exceptions when a month is listed by itself or a digit displays before the month, such as 1 January.
- **E-mail address** – searches for any alpha character including a hyphen or period, followed by @ with any alpha character following including a hyphen or period.
- **Mixed Alpha and Digits** – searches for occurrences at the beginning of a word any alpha characters followed by numeric characters or occurrences that begin with any number character followed by alpha characters.
- **One Alnum** – searches for any alpha/numeric character.
- **One Alpha** – searches for any alpha character. This will treat each alpha character in a word as a single search item.
- **One Digit** – searches for any single numeric character. This will treat each numeric character as a single search item.
- **Phone Number** – searches for the number 1 followed by either a period or hyphen, but the search will continue even if this condition does not exist. The search will continue and look for a three digit number followed by a period or hyphen but will continue even if this condition does not exist. A match is only found when a three digit number followed by period or hyphen followed by a 4 digit number is found.
- **Repeated Words** – searches for occurrences of a word that begins and ends with alpha characters and the same word immediately follows.
- **SSN** – searches for occurrences of 3 digits followed by a hyphen, followed by 2 digits followed by a hyphen followed by 4 digits.
- **Stitched** – searches for occurrences that begins a word with a single alpha character followed by one or more hyphens.
- **Time** – searches for occurrences of time with the exception of “o’clock” time.

### Whole Word

This option is not available if Regular Expression is selected. Check this box to search the text for the word typed in the *Text* field as a standalone, not part of a word. For example, if you only want to find occurrences of "able" when the word is not part of a word such as "table," type the word able" in the *Text* field and select the Whole Word option.

If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. For example, searching for "able" entries such as "able", "table", "unsinkable", "controllable", etc.

### Case Sensitive

Check this box to search for the text exactly as it is typed in upper and lower case. For example, if you only want to find occurrences of "Mark" when it is capitalized, you would type "Mark" and select the Case Sensitive option.

If you do not select **Case Sensitive**, the search finds occurrences of the word as initial capped, all capped and all lower case. For example, if you search for "Mark" and do not check this box, Case CATalyst finds all occurrences of word "Mark," "MARK" and "mark".

**Partial**

Check this box to search dictionaries for the specified steno regardless of whether or not it is the entire steno outline or only part of the steno outline. For example, when **Partial Stroke** is selected, searching for -FPLT finds: -FPLT, -FPLTD, -FPLTS, -EUFPLT, etc. Searching for -FPLT without the **Partial Stroke** option selected, displays entries with -FPLT as a separate outline, such as: -FPLT, -FPLT/-FPLT, etc.

**Where**

Select one of the following:

**All Users**

Search all users in all Root folders where Case CATalyst is loaded.

**Current User**

Search the current user. This is the default.

**Current case and contents**

Search the current open case and any cases within the case. This option is only available in an open case.

**Location**

Select one of the following:

**Exact**

Search for entries that exactly match the specified text or steno outline entered in the field.

**Contains**

Search for entries that contain, anywhere in the entry, the specified text or steno outline entered in the field.

**Begins With**

Search for entries that begin with the specified text or steno outline entered in the field.

**Ends With**

Search for entries that end with the specified text or steno outline entered in the field.

3. Press **Alt + e (Search)** to begin the search using the designated search criteria. By default, the Search File Content Results dialog box displays on the left side of the Manage Jobs screen. A status bar at the bottom of the dialog box displays the search results. Use either of the following options at the bottom of the dialog box:

**Stop search**

Click the Stop search  icon to stop the active search. When the icon is grayed out, the search is complete or has been canceled.

**Start new search**

Press **Ctrl + Shift + f** (**Tools/Search File Contents**) or click the Start new search  icon to display the Search File Contents dialog box and start a new file contents search.

4. Double click an entry to open the transcript or dictionary, depending on your search File Type selection.

## Search Due Jobs

Search Due Jobs is a Manage Jobs feature that searches for jobs with that are reported as due and displays them in the Search Due Jobs Results dialog pane. All transcripts that meet the due date criteria for the current user are listed. Due date criteria is determined by [Job History Options](#) and the assignment of a due date to the job.

The Search Due Jobs Results dialog pane automatically displays the results when you conduct a Search Due Jobs search or when you open a Case CATalyst User if the Job History option, [Display Search Due Jobs Results at startup](#) is active. The search results display in a dialog pane. You can group the results by Path or Due Date. The Path indicates the location of the file and includes the case name, when the file is located in a case. The Due Date indicates the due date assigned to the job. By default, two columns display in the Search Due Jobs Results dialog box, Job name and Due Date. You can add a third column, Path. When all columns show, grouping information does not display.

Double click a job name to move the cursor to the Manage Jobs location of the job. If the job is in a Case, the Case automatically opens. Case CATalyst highlights all the available subfiles for the job. Click the plus icon next to the job name to display the subfiles for the job. Double click a subfile to open it in the appropriate function. For example, you double click the text file, Anderson.sgngl. Case CATalyst opens the transcript in Edit. If you double click the dictionary file, Anderson.sgdct, Case CATalyst opens the dictionary in Manage Dictionary.

To search due jobs in Manage Jobs, press **Ctrl + Shift + d** (**Tools/Search Due Jobs**). The Search Due Job Results pane displays with the list of due job. Double click a file to quickly locate it. To display the subfiles for a job in the list, click the expand  button.

## Modify the Dialog Pane Display

### Change the Sort Order of Entries

Click a column heading to sort the entries in ascending and descending order. An arrow in the column indicates the sort order.

### Change the Display Order of Columns

Click the desired column heading and hold the left mouse button. Drag the heading to a new location on the column heading bar. Red arrows indicated the new location. Release the mouse button. Case CATalyst remembers the last sort display.

### Manage Column Widths

- Place the cursor on the line dividing the column headings and hold the mouse button down. Move the line left or right to the desired position. Release the button.
- Place the cursor on the column heading. Use the right click menu and select **Best Fit** to automatically size the column based on the longest entry on a single line.

## Select All

The Select All feature in Manage Jobs that allows you to highlight all Manage Jobs entries for a subsequent action [Copy List View to Clipboard](#) that allows you to pasting the information into other programs, such as Microsoft Excel for tracking and billing. Case CATalyst copies information from the columns (not transcripts or files) currently selected to Show.

## Send 'em Backup

Send 'em Backup is a Manage Jobs feature that allows the user to select specific files to always include with jobs backed up using the Send 'em Backup feature. For example, a reporter has desktop and notebook computers. Using Send 'em Backup they can pre-set the important user files to zip and transport between computers, easily keeping files updated.

The first time you use Send 'em Backup, Case CATalyst prompts you through the Pre-set and Additional Pre-set file selection process. Pre-set files can include Personal Dictionary, Phonetic Table, Update Area, Wordlists and Job and Case dictionaries. Additional Pre-set files are any other files you want add to the zip file, such as your Conflict Database. After initially selecting all your pre-set files, the next time you use Send 'em Backup, all the preselected files are automatically included when you select the job. You can make changes to your Pre-set selection from the Send 'em Backup dialog box.

## Send Files Using Send 'em Backup

1. From Manage Jobs, press **Alt + t, p (Tools/Send 'em Backup)**. The Send 'em Backup dialog box displays.

If this is the the first time you are using the Send 'em Backup feature, you must first select your Pre-set files:

### Send 'em Pre-set Files

Check the box next to the files you always want to include when using Send 'em Backup and then press **Enter (Next)**. Files remain selected until you change them.

- Personal Dictionary
- Phonetic Table
- Update Area
- Wordlist (Personal + Case)
- Job/Case Dictionaries—includes any job and case dictionary that was used to translate the job. Case CATalyst uses the Job dictionary information from the file's Job History.

### Send 'em Additional Pre-set Files

Check the box next to any other files to regularly include in the Send 'em Backup zip file and then press **Enter (Next)**. Files remain selected until you change them.

2. In the Send 'em Backup dialog box, select the job or jobs to backup. If you highlighted jobs in Manage Jobs before selecting Send 'em Backup, the jobs are already selected.
3. Use the following options as necessary:

### Show subfiles

Check this box to display subfiles with their file type extension. This is useful when selecting individual subfiles for backup. Uncheck this box to display a separate window with a list of subfile types. This is useful when backing up the same subfiles for all the selected jobs.

### Copy from

Check the box next to each case or file to include in the Send 'em Backup. Checking a case selects all the files contained in the case. Click the  icon to display the contents of the case. To backup all the cases and jobs for a user, check the box next to the user name. If you highlight a case or file in Manage Jobs before invoking the Send 'em Backup feature, it displays already selected.

The Status bar at the bottom of the screen displays the number of files and total file size for all jobs selected.

### Subfile types

This window displays when you uncheck the Show subfiles feature. Check the box next to each subfile type you want to include in the Send 'em Backup. To include all subfile types, check the All subfile types box. Subfile selection affects all the jobs in the Send 'em Backup.

### Save in

The location for storing the Send 'em Backup file. Files for the current folder display in the window below this field. To select a location other than the default, click the arrow button to browse. Use any of the other icon tools as needed:

Return to last folder

Up one folder level

Create new folder

Change view menu

### File name

This field displays when the option *Place all selected jobs in a single package* is selected. Do **one** of the following:

- Accept the default file name.
- Change the default file name. Select [Options](#) to display the Send 'em Backup Options dialog box.
- Type a name for the backup file.
- Select an existing backup file from the list in the window.

If you place the file on your computer with the same file name as an existing file name, Case CATalyst opens the folder instead of saving the file. Include the .zip extension in the file name to have Case CATalyst recognize the name as a file. For example, Anderson030202.zip.

### Save as type

The Send 'em Backup type is .ZIP. The .ZIP extension indicates a compressed file.

### View Files

Display the Selected Files for Zip where you can review the files selected for inclusion in the Send 'em Backup zip file. Selected files that Case CATalyst is not able to locate are preceded by an \* and are not included in the Send 'em Backup zip file. When finished viewing, press **Enter (Close)**.

### Options

Display the [Send 'em Backup Options](#) dialog box where you can choose how to package the zipped files. You can place each job in a separate package or place all the jobs into a single package. When placing files into a single package, you can select to use a default package name. Press **Enter (OK)** in the Send 'em Backup Options dialog box after making your selection.

Send 'em Backup Options do not affect the zip options set for Zip & e-mail, Send 'em e-mail or Backup for job files.

### Pre-set Files

Display the Send 'em Pre-set Files dialog box where you can change your selection of Send 'em Pre-set and Additional Pre-set files. After making your changes in the Send 'em Pre-set Files dialog box, press **Enter (Next)** to display the Additional Pre-set Files dialog box. When finished making changes, press **Enter (Next)**.

4. Press **Enter (OK)**. In a few moments, your default e-mail package displays with the Send 'em Backup zip file or files attached.

## Up One Level

Up One Level is a Manage Jobs feature that allows you to move up to the next folder level until you reach the User Root Level. from Manage Jobs press **Alt + t, u (Tools/Up One Level)** or click the  icon. Use this command when you are in a case and want to return to your user files.

## Users Level

Users Level is a feature in Manage Jobs that takes you to the User Level Screen. The Users Level Screen shows all the available users in Case CATalyst in the current [User Root](#). It displays each time you start Case CATalyst unless you use [Auto Logon](#). Only one user can be active in a Case CATalyst session although you can open files from other users, if necessary. If a session is already in progress when you select to [change users](#), a message displays prompting you to either close the current session or open a new session. To select a user, double-click (or highlight and press Enter) the appropriate user

at the Users Level. To access the Users Level from Manage Jobs, select **Tools/User Level** or click  from the Manage Jobs toolbar.

You must be at the Users Level to [create a user](#) or [delete an existing user](#).

## CaseViewNet Browser Link...

You can generate a link that your CaseViewNet clients can use to automatically open their default web browser to [www.caseviewnet.com](http://www.caseviewnet.com) with the Session Code and Password login fields already populated. This makes it easier for you and your clients to connect for CaseViewNet Browser Edition. The CaseViewNet Browser Edition Link will avoid Session Code and Password typing mistakes by clients and provides you with an easy method for communicating the necessary login information.

You can generate a CaseViewNet Browser Link by using the Tools menu option or from inside of the CaseView Passwords dialog.

Using the tools menu allows you to generate a CaseViewNet Browser Link from Manage Jobs and/or while writing realtime:

1. Select **Tools, CaseViewNet Browser Link...**
2. Inside of the CaseViewNet Browser Link dialog, verify your Session Code is listed in the *Session Code:* field. Case CATalyst will remember the last Session Code you used. If no Session Code is listed, or if the wrong Session Code is listed, you may type a Session Code into the field.
3. Click the drop down arrow to select the *Choose Password to create link for:* option. This option allows you to select from the Multiple Connections passwords and Allow Save Rights options currently available in your CaseView Passwords dialog.
4. Click **Generate Link**. A message will display to let you know that the link has been copied to your Windows clipboard. You may paste the link into an email/chat and sent it to the clients.

Here is an example of what the link will look like: [https://www.caseviewnet.com/index.php?sessionCode=JAMEZS&password=Save\\_c108](https://www.caseviewnet.com/index.php?sessionCode=JAMEZS&password=Save_c108)

The client needs only to click the link for CaseViewNet Browser Edition to open. The Session Code and Password information will be populated automatically from the link.

- Note: "Session Code Only" is an option available in the *Choose Password to create link for:* drop down list. This allows you to create a link that will automatically populate the Session Code, but still allows you to communicate the Password information separately and more privately.

Generating a CaseViewNet Brower Link from inside of the CaseView Passwords dialog follows similar steps to the Tools menu option:

1. From Manage Jobs, click the **Translate** icon on the Function toolbar (*Ctrl+t*) to open the Translate dialog.
2. Click the **Passwords** button for the *View or Change CVNet Passwords* option.
3. Click the **Browser Link** button inside of the CaseView Passwords dialog.
4. Same as when accessing the CaseViewNet Browser Edition dialog from the Tools menu, verify the information in the *Session Code:* field, select the password and save rights from the drop down menu, and click the **Generate Link** button to copy the link to the Windows clipboard.

## Options

Several Case CATalyst options can be set from Manage Jobs. These include settings for:

- [Manage Jobs](#)
- [Read](#)
- [Translate](#)
- [Edit](#)
- [Manage Dictionary](#)
- [Import](#)
- [Export](#)

- [Advanced Manage Notes](#)
- [Reminders](#)
- [Computer Theme](#)
- [Computer Options](#)

## UserSettings File

The UserSettings file contains settings that determine the default selection for Case CATalyst options. Each user has an individual UserSettings file located in the Systems File case. The majority of UserSettings options are modifiable within the function through various option settings, such as Case CATalyst Translate Options, Advanced Edit Options, Brief It and Live Suggestion Options. Most feature options are available through Manage Jobs' Options but some many only be available in the function and/or dialog pane. A few UserSettings options not accessible from within Case CATalyst are customizable by changing the option directly in the UserSettings file. Instructions for these changes are contained within the relevant topics.

## Translate

Case CATalyst [Translate options](#) determine how your steno outlines translate into text. The [Advanced Translate Options](#) allow you to make default selections for additional settings applied during translation.

## Translate Options

Translate options determine how Case CATalyst translates steno outlines or note files into text. The first time you translate, you must set up your translate options. If you do not, Case CATalyst initiates the Translate Wizard which prompts you through setup. Translate options are grouped together in the same dialog box on the following tabs:

- [Input](#) (The Input tab provides access to the Advanced Translate options along with translation options such as TrueStroke Drag/Drop, Number Conversion, etc.).
- [Realtime](#) (The Realtime tab allows selection of the realtime writer, AudioSync settings, Brief It, Live Suggestion and Work Units.)
- [Output to CaseView](#) (The Output to CaseView tab contains CaseView output options along with CaseViewNet password assignments.)
- [Output to ASCII/ANSI](#) (Output to ASCII/ANSI tab contains connection and hold stroke settings specific to outputting via ASCII/ANSI.)
- [Output to Speche](#) (Output to Speche tab contains connection information including user name and password.)
- [Output to Caption](#) (Output to Caption tab contains connection options, Encoder selection and translate options.)
- [Output to StenoKeys](#) (Output to StenoKeys tab contains hold stroke settings specific to outputting to StenoKeys.)
- [Output to Other Devices](#) (Output to Other Devices tab contains connection options along with hold stroke settings, Device output selection and translate options.)

## Advanced Translate Options

Advanced Translate Options **determine the default selection for certain options applied during translation in Case CATalyst. You can access the Advanced Translate Options:**

- each time you translate. In the Translate dialog box, select **Options**. On the Input tab, select **Advanced**.
- in Manage Jobs. From the **Tools** menu, select **Options/Translate**. On the Input tab, select **Advanced**.

### Advanced Translate Options

To make a change, click an option and select a choice from the drop down box. When finished with all your changes, select **OK**. The *Restore Default Settings* option returns all the Advanced Translate Options to their original Case CATalyst default selection.

#### Digits with words convert with commas up to - none/hundreds/thousands/millions

Select **hundreds**, **thousands** or **millions** to have Case CATalyst convert digits followed by the words "hundred," "thousand" or "million" to a number with commas when no automatic number keyword is written. This feature is useful if you want numbers (digits) written with the words "thousand" and "million" to format differently than when word numbers are written. For example, "5 thousand people" converts to "5,000" people. If you write "five thousand people," it does not convert. For example, 18 hundred converts to 1,800 and eighteen hundred converts to 1800.

Case CATalyst converts digits and words up to the option selected. For example, if you select thousands, Case CATalyst converts digits followed by the word "hundred" and "thousand" but not digits followed by the word "million." For example, 18 hundred converts to 1,800; 18 thousand converts to 18,000; but when you write 5 million no conversion occurs.

At least one number written must be a digit. For example, if you write eight hundred or eighteen thousand, no conversion occurs. If you write one hundred 50 thousand it converts to 150,000 because a digit number is written. However, if you write eighteen thousand and the [option](#) Otherwise Display As Digits is active, then the number translates as 18000 with no commas inserted.

This feature works in conjunction with Automatic Number Conversion. The Automatic Number Conversion [option](#) must be selected in Translate options.

If a keyword identified in the NumberConversion.ini follows the number written, then the number conversion format from the NumberConversion.ini takes priority. For example, "2 thousand four hundred dollars" converts to "\$2,400."

Select **None**, the default, if this option does not fit your number writing style.

#### Automatically resolve EZ Choice Conflicts Yes/No

EZ Choice is a conflict resolution feature based on what conflicts you select while editing. Select **Yes** to have Case CATalyst automatically confirm conflicts selected by EZ Choice and add the resolution information to the conflict database. Resolution during translation is based on previous conflict selections while editing. Scan does not stop on the confirmed conflicts and the confirmed conflicts do not display in a conflict color. This option applies to EZ Choice selected conflicts only and has no effect on Second Choice selected conflicts.

Select **No** to confirm the selected conflicts manually while editing. No is the default.

#### Default dictionary for Power Define

[Power Defines](#) allow you to open a dialog box where you can write the steno and the text definition all from your writing machine. Case CATalyst defaults to placing Power Define entries in the current job dictionary or a case dictionary if working within a case. You can change the dictionary to which the Power Define dictionary defaults. From the drop down list, select an alternate dictionary. If you select Other, you must also select a location in the *Other Path* field.

### Other Path

This field is active when Other is selected in the *Default dictionary for Power Define* field. Click the Browse  button to locate the dictionary you want as the default when making Power Defines.

### Insert Oops FS after aborted Power Define Yes/No

By default, an <Oops 10> (CATalyst Inserted Oops category) is inserted into the transcript where the Power Define, Scan Define, Text Define or Create EZ Speakers was aborted. Any steno written into the Power Define, etc., dialogs will appear grayed out in vertical notes at the Oops location. For example, you open the Power Define dialog box to define the name of a company and suddenly they go back on the record so you abort the Power Define. When you go back to that section in the file, you will see the <Oops 10> format symbol in Reveal Codes and you will see any steno that you wrote in the Power Define dialog box before aborting it in Vertical Notes grayed out. You can scan, search or use the [Hotspots pane](#) to find all locations of the Oops 10 format symbol. Select No, to prevent the Oops 10 format symbol from being inserted when a Power Define, Scan Define, Text Define or Create EZ Speakers is aborted.

### Default Action for Scan Define

The Scan Define command scans back in the transcript to the last untranslate/untranslates, opens the [Power Define](#) dialog box with the steno in the Steno Field and the cursor in the Text field. You can quickly define or replace the steno from your writing machine. The option defaults to creating a Job Dictionary entry unless the job is in a case, then it defaults to the Case Dictionary. You can select the default action for the Scan Define to be Personal, Job or Case Dictionary or Replace Only. The Replace Only action will only change the current occurrence and will not global the action. For example, while writing realtime some reporters feel it is safer to replace mistranslates rather than define them to the job dictionary and decide later. If you are one of those reporters, you can simply make the default action for Scan Define to be a Replace. If during the proceedings, you want to J-define something, using the Power Define dictionary commands, you can always change the action for that one time.

### Scan Define stop on Untranslates plus

By default, the Scan Define realtime command scans back in the transcript to the last untranslate(s), opens the Power Define dialog box, puts the untranslated steno in the Steno field and positions the cursor in the Text field. If you would like the Scan Define command to also stop on Drag/Drop translations and/or [Suffix Drag/Phrase Maker](#) translations, select Yes in the respective option.

**Drag/Drop** translations include translations as a result of the [Drag/Drop Analysis](#) option and [TrueStroke Drag/Drop](#) translations. Drag/Drop Analysis and/or TrueStroke Drag/Drop options must be selected in the [Translate Input](#) tab.

**Suffix Drag** translation includes translations as the result of dragging or tucking a suffix in a single stroke steno outline. The [Suffix Drag/Phrase Maker](#) option must be selected in the [Translate Input](#) tab.

### Colloquy plus Answer plus Question = Auto By Line - Yes/No

This option is usually only applicable to the Texas format. Select **Yes** to have Case CATalyst translates Colloquy + A + Q into a By Line. Select **No** to turn this option off. The default is No.

This option is usually only applicable to the Texas format. For example, you have:

<Colloquy>MR. JONES: The witness can answer.

<Answer>Yes.

<Question>Did you...

Using the Texas format produces:

<Colloquy>MR. JONES: The witness can answer.

<Answer>Yes.

Q. (BY MR. SMITH):

To have the "Texas" format to work correctly, set the following Case CATalyst Translate options:

**Select:** *Colloquy + Q = Auto By Line*

**Deselect:** *Colloquy plus A= THE WITNESS*

### **Tuck punctuation with quoted words - Yes/No**

Select **Yes** to automatically have period, comma or 's (apostrophe s - defined in a dictionary) automatically placed inside a dictionary defined quoted word or phrase when punctuation is written after the quoted word/phrase. For example, let's say you have a dictionary definition for "Spider Man" (definition includes the quotes). You write: Let's go see "Spider Man" followed by a period. The result is: Let's go see "Spider Man."

You can change the default Edit display color assignment for automatic punctuation by using the Colors feature. In Edit select View/Display/Colors. In the drop down list, select Auto Punctuation and then select a color.

To have apostrophe s ('s) work with this option, you must have steno defined in a dictionary as 's without format symbols.

Select **No** to allow period, comma and apostrophe to remain where written. The default is No.

### **Analyze numbers in a series - Yes/No**

Select **Yes** to have numbers written in a row convert to digits if they are separated by one or more spaces, a comma, dash, slash or the word "and," "or," "through," "to," or "of." For example, when selecting Yes, the display 10 and under as words option would normally result in "two to four things," the result will now be "2 to 4 things" and if the automatic number conversion result would have been "Page 2 of four," the result will now be "Page 2 of 4."

Select **No** to prevent Case CATalyst from converting numbers as a series when you use the above words or punctuation as separators. Numbers in a series are translated as digits when you write digits or if the Otherwise Display as Digits option is selected. The Display 10 and Under as Words option does not apply to digits in a series. The default setting is Yes.

This feature works in conjunction with Automatic Number Conversion. The Automatic Number Conversion [option](#) must be selected in Translate Input options.

### **Number Triggers convert only when preceding a number - Yes/No**

Select **No**, the default, to have Number Trigger commands active for approximately three paragraphs after the Number Trigger is written. If Case CATalyst finds a number that matches the Number Trigger criteria within the following three paragraphs, the number converts according to the Number Trigger.

Select **Yes** to have Case CATalyst only apply the Number Trigger if a number, either word or digit, is written immediately after the Number Trigger stroke. Captioners may want to use this feature so the Number Trigger is applied immediately and removes the chance of a number changing later in the caption text.

### **Add missing comma after year in {Month} number conversion - Yes/No**

Select **Yes**, the default, to insert a comma after the year when using the {MONTH} rule with Automatic Number Conversion. For example, "July two 2009" converts to "July 2nd, 2009," with a comma after the year.

Select **No** to prevent Automatic Number Conversion from placing a comma after the year. For example, "July two 2009" converts to "July 2nd, 2009" without a comma after the year.

### Quick Tran filename format

Customize the [Quick Tran](#) file naming convention. The Quick Tran feature allows you to quick stop one realtime session and start a new realtime session without encountering any dialog boxes.

Position your cursor in the field on the right of the option and type the formula for Quick Tran filenames. The default file naming formula is: %Y%M%D\_%h%m%s. For example, 20091029\_104236.

Use any of the following format codes to customize the naming formula. You can also use spaces and underscores in the formula but should avoid using any characters that Windows recommends not to use in file names, such as \ / ? : \* " > < |.

If you add text to the formula, that text is included in each Quick Tran file name. For example, adding the word "Mattheson" to the formula, "Mattheson%Y%M%D\_%h%m%s" generates "Mattheson20091029\_104236". Mattheson is included all Quick Tran file names.

Quick Tran Filename Formatting Codes:

- %M = Month (2 digits)
- %D = Day (2 digits)
- %Y = Year (4 digits)
- %h = Hour (2 digits)
- %m = Minute (2 digits)
- %s = Seconds (2 digits)
- %# = Adds the next available number to the end of the file name.
- %a = Abbreviated weekday name (i.e. Mon)
- %A = Full weekday name (i.e. Monday)
- %b = Abbreviated month name (i.e. Nov)
- %B = Full month name (i.e. November)
- %C = Year with century (i.e. 2013)

### Phonetic untranslates display as words - Yes/No

Select **Yes** to phonetically translate single stroke untranslates during realtime using algorithmic logic to determine the intended pronunciation. Case CATalyst bases the logic on Stenograph Theory and the WinterTree Spell Check, Stedman's Medical and Black's Legal wordlists to create a word with the most accurate spelling of the phonetically sounded word. Phonetic translation applies when no dictionary match is found in any dictionary used for translation.

You can create an exclude file of words you do not want to phonetically translate when using the *Phonetic untranslates display as words* option. For example, you are reporting a meeting and displaying the realtime text via a projector and do not want to display inappropriate words. Using Windows Notepad or WordPad, list each word on a separate line or on single lines with a space between each word. The file must have the name, *phoneticexclude.txt*, and reside in your System Files case.

Select **No** to phonetically translate during realtime using the [Phonetic Table](#). Steno outlines that normally display as untranslates, translate phonetically based on the text equivalent entry in the table. No is the default.

### Example of CATalyst Phonetic Translation Methods

You write, SKWRAEUPLS, and are using the Phonetic Table. The translation is, "JAIMZ." When you use the Advanced Translate option, *Phonetic untranslates display as words*, the same steno outline translates as "James." In another example, you write, /PAEUPLT. The Phonetic Table translation is, "Payment." The algorithmic logic translation is, "payment."

You must select [Phonetic Translation](#) in Translate Options or use the [Toggle Phonetic Mode](#) during realtime to apply either method of phonetic translation methods during realtime. Phonetically translated words appear in the selected untranslate color. If your [Scan For Options](#) are set to stop on untranslates, then **F8 (Scan)** and **Shift + F8 (Scan Backward)** stop on phonetically translated words.

### **Digits attach to {Glue} Alphabet - Yes/No**

When set to Yes and CATalyst encounters alphabetic dictionary entries containing the {Glue} format symbol and undefined numbers either preceding or following the alphabetic character(s), CATalyst will attach the glued alphabet and the number(s). For example, let's say that you do not have your number bar numbers defined in your dictionary. You have W-FPLT defined in your dictionary as {Glue}W. You write /W-FPLT/2 and the result is W2. If you write 2/W-FPLT/3, the result is 2W3. If your {Glue} definition contains a hyphen or period, undefined numbers will also attach using the rule CATalyst has always used for {Glue} defines. So 2 followed by {Glue}-W would result in 2-W. The default setting is Yes.

### **Use Higher Level Case Dictionaries - Yes/No**

If you have a case within a case, select Yes to use the top level case dictionary and any subsequent case dictionaries when translating a steno file or writing realtime. The current case dictionary has the highest priority, the next case dictionary above the current case dictionary has the second highest priority, etc. The default setting is No.

### **Second Chance Drag/Drop - Yes/No**

This feature works in conjunction with Translate's Drag/Drop Analysis feature. When this option is set to Yes and the Drag/Drop Analysis option is selected, and at least one steno character is selected as either a dragged or dropped character, if during translation the result of the Drag/Drop Analysis would still result in an untranslate, the Second Chance Drag/Drop feature will apply other steno characters in a dragged/dropped situation to find a match. When this options is set to No, if the result of the Drag/Drop Analysis will still result in an untranslate, the system will not attempt to find any further matches and the steno will remain as an untranslate. NOTE: If selected, this option takes priority over Phonetic translation.

### **Force lowercase ordinal suffixes - Yes/No**

The *Force lowercase ordinal suffixes* option, by default, is set to No. If you are using the All Cap On format symbol to capitalize transcript text and you want ordinal suffixes (st, nd, rd, th) to be lower case, set this option to Yes. This option affects {Number Conversion}[\*Ordinal], {Number Trigger}[\*Ordinal] commands and selecting an ordinal conversion from Edit's Number Conversion dialog box.

### **Show audio codec warning when starting translation - Yes /No**

Select whether or not you want a warning message to display when starting realtime and your audio codec setting is higher than 159 MB/hr. By default, this option is set to Yes. If your audio codec setting is higher than 159 MB/hr, when you start realtime the following message displays:

*Audio WAV files may not exceed 2GB. Based on your audio codec selection you will exceed this limit after X hours of realtime recording. Do you wish to change your audio codec selection? Yes / No*

Select Yes to change your audio codec selection. If you have started translation, translation will be canceled and the Translate dialog box displays.

Select No to continue with translation knowing the realtime time audio file size limitation.

If you select the *I understand the consequences of my actions. Please stop asking.* option, this option will be set to No and the warning message will no longer be displayed when starting realtime.

The warning message is dynamic based on the audio recording selection you make. If you select the 231 MB/hr option, your realtime recording cannot exceed 9 hours. If you select the 318 MB/hr or 346 MB/hr option, your realtime recording cannot exceed 6 hours.

This option has no effect on the warning message that displays when selecting an audio codec in the Audio section of Translate's Realtime tab. If you select an audio codec higher than 159 MB/hr, the following message displays after clicking OK or Apply:

*Audio WAV files may not exceed 2GB. Based on your audio codec selection you will exceed this limit after X hours of realtime recording. Do you wish to change your audio codec selection? Yes / No*

### **Apply Personal Globals during translate**

The Personal Globals feature is a great way to have Case CATalyst automatically correct your common mistyped words while editing. Now, you can have Personal Globals apply during translation. For example, let's say you often mean to write "armed robbery," but end up writing "around robbery." With the *Apply Personal Globals during translate* option, you can have Case CATalyst automatically correct the occurrences of "around robbery" on-the-fly during translation. Correcting common grammar mistakes is also possible, such as writing "they're is" when you always want "there is." The *Apply Personal Globals during translate* option can be used when translating an existing steno file or when writing realtime.

Select Yes to have Case CATalyst apply your Personal Globals when translating an existing steno file or when writing realtime.

Select No to not have Case CATalyst apply your Personal Globals when translating an existing steno file or when writing realtime.

### **Load Alternate User Settings when Realtime Tran Starts**

You may want different settings to apply when you are writing realtime than when you are editing a transcript. For example, you may not want audio to begin playing automatically when clicking on an Oops or Untranslate in the Hotspots pane during realtime.

To use the Load Alternate User Settings when Realtime Tran Starts option, click the down arrow ▼ to the right and then select the settings file you would like to load automatically when translation starts.

### **Load Alternate User Settings when Tran ends**

You may want different settings to apply when you end realtime writing and begin editing a transcript. For example, when you press Ctrl + \ to end realtime or press end on your writing machine.

To use the Load Alternate User Settings when Tran ends option, click the down arrow ▼ to the right and then select the settings file you would like to load automatically when translation ends.

## **Edit**

Several Edit options allow you to determine settings that affect Case CATalyst features used while editing. These options include:

- [Auto Recover/Auto Save](#)
- [Advanced Edit](#)
- [Advanced Global](#)
- [Transcript Spell Check](#) and [Advanced Transcript Spell Check](#)

- [Include](#)
- [Field](#)
- [Word Definition](#)
- [QuickFix Prefix](#) and [QuickFix Suffix](#)
- [Brief It](#)
- [Contraction Rules](#)

### Auto Recover/Auto Save

The [Auto Recover Options](#), Auto Recover and Auto Save automatically save the current transcript at specified timed intervals. If you are editing a dictionary or using the Dictionary Build feature, Auto Recover and Auto Save will save the current dictionary also. Auto Recover, active by default, saves the changes to a temporary file (transcript or dictionary) at the specific time increment. The temporary file is used only if you exit the file abnormally. Auto Save saves the changes directly to the current file at the specified time increment but does not create a temporary file. Review the Auto Recover and Auto Save details. Selecting neither option, Auto Recover or Auto Save feature for transcripts, means no transcript or dictionary recover file will be created. Stenograph recommends using one of these automatic file saving features. For the last 10 saved files, see the [Recently Saved Files](#) dialog box.

These settings affect both regular CATalyst translation and CATalyst BCS captioning and all dictionaries.

### Auto Recover

Auto Recover, active by default and set for 30 seconds, automatically saves the text portion of the open job or the dictionary to a temporary file at specified time intervals. Normally, when you exit Edit or a dictionary using the Close or Exit command, Case CATalyst prompts you with a message when any unsaved changes exist. You then choose to save the changes or exit without saving. With the Auto Recover feature selected, the recovered file is available if you exit a job/dictionary in an abnormal way, such as turning off the computer with open files, rebooting the system with open files, a Windows update running unexpectedly or experiencing a General Protection Fault (GPF). (Also see AutoArchive option below.)

When Edit/Manage Dictionary abnormally terminates, Auto Recover saves the temporary file using the original file name plus a number. Auto Recover automatically assigns a number using a sequential order. For example, you have the Anderson 122012 job open when the electricity fluctuates causing your computer to reboot. You made changes to the file but you did not save the most recent changes. When you open Case CATalyst, the Auto Recover file displays in Manage Jobs as Anderson 122012 (1).sgnjl.sav. If the same file abnormally closes a second time, the Auto Recover file name is Anderson 122012 (2).sgnjl.sav, unless you renamed the first recovered file. Then Auto Recover uses number one.

**To open the file with the most recently saved changes, simply double click the original transcript/dictionary name.** CATalyst opens the most recent recovered file and names it the original file name, renames the original file to filename\_Original#.sgnjl (# in the file name is for a unique name if necessary) and allows you to continue editing in the most recently saved changes file with all the associated subfiles. The following message displays when this process is successful:

Transcript successfully recovered. Press **Enter** to continue editing in your recovered file.

Old file location: *path for the renamed original file*

or

Dictionary successfully recovered. Press Enter to continue editing in your recovered file.  
Old file location: *path for the renamed original file*

If for some reason the CATalyst renaming function takes too long or the auto recovered file cannot be renamed, the following message displays:

Your file was successfully recovered but we are unable to complete the renaming process due to an error. (The description of the error follows.)

Press Enter to open your original transcript. Click Cancel to correct the issue and try again. The recovered file location: *path for the renamed recovered file*.

The AutoArchive case is created when the AutoArchive option is selected along with the [Auto Recover](#) feature and the first time Case CATalyst prompts you to save changes upon exiting a Case CATalyst text file (transcript or caption file) or dictionary. CATalyst automatically saves up to four copy of the temporary transcript/caption file (.sgngl) or dictionary (.sgdct) to the AutoArchive case when you select an action (Yes or No to save the changes) at the Save Changes prompt upon exiting Edit or Manage Dictionary. The Auto Recover option, [Keep Auto Recover Files in Archive](#), must be active to use the AutoArchive case. If you do not use the AutoArchive case, selecting No at the Save Changes prompt results in losing all **unsaved** changes in the transcript. See [AutoArchive Case](#) for more details on recovering a file that is in the AutoArchive case.

## Auto Save

Auto Save, when active, automatically saves changes to the open job/dictionary at timed intervals set in [Auto Recover Options](#). When you select Auto Save, you can also select the Archive File upon Close option to save a copy of the file in the [AutoArchive case](#). If you exit the file abnormally, you will reopen the same file or check the AutoArchive case for a copy of the file in its current form if using the Archive File on Close option. Changes made up to the point of the last save are retained. Since changes are saved to the same file, there may be times when you select to exit a file/dictionary and you are not prompted to save changes because an automatic save was performed.

## Auto Recover/Save Options

Translate and Edit's Auto Recover feature, automatically saves transcript or dictionary changes to a temporary file every 30 seconds, by default, or whatever time increment you have selected. If you exit the transcript or dictionary abnormally (such as a crash or power outage), there will be an auto recovered copy of the transcript or dictionary in Manage Jobs. Simply double click the original dictionary name to open the recovered dictionary. Auto Recover Options determine whether or not Case CATalyst automatically creates a temporary file (text and/or dictionary) and makes a copy in the AutoArchive case if the option is selected. [Auto Save](#) saves the changes to the open transcript or dictionary every X seconds based on the time increment you have selected. No temporary file is created when using the Auto Save option. These settings affect both regular CATalyst translation and CATalyst BCS captioning. By default, the Auto Recover option is selected and set to 30 seconds.

Please note, if you do not use the Auto Recover or Auto Save feature for transcripts, no dictionary recover file will be created.

### You can access Auto Recover/Auto Save options:

- from Manage Jobs. Press **Alt + t, o, e, r** (Tools, Options, Edit, Auto Recover).
- from Manage Jobs. Press **Alt + t**, click **All Options**, navigate to the **Edit** section and click **Auto Recover**. (Tools, All Options, navigate to the Edit section, Auto Recover).

- from the Standard toolbar, click the **All Options** icon (  ), navigate to the **Edit** section and click **Auto Recover**.
- from Edit. Press **Alt + t, o, r** (**Tools, Options, Auto Recover**).

### Auto Recover/Auto Save Options

Make necessary entries. When finished, select **OK**.

#### Use Auto

Check this box to activate the Auto Recover or Auto Save option. You can only select one of the options to be active at a time. Click the option you want to use.

#### Recover

Automatically save the transcript or dictionary to a temporary file at the specified interval. From the drop down list, select the frequency at which you want to automatically save the transcript or dictionary to the temporary file. If you exit the Edit file or dictionary abnormally, a recovered file is created with the most recent saved changes. To open the file with the most recently saved changes, simply double click the original transcript or dictionary file name. CATalyst opens the most recent recovered file and names it the original file name, renames the original file to filename\_Original#.sgnlg (# in the file name is for a unique name if necessary) and allows you to continue editing in the most recently saved changes transcript or dictionary file with all the associated subfiles. The following message displays when this process is successful:  
Transcript or Dictionary successfully recovered. Press Enter to continue editing in your recovered file.

Old file location: *path for the renamed original file*

For example, you have Auto Recover active, you are editing the Smith vs Jones 12-16-12 file and the power goes out. Twenty minutes later, you start Case CATalyst, you see the original file, Smith vs Jones 12-16-12 and you double click it. In the background, CATalyst renames the Smith vs Jones 12-16-12 (1) file to be Smith vs Jones 12-16-12 and renames the Smith vs Jones 12-16-12 to Smith vs Jones 12-16-12\_Original1. As a result, the Smith vs Jones 12-16-12 file with the most changes is opened and you can begin editing as usual (with all existing subfiles since you are continuing with the same original name).

If for some reason the CATalyst renaming function takes too long or the auto recovered file cannot be renamed, the following message displays:

Your file was successfully recovered but we are unable to complete the renaming process due to an error *error description*.

Press Enter to open your original transcript. Click Cancel to correct the issue and try again. The recovered file location: *path for the renamed recovered file*.

#### Keep Auto Recover Files in Archive

When Use Auto Recover is selected, check this box to automatically save up to four copies of the transcript or dictionary file when you select an action at the Save Changes dialog box upon exiting a file. Case CATalyst automatically stores up to four copies of the transcript subfile (.sgnlg) or dictionary (.sgnlg) in the [AutoArchive](#) case when you select an action at the Save Changes prompt upon exiting Edit or Manage Dictionary. The AutoArchive case is created the first time you are prompted to save changes as you exit a file. Copies of the transcript subfile (.sgnlg) or dictionary subfile (.sgdct) are the only files saved.

Uncheck this box to not make a copy of the temporary file when you select an action at the Save Changes prompt. When you select No at the Save Changes prompt, all unsaved changes in the transcript/dictionary are lost.

For detailed instructions on recovering a transcript or dictionary from the AutoArchive Case, see the [AutoArchive Case](#) topic.

## Save

Automatically save changes to the transcript file at the specified interval but does not auto save a dictionary. If editing a dictionary and your option is Auto Save, if there is an abnormal exit, a recovery file is created. From the drop down list, select the frequency at which you want to automatically save the transcript. Changes are saved to the same file at the timed intervals. If you exit the file abnormally, reopen the same file. Since changes are saved to the same transcript file, there may be times when you select to exit a transcript file and you are not prompted to save changes because an automatic save was performed. If a lot of changes were made to the transcript file, you will not be able to exit without saving to "undo" all the changes.

## Archive File on Close

If you select Auto Save and select the Archive File on Close option, when you close a transcript or dictionary, a copy of the file will be saved in the AutoArchive case whether you selected to save or not save the file upon closing.

## AutoArchive Case

The AutoArchive case is created when the AutoArchive option is selected along with the [Auto Recover](#) feature and the first time Case CATalyst prompts you to save changes upon exiting a Case CATalyst text file (transcript or caption file) or dictionary. CATalyst automatically saves up to four copy of the temporary transcript/caption file (.sgngl) or dictionary (.sgdct) to the AutoArchive case when you select an action (Yes or No to save the changes) at the Save Changes prompt upon exiting Edit or Manage Dictionary. The Auto Recover option, [Keep Auto Recover Files in Archive](#), must be active to use the AutoArchive case. If you do not use the AutoArchive case, selecting No at the Save Changes prompt results in losing all **unsaved** changes in the transcript.

In addition to getting the \*.sgngl or \*.sgdct file saved in the AutoArchive case when you Save, Close or Save As a file, you could also have up to three additional copies of the file. If you have an issue with your original file, you can look at the copies of the file in the AutoArchive case and select "Recover" on the copy of the file you want to recover. Once you recover the file, you are placed in the newly recovered file and you can continue editing. In the AutoArchive case, when you highlight a job/dictionary, Job Details may display Archived text\_1, Archived text\_2, Archive text\_3 or Archived dictionary\_1, Archived dictionary\_2, Archive dictionary \_3 (depending on the number of copies of the file). Every time you open a file and make changes, up to the last four copies of the file will be saved in the AutoArchive case. You can look at the archived files and select "recover" on the copy of the file you want to recover. Once you confirm you want to recover the file, you are editing the newly recovered file and you can continue editing.

For example, let's say you just wrote a file named 051617 and saved and exited the file.

- In the AutoArchive case, there is a file named 051617 that matches the file named 051617 in the root of your user as long as there was time for auto recover to save the last changes you made before closing the file.
- You open 051617 and start editing. After a couple of hours, you save and close the 051617 file. In the AutoArchive case, you will find the file named 051617 and in the Job Details pane an Archived Text\_1 subfile.

- The next day, you open 051617 again to finish editing it and you edit for an hour or so and save and close the file. In the AutoArchive case, you will see the text file named 051617, along with Archived Text\_1, Archived Text \_2 Text subfiles in Job Details.
- Finally, you open the 051617 file for the last time, make a couple of minor changes and save and close the file. In the AutoArchive case Job Details pane, you will see 051617, along with Archived Text\_1, Archived Text \_2, Archived Text\_3 Text subfiles.  
If you show subfiles, you will see 051617.sgngl, 051617.sgngl\_A1, 051617.sgngl\_A2 and 051617.sgngl\_A3.
- When you double click the text file (which will always be the most recent copy of the file) or any of the additional text subfiles while you are in the AutoArchive case, a message displays with information as to how recent this copy of the file is:

(The “You are opening...” messages are dynamic and automatically adjust the wording whether you are opening the only version of the file that exists, the oldest archived copy or the most recent of two files.)

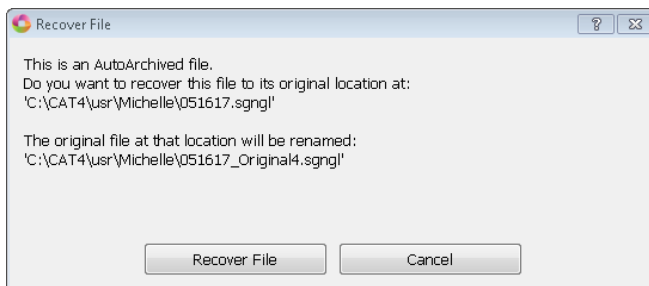

The archived file subfiles are always being renamed/renumbered so that the file with the .sgngl extension is always the most recent, the Archived Text \_1 subfile is always the next most recent copy and continuing with the Archived Text\_3 subfile always the oldest copy. The number of Archived Text subfiles depends on the number of times the file was opened, modified and closed with a maximum of four most recent copies of the file.

When you open a file in the AutoArchive case, the following dialog box displays:

If this is the file you want to salvage and place in the original location of the file, click the **Click to Recover to its Original Location** button.

The Recover File confirmation dialog box displays.

Do one of the following:

- Click **Recover File** to recover the file to its original location in your user and have the original file renamed with the file name followed by underscore Original (051617\_Original). This is the recommended action.
- Click Cancel to cancel the recovery process.

When you select **Recover File**, the following message displays:

When you click **OK**, the **file is recovered to its original location and you are automatically moved into the newly recovered file so you can start editing the file in its original location.** Depending on how you accessed the AutoArchive case, when you close the recovered file, your view may be in the AutoArchive case. To return to the recovered file, follow the path listed in the dialog which is the original location of the file.

In addition to saving extra copies of your files, CATalyst now goes even further in saving to the AutoArchive case by saving copies of CATalyst files you open or save outside of the current user. Any time you are editing a file in your user, regardless of where it originated or if you did a Save As to an outside location, CATalyst 's Auto Archive feature will save copies of that file in the current user's AutoArchive case and place the files in a Recovered External Files case within the AutoArchive case. If you click the 161108 file name, the following message displays stating that you are opening a file in the AutoArchive Case and displays what copy it is of the archived copies of this file. If you open the file, the following dialog box displays:

If this is the file you want to salvage, because this file originated outside of your user, the file will be recovered to a case in your user called Recovered External Files. When you click the **Click to Recover to its Original Location** button. The following dialog box displays:

If you select Recover File, a Recovered External Files case is created at the root of your user (Michelle) and the 161108 will be there. If you select Cancel, you are returned to the open file.

If you selected **Recover File**, a message displays:

When you click **OK**, the file is recovered to the **Recovered External Files** case in your user and you are automatically moved into the newly recovered file so you can start editing the file in its original location. Depending on how you accessed the AutoArchive case, when you close the recovered file, your view may be in the AutoArchive case. To return to the recovered file, go to the Recovered External Files case in the root of your user.

### Advanced Edit Options

Advanced Edit Options determine certain Edit settings. You can access Advanced Edit Options:

- in Manage Jobs. Press **Alt + t, o, e, a** (**Tools, Options, Edit, Advanced Edit**).
- in Edit. Press **Alt + t, o, a** (**Tools, Options, Advanced Edit**).

### Advanced Edit Options

To make a change, click an option. Depending on the field, make a selection from the drop down box, type an entry or use the Browse button. When finished with your changes, select **OK**.

The *Restore Default Settings* option returns all the Advanced Edit Options to their original Case CATalyst default selection.

#### Search feature "restart from top" defaults to Yes

Set the default action for the cursor focus in the Search prompt, "Would you like to restart from the top of the document?" When Case CATalyst reaches the end of Edit file while performing a search, the prompt displays.

Select **Yes** to have the cursor focus on the Yes option in this dialog box. Pressing Enter continues the Search at the beginning of the file. Select **No** to have the cursor focus on the No option in this dialog box. Pressing Enter ends the Search. You can always click a choice when the prompt displays.

#### Retain Steno when pasting

Select to include underlying steno or use only the text when cutting or copying text in Edit. If you need the timestamps for cut or copied text, include the underlying steno to retain the timestamps.

The Case CATalyst default includes the underlying steno with the cut or copied text. Select **Yes** to include the underlying steno; **No** to not include the steno; or **Ask** to have Case CATalyst automatically prompt to include the underlying steno.

#### Default Internet search engine

Specify the Internet Search engine when using the [Internet Search](#) command. The Edit, Internet Search feature allows you to search the Internet for a word or series of words you highlight in the job.

Select a search engine from the drop down list. The list contains popular search engines and includes the Default IE Search Engine. The default uses the search engine specified in your Windows Registry. If Case CATalyst cannot locate the registry information, Google is used. International customers will likely want to select, Default IE Search Engine.

## Definition Search

Specify the search engine to use with the [Definition Search](#) command in Edit.

## Surround search phrase with quotes

Surround words and phrases with quotes for an Internet or Definition search. When using the Edit, [Internet Search](#) or [Definition Search](#) feature, Case CATalyst automatically surrounds the words in the Search field of the Search engine in quotes. Case CATalyst considers all the words together, narrowing the search.

Select **Yes** to use quotes. Select **No** to have words considered individually for the Internet Search. This broadens the scope of the search, increasing the possibility of identifying sites that contain only one of the words. The default is Yes.

## Keyboard Map Options

### Default Keyboard map

Select the [keyboard map](#) that is active when Translate and Edit and Edit starts. Case CATalyst comes with the Default and CAT4 keyboard maps located in your System Files case. The Default keyboard map is not initially visible in the System Files case until it is opened by typing *default* in the File name field. You can create multiple keyboard maps.

The default setting uses the Case CATalyst Default keyboard map. Choose a keyboard map from the drop down list which displays customized keyboard maps located in your User System Files case. Use the Browse button to locate a keyboard map in outside your System Files case. For example, you are a scopist and work for six reporters. You use a customized a keyboard map, named MY KBD and want it active in every user. You open the Advanced Edit Options for each user and select the MY KBD keyboard map using the Browse button. When you make a change to the keyboard map, the change is available in all users.

### Additionally Display Keyboard Maps located in

Select a keyboard map outside of your System Files case to add to the list of available keyboard maps while Editing. Available keyboard maps are accessible when using the *Change Keyboard Map* command and when you click the current keyboard map name on the Status bar in Edit.

Use the Browse button to add keyboard maps located outside of your System Files case. The path for the selected keyboard map displays in the field. For example, you have multiple users on your system. In your user name, you have several specialty keyboard maps and want them readily available when editing in your other users. Select your user System Files case as the location of the keyboard maps. The Keyboard Maps list display.

### Keyboard to open when assigning recorded macros

When saving a recorded [macro](#) and the *Assign to key in keyboard map* option is active, you are immediately prompted to select a keyboard map for the macro's key combination assignment. If you always assign macros to the same keyboard map, you can designate a keyboard map to automatically open.

Choose a keyboard map from the drop down list which contains customized keyboard maps located in your System Files case. Use the **Browse** button to locate a keyboard map outside of your System Files case. For example, you have multiple user on your system and want to select a keyboard map from another user.

## Words to suppress capping when found in middle of phrase

Case CATalyst comes with a default list of articles and conjunctions to leave lower cased when using the Edit Cap/[Uncap](#) feature, the Cap command in a Global dialog box and the [Cap Previous](#) translation commands. You can specify articles or conjunctions that Case CATalyst should not initial cap when they occur in between a series of words that are initial capitalized, such as United States of America, State of the Union or Halls of the Senate. Case CATalyst does initial cap the article or conjunction when it occurs at the beginning of a phrase such as The Main Store.

Click the  button to display the Capitalization dialog box which contains the list of words Case CATalyst does not capitalize when using the Edit Cap/Uncap feature, the Cap command in a Global dialog box and the Cap Previous translation commands. To add a word to the list, click the New  button and type the entry in the field that displays. To remove a word from the list, highlight the word and click the Delete  button. Press **Enter (OK)** when finished to save the changes.

### Stitch characters in cycle order

Customize the character selection and cycle order of characters that separate characters when using the [Stitch](#) command. Type the punctuation in the order you want it to cycle when using the Stitch command. The default characters are hyphen, space and period.

### Stitch Spaces

The Stitch Spaces option allows you to select how a "space" is handled if a "space" is part of your Stitch characters in cycle order options. The available options apply to the "space" in your cycle order of the stitch command. Three options on handling a space are available and explained below:

- **<Sticky Space> and regular space** which means a <Sticky Space> format symbol will be inserted between the characters/words and if you cycle again, a regular space (no format symbols) will be inserted between the characters/words.
- **regular space** which means a "regular space" (no format symbols) will be inserted between the characters/words.

The default setting for the Stitch Spaces option is <Sticky Space>.

### Include Delete Space

The Include Delete Space option is the second option available for the Stitch command. If this option is set to Yes, then the very last cycle of the Stitch command will insert a <Delete Space> format symbol between the characters/words. For example, during the testimony the witness refers to WITC and it translates as W I T C. During editing you highlight W I T C and if a <Delete Space> was at the end of the stitch cycle, then the result would be WITC and Reveal Codes would show W<Delete Space>I<Delete Space>T<Delete Space>C.

The default setting for Include Delete Space option is No

### Hide Caption-specific format symbols

Caption specific format symbols are included in the Case CATalyst format symbol list. You can hide the captioning format symbols to reduce the number of format symbols in the list. If you are not using the CATalyst BCS optional software, selecting to hide the captioning format symbols hides the captioning format symbols in both the Edit and Dictionary format symbol list. If you are using CATalyst BCS and select to hide the captioning format symbols, the captioning format symbols are hidden in the Edit format symbol list but continue to display in the Dictionary format symbols list.

### Redacted text displays as

Select the appearance of [redacted](#) transcript text in Edit and Print, including PDF format. Redaction eliminates the display of sensitive text such as social security numbers but retains the integrity of the transcript. In other words, a transcript with redacted text matches line for line with the same transcript where there isn't redacted text. The Case CATalyst default is Black rectangle. From the drop down list, choose **Black rectangle**, **White space**, **Lines** and **X's**.

#### **Remember last folder used for Save As**

Select **Yes**, the default, to have Case CATalyst remember the last folder in which you saved a file using the Save As function. Select **No** to use the folder location of the current file.

#### **Stop audio when dialog opens**

Select **Yes** to suspend the audio playback while a dialog box is open and automatically resume playback when the dialog box closes. Select **No**, the default, to have the audio play continuously, regardless of an open dialog box, until you use the Stop Audio command.

#### **Play Audio command starts/stops audio playback:**

Select **Yes** to press one key to play the audio and the same key to stop the audio playback. You can use the Play Audio keyboard map function, menu item or play audio icon to toggle between playing audio and stopping audio. The default setting for this option is No.

#### **Cat Scratch scope**

Determine the availability of information in the Cat Scratch dialog pane. Choose one of the following:

##### **Case**

Items in the Cat Scratch pane are available for any job related to the case and the information is stored in the Case History. The default scope setting is Case. When the job is not in a case, the CAT Scratch information is available in the job and Case CATalyst creates a Username\_Case file.

##### **Job**

Items in the Cat Scratch pane are available for that job and the information is stored in the Job History.

##### **User**

Items in the Cat Scratch pane are available for any job in the current user and the information is stored in the User History, System Files\_Case.

#### **Detect Caps Lock**

Select **Yes** to automatically turn Off Caps Lock and correct the typed word when it results with the initial letter lower case and the remaining letters upper case. This feature applies to text typed in the body of the transcript and in the Text field of dialog boxes. For example, the Caps Lock is On and you type, "rOBERT." Case CATalyst automatically corrects the word, changing it to "Robert" and turns Caps Lock Off. This setting applies to editing captioning files if you have BCS on your e-key.

#### **Autolink after selecting attachment**

Select **Yes** to automatically link exhibit references and attachments to multiple locations in the transcript. The [Autolink Exhibits](#) dialog box displays after selecting an attachment which contains Autolinked exhibit information.

Select **No** to not Autolink the attachment. The Autolink Exhibits dialog box does not display. You can [manually link](#) the attachment at a later time if necessary.

#### **Match ending punctuation with inserted style**

Select **Yes** to change the current ending paragraph punctuation to match that of inserted or globalled paragraph style. Select **No** to retain the current ending paragraph punctuation regardless of the paragraph style of the inserted or globalled text. The default is Yes.

### Use Enhanced Smart Punctuation

A Use Enhanced Smart Punctuation option has been added to the Advanced Edit options. When set to Yes, you are able to remove existing punctuation by typing the same Smart punctuation while continuing to be able to add or modify punctuation by typing the desired punctuation. Regardless of your cursor position, the action will take place at the end of a word and never in the middle. **This option may work best for those users that have transitioned from a previous CAT system that allowed you type the same punctuation to insert or remove it.** The default setting is set to No.

[Smart Punctuation](#) is designed to help reduce steps when typing and removing certain punctuation. When you press the selected keyboard command, Case CATalyst inserts the punctuation, preset spacing, and when appropriate, capitalizes the next word. Case CATalyst inserts only the amount of spaces needed for the selected punctuation. For example, the default Smart Punctuation setting for a period inserts two spaces after the period.

If the *Use Enhanced Smart Punctuation* option is selected, the following is an example of how it affects Smart Punctuation. For example, let's use the sentence: I believe so, yes, it was a home improvement store.

If your cursor is positioned immediately after the comma following the word 'yes' or immediately before the 'i' in the word "it", and you press comma (,) the results is: I believe so, yes it was a home improvement store. (The comma after the word "yes" is removed.)

If your cursor is positioned **in** the word "yes" and you type a period (.), then the result is: I believe so, yes. It was a home improvement store. (The comma after the word "yes" is replaced by the period, a space is added and the 'i' in "it" is initial capped.)

To get the desired results with the Use Enhanced Smart Punctuation option, the option needs to be set to Yes and the punctuation you want to use needs to be assigned to "Smart" punctuation in the keyboard map being used. For example, period (.) needs to be assigned to Smart Period, question mark (?) needs to be assigned to Smart Question, etc.

#### Valid punctuation:

- Period
- Question mark
- Comma
- Semi colon
- Colon
- Exclamation mark

**NOTE:** If this option is set to Yes and you need to add punctuation in the middle of a word, you will need to use another method such as the Insert dialog box or switching to a keyboard map where the punctuation is not assigned to Smart Punctuation. In other words, the punctuation mark is defined as the punctuation and not Smart Period, Smart Question, etc.

When this option is set to Yes and you are typing into the cells of a table, make sure there is a new paragraph format symbol following the table.

### Reporter's dash removes punctuation

Reporter's Dash removes punctuation option, when set to Yes, means the Reporter's Dash (Ctrl + / by default) when inserted immediately after a question mark, period, comma, colon, semi colon or exclamation mark, the punctuation will be removed and the first letter of the word following is lower cased.

If you change the setting to No, when inserting the Reporter's Dash immediately after a question mark, period, comma, colon, semi colon, or exclamation mark ending, the dash will be inserted, the punctuation will **not** be removed and the initial letter of the word following the dash, if appropriate, will be lower cased. This setting also applies to the Surround with dash (Ctrl + = by default) command when there is punctuation. If the option is set to Yes, punctuation will be deleted. If the option is set to No, the punctuation will not be deleted. See examples below.

For example, let's say the questioner is asking a question and pauses long enough for the reporter to think the question is over, so the reporter writes a question mark but then immediately the questioner continues but with a change of subject. The following sentence is in the transcript:

Q. And there's what's her last name? She's 43.

If the *Reporter's Dash removes punctuation* option is set to Yes and you positioned your cursor before the "s" in She and pressed Ctrl + /, the result is:

Q. And there's what's her last name -- she's 43.

If you highlighted 'what's her last name?' and pressed Ctrl + =, the result would be:

Q. And there's -- what's her last name -- she's 43.

If the *Reporter's Dash removes punctuation* option is set to No and you position your cursor before the "s" in She and press Ctrl + /, the result is:

Q. And there's what's her last name? -- she's 43.

If you highlighted 'what's her last name?' and pressed Ctrl + =, the result would be:

Q. And there's -- what's her last name? -- she's 43.

**Note:** If you positioned your cursor after a colon (:) with two spaces and pressed Ctrl + /, the Reporter's Dash would be inserted and the colon will not be removed. If you positioned your cursor after a colon (:) followed by one space and press Ctrl + /, the Reporter's Dash would be inserted and the colon will be removed. The setting of this option has no affect on how the Reporter's Dash works when used after a colon.

### Cursor location after Inserting Text

When Before is selected (default setting) when you use the Insert Conflict/Text command (**Alt + e, i c**) while editing, once you type the text in the Insert Conflict/Text dialog box and press Enter, the conflict/text is inserted and your cursor is positioned **before the text you just inserted**. For example, let's say you open the Insert Conflict/Text dialog box, insert <Colloquy><Bold On>THE REPORTER: <Bold Off> and press Enter. By default, the cursor is positioned immediately before the <Colloquy>. If you find that the majority of the time you insert plain text using the Insert Conflict/Text command, you may want to always position the cursor after the inserted text. Select After to have the cursor positioned after the inserted conflict or text. Select one of the following:

- **After** to have the cursor positioned after the inserted text when using the Insert Conflict/Text command.
- **Before** to have the cursor positioned before the inserted text when using the Insert Conflict/Text command. This is the default setting.

### Index Placeholder Assignments

Index Placeholder Assignments allow you to create text and assign an index category to that text for situations that where the part of the text varies (where you might create a conflict) and is also indexed based on the selection. For example, if you need to mark exhibits by party (State's, Plaintiffs, Defendant's, etc.), you might want to use an [Index Placeholder Text format symbol](#) so you can pick the party name from the list and automatically have the correct indexing format symbols automatically inserted. The Index Placeholder format symbol is not limited to exhibits, some reporters use it in the sworn statement when it states that the witness is appearing on behalf of the State, Plaintiff, Defendant, etc.

The selected Index Placeholder text will apply to multiple adjacent paragraph styles of the same type including Continuation paragraph styles and New Line (not New Line Paragraph) that contain the Index Placeholder Text # format symbol. All other paragraph styles prevent the selection from automatically changing Index Placeholders in subsequent paragraphs. Adjacent paragraphs applies to the direction you are scanning. In other words, if you are scanning forward, the adjacent paragraphs are the paragraphs following the current paragraph. If you are scanning backwards, the adjacent paragraphs are before the current paragraph.

Click the [+] sign next to one of the nine Placeholder Index fields. Make necessary entries. You can have up to nine replacement names as indicated by the number in each Placeholder Index field.

### Placeholder Index (1 - 9)

Select the index category to assign to the Placeholder text. For example, the first category of exhibits you mark is Plaintiff's exhibits and you typically use Index Heading On B and Index On B with Plaintiff's exhibits. Select B as the category.

If you assign an indexing category, Case CATalyst automatically assigns the category to the Index Heading # or Index # format symbols when you insert the replacement name into the job.

If you do not use automatic indexing, select None from the list. Assigning a category is optional.

### Placeholder Text (1 - 9)

Double click or click the **Browse** button in the field next to Placeholder Text. The Enter Placeholder Text dialog box displays. Make necessary entries and then press **Enter (OK)**.

#### Text

Type the name of the placeholder text, e.g. Plaintiff's.

#### FS

Display the list of available [format symbols](#). To always display the format symbol list, check the box, Always Show Format Symbols. Double click the format symbol to insert. You can insert a format symbol at any point in the *Text* entry.

#### Insert Field

Display the [Insert Field](#) dialog box from which you can select a field to insert into the *Text*.

## Global Options - Advanced

Advanced Global Options determine the selection of certain settings used when making defines in Edit. These settings affect both regular CATalyst translation and CATalyst BCS captioning. You can access Advanced Global Options:

- in Manage Jobs. Press **Alt + t, o, e, g (Tools/Options/Edit/Global)**.
- in Edit. Press **Alt + t, o, g (Tools/Options/Global)**.
- in Edit. Press **Alt + t, o, g (Tools/Options/Intuitive Replace)**.

- in Edit from the Global Define dialog box. Select **Options**.

## Intuitive Replace Options

To make a change, click an option. Depending on the field, make a selection from the drop down box or type an entry. When finished with your changes, select **OK**. The *Restore Default Settings* option returns all the settings in the Advanced Global Options dialog box to their original default selection.

### Intuitive Replace Active in    **Replace and all defines**    **Only in Replace**    **Disabled**

Determine when Intuitive Replace suggests a word when you Replace or Define words in Edit. Suggestions are based on previous replacements and defines. Choose one of the following:

#### **Replace and all Defines**

Suggest a replacement word in the New Text field of the Global Define dialog box for a Replace or any type of define.

#### **Only in Replace**

Suggest a replacement word in the New Text field of the Global Define dialog box for Replace only.

#### **Disabled**

Make no suggestions for the text in the Old Text field of the Global Define dialog box.

### Intuitive Replace shows suggestions only if old text was previously replaced    **Yes** **No**

Select **Yes** to suggest a replacement word in the New Text field only if the word was previously replaced. Select **No** to not have suggested replacement words. You can toggle through previous replacements by pressing Ctrl + r with the cursor in the New Text field.

### If New Text is empty, show currently selected text    **Yes** **No**

If you have text selected (marked) and based on your Intuitive Replace options, the field would be empty, selecting Yes would put the currently selected text in the *New Text* field. If you want the New Text field to remain empty and not be populated by the selected text, select No. The default setting for this option is No.

### Scope of Intuitive Replace    **User/ Case/ Job**

Determine when to apply the replacement for Intuitive Replace. Select one:

#### **User**

Intuitive Replace is active in all jobs, remembering and suggesting all replacements made in any User job.

#### **Case**

Intuitive Replace is active across jobs in a case, remembering and suggesting all for jobs in the same case. When Case is selected and you are editing jobs that are not in an existing case, Intuitive Replace treats the scope as a User. A new case with the User name, *username\_Case.ini*, is created to store the Intuitive Replace information.

#### **Job**

Intuitive Replace is active only for the current job, remembering and suggesting replacements for the open job.

### Expiration (in months)

Designate the number of months that eligible Intuitive Replace entries must remain unused before identified as expired and automatically deleted. The expiration timer for an entry starts from the time the entry was last used.

The scope of an Intuitive Replace entry determines eligibility. All entries with an Intuitive Replace scope of *User* are deleted. Expiration does not apply to entries with a scope of *Job* or with a scope of *Case* when the entry is located in a Case. If an entry with a scope of *Case* is not located in a Case, then expiration applies. For example, the scope for an entry is set to Case. You do not create a Case for the *Anderson040511* job and Edit without one. Since no Case exists, the Intuitive Replace entries are not placed in a Case and the expiration applies.

### Control + R displays last number of replacements 10

Pressing Ctrl + r cycles through the last text replacements when the cursor is in the *New Text* field of the Global dialog box. The default cycles through the last 10 text replacement. To change the number of replacements, type a number.

Intuitive Replace remembers the last three replacements for the same word and adds them to the replacement cycle before other replacement cycle words. For example, Intuitive Replace remembers the words "too," "to" and "tote" for the word "to" and displays them before other words in the cycle list.

## Advanced Global Options

To make a change, click an option. Depending on the field, select a choice from the drop down box or type an entry. When finished with all your changes, select **OK**. The *Restore Default Settings* option returns all the settings in the Advanced Global Options dialog box to their original default selection.

### Apply dictionary defines to included text

Select **Yes** to have all the Global Table's D, J, and K-defines apply to included, appended, multi-file appended and merged text. The globals apply from the point of the include, appended or merge text to the end of the file. E-defines (which are not dictionary definitions) always apply to included, appended, multi-file appended and merged text regardless of the status of the "Apply E-defines to typed-in text" option. The default setting for this option is No.

### Apply E-Defines to typed-in text

Select **Yes** to apply [E-define](#) globals to text that is typed, inserted via EZ Text, Text/Conflict dialog, Cat Scratch, replaced, pasted and resolved conflicts. For example, you often mistype the word "and" as "adn". You E-define "adn" to be "and". The next time you type "adn" and press **Spacebar** to apply the E-define "adn" to "and". This example could also be a [Personal Global](#) entry. An E-define applies only to words that contain the exact characters of the definition. Using the previous example, the E-define would not apply to the typed word "ad nauseam".

If this option is not selected and you E-define a word/phrase to be a conflict where the original word/phrase is a choice of the conflict, throughout the transcript you will be allowed to select any choice in the conflict. If the Apply E-Defines to typed-in text is selected and you E-define a word/phrase to be a conflict where the original word/phrase is a choice of the conflict, you will only be able to select conflict choices that are not the original word/phrase. For example, the word *your* translates and you E-define "your" to be ^ your ^ you're. If the option is deselected, you will be able to select conflict choice 'your' or 'you're'. If this option is active, you will only be able to select conflict choice 'your' in this file unless you open the Global Table and delete the conflict global.

#### **Use Personal Globals    Yes No**

Select **Yes** to automatically correct mistyped words while editing using the [Personal Globals](#) table. A default Personal Globals table, located in your System Files case, contains common mistyped words with the correctly spelled equivalent. You can insert new and modify existing entries in your Personal Global table.

#### **Remember selected options for E-Defines    Yes No**

Select **Yes** to retain the *Entire File*, *Case Sensitive* and *Selective* settings in the Global Define dialog box when making an E-Define. The Global Define dialog box opens with the settings used in the previous E-Define. Select **No** to always return the options to the default settings after making an E-Define.

#### **Remember selected options for D-Defines    Yes No**

Select **Yes** to retain the *Entire File* and *Selective* settings in the Global Define dialog box when making an D-Define. The Global Define dialog box opens with the settings used in the previous D-Define. Select **No** to always return the options to the default settings after making an D-Define.

#### **Remember selected options for J-Defines    Yes No**

Select **Yes** to retain the *Entire File* and *Selective* settings in the Global Define dialog box when making an J-Define. The Global Define dialog box opens with the settings used in the previous J-Define. Select **No** to always return the options to the default settings after making an J-Define.

#### **Remember selected options for K-Defines    Yes No**

Select **Yes** to retain the *Entire File* and *Selective* settings in the Global Define dialog box when making an K-Define. The Global Define dialog box opens with the settings used in the previous K-Define. Select **No** to always return the options to the default settings after making an K-Define.

#### **Remember selected options for O-Defines    Yes No**

Select **Yes** to retain the *Entire File* and *Selective* settings in the Global Define dialog box when making an O-Define (Other Dictionary). The Global Define dialog box opens with the settings used in the previous O-Define. Select **No** to always return the options to the default settings after making an O-Define.

#### **Generate Misstrokes for D-Defines    Yes No**

Select **Yes** to retain the *Generate Misstrokes* setting in the Global Define dialog box when making an D-Define. The Global Define dialog box opens with the setting used from the previous D-Define. Select **No** to always return the option to the default setting after making an D-Define.

**Generate Misstrokes for J-Defines    Yes No**

Select **Yes** to retain the *Generate Misstrokes* setting in the Global Define dialog box when making an J-Define. The Global Define dialog box opens with the setting used in the previous J-Define. Select **No** to always return the option to the default setting after making an J-Define.

**Generate Misstrokes for K-Defines    Yes No**

Select **Yes** to retain the *Generate Misstrokes* setting in the Global Define dialog box when making an K-Define. The Global Define dialog box opens with the setting used in the previous K-Define. Select **No** to always return the option to the default setting after making an K-Define.

**Generate Misstrokes for O-Defines    Yes No**

Select **Yes** to retain the *Generate Misstrokes* setting in the Global Define dialog box when making an O-Define (Other Dictionary). The Global Define dialog box opens with the setting used in the previous O-Define. Select **No** to always return the option to the default setting after making an O-Define.

**Remember last O-Define Browse location    Yes No**

Select **Yes** to retain the last *Pick Other Dictionary* path in the Global Define dialog box when making an O-Define (Other Dictionary). The Global Define dialog box opens with the setting used in the previous O-Define. Select **No** to always remember the default setting after making an O-Define. Set a default folder by making an entry in the *O-Define browse location* field.

**O-Define browse location**

Select the default folder location for the job dictionary when making an O-Define (Other Dictionary). This option is only available when the option, *Remember last O-Define Browse location*, is set to No.

**Open Global Dialog with Suggestions    Yes No**

Select **Yes** to automatically display a list of up to ten [suggested](#) text definitions for the steno in the *Steno* field when the Global Define dialog box opens. This option does not apply to E-Defines or Replace.

Select **No** to manually display the list by selecting *Suggest* in the Global Define dialog box. If you are using macros or AccelerWriters to open a Global Define dialog box, do not select this option. Use a key combination, such as, Alt + u (Suggest), to manually display the suggestion list. The default setting is No.

**Add Other Globals go to dictionaries    Yes No**

When using the [Add Other Globals](#) feature, all selected D, J and K-defines are added to the current Global Table and added to the respective dictionary. If you would only like the selected defines to go to the current Global Table, select No. The default setting is Yes.

**Open Global Dialog when no Quick Suggest available    Yes No**

When using the [Quick Suggest](#) feature, if a suggestion cannot be generated, a *No Suggestions were found* message displays. If, rather than having the No Suggestion message display, you want the J-define Global dialog box to display, select Yes. The default setting is No. Please note: The Quick Suggest feature is not available while editing a voice produced transcript.

## Transcript Spell Check Options

Transcript Spell Check Options determine the Spell Check settings used when spell checking in Edit. You can select automatic Spell Check features, choose Wordlists, set the number of Suggestions and choose the language type. For example, you can add a job wordlist, choose the Wintertree Medical Wordlist, activate the option to have Spell Check ignore all capped words and single characters, display notification when Spell Check completes in a text field and set the number of suggested words to display at 10. Additional Transcript Spell Check options are available by selecting the [Advanced](#) button in the Transcript Spell Check Options dialog box.

Spell Check uses a default wordlist along with any provided wordlists you select. Spell Check will also use the Personal Wordlist and case and/or job wordlist when spell checking. If, in the rare case, there is a word you feel is misspelled in the default wordlists, you can put the word in your [Personal Wordlist](#) with the exclude attribute.

Use [Dictionary Spell Check options](#) to set Spell Check parameters for spell checking the text portion of dictionary entries in Manage Dictionary. Dictionary Spell Check options are set independently from Transcript Spell Check options.

The priority of the wordlists are as follows: Ignore All (which is in memory only), Job, Case, Personal, Exclude List (if selected), optional "other" wordlists, main language wordlists provided by Wintertree, Wintertree medical (if selected), Stedman's medical (if selected), Wintertree legal (if selected) and Black's legal (if selected).

These settings affect both regular CATalyst translation and CATalyst BCS captioning.

Access Transcript Spell Check Options:

- in Manage Jobs. Press **Alt + t, o, e, t** (**Tools/Options/Edit/Transcript Spell Check**).
- in Edit. Press **Alt + t, o, t** (**Tools/Options/Transcript Spell Check**).

## Transcript Spell Check Options

To make a change, click an option. Depending on the field, check or uncheck the box or select a choice from the drop down list. When finished with all your changes, select **OK**.

### Language

Select the language set to use when running Spell Check. Selecting a language set for Spell Check affects the language set for the general WinterTree [Wordlist](#). Black's Law and Stedman's Medical wordlists are only available in English.

- **American English**
- **British English**
- **French** — When using French, Spell Check considers words beginning with a letter followed by an apostrophe, such as "c'est" to be misspelled and suggests a space following the apostrophe, "c' est." Change the [Advanced Spell Check](#) option, *Spell Check contractions as separate words* to prevent Spell Check from stopping on these words.
- **Italian** — When using Italian, Spell Check considers words beginning with a letter followed by an apostrophe to be misspelled and suggests a space following the apostrophe. Change the [Advanced Spell Check](#) option, *Spell Check contractions as separate words* to prevent Spell Check from stopping on these words.

- **Spanish**
- **Brazilian Portuguese**

### Options

Check the boxes next to the features you want active when Spell Check runs.

#### **Pause after change**

Suspend Spell Check after an action is taken, such as Change or Ignore. You must press **Resume** to move to the next item. If you do not select this option, Case CATalyst performs the action and scans to the next item.

#### **Autocorrect**

Automatically correct a word with the specified alternative contained in a selected [Wordlist](#). For example, Spell Check recognizes "teh" as misspelled and automatically replaces it with "the" because the entry in the selected Wordlist is: "teh" Autocorrect "the."

#### **Ignore Allcapped Words**

Do not stop on words or abbreviations that are all capitalized and not recognized by Spell Check.

#### **Ignore Mixed Case**

Do not stop on mixed case words that have more than one initial capped letter and are not recognized by Spell Check. For example, Spell Check does not stop on "CATalyst ", "McNeal", or "OZpc."

#### **Ignore Mixed Digits**

Do not stop on combinations of digits and numbers not recognized by Spell Check. For example, Spell Check does not stop on 12F, t3sting, or 500th.

#### **Report Repeated Words**

Stop on repeated words unless the words have been added to your Personal, Case or Job wordlist.

#### **Strip Possessives**

Spell check only the root word.

#### **Suggest Split Words**

Offer two separate words as a Suggestion for a single word that can legitimately be two words. For example, Spell Check stops on "someperson" and offers the Suggestion "some person."

#### **Ignore Single Characters**

Do not stop on individual characters. For example, do not have Spell Check stop on the X in "X marks the spot."

#### **Add Changes To Wordlist**

Add the highlighted word and its replacement to the job Wordlist as a Suggest, when the Change action is used. For example, Spell Check stops on the word "someperson". You select "some person" from the Suggestions list and the Change action. In the job's Wordlist, the following entry is added: "someperson" Suggest "some person."

#### **Check Punctuation**

Stop on multiple punctuation that is not recognized and suggest correct ending punctuation for Question and Answer paragraph styles. Ending punctuation includes question mark, period or dashes.

**Check Colloquy Punct.**

Check for a period at the end of a Colloquy paragraph.

**Check Spacing**

Stop on incorrect spacing following punctuation, abbreviations, between words or at the beginning of a paragraph. Spell Check does not stop on a space at the beginning of the paragraph created by a <Tab> format symbol. [Advanced Spell Check Options](#) affect how Spell Check handles spaces after a colon and an abbreviation.

**Check Fields**

Spell check text typed when filling in fields. This option is active when you also select the Spell Check While Defining option or while Spell checking the transcript.

**Report Repeated Paragraphs**

Stop on repeated paragraph styles. Spell Check suggests specific names from the Speaker List when repeated Colloquy is reported.

**Report Empty Pages**

Stop on pages with no text. You can select to Ignore the empty page or click in the transcript and delete the New Page format symbol from Reveal Codes.

**Check for missing By Lines**

Stop on possible missing By Lines. The Fix Missing By Line dialog box displays where you can determine how to handle the possible error. See [Search Next Missing By Line](#) for additional information.

**Report Empty Q/A/C Paragraph**

When selected, Spell Check will stop on empty Question, Answer and Colloquy paragraphs. If you select Ignore All on an empty Colloquy paragraph, Spell Check will not stop on empty Colloquy occurrences with the same name. For example, if Spell Check stops on an empty <Colloquy>MR. WILSON: and you select Ignore All, Spell Check will not stop on any remaining empty occurrences of <Colloquy>MR. WILSON:. Ignore All is not available when Spell Check stops on an empty Q or A.

**Deselect All**

Deselect all options. By using Deselect All, you can deselect all the options at once and then select the specific one you want to use. For example, you may want to use this feature when creating a macro to select a specific Spell Check Option. To run a macro for a specific Spell Check Option, first deselect all the other options.

**Additional Wordlists**

Use the **Add** button to display the locate and include additional [Wordlists](#) for use with Spell Check. Once added to the list, you must check the box next to each Wordlist you want to apply during Spell Check. Uncheck the box to inactivate the Wordlist but keep it in the list for later use. Use **Remove** to delete the Wordlist from the list. You can Add it again if necessary.

Wordlists are applied during Spell Check in a [priority](#) order. Additional Wordlists are applied before all other Wordlists except the Ignore All Wordlist which is a temporary Wordlist that is not viewable. Wordlists contained in the Additional Wordlists are applied in display order. Use the **Move Up** and **Move Down** buttons to reorder the list.

### Match Common Word Processors

The Match Common Word Processors option uses an exclude list that contains all common words from the Wintertree American wordlist or Wintertree British wordlist that some commonly used spell checkers (i.e. word processor software) report as being misspelled. Although there are words in the Wintertree American wordlist or Wintertree British wordlist that commonly used spell checkers mark as misspelled, many of those same words may be recognized spellings in other spell checkers. By checking this option, you are setting CATalyst's spellchecker to stop on these words even though the built-in wordlist says these words are correct.

When you select the Match Common Word Processors option, the listed legal and medical wordlists are automatically deselected (to give you the most desired results). Deselecting the Match Common Word Processors option does not automatically reselect all the wordlists listed below. You will need to select each wordlist you want to use. All commonly used spell checkers may not have medical and legal terminology as a part of their wordlists. If all the medical and legal wordlist are deselected, you most likely will need to add some medical and legal words to your Personal Wordlist (with the Ignore attribute) so Spell Check doesn't stop on them. For example, if you select the Match Common Word Processors option and deselect the medical and legal words, you may have to add "Voir" (Voir Dire) to your Personal Wordlist so Spell Check doesn't stop on it. There may be medical words you will need to add also. If you select this option and continue to select all medical and legal wordlists, you may still find some words that commonly used spell checkers would consider misspelled. You can select all, some or none of the wordlists, it is your decision.

*This option is grayed out if American English or British English is not selected in the Language field.*

### Use Wintertree Medical Wordlist

Check this box to use the Wintertree Medical Wordlist.

### Use Stedman's Medical Wordlist

Check this box to use Stedman's Medical Wordlist.

### Use Wintertree Legal Wordlist

Check this box to use the Wintertree Legal Wordlist.

### Use Black's Legal Wordlist

Check this box to use Black's Legal Wordlist.

### Display Red Squiggle Under Misspelled Words

Check this box to display a red squiggle underline on words that Spell Check considers misspelled. You can add the red squiggle underlined word to the Personal, Job, Case or Ignore All Wordlist. Selecting Ignore All prevents Case CATalyst from stopping on any occurrence of the word in this job during this Edit session. If you exit or close the session and reopen the file, Spell Check stops on the text previously identified in the Ignore All. By default, this option is turned on.

Move to the next red squiggle and Move to the previous red squiggle keyboard commands allow you to move directly to the next or previous red squiggle. Once you create a [keyboard assignment](#) for the commands, you can invoke them from the keyboard or include them in a macro.

### Spell Check While Defining

Check this box to invoke Spell Check automatically when the spelling of text in the Global dialog box and inserting text. When you type in the Text field and then press Enter in the dialog box, Spell Check automatically checks the word or words for correct spelling. If Spell Checks detects a possible error, the Spell Check dialog box displays. The spell check while defining options affects the following dialog boxes: Global/Replace, Filling in a field, Change Header Text, Hidden Text - insert/modify, Insert Conflict/Text, Modify Header/Footer in Layout, Make Exhibit Index Entries, define from Vertical Notes and define from Brief It. This option is active by default.

### **Spell Check While Defining during Realtime**

Spell Check While Defining during Realtime automatically checks the spelling of text in the Global dialog box and inserting text and applies strictly while writing realtime. The Spell Check While Defining during Realtime is selected by default. If you don't want Spell Check to interrupt the define process while writing realtime, deselect the option. If you only want spell check while defining active while editing, select the Spell Check While Defining option and leave the Spell Check While Defining during Realtime option unselected. The spell check while defining options affects the following dialog boxes: Global/Replace, Filling in a field, Change Header Text, Hidden Text - insert/modify, Insert Conflict/Text, Modify Header/Footer in Layout, Make Exhibit Index Entries, define from Vertical Notes and define from Brief It. This option is active by default.

### **Scan While Spellcheck**

Check this box to use the selected Scan options during Spell Check. Use the Scan Options feature to select the options.

### **Scan Options**

Set [Scan For Options](#) for Spell Check to recognize. Changes made here are also reflected in the Scan For options accessed in Edit from Tools/Options/Scan For.

### **Notify me when spellcheck completes in a text field**

When the Spell Check while Defining option is Off and you manually spell check text in a field within a dialog box using Spell Check (Shift + F7), the No Spelling Errors dialog box displays.

### **Maximum Number of Suggestions**

Enter a number between 10 and 100 to determine the maximum number of alternative words that display in the Suggestions field. The smaller the number of suggestions, the more accurate the suggestions.

### **Advanced**

Display the [Advanced Spell Check Options](#) dialog box where you can make additional Spell Check settings.

## **Advanced Transcript Spell Check Options**

Additional Transcript Spell Check options are available by selecting the **Advanced** button in the [Transcript Spell Check Options](#) dialog box. Access Advanced Transcript Spell Check Options:

- in Manage Jobs. Press **Alt + t, o, e, t (Tools/Options/Edit/Transcript Spell Check)**. In the Transcript Spell Check dialog box, select **Advanced**.
- in Edit. Press **Alt + t, o, t (Tools/Options/Transcript Spell Check)**. In the Transcript Spell Check dialog box, select **Advanced**.

## **Advanced Spell Check Options**

To make a change, click an option and select a choice from the drop down box. When finished with all your changes, select **OK**. The *Restore Default Settings* option returns all the Advanced Spell Check Options to their original Case CATalyst default selection.

### **Expect two spaces after colon - Yes/No**

Determine how Spell Check handles spaces after a colon. Select **Yes** to have Spell Check stop when there are less than two spaces following a colon. Select **No** to set Spell Check to not stop when one or two spaces follow a colon. The default is No.

### **Allow one or two spaces after an abbreviation - Yes/No**

Determine how Spell Check handles spaces after abbreviations with periods. Select **Yes** to prevent Spell Check from stopping when one or two spaces follow an abbreviation with a period. Select **No** to have Spell Check stop when one space follows an abbreviation with a period. The default is Yes.

### **Restart from top defaults to Yes - Yes/No**

When Spell Check reaches the end of the file, you are prompted to continue Spell Check from the beginning of the document. Select **Yes** to set the cursor focus default to "Yes." Spell Check continues checking the document from the beginning. Select **No** to set the cursor focus default to "No." Spell Check stops and the cursor focus remains at the end of the file. The default selection for this option is Yes.

### **Default action in Spell Check dialog box - Change/Global/Ignore/Ignore All/Wordlist**

Set the default action for the cursor focus in the Spell Check dialog box. For example, when spell checking a transcript, you generally select the Ignore All action. Select Ignore All as the default action. When you press Enter in the Spell Check dialog box, Case CATalyst invokes the Ignore All option. Choose one of the following: **Change**, **Global**, **Ignore**, **Ignore All**, or **Wordlist**. The default is Ignore.

### **Spell Check contractions as separate words - Yes/No**

Spell Check considers words that start with a letter followed by an apostrophe, such as c' , l' or d' misspelled. For example, Spell Check considers "c'est" misspelled and suggests "c' est" with a space following the apostrophe. Select **Yes** to prevent Spell Check from considering these types of words misspelled when writing in languages such as French or Italian with the [Transcript Spell Check](#) Language option set for the respective language. The default is No.

### **Use Higher Level Case Wordlists - Yes/No**

If you have a case within a case, select Yes to use the top level case wordlist and any subsequent case wordlists when spell checking the current transcript. The current case wordlist has the highest priority, the next case wordlist above the current case has the second highest priority, etc. For example, let's say you have a case called Arbitration. In the Arbitration case, you have another case called 2012. In the 2012 case you have another case called Smith. In the Smith case you have a job called Nov11AR. If this option is set to yes, when you are spell checking the Nov11AR job, the Smith **case** wordlist has the highest **case** wordlist priority, 2012 **case** has the second highest **case** wordlist priority, and the Arbitration **case** wordlist having the third highest **case** wordlist priority.

### **Personalized Spell Check punctuation characters**

Specify nonstandard grammatical punctuation on which you want Spell Check to stop. For example, let's say want Spell Check to stop on a ^ (caret) or \* (asterisk) you or your scopist use as a placeholder. You would type the characters in the field without spaces.

## Include Options

Include options determine certain settings when using the [Include](#) feature. Set the folder location from which to select a file and determine how to apply the page layout for the included file.

Access Include options:

- in Manage Jobs. Press **Alt + t, o, e, i** (**Tools/Options/Edit/Include**).
- in Edit. Press **Alt + t, o, i** (**Tools/Options/Include**).

## Include Options

To make a change, click an option. Depending on the field, make a selection from the drop down box, type an entry or use the Browse button. When finished with your changes, select **OK**. The *Restore Default Settings* option returns all the Advanced Edit Options to their original Case CATalyst default selection.

### Remember Bring Layout setting

The default setting of **Yes** has Case CATalyst remember the status of *Bring Layout* field along with the state of the Keep Inc (Include) File Page Numbering and Keep Orig (Original) File Page numbering options and will retain the settings the next time the selected include file is included. For example, you include your Title page and check the *Bring Layout* box. You then include your Mark Exhibit file and do not check the *Bring Layout* box. Case CATalyst remembers that *Bring Layout* is checked for the Title page and unchecked for the Mark Exhibit. The next time you Include the Title page, Case CATalyst displays the Included dialog box with *Bring Layout* checked. The next time you Include the Mark Exhibit file, Case CATalyst displays the Include dialog box with *Bring Layout* unchecked. If you do not want CATalyst to remember the state of the Bring Layout option, set this option to **No**. The default setting is Yes.

### Remember last include folder

Select **Yes** to have Case CATalyst remember the last folder location from which you selected an Include file. The next time the Include command is used, the Include dialog box defaults to the last folder location. Select **No** to have Case CATalyst always default to the current user folder unless you choose a different default location, by selecting Yes in the *Use default include folder* field and identifying a location in the *Default Include Folder* field. The default is Yes.

### Use default include folder

Select **Yes** to choose to a default location from which you select Include files when using the Include command. You must also identify the location in the *Default Include Folder* field. For example, if you work in a network environment, you have one location to store all the Include files for reporters and scopists to share. Select Yes and then identify the location in the Default Include Folder field. Select **No** to not use a default folder. Case CATalyst always defaults to the current user folder.

This option is only available when the *Remember last include folder* option is set to No.

### Default Include Folder

This option is only available when the *Remember last include folder* option is set to No. Click the Browse  button to select the default folder that the Include command automatically opens. The setting is remembered until you change it.

## Field Options

Field Options determine how Case CATalyst handles certain parameters when working with fields.

Access Field Options:

- in Manage Jobs. Press **Alt + t, o, e, f** (**Tools/Options/Edit/Field**).
- in Edit. Press **Alt + t, o, f** (**Tools/Options/Field**).
- in Edit. From the Speaker List dialog pane, click the Settings  icon. From the Choose Speaker List Fields dialog box, click **Options**.

## Field Options

To make a change, click an option. Depending on the field, make a selection from the drop down box, type an entry or use the Browse button. When finished with your changes, select **OK**. The *Restore Default Settings* option returns all the Advanced Edit Options to their original Case CATalyst default selection.

### Time separated by

Determine how to format the time in Time fields, such as [!Static Time] or [!Current Time]. Select **None**, **Colon (:)** or **Period (.)**. The default setting is Colon (:). Select None to the time display without a separator, for example, when using the Static Time - 24 Hour predefined field.

### Time display morning/afternoon

Fields that indicate time are followed by the morning or afternoon designation. Select the format to display with or without periods. The default is a.m./p.m., with the periods.

### Fill-In-Field in current user

Select **Yes** to open the Fill-In-Field List in the current user when using the Scan and Fill in Fields command or when double clicking a List Group field. Select **No** to open the Fill-In-Fields list from another location. You may want to use another location in a network environment when all users share a Fill-In-Fields List. Specify the path for the alternate location in the *Fill-In-Field path* field. The default is Yes.

### Fill-In-Field List path

This option is only available when the *Fill-In-Field in current user* option is set to No. Click the Browse  button to select the location of the Fill-In-Fields List. The setting is remembered until you change it.

### Fill-In-Field cursor location in

Set the default position for the cursor when opening the Fill in Fields dialog box. Place the cursor focus in either the **Field Value** text box or the **Select List**. Having the cursor location in either field allows you to quickly locate an entry by typing the first few letters. If the cursor is in the Select List section, capitalization of entries is ignored. Field Value is the default location.

### Retain Fields when Pasting

Select **Yes** to retain the field value and functionality of fields when pasting cut or copied text containing fields. Select **No** to paste fields as plain text without field functionality. The default is No.

### Sort attorney names using Attorney Sort column

Select Yes to display attorney names last name first in the [Fill In Field](#) dialog box for easy selection. Case CATalyst inserts the name into the transcript as it appears in the Attorney field of the [Fill-In-Fields List](#). For example, in the Fill-In-Fields List, you have the Attorney field entry as Jessica M. Sordillo. In the Attorney Sort field it displays as Sordillo, Jessica M. The name is inserted into transcript as Jessica M. Sordillo.

Yes is the default. When this option is active, the cursor focus defaults to the Select List section of the dialog box. Case CATalyst displays (*Attorney Sort Active*) in the Fill in Field dialog box when this option is set to Yes.

You may want to review entries in the Fill-In-Field List to make sure the names are sorted correctly when using this option. There may be occasions where Case CATalyst cannot properly sort the name. For example, you have an attorney JOHN VAN DEN TILLAAR listed in the Attorney field. Case CATalyst sorts the name as TILLAAR, JOHN VAN DEN because it does not know "Van Den Tillaar" is the entire last name. Modify the Attorney Sort field to reflect the correct sorting order, VAN DEN TILLAAR, JOHN. Case CATalyst ignores certain suffixes when filling in the Attorney Sort field, such as Jr., Sr. and Esq.

### Common Speakers

Specify default [EZ Speaker](#) names, those that do not change from job to job, to display in the [Speaker List](#). Common speakers, for example, might be THE BAILIFF, THE CLERK or THE WITNESS. The Speaker List allows you to easily insert speaker names into a transcript in Colloquy or By Line format. You can add job specific speaker names to the Speaker List before translating or during Edit.

Click an EZ Speaker and type a new name or modify the name in the field on the right. Click the down arrow to display the color pallet and click a color. The speaker name displays in the transcript with the selected color.

## Word Definition Options

Word Definition Dictionary Options allow you to confirm the version of Merriam-Webster dictionary being used, confirm the location of the Merriam-Webster wordlist and definition files and change the colors for the Word Definition dialog box. These settings affect both regular CATalyst translation and CATalyst BCS captioning.

Access Word Definition Options:

- in Manage Jobs. Press **Alt + t, o, e, w** (**Tools/Options/Edit/Word Definition**).
- in Edit. Press **Alt + t, o, n** (**Tools/Options/Word Definition**).
- in Edit. From the Word Definition dialog box, click the **Setup** icon.

## Word Definition Options

To make a change, select a choice from the drop down box or navigate to a folder location using the Browse button. When finished with your selection, click **Apply**. When finished with all your changes, select **OK**.

### Dictionary Tab

#### Available Word Dictionaries

The default dictionary, Merriam-Webster Dictionary, comes with the Case CATalyst software. The most current Merriam-Webster dictionary displays. Click the down arrow to display other available versions.

#### Words Path

Displays the current location for the Merriam-Webster wordlist file, MWWords.bin. The default location for this file is the same location where Case CATalyst was installed. To change the location, click  and navigate to the new location.

### Definitions Path

Displays the current location for the Merriam-Webster definitions file, MWDef.bin. The default location for this file is the same location where Case CATalyst was installed. To change the location, click  and navigate to the new location.

### Colors tab

Using the options on the Color tab, modify the Background Color, Text Color, and Link Color in the Word Definition Dictionary dialog box. For each option, select a color from the drop down menu or create a customized color. To create your own color, consult your Windows documentation for more information.

## QuickFix Prefix Options

QuickFix Prefix Options displays the Prefixes dialog box which contains the current A - Z assigned entries that. The QuickFix Prefix command attaches a prefix to a word using the [EZ Link](#) rules of spelling. QuickFix Prefix also uses the [Prefixsuffixrules.ini](#) file when the Prefixsuffixrules.ini file is located in your System Files case. Case CATalyst attaches the prefix you select from the list of prefixes and attempts to correctly spell the combined word, first checking the Spell Check wordlist for a match. If no match exists then Case CATalyst attaches the combined root word and prefix without any spelling changes.

To Access QuickFix Prefix options:

- in Manage Jobs. Press **Alt + t, o, e, p** (**Tools/Options/Edit/QuickFix Prefix**).
- in Edit. Press **Alt + t, o, p** (**Tools/Options/QuickFix Prefix**).
- in Edit. From the QuickFix dialog box, select **Prefix** and then select **Options**.

## QuickFix Prefix Options

Type in a field to modify the entry. To remove an entry, highlight the existing text and press **Del** (**Delete**). When finished, press **Enter** (**OK**). The changes display in the QuickFix Prefix list.

## QuickFix Suffix Options

QuickFix Suffix Options displays the Suffixes dialog box which contains the current A - Z assignments. QuickFix Suffix attaches a suffix to a word using the [EZ Link](#) rules of spelling. QuickFix Suffix also uses the [Prefixsuffixrules.ini](#) file when the Prefixsuffixrules.ini file is located in your System Files case. Case CATalyst attaches a suffix you select from the list of suffixes and attempts to correctly spell the combined word, first checking the Spell Check wordlist for a match. If no match exists then Case CATalyst attaches the combined root word and suffix without any spelling changes.

Access QuickFix Suffix options:

- in Manage Jobs. Press **Alt + t, o, e, s** (**Tools/Options/Edit/QuickFix Suffix**).
- in Edit. Press **Alt + t, o, s** (**Tools/Options/QuickFix Suffix**).
- in Edit. From the QuickFix dialog box, select **Suffix** and then select **Options**.

## QuickFix Suffix Options

Type in a field to modify the entry. To remove an entry, highlight the existing text and press **Del** (**Delete**). When finished press **Enter** (**OK**). The changes display in the QuickFix Suffix list.

## Brief It Options

Brief It is a translation feature that suggests conflict free brief forms for words and phrases that you write during a realtime job. When you write three or more steno strokes, Case CATalyst generates a brief form or reminds you of an existing brief form in one of your dictionaries (or your Personal Briefs file) and displays it in the Brief It dialog pane. You can write the suggested/reminder brief to reduce writing multiple stroke outlines.

[Brief It](#) options (Realtime Aid Options dialog box) contain certain customized settings that control how briefs are suggested, what briefs are displayed, where used briefs go, what steno characters are included/excluded in briefs and how briefs are displayed in the Brief It dialog pane during realtime. [Live Suggestions](#) options are also available in the Realtime Aid Options dialog box when selecting Brief It options. The Brief It and/or [Live Suggestions options](#) need to be selected on the Case CATalyst Translate Options [Realtime tab](#) in order for Brief It and/or Live Suggestions to be active. By default, the Brief It and Live Suggestions options are checked and active.

Brief It options affect both regular CATalyst translation and CATalyst BCS captioning.

Access Brief It Options:

- at Manage Jobs. Press **Alt + t, o, e, b** (**Tools/Options/Edit/Brief It**).
- at Manage Jobs or anywhere in Case CATalyst. Click the All Options icon () in the All Options dialog box select Edit Panes and then Brief It.
- at Manage Jobs. Press **Alt + t**, select All Options, in the All Options dialog box select Edit Panes and then Brief It.
- in Edit. Press **Alt + t, o, b** (**Tools/Options/Pane Options/Brief It**).
- in the Brief It dialog pane. Click the Brief It Settings  icon.

## Brief It Options

### Max Words Per Brief

Set the maximum number of words for a brief that Brief It suggests. Select between 1 and 10 words. For example, if the setting is 7 and you write "...first date you contacted Rockford Credit Union," a brief may be generated for the entire phrase. If the setting is 3, a brief might be suggested for "Rockford Credit Union." The default is 5.

This setting is also used when generating phrases for the [Case Prep](#) feature.

This option does not affect marking a phrase and using the Suggest a Brief command.

### Show Phonetic Steno

When selected, this option will change steno character combinations into the "phonetic" sound of the combined letters when offering a suggestion. The option simply changes the display of the steno characters and still keeps the normal Brief It logic. For example, let's say you select the Show Phonetic Steno option and you write the phrase "large imbalances", Brief It would display the suggestion as "LARJ" instead of "HRARPBLG." Another example might be if you wrote "to the extent that" and Brief It offered "TO\*EX" instead of "TO\*EBGS".

The Show Phonetic Steno option includes two options for words starting with Z and ending with X. The options are selected by default. If the SWR=Z option is selected, then suggested briefs for words/phrases starting with Z will display as Z. If the option is deselected, suggested briefs for words/phrases starting with Z will display as SWR. If you write SWR for the Z sound, then you most likely will leave the option selected. Since the initial Z sound can be written differently depending on the steno theory, if you write different steno for the initial Z, you may want to deselect the option. For example, let's say the reporter doesn't write SWR for the initial Z and the option is selected. During the job the name "Zimmerman" (STKEUPL/ER/PHAPB) is written several times and Brief It suggests Z\*IM. Since the reporter doesn't write SWR for initial Z (the reporter writes STK for Z), the reporter automatically writes STK\*EUPL (not SWR\*EUPL) and the steno does not translate as Zimmerman because CATalyst is expecting SWR\*EUPL. The reporter can deselect the SWR=Z option and when a Brief It suggests a brief for a word/phrase starting with Z, the steno will display SWR instead of showing a Z.

With the BGS=X option selected, suggested briefs for words/phrases ending in the X sound will display an X. If the option is deselected, the suggested briefs for words/phrases ending in the X will display as BGS (KS). For example, let's the reporter writes the word "hoax" several times or the reporter uses the Suggest a Brief command to get a brief suggestion. If the BGS=X option is selected, Brief It might display a suggestion using an X like HO\*X. If the BGS option is deselected, the suggestion might display as HO\*KS.

The Show Phonetic Steno option can be selected or deselect at any time. During realtime or in previous jobs, you can open the Brief It pane, then select Options and select or deselect the Show Phonetic Steno option to see the difference in how the suggestions display. The option also affects how steno outlines display in the Text/Steno section of the Cat Scratch pane.

While writing realtime with the Show Phonetic Steno option selected, Personal Briefs display the steno outline(s) as it appears in the Personal Briefs table. For example, if you have an entry such as "as a result of the accident" with the steno "SRUFBGS" that is how the steno will appear in the Brief It pane during realtime. If you close the realtime file and reopen it, the Personal Brief steno will display phonetically since the Personal Brief table is only used during realtime. For this example, when reopening the file, the steno for "as a result of the accident" will display as "VUFX".

**Note:** If you decide to change the status of one or both of the Show Phonetic Steno options during a session, the already suggested briefs will not change/display the suggested steno differently.

### **Only Suggest 1 Stroke Briefs**

Check this box to have Brief It suggest only one stroke Suggested briefs. By default, Brief It always suggests a one stroke brief with the asterisk before suggesting a two stroke brief. Selecting this option also affects Reminder and Personal briefs. For example, you write "neurotoxicity" in 4 or 5 strokes. When this option is active, Brief It does not remind you that you have "TPHEOR/TOX" in your Personal Dictionary as a two stroke entry for "neurotoxicity."

### **Write Twice to Define**

Brief It, by default, automatically creates a J-Define or a K-Define (Define to Case Dictionary) the first time you use a Suggested brief. Checking this box requires you to consecutively write a brief twice before Brief It creates a J-Define or K-Define. You may want to use this option to try a Suggested brief before making it a definition.

For example, Brief It suggests /A\*BT for "Abbott Labs." If the Write twice to Define option is active, you would need to write /A\*BT/A\*BT to have Case CATalyst create the define, /A\*BT for "Abbott Labs." Once defined, you write A\*BT for "Abbott Labs" for the remainder of the job. By default, this option is not active.

When you have the Write Twice to Define option selected and the Allow Double First Syllable option selected, if the suggested brief has two identical strokes, Brief It will behave as if "Write Twice to Define" option was not active. (In other words, you do not need to write the brief 4 times to use it.) If the brief is one stroke or is multiple (not identical) strokes, briefs will need to be written twice to be used.

### **Define to Case Dictionary**

Check this box to place a Suggested brief in the case dictionary once it is written. This is the default. If the current job is not in a case, then the brief is placed in the job dictionary.

### **Personal/Reminders Only**

Check this box to display only Reminder (shorter definitions in your Personal Dictionary) and Personal (entries in your Personal Briefs file) briefs in the Brief It dialog pane. Suggested briefs are not created. When using the Suggest a Brief, Transcript Brief It or Text List Brief It commands, Brief It only displays Reminders or Personal Briefs. When using Suggest a Brief and no Reminders or Personal Briefs are available, a message displays indicating that a brief cannot be suggested.

### **1 Stroke Reminders for 2 Strokes**

Check this box to have Brief It offer one stroke Reminders or Personal briefs when writing two stroke entries. For example, you write "you don't" in two strokes and there is a one stroke version in your Personal Dictionary. Brief It shows the one stroke brief as a Reminder. If Brief It finds two one stroke dictionary entries for the matching text, Brief It suggests the most frequently used matching one stroke entry. If the matching one stroke entries have been used the same many times, then Brief It suggests the matching one stroke entry with the least amount of steno keys.

### **Auto Open Brief It**

Check this box to automatically display the Brief It dialog pane when starting realtime. By default, this option is selected.

### **Send Used Briefs To Cat Scratch**

Check this box to automatically send a Suggested brief you use to the Steno/Text section of the [Cat Scratch](#) dialog pane.

### **Steno Include/Exclude**

Displays the Brief It Options table where you can [modify](#) the Require and Exclude entries. If you select Steno Include/Exclude, you will be prompted to save your changes and Brief It options open. The Require entry contains the steno character or steno combination that you want included in every Suggested brief Brief It generates. There is only one Require entry. By default, the asterisk (\*) is set as a required character.

Exclude entries contain steno characters or steno combinations to exclude from every Suggested brief. In other words, you can add steno characters or steno combinations that may be difficult for you to write or you don't want offered in a suggestion. You can have multiple Exclude entries.

### **Personal Briefs**

Display the Briefs.txt file where you can [create](#) and [modify](#) Personal brief entries. If you select Personal Briefs, you will be prompted to save your changes and the Realtime Aid Options dialog box will close and the Personal Briefs file will open. Personal briefs are brief forms you create which contain words and phrases along with the steno. These may be briefs received from magazines or another reporter which you did not want to put in a dictionary. Brief It does not use a personal brief that conflicts with dictionary entries.

### **CommonWords**

The CommonWords list contains words that prevents Brief It from suggesting a phrase that begins or ends with any word in the list. For example, let's say you write "after all was said" several times in the transcript but a brief is not suggested. If you look in the CommonWords list you see that all the words in the phrase are in the CommonWords list. Display the [CommonWords.txt](#) file in Notepad or WordPad to review, delete, add or [modify](#) entries. This file is also used for [Case Prep](#).

### Allow Briefs with Numbers

An Allow Briefs with Numbers option has been added to Brief It. Perhaps you have been in that court proceeding or deposition where Bates numbers or dollar amounts are repeated and you wished Brief It would give you a brief for those repeated number sequences. An additional option is available in the Steno Include/Exclude list, where a Required for Numbers entry is available. The Required for Numbers entry allows you to specify particular steno characters that will be included in the number brief suggestion. For example, let's say that the Required for Numbers entry is EU. You write 23925 several times throughout the transcript, Brief It might suggest 23EU9 incorporating the first, second and third numbers along with the required entry steno characters for numbers. By using the Required for Numbers entry, you will have a consistent steno outline with a suggested numbers brief. By default, EU is the steno assigned to the Required for Numbers entry in the Brief It Include/Exclude List. The Required for Numbers steno can be modified to fit your writing style or deleted so that no steno is required for numbers.

Brief It will remove the digits and use the normal Brief It logic for a suggestion and if no suggestion is found, Brief It will suggest a brief using up to 3 digits that were written in the order the digits were written (along with the required steno from your Brief It options) and if no suggestion is found, Brief it will continue to suggest numbers written in order with non-digit sounds or digits in any order with non-digit sounds.

By default, the following number/steno key combinations are excluded in the Brief Include/Exclude Options:

#1K, #2K, #3W, #4R, #6-R, #7-B, #8-G, #9-S

To prevent any number bar number from being suggested, press **Ctrl + i** and type **#** and press **Enter**.

### Allow Double First Syllable

Many reporters learned to brief speaker names and terminology by writing the first syllable of the name/terminology twice. For example, let's say the word "neurotoxicity" is used multiple times in the transcript. A reporter might write "neurotoxicity" as TPHUR/OE/TOBGS/EUS/TEU and since it is appearing multiple times in the job, the reporter might write TPHAO\*UR/TPHAO\*UR as a brief. The Allow Double First Syllable option has been added to the Brief It feature for those reporters that might want Brief It to offer the first syllable twice as a suggestion. When the Allow Double First Syllable option is selected, Brief It may offer the first syllable of the text (single word or phrase) written twice as the suggested brief. For example, the word "fluorescent" is used multiple times in the transcript. You write "fluorescent" in multiple strokes and Brief It suggests TPHRAOU/TPHRAOU. In other words, it suggests doubling the first syllable of the word "fluorescent."

When you have the Write Twice to Define option selected and the Allow Double First Syllable option selected, if the suggested brief has two identical strokes, Brief It will behave as if "Write Twice to Define" option was not active. (In other words, you do not need to write the brief 4 times to use it.) If the brief is one stroke or is multiple (not identical) strokes, briefs will need to be written twice to be used.

When this option is selected, it has the highest priority over other selected options for words and a later priority for phrases.

To select or deselect the Allow Double First Syllable option, do any of the following to display the Realtime Aid Options dialog box:

- At Manage Jobs, select Tools, Options, Edit, Brief It.

- During realtime, click the Options icon on the Brief It toolbar.
- Select Tools, Options, Pane Options, Brief It...

**PLEASE NOTE:** If you do not want the asterisk (\*) as a part of any double first syllable brief suggestions, you need to put the asterisk in as an exclude stroke in the Steno Include/Exclude table. Excluding the asterisk means that asterisk will not be a part of any brief suggestion.

## Live Suggestions

### Insert Oops when replacing with a live suggestion

By default, when you select to replace an untranslate and/or text with a Live Suggestion, an [Oops](#) format symbol (Oops-10 category) is inserted into the transcript at the location of the replacement. If you use the [Hotspots](#) pane, you can display all locations of the Oops format symbols in the transcript or you can set your [Scan For](#) options to stop on Oops format symbols. If you do not want the Oops format symbol inserted when replacing an untranslate and/or text with a Live Suggestion, deselect this option.

If you define an untranslate and/or text with a Live Suggestion, the Oops format symbol is not inserted into the transcript at the location. The define will be in the transcript's Global Table.

### Number of suggestions

By default, up to three Live Suggestions will display in the Brief It pane. You can adjust the number of suggestions that display from 2 to 5. To make a change, use the up/down arrows to increase or decrease the amount of Live Suggestions that display for a particular untranslate.

### Dictionary Defines go to:

Select the destination dictionary you want a defined suggestions to go to when using the Define With LS1 - LS5 commands. When this option is set to Case dictionary, if the transcript is not in a case, the destination dictionary is the job dictionary. When defining a Live Suggestion, the global is applied to the entire file. When defining with a Live Suggestion, the definition is placed in the transcripts Global Table in addition to the respective dictionary. If your [Dictionary Options](#) are set to have D-defines go to the Update Area, then if this option is set to Personal Dictionary, the Live Suggestion definitions will go to the Update Area.

### Show "translated" text as first Live Suggestion

By default, this option is active and Drag/Drop, Suffix Drag/Phrase Maker and phonetic translated text will be the first choice in the Live Suggestions list (and Quick Suggest). If Spell Check thinks the "translated" text is misspelled and this option is selected, the misspelled translation will not be offered as the first suggestion. If you do not want the Drag/Drop, Suffix Drag/Phrase Maker or phonetic "translated" text offered in the Live Suggestion and Quick Suggest list, deselect this option.

### Live Suggestions Favor

By default, the Live Suggestions feature is set to Balanced. Depending on many factors, you may want to adjust the Live Suggestions Favor option. For example, let's say you have a very fast computer and you want to improve the quality of your Live Suggestions, you may want to try the Quality setting. Or, let's say your realtime is a little sluggish on your old notebook, you may want to try the Speed setting to reduce the time Live Suggestions looks for suggestions.

- Quality  
Quality settings are set to spend up to 5 seconds looking for suggestions and will wait up to 5 steno strokes before ending the search for suggestions.

- **Balanced**  
Balanced is the default setting with settings to spend up to 2 seconds looking for suggestions and will wait up to 3 steno strokes before ending the search for suggestions.
- **Speed**  
Speed settings are set to spend up to 1 second looking for suggestions and will wait up to 3 steno strokes before ending the search for suggestions. If you are running Case CATalyst on older hardware and your realtime is a little sluggish and you want to use Live Suggestions, you may want to try this setting.

## Contraction Rules

The [Cycle Contraction](#) command expands a contraction into whole words and contracts whole words into a contraction. Expansion and contraction rules determine how the Cycle Contraction command handles the expansion and contraction of words. You can modify these rules.

Expansion rules determine how a contraction becomes two words. As an example, the expansion rule for the apostrophe d ('d) contains the words "would" and "had." The Cycle Contraction command presents the words "would" and "had" when expanding a contracted word ending in 'd. If you used the Cycle Contraction command on the word "you'd" it cycles through "you would" and "you had."

Contraction rules determine how two words become a one word contraction. As an example, the contraction rule for the word "had" contains, apostrophe d ('d). The Cycle Contraction commands uses the "'d" when making two words into one contracted word. If you used the Cycle Contraction command on the words "she had," it presents "she'd."

You can specify exceptions to the rules. The Contraction Rule dialog box, by default, contains two exceptions to the rules. For example, there is a rule for the word "us" and to have it only contract when preceded by the word "let" to make the word "let's." In another example is a rule that correctly cycles "will not" to "won't" but never to "willn't."

Access Cycle Contraction Rule dialog box:

- in Edit. Select **Tools/Options/Contraction Rules**.
- in Manage Jobs. Press **Alt + t, o, e, c (Tools/Options/Edit/Contraction Rules)**.

## Contraction Rules

Create or modify a contraction rule:

1. On the Contraction Rules tab, do one of the following to create or modify a rule. If you want to remove an entry from the list, highlight it and click the Delete icon.
  - Click the New icon to create a new rule.
  - Double click an entry to modify an rule.
2. The Edit Contraction Rule dialog box displays. Make necessary entries:

### Root Word

Type the whole word of the contraction. For example, if adding the contraction "not" you would type "not" (without the quotes).

### Contracted from

Type the abbreviated version of the root word. For example, using the root word "not," type "n't".

3. Press **Enter (OK)** to complete the entry and close the Edit Contraction Rule dialog box.

4. Press **Enter (OK)** to save the entry or create an Exception or Valid Precedent for the entry. Do one of the following:

### Exceptions

Use Exception when there is an exception to the contraction rule for a specific word.

- a. Click the **Exception** radio button.
- b. In the Exception text box, click the New  icon. The Edit Contraction Exception dialog box display.
- c. In the *Exception Text* field, type the root word that, when combined with the contraction, forms an unexpected word. For example, when “will” and “not” contract, the correct contracted form of the word is “won’t” not “willn’t.” You type the root word “will” (without quotes).
- d. In the *Cycle to* field, type the correct contracted word. Using the previous example, you type “won’t” (without quotes).
- e. Press **Enter (OK)** to complete the entry and close the Edit Contraction Exception dialog box.
- f. Press **Enter (OK)** in the Cycle Contraction Rules dialog box to save the entries.

### Valid Precedents

Use Precedents when there is an exception to the contraction rule because it is only used as a contraction when a specific word precedes it, such as “us” contracting to “s” only when preceded by “let.”

- a. Highlight an entry and click the **Valid Precedent** radio button.
- b. In the Exception text box, click the New  icon.
- c. In the blank field, type the word that precedes the contraction. Using the same example, type the word “let” (without quotes).
- d. Press **Enter** to complete the entry.
- e. Press **Enter (OK)** in the Cycle Contraction Rules dialog box to save the entries.

## Expansion Rules

Create or modify an expansion rule:

1. On the Expansion Rules tab, do one of the following to create or modify a rule. If you want to remove an entry from the list, highlight it and click the Delete icon.
  - Click the New icon to create a new rule.
  - Double click an entry to modify an rule.
2. The Edit Expansion Rule dialog box displays. Make necessary entries:

### Contraction

Type the contracted form of the word. For example, if adding the contraction “not” you type “n’t” (without quotes).

### Expansion

Type the whole word the contraction represents. Using the previous example, you type "not" (without quotes). To add additional root words, click the New icon and type the new word and press **Enter**.

3. Press **Enter (OK)** to save the entry or create an Exception or Valid Precedent for the entry. Do one of the following:

### Exceptions

Use Exception when there is an exception to the expansion rule for a specific word.

- a. Click the **Exception** radio button.
- b. In the Exception text box, click the New  icon. The Edit Contraction Exception dialog box display.
- c. In the *Exception Text* field, type the contracted form of a word. For example, you want to create an exception for the expansion rule to expand "can't" to "cannot" instead of "can not." Type "can't" (without quotes).
- d. In the *Cycle to* field, type the words the expansion of the contraction represents. Using the same example, type "cannot" (without quotes).
- e. Press **Enter (OK)** to complete the entry and close the Edit Contraction Exception dialog box.
- f. Press **Enter (OK)** in the Cycle Contraction Rules dialog box to save the entries.

### Valid Precedents

Use Precedents when there is an exception to the expansion rule when a specific word precedes it the contraction.

- a. Highlight an entry and click the **Valid Precedents** radio button.
- b. In the Exception text box, click the New  icon.
- c. In the blank field, type the word that precedes the contraction.
- d. Press **Enter** to complete the entry.
- e. Press **Enter (OK)** in the Cycle Contraction Rules dialog box to save the entries.

## Read

Read options allow you to determine settings applied when reading steno notes into your computer. These settings cover [basic](#) and [advanced](#) options. You can also select to display certain [warning messages](#) associated with reading notes.

## Read Setup

Read Setup determines the settings necessary for reading steno notes from your writing machine into Case CATalyst. Settings depend on your writer and your method for reading notes, such as USB cable or Data SD card. Depending on the selected method, fields in the Read Setup dialog box are unavailable when they are not applicable.

Read Setup options are customizable by user and remain until you change them. The Read Setup dialog box with the Read options is available each time you read steno notes. If you use the same method each time you read notes, such as USB or Data SD card and are the only user on your system, you can select to by-pass the Read Setup dialog box.

For steno machines not manufactured by Stenograph, refer to your vendor for more information about read settings. Additional information may also be available on the Stenograph Solution Center at <http://www.stenographsolutions.com/solution>.

Access Read Setup options:

- in Manage Jobs. Press **Alt + t, o, r, s (Tools/Options/Read/Settings)**.
- in Manage Notes. Press **Alt + t, o, r (Tools/Options/Read Settings)**.
- when reading notes, if the Option to remember settings has been previously selected to prevent the display of the Read Setup dialog box. Press **Alt + u, r (Function/Read Notes)**.

## Read Setup Options

Make a selection from the drop down list or check the box next to an option to select it. When finished with all your changes, select **OK**.

### Device

Select the steno machine used to create the note file or connected to your computer. Steno machines listed are Luminex, Diamante, Fusion, élan, Stentura, SmartWriter, Wave, Protégé, StenoRam III, III+, Ultra, FlashWriter and Baron TX.

### Method

Select one of the following methods for reading steno notes. Only methods applicable to the selected steno machine selected in the *Device* field are available for selection.

#### Direct (cable)

Read steno notes through a serial cable directly connected between your steno machine and your computer. You can read notes from a disk in the disk drive of the steno machine or read notes from the steno machine's memory, depending on your steno machine.

You cannot use the Direct (cable) option for the Luminex, Diamante®, élan Mira A3 or the Stentura Fusion. To read steno notes directly from these writing machines via USB cable, select **USB** as the Method.

#### Disk Drive

Read steno notes from a diskette or Data SD card onto your computer.

#### Backup Flash

Read steno notes from the Luminex or Diamante® Backup SD card or a élan Mira CompactFlash card or Backup SD card. This option is only available when you select Luminex, Diamante® or élan Mira in the *Device* field.

#### USB

Read steno notes from the steno machine to your computer via USB cable. This option is available when you select Luminex, Diamante®, élan, fusion or Protégé in the *Device* field. To connect the writer using a USB cable, you must be using Case CATalyst version 4.x or higher and, depending on your steno machine, have installed the Luminex, Diamante®, élan Mira or Stentura Fusion, Stentura Protégé USB driver on your computer. See your steno machine documentation for information about the installing the USB driver.

#### Luminex/Diamante®/élan Mira A3/Stentura Fusion

If you are connecting a Luminex, Diamante®, élan Mira A3 or Stentura Fusion, the Data SD card must be inserted in the Data SD slot on the steno machine to read via USB cable. Confirm selection, **Data SD card**, in the *Drive/Path* field. *When running Windows 10, you may need to set Case CATalyst to Run as Administrator in order for Windows to recognize the SD Card.*

### **élan Cybra Student/Professional/Stentura Protégé,**

If you are connecting an élan Cybra Student, élan Cybra Professional or a Stentura Protégé, select the **RAM** option in the *Drive/Path* field.

### **Browse**

Read steno notes from a location on your computer other than the selected drive. For example, you may want to use this option if you have stored your steno notes in a location on your hard drive outside of Case CATalyst.

### **Drive/Path**

Select one of the following:

#### **The appropriate drive letter**

Read steno notes from a diskette, Backup SD card, Data SD card or Memory. *When running Windows 10, you may need to set Case CATalyst to Run as Administrator in order for Windows to recognize the Data SD or Backup SD Card.*

#### **Data SD**

Read steno notes from a Data SD card via USB cable.

#### **RAM**

Read steno notes from the writer's RAM via USB cable. Select this option if you are reading notes from an élan Cybra Student, élan Cybra Professional or a Stentura Protégé.

#### **Memory**

Read steno notes from the Wave's memory via USB cable.

#### **Browse**

Identify the folder path to read steno notes from another location, such as a folder on your hard drive.

### **Port**

When reading steno notes through a cable, select the appropriate COM port. For more information on COM or serial port, refer to the user guide for your computer.

### **Automatically break files during Read**

Check this box to automatically break the steno note file into multiple note files during the Read process. In the Breaking Stroke field, enter the steno outline you use to designate a file break.

#### **Breaking Stroke**

If you do not turn your steno machine off during proceedings but write a stroke several times to indicate the start or end of files, you can have Case CATalyst recognize the separation stroke during the Read process and prompt you for a file name.

Type the steno outline, in this field, that you write on your steno machine to indicate the end or beginning of proceedings. You enter the steno outline once here. In the job, you must write this steno outline as least five consecutive times for Case CATalyst to create a file break. For example, you enter EPBD in the Breaking Stroke field. In the job, on your steno machine you write EPBD/ EPBD/ EPBD/ EPBD/ EPBD.

### Option

Check this box to automatically use the current setting whenever you select to read notes. Case CATalyst bypasses the Read Setup dialog box when you select to read notes.

To deselect this feature, from Manage Jobs, press **Alt + t, o, r, s (Tools/Options/Read/Settings)**. Uncheck this box and then press **Enter (OK)**. When deselected, the Read Setup dialog box displays each time you select the Read Notes function.

### Advanced

Display the [Advanced Read Options](#) dialog box where you can make additional Read settings.

## Advanced Read Options

Additional Read options are available by selecting the **Advanced** button in the [Read Setup](#) dialog box. Access Advanced Read Options:

- in Manage Jobs. Press **Alt + t, o, r, s (Tools/Options/Read/Settings)**. In the Read Setup dialog box, select **Advanced**.
- In Manage Jobs. Click the All Options icon () or press **Alt + t** and select **All Options, Read/Manage Notes**. In the Read Setup dialog box, select **Advanced**.
- when reading steno notes. In the Read Setup dialog box, select **Advanced**.

## Advanced Read Options

To make a change, click an option. Depending on the field, make a selection from the drop down box or use the Browse button. When finished with your changes, select **OK**. The *Restore Default Settings* option returns all the Advanced Edit Options to their original Case CATalyst default selection.

### Change default to Save & Edit

Set the action of the Enter key in the Read [Name and Save] dialog box when reading notes into Case CATalyst. The default setting saves the file when you press Enter. You can change the default to Save and Edit Notes so that Case CATalyst saves the files and then opens Manage Notes when you press Enter. For example, if you are an official court reporter and only need to transcribe portions of the day's notes, you may want to always select the Save and Edit Notes option. To change the setting, from the drop down menu, select **Yes** to have the Enter action Save & Edit or **No** to Save only.

### Display Print to PDF option

Select to display or hide the Print to PDF option in the Read [File Selection] dialog box. Displaying the Print to PDF option allows you to read or print the selected steno note files to PDF. [Printing notes to PDF](#) is a way to save steno notes in an generic electronic format.

From the drop down menu, select **Yes** to display the option or **No** to hide the option. The default setting is Yes.

### Default PDF Folder

The default location for steno notes printed to PDF is the My Documents folder on your computer. To change the location for the files:

- a. Click the **Browse** button,  to display the Browse for Folder dialog box.
- b. The current user displays in the Folder field as the selected location.
- c. If necessary, navigate to a different location in the Choose Folder window. To create a new folder, click the Make New Folder and type a new name in the highlighted area.
- d. Press **Enter (OK)**. The path and folder name display in the Default PDF Folder field.

## Read Warnings

Read Warnings determine whether or not a confirmation message displays if you cancel the Read function while reading notes. Access Read Warnings in Manage Jobs. To access the Read Warning option:

- At Manage Jobs, press **Alt + t, o, r, w (Tools/Options/Read/Warnings)**.
- At Manage Jobs, click the All Options icon () , select **Read/Manage Notes** and then **Read Warnings**.
- At Manage Jobs, press **Alt + t**, select **All Options, Read/Manage Notes** and then **Read Warnings**.

## Read Warnings

Make your change in the Save Options dialog box. When finished with your change, select **OK**.

### Warn before not saving steno file.

Check this box to have a warning message display if you cancel the Read process before you finish reading steno notes.

## Advanced Manage Notes Options

### Advanced Manage Notes Options

Advanced Manage Notes options determine how steno notes print and what font is used for display. You can print steno notes from the Manage Notes feature by opening the notes file, selecting File and then Print. You can print your steno notes to a PDF file by selecting File and then Print notes to PDF.

Access the Advanced Manage Notes options:

- from Manage Jobs. Press **Alt + t, o, m (Tools/Options/Manage Notes)**.
- from Manage Notes. Press **Alt + t, o, m (Tools/Options/Manage Notes)**.

To make a change, click an option. Depending on the field, select a choice from the drop down box or type an entry. When finished with all your changes, select **OK**. The *Restore Default Settings* option returns all the Advanced Manage Notes Options to their original Case CATalyst default selection.

### Print Timestamps

Select to include or remove timestamps when printing steno notes. Including timestamps when printing steno notes affects the character size to steno notes. This option does not affect transcript printing. To change the setting, from the drop down menu, select **Yes** to include timestamps or **No** to not include them. The default setting is No.

### Print columns per page

Set the number of steno note columns when printing steno notes to paper or PDF. Increasing the number of columns per page decreases the size and readability of the steno notes. Type the number of desired columns per page. The default setting is three.

### Display/Print Font

Customize the font display of steno notes in Manage Notes and printed steno notes. Click the  (Browse) button to display the Font dialog box where you can choose a font style and size. The font size of printed steno notes is not affected by this setting but is determined by the *Print columns per page* option. Although the Font Style selection box is displayed, those selections do not apply to the font selection. It is suggested you select a fixed (mono) spaced font so the steno characters line up correctly as they would on a steno paper tape or steno machine.

## Dictionary

[Dictionary Options](#) include settings for where D-defines go, how to handle conflicting entries when defining, including dictionaries and pasting entries. Options also include warning settings, default keyboard map, the column display for the dictionary, [Dictionary Builder](#) options and [Dictionary Verify](#) options.

### To access Dictionary Options:

- At Manage Jobs, press **Alt + t, o, d, o** (Tools, Options, Dictionary, Options).
- At Manage Jobs, press **Alt + t** and then select All Options. Navigate to the Dictionary section and select Options.
- In Manage Dictionary, press **Alt + t, o, t** (Tools, Options, Dictionary, Options).
- At Manage Dictionary, press **Alt + t** and then select **All Options**. Navigate to the Dictionary section and select **Options**.
- Click the All Options icon () on the toolbar and then navigate to the Dictionary section and select **Options**.

## Dictionary Spell Check Options

Dictionary Spell Check Options determine Spell Check parameters applied when spell checking dictionary entries. You can select automatic Spell Check features, choose Wordlists, set the number of Suggestions and choose the language type. For example, you can add a job wordlist, choose the WinterTree Medical Wordlist, activate the option to have Spell Check ignore all capped words and single characters, display notification when Spell Check completes in a text field and set the number of suggested words to display at 10.

Spell Check uses a default wordlist along with any provided wordlists you select. Spell Check will also use the Personal Wordlist and case and/or job wordlist when spell checking. If, in the rare case, there is a word you feel is misspelled in the default wordlists, you can put the word in your [Personal Wordlist](#) with the exclude attribute.

Use [Transcript Spell Check options](#) to set Spell Check parameters for spell checking during Edit. Transcript Spell Check options are set independently from Dictionary Spell Check options.

The priority of the wordlists are as follows: Ignore All (which is in memory only), Job, Case, Personal, Exclude List (if selected), optional "other" wordlists, main language wordlists provided by Wintertree, Wintertree medical (if selected), Stedman's medical (if selected), Wintertree legal (if selected) and Black's legal (if selected).

Access Dictionary Spell Check Options:

- from Manage Jobs, press **Alt + t, o, d, s** (**Tools/Options/Dictionary/Dictionary Spell Check**).
- from Manage Dictionary, press **Alt + t, o, d** (**Tools/Options/Dictionary Spell Check**).

## Dictionary Spell Check Options

To make a change, click an option. Depending on the field, check or uncheck the box or select a choice from the drop down list. When finished with all your changes, select **OK**.

### Language

Select which language set to use when running Spell Check. Selecting a language set for Spell Check affects the language set for the WinterTree Medical and Legal [Wordlists](#). Black's Law and Stedman's Medical wordlists are only available in English.

- **American English**
- **British English**
- **French** — When using French, Spell Check considers words beginning with a letter followed by an apostrophe, such as "c'est" to be misspelled and suggests a space following the apostrophe, "c' est." Change the [Advanced Spell Check](#) option, *Spell Check contractions as separate words* to prevent Spell Check from stopping on these words.
- **Italian** — When using Italian, Spell Check considers words beginning with a letter followed by an apostrophe to be misspelled and suggests a space following the apostrophe. Change the [Advanced Spell Check](#) option, *Spell Check contractions as separate words* to prevent Spell Check from stopping on these words.
- **Spanish**
- **Brazilian Portuguese**

### Options

Check the features you want active when Spell Check runs.

#### Autocorrect

Automatically correct a word with the specified alternative contained in an applied [wordlist](#). For example, Spell Check recognizes "teh" as misspelled and automatically replaces it with "the" because the entry in the applied wordlist is: "teh" Autocorrect "the".

#### Ignore Allcapped Words

Do not stop on words or abbreviations that are all capitalized and not recognized by Spell Check.

#### Ignore Mixed Case

Do not stop on mixed case words that have more than one initial capped letter and are not recognized by Spell Check. For example, Spell Check does not stop on "CATalyst ", "McNeal", or "OZpc."

#### Ignore Mixed Digits

Do not stop on combinations of digits and numbers not recognized by Spell Check. For example, Spell Check does not stop on 12F, t3sting, or 500th.

#### Report Repeated Words

Stop on repeated words unless the words have been added to your Personal, Case or Job wordlist.

### **Strip Possessives**

Spell check only the root word.

### **Suggest Split Words**

Offer two separate words as a Suggestion for a single word that can legitimately be two words. For example, Spell Check stops on "someperson" and offers the Suggestion "some person".

### **Ignore Single Characters**

Do not stop on individual characters. For example, do not have Spell Check stop on the X in "X marks the spot".

### **Add Changes to Wordlist**

Add the highlighted word and its replacement to the Job wordlist as a Suggest, when using the Change option. For example, Spell Check stops on the word "someperson". You select "some person" from the Suggestions list. In the wordlist, the following entry occurs: "someperson" Suggest "some person". Spell Check continues to stop on every occurrence of the word in the dictionary.

### **Deselect All**

Deselect all options. You may want to use this feature when creating a macro to select a specific Spell Check option. To run a macro for a specific Spell Check option you would first need to deselect all the other options. By using Deselect All, you can deselect all the options at once and then select the specific one you want to use.

### **Additional Wordlists**

Use the **Add** button to display the Open dialog box where you can locate and include other [wordlists](#) to apply during Spell Check. Once added to the list, you must check the box next to each wordlist you want to apply during Spell Check. Uncheck the box to inactivate the wordlist but keep it in the list for later use. Use **Remove** to delete the wordlist from the list. You can Add it again if necessary.

Wordlists are applied during Spell Check in a [priority](#) order. Additional wordlists are applied before all other wordlists except the Ignore All Wordlist which is a temporary wordlist that is not viewable.

Wordlists contained in the Additional Wordlists field are applied in the order they occur. Use the **Move Up** and **Move Down** buttons to reorder the list.

### **Match Common Word Processors**

The Match Common Word Processors option uses an exclude list that contains all common words from the Wintertree American wordlist or Wintertree British wordlist that some commonly used spell checkers (i.e. word processor software) report as being misspelled. Although there are words in the Wintertree American wordlist or Wintertree British wordlist that commonly used spell checkers mark as misspelled, many of those same words may be recognized spellings in other spell checkers. By checking this option, you are setting CATalyst's spellchecker to stop on these words even though the built-in wordlist says these words are correct.

When you select the Match Common Word Processors option, the listed legal and medical wordlists are automatically deselected (to give you the most desired results). Deselecting the Match Common Word Processors option does not automatically reselect all the wordlists listed below. You will need to select each wordlist you want to use. All commonly used spell checkers may not have medical and legal terminology as a part of their wordlists. If all the medical and legal wordlist are deselected, you most likely will need to add some medical and legal words to your Personal Wordlist (with the Ignore attribute) so Spell Check doesn't stop on them. For example, if you select the Match Common Word Processors option and deselect the medical and legal words, you may have to add "Voir" (Voir Dire) to your Personal Wordlist so Spell Check doesn't stop on it. There may be medical words you will need to add also. If you select this option and continue to select all medical and legal wordlists, you may still find some words that commonly used spell checkers would consider misspelled. You can select all, some or none of the wordlists, it is your decision.

*This option is grayed out if American English or British English is not selected in the Language field.*

### **Use Wintertree Medical Wordlist**

Use the Wintertree Medical Wordlist.

### **Use Stedman's Medical Wordlist**

Use the Stedman's Medical Wordlist.

### **Use Wintertree Legal Wordlist**

Use the Wintertree Legal Wordlist.

### **Use Black's Legal Wordlist**

Use the Black's Legal Wordlist.

### **Display Red Squiggle Under Misspelled Words**

This option does not apply to dictionary Spell Check.

### **Spell Check While Defining**

Invoke Spell Check when inserting and modifying entries.

### **Scan While Spell Check**

This option does not apply to dictionary Spell Check.

### **Scan Options**

This option does not apply to dictionary Spell Check.

### **Notify me when spellcheck completes in a text field**

When the Spell Check while Defining option is Off and you spell check a field using Spell Check (Shift + F7), the No Spelling Errors dialog box displays.

### **Maximum Number of Suggestions**

Enter a number between 10 and 100 to determine the maximum number of alternative words that display in the Suggestions field. The recommended setting is 10. This is the default.

## Dictionary Options

Dictionary Options allows you to customize whether your D-defines go directly to your Personal Dictionary or to the Update Area, what happens to conflicting entries when combining dictionaries, decide what warning messages you see and more. Settings in Dictionary Options affect all dictionaries in the user folder.

Access Dictionary Options:

- At Manage Jobs, press **Alt + t, o, d, o** (Tools, Options, Dictionary, Options).
- At Manage Jobs, press **Alt + t** and then select All Options. Navigate to the Dictionary section and select Options.
- In Manage Dictionary, press **Alt + t, o, t** (Tools, Options, Dictionary, Options).
- At Manage Dictionary, press **Alt + t** and then select **All Options**. Navigate to the Dictionary section and select **Options**.
- Click the All Options icon () on the toolbar and then navigate to the Dictionary section and select **Options**.

## Dictionary Options

Select your choice from the drop-down list on the right side of the option. When finished, to save and close the Dictionary Options dialog box, select **OK**.

### D-Defines go to the Update Area Yes/No

When making D-defines (entries defined to the Personal Dictionary), entries are placed in the Personal Dictionary and the newest entry is always used during translation. When you open your Personal Dictionary, based on your Dictionary Options (see below) you may be prompted to take action on any conflicting (entries with identical steno outline(s) and different text definition) entries. To have your D-defines go directly to the Personal Dictionary, select **No**. By default, D-defines made while editing go to the Personal Dictionary.

When D-defines go to the Update Area, the entries go to a holding dictionary that allows you to review, revise, delete entries before moving them to your Personal Dictionary. If you work with a scopist that creates dictionary definitions or you edit on multiple computers, you may want to select the D-Defines go to Update Area option. The scopist can send the Update Area along with the edited file or you can backup and restore the Update Area on your main computer. You can then review the entries and add the ones you want to your Personal Dictionary. To have your D-defines go to the Update Area, select **Yes**.

### How to treat entries with duplicate steno from D-defines Stop for Decision / Keep New Text / Keep Old Text / Create Conflict

When the *D-Defines go to the Update Area* option is set to No, select one of the options as the default action when D-defines conflict with entries in your Personal Dictionary. When a D-define is made while writing realtime or editing that is different than the existing Personal Dictionary entry, the entry goes into your Personal Dictionary and is automatically used until you open your dictionary. Once you open your dictionary, depending on your dictionary options, either the action that you selected is performed or you need to decide how to resolve the conflict. Select from the following options: Stop for Decision which allows you to select the action for each conflicting entry, or automatically have one of the following actions performed: Keep New Text, Keep Old Text or Create Conflict. If undecided, select Stop for Decision.

If *D-defines go to the Update Area* is set to Yes, this option is not available.

### Stop for Decision

Displays the Duplicate Entry dialog box for each conflicting steno outline along with the text definitions. Review the steno. and text and then select an action: **Keep New Text**, **Keep Old Text**, **Create Conflict** or **Keep Neither**. Keep Neither removes the original dictionary entry from the destination dictionary and does not include the new dictionary entry.

Selecting an action applies only to the duplicate entry displayed. If you want to apply the same action to all duplicate entries, check the box, *Apply this choice to the rest of the duplicate entries for this include*. When finished selecting your action, choose **OK**.

If you choose Cancel, Case CATalyst prompts you with a Yes/No option to confirm the cancellation. Selecting Yes cancels any action taken with the Include and closes the Duplicate Entry dialog box. Selecting No displays the Duplicate Entry dialog box.

### Keep New Text

Keep the text definition from the newest D-define and remove the old entry.

### Keep Old Text

Keep the text definition from the current Personal Dictionary entry and disregard the newest dictionary entry.

### Create Conflict

Keep both the original and new text to create a conflict in the entry.

## How to treat entries with duplicate steno when Including Stop for Decision / Keep New Text / Keep Old Text / Create Conflict

When using Manage Dictionary's Include feature to combine dictionaries, you need to decide how you want Case CATalyst to handle the included entries if some entries conflict (entries with identical steno outline(s) and different text definition) with entries in the destination dictionary. Select **one** of the following:

### Stop for Decision

Displays the Duplicate Entry dialog box for each conflicting steno outline along with the text definitions. Review the steno. and text and then select an action: **Keep New Text**, **Keep Old Text**, **Create Conflict** or **Keep Neither**. Keep Neither removes the original dictionary entry from the destination dictionary and does not include the new dictionary entry.

Selecting an action applies only to the duplicate entry displayed. If you want to apply the same action to all duplicate entries, check the box, *Apply this choice to the rest of the duplicate entries for this include*. When finished selecting your action, choose **OK**.

If you choose Cancel, Case CATalyst prompts you with a Yes/No option to confirm the cancellation. Selecting Yes cancels any action taken with the Include and closes the Duplicate Entry dialog box. Selecting No displays the Duplicate Entry dialog box.

### Keep New Text

Keep the text definition from the source and remove the old entry from the destination dictionary.

### Keep Old Text

Keep the text definition from the destination dictionary entry and disregard the source dictionary entry.

### **Create Conflict**

Keep both the original and new text to create a conflict in the entry.

### **What to do with source dictionary after Include   Stop for Decision / Delete Source Dictionary / Leave Source Dictionary**

The Source dictionary is the dictionary you select to bring entries into the current (destination) dictionary. You open the destination dictionary, select Include and then select the dictionary (source) you want to include into the currently opened dictionary. The default action is to Stop for Decision.

Depending on your dictionary options, if the *Warn before voiding undo ability when using Include* option (see below) is active, you will be prompted that if you continue you will not be able to undo changes that were done before the include. If you need to "undo changes" you can exit the dictionary without saving it. By default, this prompt is active.

Select **one** of the following:

#### **Stop For Decision**

Displays the following message prompting you for a decision after including the entries: "Do you want to delete the source dictionary?" Select **Yes** to delete the source dictionary or **No** to retain the source dictionary after including. Stop For Decision is the default.

#### **Delete Source Dictionary**

Automatically delete the source dictionary after including the entries in the destination dictionary.

#### **Leave Source Dictionary**

Automatically retain the source dictionary after including the entries in the destination dictionary.

### **How to treat entries with duplicate steno when Pasting   Stop for Decision / Keep New Text / Keep Old Text / Create Conflict**

When using the cut, copy and paste commands in the Manage Dictionary function, you need to decide how you want Case CATalyst to handle the pasted entries if some entries conflict (entries with identical steno outline(s) and different text definition) with entries in the destination dictionary. Select **one** of the following:

#### **Stop for Decision**

Displays the Duplicate Entry dialog box for each conflicting steno outline along with the text definitions. Review the text and select an action **Keep New Text**, **Keep Old Text**, **Create Conflict** or **Keep Neither**. When finished selecting your action, choose **OK**. No action occurs if you choose Cancel. Stop for Decision is the default. Keep Neither is an action available when you use Stop for Decision. Keep Neither removes the original dictionary entry from the destination dictionary and does not paste the new dictionary entry.

#### **Keep New Text**

Keep the copied/cut text definition and remove the old entry from the destination dictionary.

#### **Keep Old Text**

Retain the destination dictionary entry and disregard the copied/cut entry.

#### **Create Conflict**

Keep both the original and new text to create a conflict in the entry.

### **Break steno outlines based on key order Yes/No**

Case CATalyst allows you to type text characters in the Steno field of a dialog box to generate steno characters. For example, you type JAIMS and Case CATalyst generates SKWRAEUPLS.

Select **Yes** to have Case CATalyst automatically add a / (forward slash) between steno strokes based on steno key order. For example, you type PATRIK. The result is /PAT/REUBG. You do not need to type the / . Select **No** to manually insert the slash between steno strokes to indicate multiple strokes.

### **Swap steno entered out of key order Yes/No**

Select **Yes** to have Case CATalyst automatically corrects typed steno in the Steno field of a dialog box. For example, you type READ. The steno order corrects to /RAED; TOAD corrects to TAOD.

Select **No** to not have Case CATalyst automatically correct incorrectly ordered steno keys. Case CATalyst does not generate the correct steno character or may generate the steno character as a "final" character instead of the intended "initial" character. Case CATalyst inserts / to separate strokes when it is clear a second stroke is written.

This field is only available if you select No in the *Break steno outlines based on key order* field.

### **Default Keyboard map**

Select the active [keyboard map](#) when using Manage Dictionary. Click the down arrow to display the list of available dictionaries. All dictionary keyboard maps located in the Dictionary case within your System Files case, are available for selection from the list. The Default keyboard map will be used until it is changed to another keyboard map. Only dictionary commands can be used in the dictionary keyboard map.

### **Warn before deleting entries**

Check this box to display a confirmation message when deleting dictionary entries. Each time you delete an entry, the message prompts you with a Yes/No option to continue the deletion. This is the default.

Uncheck this box to disable the confirmation message when deleting entries. You can also deselect this message by checking the option, *I understand the consequences of my actions. Please stop asking.* in the message box.

### **Warn before Search and Replace Yes/No**

Search and Replace allows you to search for and replace the text portion of a dictionary entry. You can search and replace all entries forward, backward or all matching entries at one time.

Check this box to display a confirmation message when selecting the Replace All option. The message prompts you with a Yes/No choice option to continue the replace without stopping for a decision. This is the default.

Uncheck this box to disable the confirmation message when replacing. You can also deselect this message by checking the option, *I understand the consequences of my actions. Please stop asking.* in the message box. The confirmation message displays only when you select Replace All. It does not display when you select Forward or Backward. Forward and Backward stop on every occurrence.

### **Warn before voiding undo ability when using Include Yes/No**

The Include feature allows you to include the entire contents of another dictionary into the displayed dictionary. You cannot Undo the Include unless you exit the dictionary without saving. All unsaved changes made prior to the Include are lost.

Check this box to display a warning message when including a dictionary. The message prompts you with a Yes/No choice option to continue the Include. This is the default.

Uncheck this box to disable the warning message when you Include a dictionary. You can also deselect this message by checking the option, *I understand the consequences of my actions. Please stop asking.* in the message box.

#### **Warn when inserting or modifying an entry in a filtered display Yes/No**

When you display dictionary entries in a filtered view, and then modify a filtered entry so that it no longer meets the filter criteria, the modified entry no longer displays in the filtered view.

Check this box to display a warning message when the modified entry does not meet the filter criteria. The message prompts you that the entry will not be displayed and press Enter to continue.

Uncheck this box to disable the warning message when modifying an entry in filtered view. You can also deselect this message by checking the option, *I understand the consequences of my actions. Please stop asking.* in the message box.

#### **Warn when overwriting EZ Speakers Entries Yes/No**

Check this box to display a confirmation message when you create a duplicate speaker identification with an existing token number in the Create EZ Speaker Entries feature. The message prompts you with a Yes/No choice option to overwrite the existing entry.

Uncheck this box to disable the confirmation message when identifying speaker names. You can also deselect this message by checking the option, *I understand the consequences of my actions. Please stop asking.* in the message box.

#### **Warn twice before exiting without saving changes Yes/No**

If you have unsaved changes and you select to exit the dictionary, select Yes to have an Are you sure message display. Select No, if you do not want the extra warning dialog box. The default setting is Yes.

#### **Confirm Conflict Resolution Yes/No**

If a dictionary entry is a conflict and you eliminate the conflict by using one of the Resolve Conflict with Choice # - Dict commands, a confirmation message displays prompting you to confirm you want to replace the conflict (conflict displays) with the conflict choice (the conflict choice displays). To disable the confirmation message from displaying when you resolve a conflict, set this option to No. To change the setting, double click the Confirm Conflict Resolution option to toggle between Yes and No. The default setting is Yes.

#### **Print Steno in Crowded Format Yes/No**

Check this box to print the dictionary entries in crowded line format and reduce the number of pages needed to print the dictionary entries. Crowded line format prints the steno outlines using a forward slash to separate the strokes. The steno for the entry prints on the same line. For example, let's say you have a dictionary definition for "cap on" it would print as the following when this option is set to Yes: /KA\*P /O\*PB.

Uncheck this box to print the dictionary entries to print steno outlines in steno paper tape format. For example:

```
K A * P
O* PB
```

#### **Display steno in "paper tape" format Yes/No**

Select **Yes**, the default, to display the steno outlines for dictionary entries in paper tape format. Paper format displays steno outlines for a dictionary entry in a vertical display as it appears written on paper tape. For example, you have the dictionary entry "arrhythmia" which contains multiple steno outlines for the dictionary entry.

```
arrhythmia      A R
                R EU PBLG
                PH AO E
                K W RA
```

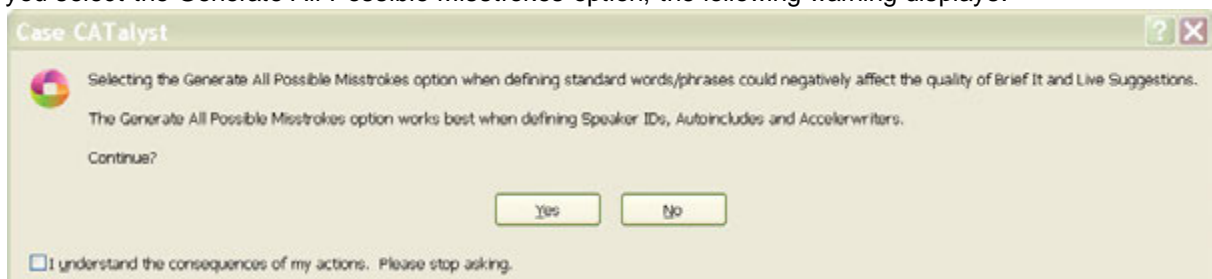

Select **No** to display the steno outlines in crowded format. This setting also affects the display of printed dictionary entries. Crowded format reduces the amount of space it takes to display the dictionary entry. In crowded steno format, multiple steno outlines for entries are separated by a slash on one or more lines. The same entry displays as:

```
arrhythmia      AR/REUPBLG/PHAOE/KWRA
```

### Warn when inserting/modifying an entry and selecting All Possible Misstrokes Yes/No

This option will display a warning message when inserting or modifying dictionary entries in your Personal Dictionary or Update Area (if used) when you have selected the Generate All Possible misstrokes option in the Insert/Modify dialog box. The Generate All Possible Misstrokes option can be a good option when creating additional definitions for speaker identifications, realtime commands, format symbols, Auto Includes, AccelerWriters and punctuation. The option can also be helpful for case-specific or job-specific terminology (names, briefs). However, for average words and phrases, especially when a dictionary is not mature enough, using the Generate All Possible Misstrokes option is much more likely to generate defines that will either never be used in translation; mistranslates that need to be re-defined or it will prevent Brief It from working as well as it could/should. This option is set to Yes as the default action. Change the option to No if you do not want to see this warning when inserting/modifying entries in the Personal Dictionary and Update Area.

If defining to the Personal Dictionary and/or inserting/modifying an entry in the Personal Dictionary and you select the Generate All Possible Misstrokes option, the following warning displays:

- Selecting **Yes** (Alt + y) will generate all possible misstrokes for the current steno outline.
- Selecting **No** (Alt + n) will return to the Insert or Modify dialog box with the Generate All Possible Misstrokes option deselected.
- Select the *I understand the consequences of my actions. Please stop asking.* option to set the warning option to **No**.

### Column Display Order:

Customize the order in which you want the columns to display on the Manage Dictionary screen. Click in the Column Display Order: option and then click the Browse () button to display the Confirm Column Order dialog box. In the Choose column order section, highlight a column name and then use the arrow icons ( ) to position the order of the columns. When finished, click **OK** to save the changes.

To customize which columns display, double click the column name to toggle between Visible and Not Visible. The Text and Steno columns are inactive as those two columns will always display in a dictionary.

### **Replace spaces following titles Yes/No**

When this option is set to Yes and you are in the Dictionary Builder feature, a space following a title (i.e. Mr., Mrs., Dr., etc.) will automatically be replaced with a <Sticky Space> format symbol. For example, the text in the Word: field displays Dr. Kay. The space following Dr. is removed and replaced with a <Sticky Space> format symbol, Dr.<Sticky Space>Kay. Default setting is No.

### **Ask to insert entry after search doesn't find a match**

Select "Yes" (default) to have Case CATalyst ask if you'd like the Insert dialog to open when a text or steno match is not found by Search. the text or steno searched for will automatically appear in the Insert dialog. Selecting "No" will result in Search notifying you that a match was not found without asking if you'd like to open Insert.

### **Dictionary Verify Options:**

The [Dictionary Verify](#) feature, checks your dictionary for potential issues. In the Dictionary Verify reporter, you may see invalid modification date or invalid used date. There is nothing wrong with the dictionary entry, it is just the date information for specific entries is not correct. You can select to correct the issue by selecting the appropriate option listed below.

### **Fix Invalid Modification Date**

Double click the Fix Invalid Modification Date option to toggle between Yes and No. If set to Yes, Dictionary Verify will reset the dictionary entry date to today's date based on your computer's date.

### **Fix Invalid Used Date**

Double click the Fix Invalid Used Date option to toggle between Yes and No. If set to Yes, the *How to fix used date:* option is active.

### **How to fix used date:**

To select an option to fix the used date, click the down arrow. Select one of the following:

#### **Set entry as unused**

Reset the Usage Count flag to reflect the dictionary entry has never been used.

#### **Set to Modification Date**

Reset the Used date to match the modification date.

#### **Set to today's date**

Reset the Used date to today's date based on your computer's date.

## **Manage Jobs/General**

General and Manage Jobs options allow you to determine settings for:

- [Dialog boxes](#)

- [User icon selection](#)
- [Backing up files.](#)
- [Zip & e-mail](#)
- [Send'em e-mail](#)
- [Send'em Backup](#)
- [Job History](#)
- [Job Manager warnings](#)
- [Job state](#)
- [User Layout](#)

## Dialog Settings

Dialog Settings allow you to customize certain general dialog box options for your user. Before changing the settings, verify you are the current user by checking the name on the Title Bar. If necessary, change to your user name.

- From anywhere in Case CATalyst, select Tools, Options, All Options or click the All Options (  ) icon on the toolbar and select Dialog.
- At Manage Jobs, press **Alt + t, o, j, d** (**Tools, Options, Manage Jobs-General/Dialog**).

## Dialog Box Settings

Make changes and select **OK** when finished.

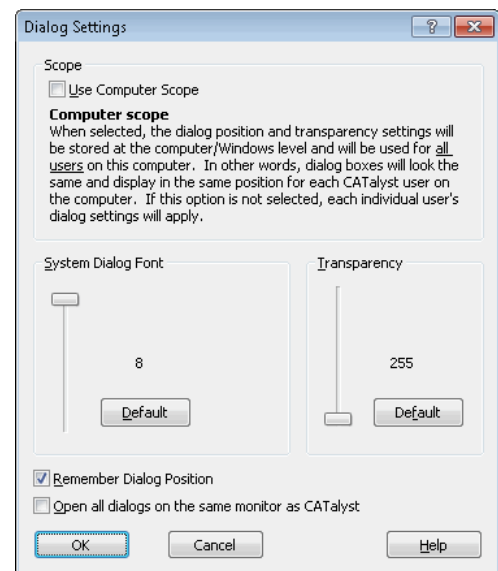

### Use Computer Scope

When this option is selected, the CATalyst dialog box positions and transparency settings will be stored at the computer/Windows level. This means the Dialog settings will be used by all CATalyst users on this computer. This option might be very helpful if you are a reporter or scopist who has multiple users in CATalyst and you always want your dialog boxes to look the same and display in the same position regardless of the user selected. If this option is not selected, then the each individual CATalyst user's dialog box position and transparency settings are used.

### System Dialog Font Size

Select a font size for all general dialog and message boxes. The default font size is 8 points. Using the mouse, move the slide bar up or down to increase or decrease the font size in the dialog boxes. Use the Default button to reset the font size back to the original system setting. The dialog box reflects the new setting the next time it opens.

If you want to customize the font size of an individual dialog box, open the desired dialog box. Right click the Title bar and select **Dialog Settings**. Adjust the slide bar to the desired font size and click **OK**. The Dialog Font Size option, *Use this setting instead of the system dialog font setting*, is automatically selected once you move the slide bar. To reset the font size to the system setting, uncheck the option. The dialog box reflects the new setting the next time it opens.

## Transparency

Set the translucency of the dialog boxes. This might be helpful if your screen resolution is lower and dialog boxes are big. The default setting is 255. Use the Default button to reset the transparency number back to the original system setting.

If you want to set the transparency of an individual dialog box, open the desired dialog box. Right click the Title bar and select **Dialog Settings**. Adjust the slide bar to the desired setting and click **OK**. The Transparency option, *Use this setting instead of the system dialog transparency setting*, is automatically selected once you move the slide bar. To reset the transparency value to the system setting, uncheck the option. The dialog box reflects the new setting the next time it opens.

## Remember Dialog Position

Select this option to retain the placement of repositioned dialog boxes in Case CATalyst. Uncheck this option to always have Case CATalyst dialog boxes open in the center of the screen. To reposition a dialog box, click the title bar and drag the dialog box to a new location.

If you want to set the placement of an individual dialog box, open the desired dialog box. Right click the Title bar and select **Dialog Settings**. In the *Dialog Box* field, choose the desired option and then click **OK**. For example, when you select to playback audio, the Audio Playback Speed dialog box opens in the middle of the screen. To set the placement of the dialog box in a different position, right click the Title bar of the dialog box and select **Dialog Settings**. Select the option, *Always remember the position of this dialog box* and click **OK**. Move the dialog box to the desired position.

## Open all dialogs on the same monitor as CATalyst

When this option is selected and you are using multiple monitors, CATalyst will always open CATalyst dialog boxes on the same computer that is running Case CATalyst.

## Change Dialog Box Font

Changing the font style affects most Case CATalyst dialog boxes except Import, Translate and Print. Standard Windows dialog boxes, such as an Open dialog box, used in Case CATalyst are not affected. To identify a Case CATalyst dialog box, right click on the dialog box Title bar. A *Dialog Settings* option on the menu indicates it is a Case CATalyst dialog box.

To change the font style:

1. In Manage Jobs, press **Alt + t, o, j, d**. (**Tools/Options/Manage Jobs-General/Dialog**). The Dialog Settings dialog box displays.
2. Press and hold **Ctrl + Shift**; and in the *System Dialog Font* field, click the **Default** button. The Font style drop down list displays.
3. Click the down arrow and select a font from the list.
4. Click **OK** to save the changes.

## Select User Icon

Select User Icon allows you to associate a different icon with your user name. For example, let's say you want To change your user icon:

1. From the Manage Jobs screen, verify you are the current user by checking the name on the Title Bar. If not, change to your user name.
2. Press **Alt + t, o, j, u** (**Tools/Options/Manage Jobs-General/Select User Icon**). The Select User Icon dialog box displays.

3. Choose an icon from the Default Icons list or click **Browse** to select an icon/picture from another folder. You can use almost any type of graphic including icon (\*.ico) files. The selected icon displays to the right.
4. Press **Enter (OK)** when finished.

## Backup Options

Backup options determine how files selected for [backup](#) are packaged. You can place each job in a separate package or place all the jobs into a single package. When backing up into a single package, you can select to use a default package name. If you use audio files, you can set options to determine how to handle audio files when using Backup. Backup options do not affect the Zip options set when using the Zip and e-mail feature.

Access Backup options:

- in Manage Jobs. Select **Tools, Options, Manage Jobs/General. Backup.**
- when using the Manage Jobs Backup feature. In the Backup dialog box, select **Options.**
- In Manage Jobs. Click the All Options icon (  ) or press **Alt + t**, select **All Options, Manage Jobs/General** then **Backup.**

## Backup Options

Make changes and select **OK** when finished. (Backup Options settings are separate from the [Back Up User\(s\) Options](#) settings.)

### Back Up Selected Jobs - Single Package / Separate Zip Files

#### Separate Zip Files

When selecting multiple files to be backed up, select this option to have each job (and associated subfiles) in a separate zip file. For example, let's say you select Jones, Smith and Petersen file to back up and you have the Separate Zip Files option selected. CATalyst will create a Jones.zip that contains the selected subfiles, a Smith.zip that contains the selected subfiles and a Petersen.zip that contains the selected subfile. Each file is backed up separately, so when the backup is complete the number of backup files equals the number of jobs selected.

#### Single Package

When selecting multiple files to be backed up, select this option to have all selected files backed up to a single package name. For example, let's say that you are backing up all the important files such as your Personal Dictionary, Macros case, UserSettings, Layout case, etc. Or, for example, let's say that you are backing up an entire case that contains a series of related transcripts. CATalyst creates one Backup.zip that contains all the jobs you selected to back up. The name of the zip file depends on whether you type a name for the single package at the time you back up or if you select the Default Package Name option.

#### Default Package Name

When Single Package is selected, the Default Package Name option is available. To use the same name for each single package backup, use the default backup name *Case CATalyst* or type a new name in the Default Package Name field. Using a default name is useful when you are adding files to the same package or you repeatedly replace files in the backup file. The name entered here displays in the File name field in the Backup dialog box when backing up a job.

To customize the single package name each time you backup, leave this field blank. When you back up a file, Case CATalyst uses the current file name to suggest a backup name: *file name.zip*. Modify the name as necessary. If you back up multiple files the field remains blank and you must type a file name.

#### **Add Date to Zip File Name (YYYY-MM-DD) - No/Yes**

Select Yes to add the current date to the single package zip file name. If a default package name is used, the date is automatically added to the end of the package name. If a default package name is not used, the current date is the suggested package name.

#### **Back Up Audio Files - Always / Never / Warn Me**

Audio files by nature are very large files. Select whether you want to Never back up audio files, Always back up audio files or you would like to be prompted (Warn Me) when you have selected a file for back up that contains an audio subfile. If Warn Me is selected, you can make the decision to back up audio files at the time of backup. The default setting is Warn Me. The following is the Warn Me message:

*PLEASE NOTE: You have chosen to include AUDIO files in this backup. Audio files usually require large amounts of storage space. Do you want to continue? Select YES to continue the backup with audio files. Select NO to continue the backup without audio files. Select Cancel to exit the backup.*

#### **Auto-select Steno X-ray files (.sgxry .sgxr2) - Always / Never**

Steno x-ray subfiles contain steno stroke information that is gathered when writing realtime with a Luminex or Diamante (via USB or WiFi) or élan Mira (via USB). The sgxr2, file contains TrueStroke data for the Diamante® and Wave™ writing machines. [TrueStroke™ data](#) is viewable through Vertical Notes in Edit. The steno x-ray files tend to be large. When you select a job for backup, choose whether the steno x-ray subfile (if available) is automatically selected or not. The default setting is Never.

#### **Auto-select index log files (.sglog) - Always / Never**

The Index Log subfiles contain information provided during the Build Index feature. usually, this subfile is important during the building of the index and may not be useful for archiving purposes. When you select a job for backup, choose whether the index log subfile (if available) is automatically selected or not. The default setting is Never.

### **Zip & e-mail Options**

Zip & e-mail Options determine how the [Zip & e-mail](#) files are packaged. You can place each job in a separate package or place all the jobs into a single package. When placing files into a single package, you can select to use a default package name. If you use audio files, you can set options to determine how to handle audio files when using Backup. Zip Options do not affect the zip options set to [Backup](#) job files, [Back Up User\(s\)](#), [Send 'em e-mail](#), [Send 'em Backup](#) or [Finish 'em](#) backup.

Access Zip & e-mail options in Manage Jobs. Select **Tools/Options/Manage Jobs-General/Zip & e-mail**.

### **Zip & e-mail Options**

Make changes and select **OK** when finished.

#### **Back Up Selected Jobs - Single Package / Separate Zip Files**

##### **Separate Zip Files**

Back up each file separately, so that the number of backup files equals the number of jobs selected. When the subfiles for a job, such as a note file and a text file have the same file name, the subfiles are saved together in one backup name.

### Single Package

A single package is a backup file that contains all the jobs you selected to back up. The associated subfiles are included in the backup for each job. Each of the files retains their individual names within this backup. If necessary, make an entry in the Default Package Name field.

#### Default Package Name

When Single Package is selected, the Default Package Name option is available. To use the same name for each single package backup, use the default backup name *Case CATalyst* or type a new name in the field. Using a default name is useful when you are adding files to the same package or you repeatedly replace files in the package. The name entered here displays in the File name field in the Backup dialog box when backing up a job.

To customize the single package name each time you backup, leave this field blank. When you back up a file, Case CATalyst uses the current file name to suggest a backup name: *file name.zip*. Modify the name as necessary. If you backup multiple files the field remains blank and you must type a file name.

#### Add Date to Zip File Name (YYYY-MM-DD) - No/Yes

Select Yes to add the current date to the single package zip file name. If a default package name is used, the date is automatically added to the end of the package name. If a default package name is not used, the current date is the suggested package name.

### Back Up Audio Files - Always / Never / Warn Me

Audio files by nature are very large files. Select whether you want to Never back up audio files, Always back up audio files or you would like to be prompted (Warn Me) when you have selected a file for back up that contains an audio subfile. If Warn Me is selected, you can make the decision to back up audio files at the time of backup. The default setting is Warn Me. The following is the Warn Me message:

*PLEASE NOTE: You have chosen to include AUDIO files in this backup. Audio files usually require large amounts of storage space. Do you want to continue? Select YES to continue the backup with audio files. Select NO to continue the backup without audio files. Select Cancel to exit the backup.*

#### Auto-select Steno X-ray files (.sgxry .sgxr2) - Always / Never

Steno x-ray subfiles contain steno stroke information that is gathered when writing realtime with a Luminex or Diamante (via USB or WiFi) or élan Mira (via USB). The sgxry2, file contains TrueStroke data for the Diamante® and Wave™ writing machines. [TrueStroke™ data](#) is viewable through Vertical Notes in Edit. The steno x-ray files tend to be large. When you select a job for backup, choose whether the steno x-ray subfile (if available) is automatically selected or not. The default setting is Never.

#### Auto-select index log files (.sglog) - Always / Never

The Index Log subfiles contain information provided during the Build Index feature. usually, this subfile is important during the building of the index and may not be useful for archiving purposes. When you select a job for backup, choose whether the index log subfile (if available) is automatically selected or not. The default setting is Never.

## Send 'em e-mail Options

Send 'em e-mail Options determine how the [Send 'em e-mail](#) zip files are packaged. You can place each job in a separate package or place all the jobs into a single package. When placing files into a single package, you can select to use a default package name. If you use audio files, you can set options to determine how to handle audio files when using Backup. Send 'em Zip Options do not affect the zip options set for [Zip & e-mail](#), [Backup](#) for job files, [Back Up User\(s\)](#), [Send 'em Backup](#) or [Finish 'em backup](#).

Access Send 'em e-mail options in Manage Jobs. Select **Tools/Options/Manage Jobs-General/Send 'em e-mail/Zip & e-mail**.

## Send 'em e-mail Options

Make changes and select **OK** when finished.

### Back Up Selected Jobs - Single Package / Separate Zip Files

#### Separate Zip Files

Back up each file separately, so that the number of backup files equals the number of jobs selected. When the subfiles for a job, such as a note file and a text file have the same file name, the subfiles are saved together in one backup name.

#### Single Package

A single package is a backup file that contains all the jobs you selected to back up. The associated subfiles are included in the backup for each job. Each of the files retains their individual names within this backup. If necessary, make an entry in the Default Package Name field.

#### Default Package Name

When Single Package is selected, the Default Package Name option is available. To use the same name for each single package backup, use the default backup name *Case CATalyst* or type a new name in the field. Using a default name is useful when you are adding files to the same package or you repeatedly replace files in the package. The name entered here displays in the File name field in the Backup dialog box when backing up a job.

To customize the single package name each time you backup, leave this field blank. When you back up a file, Case CATalyst uses the current file name to suggest a backup name: *file name.zip*. Modify the name as necessary. If you backup multiple files the field remains blank and you must type a file name.

#### Add Date to Zip File Name (YYYY-MM-DD) - No/Yes

Select Yes to add the current date to the single package zip file name. If a default package name is used, the date is automatically added to the end of the package name. If a default package name is not used, the current date is the suggested package name.

### Back Up Audio Files - Always / Never / Warn Me

Audio files by nature are very large files. Select whether you want to Never back up audio files, Always back up audio files or you would like to be prompted (Warn Me) when you have selected a file for back up that contains an audio subfile. If Warn Me is selected, you can make the decision to back up audio files at the time of backup. The default setting is Warn Me. The following is the Warn Me message:

*PLEASE NOTE: You have chosen to include AUDIO files in this backup. Audio files usually require large amounts of storage space. Do you want to continue? Select YES to continue the backup with audio files. Select NO to continue the backup without audio files. Select Cancel to exit the backup.*

#### **Auto-select Steno X-ray files (.sgxry .sgxr2) - Always / Never**

Steno x-ray subfiles contain steno stroke information that is gathered when writing realtime with a Luminex or Diamante (via USB or WiFi) or élan Mira (via USB). The sgxry2, file contains TrueStroke data for the Diamante® and Wave™ writing machines. [TrueStroke™ data](#) is viewable through Vertical Notes in Edit. The steno x-ray files tend to be large. When you select a job for backup, choose whether the steno x-ray subfile (if available) is automatically selected or not. The default setting is Never.

#### **Auto-select index log files (.sglog) - Always / Never**

The Index Log subfiles contain information provided during the Build Index feature. usually, this subfile is important during the building of the index and may not be useful for archiving purposes. When you select a job for backup, choose whether the index log subfile (if available) is automatically selected or not. The default setting is Never.

### **Send 'em Backup Options**

Send 'em Backup Options determine how the [Send 'em Backup](#) zip files are packaged. You can place each job in a separate package or place all the jobs into a single package. When placing files into a single package, you can select to use a default package name. If you use audio files, you can set options to determine how to handle audio files when using Backup. Send 'em Backup Options do not affect the zip options set for [Zip & e-mail](#), [Send 'em e-mail](#), [Backup](#) for job files, [Back Up User\(s\)](#) or [Finish 'em](#) backup.

Access Send 'em Backup options in Manage Jobs. Select **Tools/Options/Manage Jobs-General/Send 'em e-mail/Backup**.

### **Send 'em Backup Options**

Make changes and select **OK** when finished.

#### **Back Up Selected Jobs - Single Package / Separate Zip Files**

##### **Separate Zip Files**

Back up each file separately, so that the number of backup files equals the number of jobs selected. When the subfiles for a job, such as a note file and a text file have the same file name, the subfiles are saved together in one backup name.

##### **Single Package**

A single package is a backup file that contains all the jobs you selected to back up. The associated subfiles are included in the backup for each job. Each of the files retains their individual names within this backup. If necessary, make an entry in the Default Package Name field.

##### **Default Package Name**

When Single Package is selected, the Default Package Name option is available. To use the same name for each single package backup, use the default backup name *Case CATalyst* or type a new name in the field. Using a default name is useful when you are adding files to the same package or you repeatedly replace files in the package. The name entered here displays in the File name field in the Backup dialog box when backing up a job.

To customize the single package name each time you backup, leave this field blank. When you back up a file, Case CATalyst uses the current file name to suggest a backup name: *file name.zip*. Modify the name as necessary. If you backup multiple files the field remains blank and you must type a file name.

#### **Add Date to Zip File Name (YYYY-MM-DD) - No/Yes**

Select Yes to add the current date to the single package zip file name. If a default package name is used, the date is automatically added to the end of the package name. If a default package name is not used, the current date is the suggested package name.

#### **Back Up Audio Files - Always / Never / Warn Me**

Audio files by nature are very large files. Select whether you want to Never back up audio files, Always back up audio files or you would like to be prompted (Warn Me) when you have selected a file for back up that contains an audio subfile. If Warn Me is selected, you can make the decision to back up audio files at the time of backup. The default setting is Warn Me. The following is the Warn Me message:

*PLEASE NOTE: You have chosen to include AUDIO files in this backup. Audio files usually require large amounts of storage space. Do you want to continue? Select YES to continue the backup with audio files. Select NO to continue the backup without audio files. Select Cancel to exit the backup.*

#### **Auto-select Steno X-ray files (.sgxry .sgxr2) - Always / Never**

Steno x-ray subfiles contain steno stroke information that is gathered when writing realtime with a Diamante (via USB or WiFi) or élan Mira (via USB). The sgxry2, file contains TrueStroke data for the Diamante® and Wave™ writing machines. [TrueStroke™ data](#) is viewable through Vertical Notes in Edit. The steno x-ray files tend to be large. When you select a job for backup, choose whether the steno x-ray subfile (if available) is automatically selected or not. The default setting is Never.

#### **Auto-select index log files (.sglog) - Always / Never**

The Index Log subfiles contain information provided during the Build Index feature. usually, this subfile is important during the building of the index and may not be useful for archiving purposes. When you select a job for backup, choose whether the index log subfile (if available) is automatically selected or not. The default setting is Never.

### **Job History Options**

Job History Options allow you to set options to help you organize your jobs, such as automatically assign due dates and assign specific colors to the Manage Jobs job folder icons based on the completion state of the job. The completion state of the job is determined by the information stored in the Job History for the job which is assigned automatically by performing a specific action or manually modifying the job state. Job History Options also allows you to change the display of Job History data in Manage Jobs. Access Job History Options:

- in Manage Jobs. Select **Tools, Options, Manage Jobs/General, Job History**.
- in Manage Jobs. Click the **All Options** () icon or press **Alt + t**, select **All Options, Manage Jobs/General, Job History**.

### **Job History Options**

Make option changes as necessary and select **OK** when finished.

#### **Use Job History**

Use the Job History data such as number of pages, creation date and notes to determine the display of information in Manage Jobs. **Yes** is the default.

Select **No** to not display Job History data and improve the speed of Manage Jobs. **Improvement in speed may be especially desired for Network users in Icon view.** By deselecting the Use Job History option, some information may display inaccurately in Manage Jobs.

Deselecting the Use Job History data affects the display of Job History data for all the users on this computer. When you deselect this option, the *Use Colors for Job Icons* option does not apply.

### Use Colors for Job Icons

When you display Manage Jobs in Icon view, you can have different job folder colors which are determined by the job's current state. The job state is recorded in the Job History subfile and can be modified. If you deselect the *Use Job History* option, color status does not apply.

Case CATalyst uses the following colors, which are static:

- Yellow — A steno file that has been read or a file with no Job History.
- Pink — In Progress; includes Read, Translate & In Progress states.
- Blue — Final Edit; includes Final Edit and Proofread states.
- Brown — Printed; includes Final and Draft states.
- Green — ASCII created.
- Dark Gray — Done.

Use the Job History, *Use Color to Show a Job is Due* option, to have the folder color turn red when the job is due. You can automatically assign a due date using the Job History, *Automatically Set Due Date* option.

### Automatically Set Due Date

Automatically assign a due date to a job when the file is translated. Case CATalyst determines the due date based on the job date plus a specified number of days. The job date is created when you write realtime or from the date stamp of the writing machine file. Specify the number of days in the *Number of Days from Job Date* field. You can manually set the due date in Manage Jobs or in the [Job History](#) subfile depending on the Manage Jobs View setting.

#### Number of Days from Job Date

Specify the number of days Case CATalyst uses to calculate the due date for a job. Valid entries are **0 – 60**. If the automatic due date falls on a Saturday or Sunday, Case CATalyst automatically assigns the due date to the following Monday.

### Use Color to Show a Job is Due

Display the job icon in Icon view or the job line in Detailed List view in red (default) on the job's due date. The icon or job line remains red or the color selected until the job state changes to "Done" or another job state. If Yes is selected, see the Due Date Color option to select a due job color. The default setting is Yes.

To set the job icon or job line to change to the due date color prior to the actual due date, make an entry in the *Number of Days before Due Date to Show color* field. Once the job is complete, you will need to manually change the Job State to "Done" or if you use [Finish 'em](#), you can have the job state automatically change to Done that were a part of the Finish 'em process.

#### Due Date Color

The default due date color assignment is red. To change the due date color for the job icons or list view rows, highlight the Due Date Color option and click the down arrow at the end of the field. Use the arrow keys or scroll bar to highlight the color you want. This option is only available if the Use Color to Show a Job is Due option is set to Yes.

#### **Number of Days before Due Date to Show color**

Specify the number of days, before the actual due date for the job, that you want the job icon in Icon view or the job line in Detailed List view to turn red. For example, you may want a few days warning about an upcoming job that is due. Valid entries are **0 – 30**. The default setting is 3. The icon or line remains red until the job state changes to "Done."

#### **Display Search Due jobs Results at startup**

Display the Search Due Jobs Results dialog box when opening a User. All transcripts that meet the due date settings for the current user are listed. The default is No.

You can access the Search Due Jobs Results dialog pane in Manage Jobs using [Search Due Jobs Results](#) feature. Press **Ctrl + Shift + D**, (**Tools/Search Due Jobs**).

### **Job Manager Warnings**

Job Manager Warnings allow you to choose to display a warning message in Case CATalyst when you:

- rename a case.
- copy or move a case that could result in creating a case within a case.
- move a file or files into case using click and drag.
- save a modified macro.

Access the Manage Jobs warning options in Manage Jobs. Press **Alt t, o, j, w** (**Tools/Options/Manage Jobs-General/Warnings**).

### **Job Manager Warnings**

Check the box next to each of the following warnings you want to display. To turn a warning off uncheck the box or when the warning message displays, check the option: *I understand the consequences of my actions. Please stop asking.* When finished with all your changes, select **OK**.

#### **Warn before renaming case files.**

When renaming a case, display a message that prompts you to rename the associated case dictionary and case wordlist. Selecting Yes renames the case and related case dictionary and case wordlist. Selecting No renames only the case. The case dictionary and wordlist are not renamed.

Uncheck this box to not display a message when renaming cases. Case CATalyst automatically renames the case dictionary and case wordlist. You can also deselect this option in the confirmation dialog by checking the box *I understand the consequences of my actions. Please stop asking.*

#### **Warn before keeping case structure when a case within a case could be created.**

Display a message when copying and moving files that results in creating a case within a case. This can occur when you select the Keep Case Structure in the Copy or Move dialog box. Selecting Yes at the prompt copies or moves the files creating a case within a case. Selecting No cancels the copy or move.

Uncheck this box to not display a message that prompts you when the resulting move or copy results in a case within a case. You can also deselect this option in the confirmation dialog by checking the box *I understand the consequences of my actions. Please stop asking.*

### **Warn before moving files using click and drag**

When clicking and dragging a file or case into another case, display a message that prompts you to confirm the move.

Uncheck this box to not display a message when moving a file using click and drag. Case CATalyst automatically moves the file. You can also deselect this option in the confirmation dialog by checking the box *I understand the consequences of my actions. Please stop asking.*

### **Warn before saving macro changes**

When modifying a macro, display a message that prompts you to confirm the save. Saving adds the changes to the existing macro.

Uncheck this box to have not display a message when saving a macro. Case CATalyst automatically saves the macro. You can also deselect this option in the confirmation dialog by checking the box *I understand the consequences of my actions. Please stop asking.*

### **Warn before overwriting an existing PDF**

When printing to PDF, a message displays prompting you to overwrite the PDF file of the same name.

Uncheck this box to have not display a message when overwriting an existing file. Case CATalyst automatically overwrites the file.

## **Job State Options**

Case CATalyst automatically assigns Job States when certain actions are performed on the job file. For example, Case CATalyst assigns the Job State, *Done*, to the jobs included in [Finish 'em](#). [Change Job State](#) allows you to manually change the Job State.

Job State options provide the ability to modify existing default job state names, select folder colors, create customized job states and assign job states to selected functions and features.

To open Job State Options, in Manage Jobs, press **Alt + t, o, j, o** (**Tools/Options/Manage Jobs/General/Job States**).

## **Customize Job States and Assignments**

Make changes as necessary. When finished, click **OK** to save the changes and close the Job State Options dialog box.

### **Job State Customization**

Modify job state names, apply folder colors and create or delete a custom job state.

#### **Modify a job state name**

Highlight a job state name. Click the associated custom name in the *Custom Job State Name* column and type a new name. The new Job State name becomes available in Job State Assignments.

#### **Select job state folder color**

Highlight a job state name and select an available color from the drop down list.

#### **Create a new job state**

Click **New Job State**. Modify the name and assign a folder color as desired. The new job state is available in Job State Assignments section and the Job State Assignments list in Manage Jobs.

For example, you use a scopist and want a job state that reflects you have sent a file to your Scopist. You create a new job state, *Sent to Scopist*. In Job State Assignment you change the Final Edit (Choice 2 Edit) Job State Assignment to Sent to Scopist. Sent to Scopist becomes an available Job State choice.

### Remove a custom job state

Click the job state name and click **Delete Job State**. A delete confirmation dialog box displays, click **Yes** to delete the selected custom job state. The custom job state is removed from the Job State Customization section and removed from the Job State Assignments. You can only delete custom job states.

### Restore Default Settings

Click **Restore Default Settings** to restore the default settings for both the Job State Customization and Job State Assignments sections.

### Job State Assignments

Assign a job state to available functions and features.

1. Highlight a function or feature name.
2. Click the down arrow and select a job state from the list. If you do not want a job state associated with a function or feature, select **Unassigned**.

Click **Restore Default Settings** to restore the default settings. This restores the default settings to both the Job State Customization and Job State Assignments sections.

## User Layout Option

The look and feel of Case CATalyst, such as customized toolbars, right-click menus and [dialog panes](#) settings are controlled by the UserLayout file. Using the Alternate UserLayout option, allows you to apply your customized settings to each user, preventing the need to copy the UserLayout to each user or to open the user name for each reporter and making setting adjustments in each one. For example, you are a scopist who works for several reporters. You have separate user names for each reporter and want to use your customized settings when working in any user. You open each user and select the same Alternate UserLayout. Any changes you make to the selected Alternate UserLayout apply to all the users.

### Select Alternate UserLayout

1. Open the user in which you want to use an alternate UserLayout.
2. In Manage Jobs, press **Alt + t, o, j, y** (**Tools, Options, Manage Jobs/General/UserLayout**). The Set Alternate UserLayout dialog box displays.
3. Check the option, **Use Alternate UserLayout**.
4. In the *Alternate UserLayout Path* field, click the Browse button. The Select UserLayout dialog box displays the System Files content for the current user.
5. Navigate to the location that contains the UserLayout you want to use and click **Open**. The path displays in the field.
6. Click **OK** to save the changes.
7. Repeat the steps for each user in which you want to use the selected Alternate UserLayout.

## Import

Import allows you to convert files of another type to a Case CATalyst file type. For example, importing a Case CATalyst 3.0 file or Premier Power file, converts the file to the current Case CATalyst file type. Importing an RTF/CRE (Rich Text Format/Court Reporter Extension) or RTF or ASCII file, converts the file to the current Case CATalyst file type. Importing a Stentura dictionary converts the dictionary to a file format compatible with Case CATalyst. You can also import an Eclipse (transcript, dictionary and/or steno notes) to convert it to a Case CATalyst file type. You do not need to import an Eclipse transcript to use it in [Case Prep](#). Import options allow you to make default settings that include the following import formats:

- [General](#)
- [Case CATalyst 3.0](#)
- [RTF/CRE](#)
- [Stentura dictionary](#)
- [Eclipse](#)

### General Import Options

General Import Options are a certain group of settings that apply to all import types. In addition to these general settings, it is also necessary to set import options for your specific type of import, such as RTF/CRE or Case CATalyst 3.0.

Access General Import Options:

- in Manage Jobs. Press **Alt + t, o, i** (**Tools/Options/Import**). Click the **General Import Options** tab.
- in the Import dialog box when importing a file. Select **Options** and then click the **General Import Options** tab.

### General Import Options

Make necessary changes on the General Import Options tab and click **Apply**. When finished making changes on all the tabs, click **OK**.

#### Location for Imported Files

The Case CATalyst default folder where you want to store the imported files. Highlight the desired folder from the list in the window. If necessary, use the scroll bar to move the folder list up or down. The folder location displays above the window.

#### Browse

Display the Browse For Folder where you can choose a folder outside of Case CATalyst for storing the imported file. To create a new folder location, click the **Make New Folder** button. When finished, click **OK**.

#### Keep same filename as original system

Check this box to keep the same file name as the original system when you import the file.

#### If original filename already exists, automatically suggest a new name

Check this box to have Case CATalyst automatically suggest a new file name for the imported file if it detects that the imported file name already exists. For example, if you are importing the Smith file and the Smith file already exists, Case CATalyst suggests Smith 1.

## CATalyst 3.0 Options

In addition to setting Case CATalyst 3.0 Options for importing, it may also be necessary to set [general](#) import options. General Import Options are available from the same dialog box as Case CATalyst 3.0 Options.

Access Case CATalyst 3.0 Options:

- in Manage Jobs. Press **Alt + t, o, i (Tools/Options/Import)**. Click the **CATalyst 3.0 Options** tab.
- anywhere in CATalyst, press **Alt + t, o** and select **All Options**. Navigate to the **Import** section.
- in the Import dialog box when importing a file. Select **Options** and then click the **CATalyst 3.0 Options** tab.

## Case CATalyst 3.0 Options

Make necessary changes on the CATalyst 3.0 Options tab and click **Apply**. When finished making changes on all the tabs, click **OK**.

### Default Source Folder

When you select to import a Case CATalyst 3.0 steno note, transcript, dictionary, or page layout file, Case CATalyst automatically looks for source files in this folder.

### Browse

Display the Browse For Folder where you can choose a default folder for storing the imported file. When finished, click **OK**.

### Keep case structure

Check this box to retain the path structure of the Case CATalyst 3.0 source files folder when importing into Case CATalyst.

At the time of Import, you can temporarily change the folder in the Import dialog box by clicking Browse and then selecting the location.

## RTF/CRE Options

In addition to setting RTF/CRE Options for importing, it may also be necessary to set [general](#) import options. General Import Options are accessible from the same dialog box as RTF/CRE Options.

Access RTF/CRE Options:

- in Manage Jobs. Press **Alt + t, o, i (Tools/Options/Import)**. Click the **RTF/CRE Options** tab.
- anywhere in CATalyst, press **Alt + t, o** and select **All Options**. Navigate to the **Import** section.
- in the Import dialog box when importing a file. Select **Options** and then click the **RTF/CRE Options** tab.

## RTF/CRE Options

Make necessary changes on the RTF/CRE Options tab and click **Apply**. When finished making changes on all the tabs, click **OK**.

### Default Source Folder

When you select to import a RTF/CRE transcript, dictionary or note file, Case CATalyst automatically looks for source files in this folder.

### Browse

Display the Browse For Folder where you can choose a default folder for storing the imported file. To create a new folder location, click the **Make New Folder** button. When finished, click **OK**.

At the time of Import, you can temporarily change the folder in the Import dialog box by clicking Browse and then selecting the location.

## Stentura Dictionary Options

In addition to setting Stentura Dictionary Options for importing, it may also be necessary to set [general](#) import options. General Import Options are accessible from the same dialog box as Stentura Dictionary Options.

Access Stentura Dictionary Options:

- in Manage Jobs. Press **Alt + t, o, i** (**Tools/Options/Import**). Click the **Stentura Dictionary Options** tab.
- anywhere in CATalyst, press **Alt + t, o** and select **All Options**. Navigate to the **Import** section.
- in the Import dialog box when importing a file. Select **Options** and then click the **Stentura Dictionary Options** tab.

## Stentura Dictionary Options

Make necessary changes on the Stentura Dictionary Options tab and click **Apply**. When finished making changes on all the tabs, click **OK**.

### Default Source Folder

When you select to import a Stentura Dictionary, Case CATalyst automatically looks for source files in this folder.

### Browse

Display the Browse For Folder where you can choose a default folder for storing the imported file. To create a new folder location, click the **Make New Folder** button. When finished, click **OK**.

At the time of Import, you can temporarily change the folder in the Import dialog box by clicking Browse and then selecting the location.

## Premier Power

In addition to setting Premier Power Options for importing, it may also be necessary to set [general](#) import options. General Import Options are accessible from the same dialog box as Premier Power Options.

Access Premier Power Options:

- in the Import dialog box when importing a file. Select **Options** and then click the **Premier Power Options** tab.
- anywhere in CATalyst, press **Alt + t** and select **All Options**. Navigate to the **Import** section and select Premier Power.

## Premier Power Options

Make necessary changes on the Premier Power Options tab and click **Apply**. When finished making changes on all the tabs, click **OK**.

### Default Source Folder

When you select to import a Premier Power transcript, dictionary (.dct & .job) or note (.stn & .hms) file, Case CATalyst automatically looks for source files in this folder.

### Browse

Display the Browse For Folder where you can choose a default folder for storing the imported file. When finished, click **OK**.

At the time of Import, you can temporarily change the folder in the Import dialog box by clicking Browse and then selecting the location.

## Eclipse

In addition to setting Eclipse Options for importing, it may also be necessary to set [general](#) import options. General Import Options are accessible from the same dialog box as Eclipse Options.

Access Eclipse Options:

- in the Import dialog box when importing a file. Select **Options** and then click the **Eclipse Options** tab.
- anywhere in CATalyst, press **Alt + t** and select **All Options**. Navigate to the **Import** section and select **Eclipse**.

## Eclipse Import Options

Make necessary changes on the Eclipse Options tab and click **Apply**. When finished making changes on all the tabs, click **OK**.

### Default Source Folder

When you select to import a Eclipse transcript, dictionary or note file, Case CATalyst automatically looks for source files in the folder designated in this option.

### Browse

Display the Browse For Folder where you can choose a default folder for storing the imported file. When finished, click **OK**.

At the time of Import, you can temporarily change the folder in the Import dialog box by clicking Browse and then selecting the location.

## Export

Export options allow you to make default selections for [basic ASCII](#), [advanced ASCII](#) and [RTF/CRE](#) export formats.

### ASCII Export Options

ASCII Export Options determine the default location and format for the exported ASCII file. Access ASCII Export Options:

- in Manage Jobs. Press **Alt + t, o, x, a** (**Tools/Options/Export/ASCII**).
- from the Export dialog box on the ASCII tab. Press **Alt + u, x** (**Function/Export**). Select the **ASCII** tab and click **Options**.

### ASCII Export Options

Make changes and select **OK** when finished.

#### Output

##### Default Location

The default drive and folder location where you are creating the ASCII file. Your selection in this field displays under *Key Selected Options* on the Export ASCII tab. From the drop down list, choose a location:

- Same folder as selected file
- A:/
- another folder location. Use **Browse** to add alternate locations to the list.

##### Additional Copy

Check this box to create an additional copy of the ASCII export file. You may want to create a copy on your hard drive to e-mail to your client. From the drop down list, choose a destination location:

- Same folder as selected file
- another folder location. Use **Browse** to add alternate locations to the list.

##### Extension

Select from the list the type of file extension you want to use or type another extension in the field. When you press **Enter** (**OK**) to accept changes to the ASCII Export Options, Case CATalyst adds the new extension to the list.

The default selection is:

**txt**

Compatible with most word processing programs.

**v1**

Compatible with CaseView and some litigation support programs. Using the V1 extension allows an ASCII file to span multiple diskettes.

##### Keep CATalyst Job Name

Check this box to keep the original Case CATalyst file name when you export the file.

**If original filename already exists, automatically suggest a new name**

Check this box to have Case CATalyst automatically suggest a new file name to the exported file if it detects that the file name already exists on the destination location. For example, if you are importing the Smith file and the Smith file already exists, Case CATalyst suggests Smith 1.

**Formatting**

Depending on the format type you choose to create, some options are preselected, unavailable or preset and cannot be changed.

**ASCII Type**

Select an ASCII format from the drop down list:

**Page Image**

A line for line copy of the Case CATalyst printed transcript.

**Compressed**

Removes all unnumbered blank lines.

**DiscoveryZX**

Prepares the file for DiscoveryZX Convert program. To use this ASCII file in DiscoveryZX, the Convert DiscoveryZX program must be used.

This format removes headers, footers, page numbers, form feeds between pages, and all blank lines. Line numbers are retained when a value exists in the Case CATalyst layout for line numbers.

**CaseView**

Removes headers, footers, page numbers, line numbers, and all blank lines. A form feed is inserted between pages and text is set flush to the left.

**Summation**

Removes headers and footers. Page numbers display in the first column as five digits with leading zeros. Leading spaces before line numbers are removed. Line numbers are retained when a value exists in the Case CATalyst layout for line numbers.

**Amicus**

Removes leading spaces before line numbers. Numbered lines with no text are retained but unnumbered lines with no text are removed. Page numbers are flush to the left and display as four digits with leading zeros.

**Raw**

Raw ASCII format is correctly capitalized text with no line breaks, page breaks, headers, line numbers, etc. It inserts one line of text per paragraph. The raw ASCII format might be used for press releases, sports talk transcripts, interviews, etc. When Raw is selected for the ASCII Type, all formatting options are grayed out (not available) except for the Cap All option.

**Include Page Numbers**

Check this box to include page numbers in the ASCII file.

**Column**

When you select Compressed, type a column number for the page number.

### **Include Paragraph Numbers**

Check this box to include the paragraph numbers in the ASCII file.

### **Cap All**

Check this box if you want the text in the ASCII file to appear in all capital letters.

### **Forms Feeds: Beginning of Job**

Include an additional blank page at the beginning of the ASCII file.

### **Forms Feeds: Between Pages**

Ensure the page breaks in the ASCII file coincide with the original Case CATalyst job. The removal of header and footers, blank lines, etc due to type of ASCII format selected can result in the ASCII file page breaks not matching the original Case CATalyst job.

### **Forms Feeds: End of Job**

Include an additional blank page at the end of the ASCII file.

### **Include Line Numbers**

Include line numbers in the ASCII file.

### **Include Headers**

Include the headers from the job in the ASCII file.

### **Include Footers**

Include the footers from the job in the ASCII file.

### **Include Concordance Index (Single Column)**

Include the concordance index in the ASCII file. Since an ASCII file contains text with no attributes, the concordance index can only be included as a single column. This results in a much larger ASCII file.

### **Include Timestamps**

If the original file contains timestamps, you can include timestamps in the ASCII file. Select **one** of the following to determine how timestamps display:

- Clock (Actual time)
- Elapsed (Starting at 0:00)

### **Place Timestamps On Right**

Check this box to place timestamps on the right side of the page. By default, the timestamp position in your page layout determines the placement of timestamps in the ASCII file. This feature is only available if you select the Include Timestamps option.

#### **Auto Position**

Check this box to have Case CATalyst determine the placement of the timestamps on the right side of the page. Uncheck this box to set a fixed position by typing a number in the position field.

#### **Position**

Type the location for the timestamps. The location is a measurement taken from the left edge of the paper in inches. It is typed in decimals. For example, ½ inch is .50. A typical setting is between 7.00 and 8.20. For example, if the Right Margin is set at 7.20, you might set timestamps at 7.50 inches from the left edge of the paper.

### Advanced

Display the [Advanced ASCII Options](#) dialog box where you can set additional ASCII export options.

## ASCII Advanced Export Options

Advanced ASCII Options allow you to set additional export options. Access Advanced ASCII Export Options:

- in Manage Jobs. Press **Alt + t, o, x, a** (**Tools/Options/Export/ASCII**). Click **Advanced**.
- from the Export dialog box on the ASCII tab. Press **Alt + u, x** (**Function/Export**). Select the **ASCII** tab, click **Options** and then click **Advanced**.

## Advanced ASCII Export Options

To make a change, click an option and select a choice from the drop down box. When finished with all your changes, select **OK**. The *Restore Default Settings* option returns all the Advanced ASCII Options to their original Case CATalyst default selection.

### Disable "Insert Disk" prompt when diskette in drive

When exporting an ASCII file to a diskette drive, by default, you are prompted to insert a diskette, even if there is currently a diskette in the drive. Select **Yes** to disable this prompt. No message displays when the file is exported to the diskette in the drive.

Select **No** to have Case CATalyst prompt you for a diskette. This is the default.

### Disable "Second Copy" prompt

After exporting an ASCII file to a diskette drive Case CATalyst prompts you to create another copy ASCII file. Select **Yes** to disable this prompt. No message displays after Case CATalyst exports the ASCII file.

Select **No** to have Case CATalyst prompt you to create a second copy. This is the default.

## RTF/CRE Export Options

RTF is an acronym for Rich Text Format. CRE is an acronym for Court Reporter Extension. RTF/CRE is universal file formats that retain much of the original file formatting and text attributes. RTF/CRE files allow you to exchange jobs between different CAT systems and possibly writing machines. You can exchange steno notes, job dictionaries, and text files by using the [Export to RTF/CRE feature](#). RTF/CRE Export Options determine the default location and format for the exported RTF/CRE file. Access RTF/CRE Export Options:

- in Manage Jobs. Press **Alt + t, o, x, r** (**Tools, Options, Export, RTF/CRE**).
- in Manage Jobs. Click the All Options icon () or press **Alt + t**, select **All Options, Export, RTF/CRE**.
- from the Export dialog box on the ASCII tab. Press **Alt + u, x** (**Function/Export**). Select the **RTF/CRE** tab and click **Options**.

## RTF/CRE Export Options

Check the box next to each of the following options you want to use. To turn an option off uncheck the box. When finished making your selections, click **OK**.

### Output Folder

The default drive and folder location where you are creating the RTF/CRE file. Use **Browse** to select another location. The output selection display on the RTF/CRE tab.

### Keep CATalyst Job Name

Check this box to keep the original Case CATalyst file name when you export the file. Case CATalyst identifies the file type with one of three letters: d for dictionary, t for text, and s for steno. For example, you export the Collins file to RTF format. The dictionary file exports as collins\_d.rtf. The text file as collins\_t.rtf, and the steno note file as collins\_s.rtf.

### If original filename already exists, automatically suggest a new name

Check this box to have Case CATalyst automatically suggest a new file name for the exported file if it detects that the file name already exists in the destination location.

### Retain Tables

When exporting a file to RTF/CRE format, the Case CATalyst default exports the table text but does not export the table format that exists in the file. Check this box to include tables in the exported file. Tables export in table format but may require minor adjustments to the cell margins and line breaks within the cells. For example, you export to RTF/CRE a title page with a three column caption "birdcage" that contains a ) in the middle column. When importing the file into Microsoft Word, it may require narrowing the column containing the ) symbol to permit only one ) symbol per line.

## International

International settings affect features specific to differences in date, font, measurement, language and steno keyboard format that may occur in varying countries. The International options include:

- [Document](#) which affects font type in translation and editing.
- [Steno Keyboard](#) language.
- [User Interface](#) language which currently only supports English.
- [Date Format](#).
- [Measurement](#) that determines the Layout display in metric or inches.

## Document

The Document option determines the font type that displays during translation and while editing. If you change your Regional Language setting in Windows to a language other than English, choose the appropriate Document language in Case CATalyst to match your Windows selection to ensure the correct display of fonts in Case CATalyst.

Access the Document option in Manage Jobs. Press **Alt + t, o, n, d** (**Tools/Options/International/Document**). Click a language from the list to select or deselect it. A check mark next to the item indicates the current selection.

## Steno Keyboard

The Steno Keyboard option determines how and what steno displays in Steno Note files, Vertical Notes and dictionaries. The Steno Keyboard feature allows you to change the steno keyboard format in Case CATalyst to match your writing machine. The default is English, the standard Stentura format. Each user has their own steno keyboard format setting.

When you change the steno keyboard format, note files read, realtime written and dictionaries created after changing the steno keyboard format, reflect the new selection. All files read, realtime written and dictionaries created using the previous steno keyboard format, remain in that format. Copying, moving or importing a file or dictionary does not change the steno in the imported file. For example, you produce five jobs using the default English. For the sixth job, you change the steno keyboard format to Spanish and read a new steno file. The sixth file reflects the Spanish steno keyboard format. The previous five files do not change and reflect the standard Stentura keyboard format, English.

Once you change the steno keyboard format, delete or rename the existing [Steno Shortcut](#) and [Phonetic](#) tables and recreate them based on the new steno keyboard format.

Access the Steno Keyboard option in Manage Jobs. Press **Alt + t, o, n, s** (**Tools/Options/International/Steno Keyboard**) and then select a language from the list.

## Steno Keyboard Formats

The following table is based on the Standard Stentura keyboard format and does not reflect, if different, the correct steno characters and definitions for other language formats. The first line is without the number bar pressed. The second line is with the numeral bar pressed. The pound sign ( # ) is the numeral bar, the open paren ( ( ) ) is the steno mark and the exclamation mark ( ! ) is the wildcard/supertoken which is used in the EZ Speakers dictionary.

Format	Steno Keyboard

*(The letter I appears twice on the right side of the keyboard. The first letter is considered initial I, and the second one the final I.)*

## User Interface

User Interface determines the language in which the Case CATalyst menus display. The only language available at this time is English.

Access the User Interface option in Manage Jobs. Press **Alt + t, o, n, u** (**Tools/Options/International/User Interface**) A check mark indicates the current selection.

## Date Format

The Date Format option determines the format for Static Date, Creation Date and Current Date [fields](#). If a Static, Creation or Current date field already exists in a document when you change the date format, the field retains the original format. The default date format is MM/DD/YY. If you change the format, all new files created using a "date" field display in the new format. This setting affects fields used in transcripts and does not affect the date format at Manage Jobs.

If a Static, Creation or Current date field already exists in a document when you change the date format, the field retains the original format. To reflect the new date format, it is necessary to delete the original date format for the field and then reopen the document. For example, the Date Format is set as MM/DD/YY and you have a Creation Date field in an include file. You change the Date Format to now use DD/MM/YY. To have the Creation Date field reflect the new format in the include file, open the include file. Using the [Insert Field](#) feature, delete the date in the Creation Date field. Save and exit the file. When you reopen the file, the new format is used.

Access the Date Format option in Manage Jobs. Press **Alt + t, o, n, f** (**Tools/Options/International/Date Format**). Click a date format from the list to select or deselect it. A check mark next to the item indicates the current selection.

## Current Display Measurements

Current Display Measurement determine the display of Layout positions in metric or inches. This option affects the Page View display in Edit and Layout preview. Each user has their own display measurement setting.

Access the Current Display Measurement option from Manage Jobs. Select **Tools/Options/International/Current Display Measurements**). Click the radio button next to your selection **Inches** or **Centimeters** and press **Enter (OK)**.

## Themes...

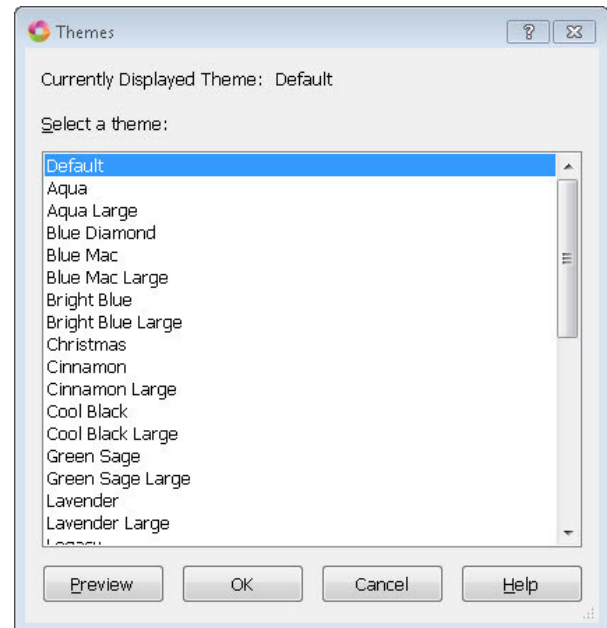

Themes affect the display of the toolbar background color, open file tab colors, dialog pane margins and the format of the open file tabs. There are a variety of pre-made themes available. You can preview a theme by selecting a theme and then clicking the Preview button (Alt + p). The current theme name is displayed at the top of the dialog box.

To Access Themes...

- in Manage Jobs, Translate and Edit and Manage Dictionary, press **Alt + t, o, h** (**Tools/Options/Themes...**).
- anywhere in CATalyst, click the All Options icon () on the toolbar.

**To select a theme:**

1. From Manage Jobs or Translate and Edit, press **Alt + t, o, h** (Tools/Options/Themes...).
2. In the Themes dialog box, highlight a theme and do any of the following:
  - a. To preview the theme, press **Alt + p** (Preview).
  - b. To apply the current theme and close the Theme dialog box, press **Enter** (OK).
  - c. To close the theme box and keep your current theme, click **Cancel**.

## Manage Custom Reminders

Manage Custom Reminder options allow you to create two different customized reminder messages. One message displays each time Edit closes and one displays each time Case CATalyst closes.

Access Custom Reminder Messages options in Manage Jobs. Press **Alt + t, o, c** (Tools/Options/Manage Custom Reminder).

### Custom Reminder Options

Make necessary entries. When finished with your changes, select **OK**.

#### Show 'Closing Edit' Message

Check this box to activate the message that displays each time Edit closes. Make entries in the following fields to create the customized message. To disable the message, uncheck the box.

##### Reminder

Type the text you want to display as the message reminder. For example, "Don't forget to backup files in process."

##### Reminder Desc

Type optional text to display below the reminder text. This text allows you to type a reason for having the reminder text. For example, "Jobs in process are backed up to the F:\drive."

##### Text

Display the reminder message for you to review.

#### Show 'Closing Case CATalyst' Message

Check this box to activate the message that displays each time you close Case CATalyst. Make entries in the following fields to create the customized message. To disable the message, uncheck the box.

### Reminder

Type the text you want to display as the message reminder. For example, "Don't forget to pack your laptop power supply."

### Reminder Desc

Type optional text to display below the reminder text.

### Text

Display the reminder message for you to review.

## Application/Computer Options

Application/Computer Options allow you to set certain defaults for Case CATalyst. Access Application/Computer Options in Manage Jobs press **Alt + t, o, a** or Edit press **Alt + t, o, /** (**Tools/Options/Application Computer Options**).

## Application/Computer Options

To make a change, click an option. Select a choice from the drop down list. When finished with your changes, select **OK**. The *Restore Default Settings* option returns all the Advanced Edit Options to their original Case CATalyst default selection.

### Start-up Settings

#### Start-up Size

Start-up size determines the size and location of the Case CATalyst window when Case CATalyst opens. This setting affects all users on this computer. By default, Case CATalyst is set to open maximized.

#### Last Known Size

Case CATalyst opens with the last customized size and position of the Case CATalyst window. It is necessary to manually resize and position the window. Do not use Windows Aero to resize the window.

It may be necessary to change the Windows settings for the Case CATalyst shortcut icon in order for the *Last Known Size* option to function properly. Some versions of Case CATalyst install with this setting set to *Maximized*. The shortcut setting must be set to *Normal window*. To modify the Case CATalyst shortcut setting, right click the Case CATalyst icon and select **Properties**. On the Shortcut tab, in the *Run* field, select **Normal window**.

#### Maximized

The Case CATalyst window opens to the size of your screen.

#### Full Screen

The Case CATalyst window opens with only the Menu bar and Full Screen toolbar displayed. The Function Bar and all other toolbars are not shown.

### Renew expiring e-Key license

Your e-Key, keyless access, requires reauthorization every 90 days. By default, reauthorization is set to automatically renew. Optionally, you can choose to manually reauthorize via renewal notification. This setting affects the current Case CATalyst application.

**Without Asking**

By default, this option is active to automatically reauthorize e-Key, keyless access, when the renewal date falls within 29 days. e-Key requires reauthorization every 90 days. When reauthorization successfully completes, a message displays indicating successful reauthorization. Close the message box by pressing **Enter**. The 90 days of reauthorization is added to the amount of authorized days currently remaining. Automatic reauthorization requires an Internet connection.

A reauthorization reminder message displays if automatic reauthorization is unavailable. For example, this may happen if you do not have Internet access at the time of automatic reauthorization.

**At User Direction Only**

Display a reauthorization reminder message that requires you to [manually respond](#) to renew keyless access. Internet access is necessary to respond to the notification message for reauthorization. If you do not have an Internet connection, follow the instructions in *e-Key Activation* for [No Internet Access](#).

**Check for Updates****Check for Updates Enabled**

The Check for Updates Help menu item or the Check for Updates button in the [About Case CATalyst](#) dialog box allows all users in this application to check for Case CATalyst updates. Select **Yes** to have the Check for Updates menu item and the Check for Updates button in the About Case CATalyst dialog box active and to receive update reminder messages when you haven't checked for updates for three months. There are some situations where Network Administrators or Instructors, for example, control the Case CATalyst version being used and do not want individuals updating. Select **No** to disable automatic update check reminders and gray out the Check for Updates menu item and button in the About Case CATalyst dialog box. The default is Yes.

**Track Changes****Editor ID**

Designate a name to associate with changes and comments made to a transcript with the [Track Changes](#) feature. When this option is left blank, the current user name is used as the Editor ID. The entry in this field applies to all files for all users on the system. The default is blank. To fill in the Editor ID field, click in the blank field to the right of the option and type the name.

**Always Track Changes in Edit**

The Always Track Changes in Edit option, when set to Yes, automatically sets the Track Changes option to be active when editing. If you are writing realtime and making editing changes in the file, realtime is active and track changes is not active. Once you stop translation (Ctrl + \ or File, Stop Translation) with this option set to Yes, the Track Changes feature is automatically active. This option may be ideal for a scopist who wants to track their changes in every file. If you manually turn Track Changes off in the file, it will remain off until you turn it back on or until you open the file in Edit again. The Always Track Changes in Edit option setting affects all Case CATalyst users on the current computer.

**Edit**

### Fast Save

Save settings works with the widest range of hardware configurations and in most situations, the selection for this option should remain Yes. Yes is the default. In a rare situation, Stenograph Technical Support may recommend changing the option to No. The selection in this field works in conjunction with Auto Save and Auto Recover and has no effect on manual saves made with Ctrl + s (File/Save) or File/Save As.

### Touch Screen Settings

#### Touch Screen Sensitivity

Use the Touch Screen Sensitivity setting to adjust the touchscreen sensitivity in Case CATalyst. This setting may need to be adjusted for each touchscreen. Select a setting between 0 and 8. 4 is the default setting.

- If tapping on the touchscreen, used to move the cursor to that screen location - is not functioning or is resulting in scrolling, select a higher number for this setting.
- If swiping on the touchscreen - used to scroll the screen - is resulting in the cursor position moving like you tapped the touchscreen, select a lower number for this setting.

## Modifying UserSettings Options

There are a few rare instances where you need to open your UserSettings options to modify a setting. If Stenograph's Technical Support Department needed to access your UserSettings file, you will be walked through the process.

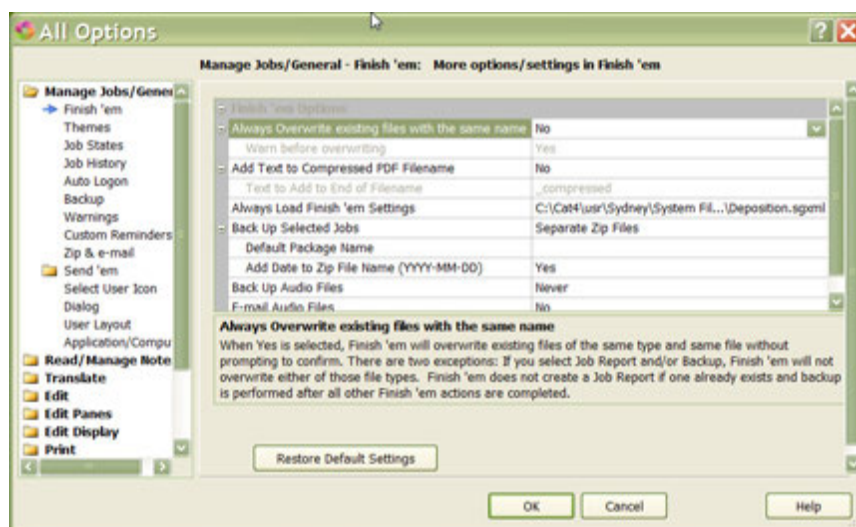

### To modify your UserSettings file:

1. Be sure you are in your User name.
2. From Manage Jobs, open the System Files case and double click the **UserSettings.sgxml** file.  
Or, you can click the System Files case icon () on the Open Special toolbar. In the Open Existing Document dialog box, your cursor defaults to the File Name field. Type **usersettings** and press **Enter**.
3. The Settings Manager dialog box displays.
4. Click in the dialog box (to set the cursor focus) and press **Ctrl + f**. The Find dialog box displays.
5. Type **keywords for the option/function you are searching for** and press **Enter** to move to the Voice-Tran-Settings section. '
6. Do any of the following:
  - To change the action of an option, click the **Edit** button on the right type the appropriate value, press **Enter** and then click **OK**.
  - To set an option back to the default settings, click the **Edit** button on the right, then click the **Default** button, and then click **OK**.
7. Press **Alt + s** (Save) to save the settings and close the dialog box. To disregard changes you have made, click the **Cancel** button.
8. Start the appropriate function and test the changes.

## All Options

For easy access to the majority of CATalyst options in one location, the All Options menu item is available at the bottom of all Tools menus. CATalyst BCS options are available at the bottom of the list. The All Options dialog box displays options starting with Manage Jobs, then Read/Manage Jobs and continues with options for all the different CATalyst functions. There may be additional options available in the actual function. For example, if you select Print in the All Options dialog box, you can set the default printer. When you go to the Print dialog box to print a specific file, additional options are available there because they are specific to a particular print session.

An All Options icon  is available on the Standard toolbar. If you have not modified your Standard toolbar, the icon automatically is added to the Standard toolbar in each area of CATalyst (Manage Jobs, Edit, Dictionary, etc.) when you updated. If you have modified your Standard toolbar, you can add the icon to your Standard toolbar by clicking the down arrow on the right hand side of the Standard toolbar. Select Add or Remove Buttons, Standard and click All Options. You will see the new All Options icon added to the end of the Standard Toolbar.

Keyboard map functions available in Edit, Dictionary and Caption keyboard maps

Open All Options Dialog

## Cloud Backup

Cloud Backup is a backup and restore service available in Case CATalyst. The service is exclusive to those who have Edge for Case Catalyst ("Edge"). Case CATalyst's Cloud Backup compresses and encrypts your files when uploading (backing up) and storing the files in the Cloud. There are many backup services available but sometimes hectic schedules and lack of time prevents users from backing up their files. Case CATalyst's Cloud Backup offers you a simple setup, an automatic pause during realtime and confidence that your CATalyst files are being backed up and are available to you in the event you need to restore them. CATalyst's Cloud Backup is built into your Case CATalyst software and backs up the files in the selected users/cases. [Specific files types](#) can be also be excluded. For example, if you don't want your .wav (audio) files backed up since audio files can be very large, you can exclude .wav files from being backed up to the cloud. Cloud Backup is not available on Student Version Case CATalyst or institutions running Case CATalyst via Network Keyless Access.

Getting started is as simple as having an internet connection, [creating an account](#) and [selecting a user](#) or users to back up and Case CATalyst does the rest. Once Cloud Backup has started, the service is always running, checking for and backing up new or modified files. However, once you start realtime or a BCS session, the service will automatically pause. The incredible advantage to the automatic pausing of Cloud Backup while you are writing realtime is you don't have to worry that the backup process is going to have an adverse effect on your system's performance, i.e. having potentially inaccessible files and/or slower processing speed and lagging realtime. Once realtime has ended, Cloud Backup automatically picks up backing up files where it left off. Cloud Backup will release a file that is currently being backed up when the Cloud Backup Service is paused either from the Cloud Backup dialog box or the Windows System Tray service. Once Cloud Backup is paused, you can move, rename or delete the file. When you select to resume, Cloud Backup will continue backing up all files that are new or have changed including the entire file that was released when you paused the service.

In addition to Cloud Backup automatically pausing while writing realtime, files that are currently open are not backed up until the file/files are closed. If you are editing a transcript/file or have open transcripts/files, those transcripts/files will not be backed up while they remain open. Once the files are closed, CATalyst will back up the files. Uploads (backups) are done on a directory basis, first backing up newer files, which are not currently open. Then, Cloud Backup finds files in the same directory that need to be backed up and continues until the all designated folders/files are uploaded. Cloud Backup then starts at the beginning again looking for the newest files that need to be backed up. Only one version (the newest) of the file will be stored in the Cloud. For example, let's say you wrote a realtime file yesterday afternoon named JONES-8-07-17. Cloud Backup backed it up when you closed the file. Today you finish editing the same file and it uploads to the cloud. Today's version of the JONES-8-07-17 is the only version that exists in the Cloud. It is also important to know that if you now moved the JONES-8-07-17 file into your August 2017 case (because you organize all your files by month and year) the result will be that you have two copies of the JONES-8-07-17 file in the Cloud. If the only copy you want archived in the Cloud is the one in the August 2017 case, then you would verify the file is in the August 2017 case and select to delete files in the Cloud and delete the JONES-8-07-17 file that is in the main level of Manage Jobs. In other words, you could have multiple copies of the same file in the Cloud because of moving, copying or renaming files/cases.

Closing Case CATalyst or closing the Cloud Backup dialog box does not shut down the backup service. You can manually pause the Cloud Backup in the Cloud Backup Status dialog box if you feel you need to suspend the backup process for some reason. Once you close Case CATalyst and turn off your computer, the Cloud Backup service is stopped. Cloud Backup starts again when the computer is turned on. If you have Windows 8 operating system or above and you have a cellular connection to the internet, you can deselect the [Use Cellular Data](#) option and in Windows, set your wireless connection to metered. Cloud Backup will automatically be suspended on a metered network.

Restoring backed up files from the cloud to your computer is as easy as selecting the appropriate file/files in the Cloud Backup Restore dialog box and clicking Restore. For example, you keep only current or in progress transcripts/files on your hard drive and you back up complete transcripts to the cloud. You get an order for a transcript from six months ago that you need to restore from the cloud. You simply access your Cloud Backup account, select Restore Files and select the file and restore it. When restoring a file/files from the Cloud to your computer, you can have any existing files of the same name that still exist on your computer be overwritten, renamed or restored to a different location. Selected files that are restored from the Cloud, still exist in the Cloud and are not deleted. For more information, see [Restoring Files from the Cloud](#).

Cloud Backup is a free service that is included with your Edge and gives you a generous amount of storage space. If you feel you need additional storage space, please contact Stenograph's sales department. You can manage your Cloud Backup storage space by excluding specific folders and or file types from backing up. You also have the ability to delete files from the cloud. Deleting files from the Cloud has no effect on files on your computer's hard drive. And once files are backed up to the Cloud, deleting files from your hard drive has no effect on files stored in the Cloud.

**Important:** Uploading (backing up) speed, regardless of what backup program you are using, is typically 2 - 3 times slower than downloading (restoring) speed. The amount and size of the files in your CATalyst directory and uploading speed will affect the time it takes to back up all your CATalyst files. Please realize it most likely will take several hours (or even days) to backup your Case CATalyst files the first time you login. If you use multiple computers, time will be required for each computer's CATalyst files to be backed up.

If you have used approximately 90% of your Cloud storage space the following message displays:

*You are nearly out of storage space in the Cloud.*

*X GB of X GB used.*

Click **OK** or the message will close in 15 seconds if no action is taken.

If you are out of your Cloud storage space the following message displays:

*Unable to Back Up to the Cloud.*

*You are out of storage space in the Cloud.*

*X GB of X GB used.*

*Please call Stenograph to upgrade your storage: 800-323-4247.*

## Creating a Cloud Backup account

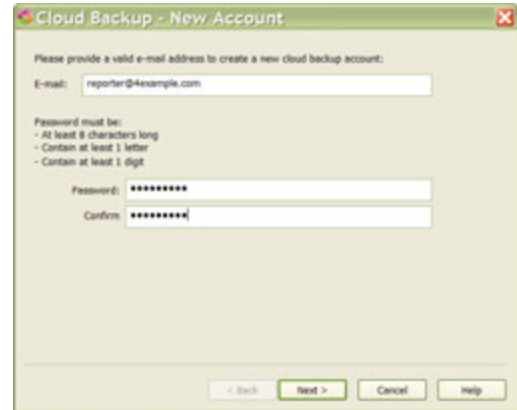

[Cloud Backup](#) is a service available in Case CATalyst. The service is exclusive to those who have purchased "Edge". There are many backup services available but there are times when things get in the way of backing up work files. CATalyst's Cloud Backup offers you a simple setup, automatic pause during realtime and confidence that your CATalyst files are being backed up and are available to you in the event you need to restore them. CATalyst's Cloud Backup is built into your Case CATalyst software and backs up files in the selected users/cases. The Cloud Backup status is represented with icons on the [Windows System Tray](#).

To get started with Cloud Backup, you need to create an account and then you can select a user or users to be backed up. The account you create is associated with your e-key license/PKC (product key code). If you have several computers that you use for Case CATalyst or CATalyst BCS, once you create an account/login, sign into Cloud Backup on each computer with your login. Cloud Backup will track files backed up by each computer to your one Cloud Backup account.

1. To create a Cloud Backup account, click the  icon or select Function and then Cloud Backup. The Account Settings dialog box displays. Click the **Create New Account Now** button to create an account for the Cloud Backup.
2. At the Create a New Account dialog box, type a valid e-mail address. A valid e-mail address must include the "at" (@) sign. If you don't type an email address that contains the @ sign, the *Please enter a valid email* message displays.

3. In the Password field, type a password for your account. Please note that the password must be at least 8 characters long, contain at least one letter and one digit. If you did not include the required password items, a *Please follow the rules to enter a valid password* message displays and you will need to type a new password.
4. In the Confirm Password field, type the same password you typed in the Password field. If this password doesn't match the first password you type, the message *The passwords don't match* message displays.
5. Once you have successfully entered a valid email address and created and confirmed an acceptable password, click **Next**. At this point, you may want to write down your e-mail address and password.
6. The second Create Account dialog box displays with three sets of security questions. Click the down arrow  at the end of the displayed question to see a list of questions. Select a question and type your answer in the appropriate field for each of the three questions. Two questions and answers will be used in case it is necessary to recover your password.

Cloud Backup - New Account

Please provide a valid e-mail address to create a new cloud backup account:

E-mail:

Password must be:

- At least 8 characters long
- Contain at least 1 letter
- Contain at least 1 digit

Password:

Confirm:

< Back Next > Cancel Help

Answer Security Questions

Please choose three security questions and provide answers.  
These questions will be used to recover your account in case of a lost password.

Question 1: What is the first name of your best friend in high school? 

Answer:

Question 2: Who was your favorite singer or band in high school? 

Answer:

Question 3: What is the name of your favorite sports team? 

Answer:

< Back Next > Cancel Help

7. The Create New Account dialog box displays stating that the cloud backup account has successfully been created.

It is important to write down your user e-mail and password in the event it is needed in the future.

Click **Finish** to sign into your account.

8. At the Account Settings dialog box, your email address and password should already be filled in, click **Next**. The *Please wait while we login* dialog box displays. Once the login is complete, the Select User for Cloud Backup dialog box displays.

9. The Select User for Cloud Backup dialog box defaults to showing all the users in the user roots you have in CATalyst.

You can select one or more user names that contain files you want backed up.

10. All files in a selected user will be backed up unless selected folders within the user are excluded and/or selected file types are excluded from being backed up.

**Please note: if you have users on a network user root, these network users may display but they cannot be backed up.**

- To select an entire user, click the check box (☐) in front of the user name and the user will be selected. For example, in the screen shot you see that the users Joan and Sydney have been selected. All files in the Joan and Sydney user will be backed up with the exception of excluded files types.

- To expand the user name to see folders/cases and files, click the plus sign (+) in front of the user name. You can select or deselect specific cases within a user.

11. Click **Next** to continue. The Cloud Backup Status dialog box displays.

For more information, please see the following topics for [selecting users/cases](#), [excluding specific files types](#), [restoring files](#) and [deleting files from the Cloud](#).

## Cloud Backup Status dialog box

[Cloud Backup](#) is a backup and restore service available in Case CATalyst. The service is exclusive to those who have “Edge”. Case CATalyst's Cloud Backup offers you a simple setup, automatic pause when writing realtime and confidence that your CATalyst files are being backed up and are available to you in the event you need to restore them. Once Cloud Backup is started, the service is always running and backing up the files in your selected users/cases unless you are writing realtime or have open files.

Once you have created your [Cloud Backup account](#), logged in and selected the folders you want backed up, when you click the Cloud Backup icon or press **Alt + u, k** (Function, Cloud Backup), the Cloud Backup Status dialog box displays. The Cloud Backup Status dialog box displays important information about the Cloud Backup status such as whether the service is running or paused and the total number of files backed up. If currently backing up files, it displays the current number of bytes of the current file and the current name, folder and user name. The Cloud Backup Status dialog box also displays the amount used of the current storage space available.

If you use a mobile hotspot or MiFi device, on Windows 8 and higher you can set a network connection to be metered so that you won't use your cellular data. If you use a metered network connection, when you open the Cloud Backup Status dialog box, the Current Status will read: Suspended On Cellular Network. For more information, see [metered networks](#).

The Catalyst [Backup System Tray](#) application is installed with CATalyst. This application displays Cloud Backup's status with icons in the System Tray area. If you hover your cursor over the Cloud Backup icon, a tooltip will display and in some cases, a Windows notification will display.

### Cloud Backup Status dialog box:

**Current Status:** Displays whether Cloud Backup is currently running or paused.

**Pause button:** The Pause button (  ) allows you to manually pause Cloud Backup. When Cloud Backup is paused, the Pause button turns into a Play button (  ) and the word **PAUSED** displays in the Current Status field.

**Overall progress bar and numbers:** Displays the overall progress of backed up files. The progress bar indicates Cloud Backup is running and the progress. The numbers below indicate the overall progress of the files backed up. The first number indicates the overall progress of files currently being backed up and the second number shows the total number of files selected to be backed up. If the two numbers match, it means all files in the selected folders have been backed up. (The color and look of the Overall progress bar depends on your selected Case CATalyst theme.)

**Current File progress bar and numbers:** Displays the current progress of files being backed up. The progress bar indicates the progress of the current file being backed up. The numbers below indicate the number of bytes of the file currently being backed up. The first number indicates the progress of the file being backed up and the second number indicates the total number of bytes in the file currently being backed up. If it displays 0/0 it means no file is currently being backed up.

**Current File:** Displays the name of the file currently being backed up.

**Current Folder:** Displays the name of the folder/case where the current file is located.

**Current User:** Displays the name of the user where the current folder is located.

*X GB of X GB used:* Displays the amount of space your backed up files have used out of the storage space allowed in the Cloud Backup storage space. You can increase the size of your Cloud Backup space by calling Stenograph's Sales Department.

*Settings button:* Allows access to resetting your password, including/excluding folders, excluding specific file types and deleting files from the cloud.

*Restore Files:* Allows access to your files that are stored in the cloud in order to download a file to your hard drive.

*Close:* Allows you to close the Cloud Backup Status dialog box. Remember, closing the Cloud Backup Status dialog box does not stop or turn off the Cloud Backup service. You can manually pause the Cloud Backup in the Cloud Backup Status dialog box if you feel you need to suspend the backup process for some reason. Once you close Case CATalyst and turn off your computer, the Cloud Backup service is stopped. When you turn on your computer, the Cloud Backup service starts again.

For additional actions, see [Settings](#) and [Restore Files](#).

## Cloud Backup Settings dialog box

The Cloud Backup Settings dialog box allows you to change your password, select what users and cases you want to back up, what file types (extensions) you want to exclude from being backed up, rename your computer for Cloud Backup, access to permanently delete files from the Cloud, Cellular Data Usage option and whether you want to see the Cloud Backup Indicators in Manage Jobs. The Settings dialog box is accessed from the Cloud Backup Status dialog box.

### [Change Password](#)

#### Options:

### [Select Users/Cases](#)

### [Exclude Extensions...](#)

### [Computer Name...](#)

### [Permanently Delete...](#)

### [Cellular Data Usage](#)

### [Show Cloud Backup Indicators in Manage Jobs](#)

## Select Users/Cases

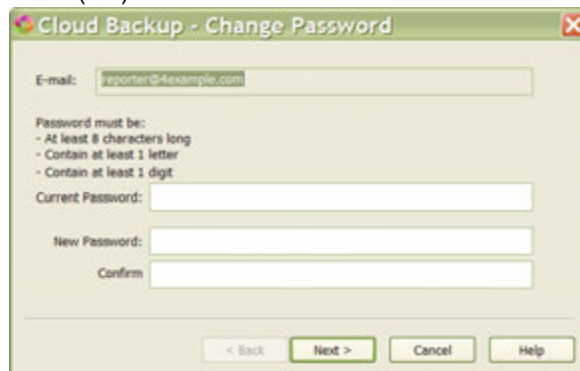

[Cloud Backup](#) allows you to include or exclude specific CATalyst users and/or user cases. For example, a user might want to exclude the [AutoArchive](#) case from being backed up or perhaps the Captioning case in the Systems Files case because he/she doesn't caption. As another example, let's say a scopist has four user names in Case CATalyst because at one time he/she scoped for four reporters and all their files were kept in the respective user name. The scopist no longer scopes for a reporter, named Jeff. The scopist could exclude (deselect) Jeff's user name and none of his files would be backed up to the Cloud. When a case or user is excluded, the universal red circle with a line through it displays before the case or user name in the Select Users/Cases dialog box.

If no users/cases are selected to be backed up, no user files will be backed up. If you did at one time back up users/cases, those files remain in the Cloud but no other files will be backed up until user/cases are selected in the Select Users/Cases dialog box.

#### To include/exclude folders:

1. To open the Cloud Backup Status dialog box, click the Cloud Backup icon  or press **Alt + u, k** (Functions, Cloud Backup).
2. In the Cloud Backup Status dialog box, click the Settings button or press **Alt + o**.
3. In the Cloud Backup Settings dialog box, click Select Users/Cases... button or press **Alt + s**.
4. Do **any** of the following:

- To select all the users in your Case CATalyst [user root](#), click the check box (☐) in front of the user root (C:\CAT4\usr). A check box with a check (☒) will display before the user root and all users in that user root will be backed up. In most situations, you may only have one user listed. If you are a scopist, you may have multiple user names based on your clients.
- To select only specific user names, click the check box (☐) in front of the user name that you want to back up to the Cloud. All cases and sub-cases in that user will have a selected check box(☒) before the cases and all will be backed up.
- To exclude specific cases within a user, click the check box (☐) in front of the user name, then click the plus sign (+) in front of the user name to expand the view and then click the check box in front of the case/sub-case you want to exclude. The check box ☒ turns to an excluded user/case check box ☒. All folders and subfolders/cases with the red *not circle* (⊗) will be excluded. When a case is excluded within a user name, the user name check box will turn black (☐) to indicate one or more cases/sub-cases have been excluded.

If a case is not excluded but there are sub-cases inside of that case that have been excluded, then the case check box will be black.

5. When finished selecting/deselecting users/cases, click **OK**. To close the Cloud Backup Settings dialog box, press **Alt + c** or click the Close button.

## Excluding Specific File Types

[Cloud Backup](#) allows you to exclude specific files types or file extensions from being backed up to the cloud. Excluding certain file types may be especially useful if you want to take full advantage of your Cloud Backup storage space with only the file types you want backed up. For example, audio files (.wav) can be very large and take up storage space. If, once transcript is complete you delete the audio file then you might want to exclude audio files (.wav) files from being backed up to the Cloud. As another example, if you use Stenograph's Luminex and/or Diamante to write realtime, a Steno X-ray (.sgxr2) subfile is created as a useful tool while editing. The Steno X-ray subfile may also be large and not needed once the transcript has been edited.

An Exclude Extensions... button is available in the Cloud Backup Settings dialog box. You can exclude additional file types or remove file types from the default exclude list if you want those file types backed up to the Cloud. By default, the following file types are excluded:

- .dmp – file created if CATalyst crashes
- .sgbak – temporary files
- .sgdel – temporary files
- .sgold – temporary files
- .sgsav – temporary files
- .sgkbu - keyboard usage subfile
- .sgngl\_A1-A3 - copies of [autoarchived](#) files
- .sgcap\_A1-A3 - copies of autoarchived caption file
- .sgdct\_A1-A3 - copies of autoarchived dictionaries
- .sgxr2 – steno x-ray file created by the Luminex and Diamante (can be large in size)
- .sgxry – steno x-ray file created by the élan Mira (can be large in size)

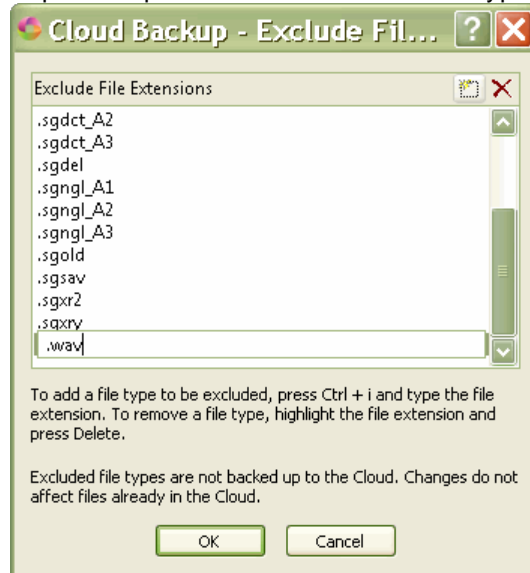

- to exclude additional file types, click in the list of files area and press **Ctrl + i** and type the file extension. For example, to exclude audio (.wav) files, type **.wav**.

- to remove an existing file type from the list, highlight the file type and press Delete on your computer keyboard. For example, if you want your Luminex or Diamante steno x-ray to be backed up so you can analyze your writing at a later date, highlight .sgxr2 and press Delete.

NOTE: Selecting to exclude file types now has no effect on files that are already backed up to your Cloud Backup.

1. To open the Cloud Backup Status dialog box, click the Cloud Backup icon  or press **Alt + u, k** (Functions, Cloud Backup).
2. In the Cloud Backup Status dialog box, click the Settings button or press **Alt + s**.
3. In the Settings dialog box, click Exclude Extensions... button or press **Alt + x**.
4. The Exclude Extensions dialog box displays with the default excluded file types listed. Do **any** of the following:
  - To add a file type to the exclusion list so the added file type will not be backed up to the cloud, press **Ctrl + i** or click the Insert (  ) icon. An empty box displays, type a period followed by the file extension. For example, to prevent audio (.wav) files from being backed up to the cloud, type **.wav**

Repeat the process to exclude more file types.

- To remove a file type from the list and have those file types backed up to the cloud, highlight the file extension and press **Delete** or click the  icon.  
*Changes do not affect files that are already backed up in the Cloud.*
- 5. To save your changes, press **Enter** (OK). To disregard your changes, click Cancel. To close the Settings dialog box, press **Alt + c** or click the Close button.

## Restoring files from the Cloud

Once your files are backed up to the cloud, there may come a time when you need to download a file or case. For example, let's say you are an official reporter and a transcript has been ordered for a proceeding that you reported months ago. In the Cloud Backup Status dialog box, you simply select Restore Files and select the file/files you want to download to your hard drive. Restoring or downloading files from the cloud does not remove them from the cloud, it simply makes a copy of the file on your hard drive. You might also restore a file from the Cloud to work on it on a different computer. For example, you were writing realtime, when finished, you used the [Cloud Back Up Now](#) command to make sure the file was sent to the Cloud. You get home and want to edit the realtime file on your home computer so you restore the file from Cloud Backup to your home computer.

When restoring a file from the cloud, if a version of the file already exists on your hard drive, you can have Cloud Backup overwrite the existing file on your hard drive, rename the existing file on your hard drive or restore the file to a different location.

### To Restore Files from the Cloud:

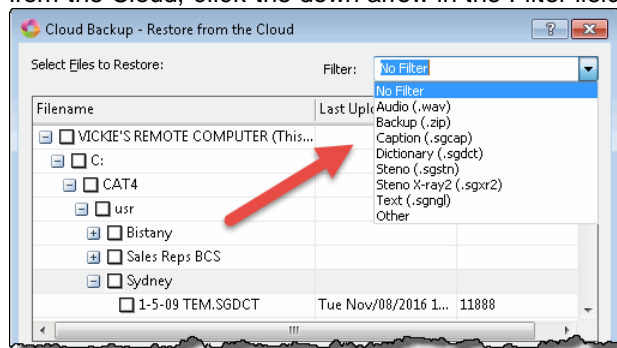

1. To open the Cloud Backup Status dialog box, click the Cloud Backup icon  or press **Alt + u, k** (Functions, Cloud Backup). When using a [metered network connection](#), a message displays prompting you to continue or not with the restore.
2. To select files to restore, press **Alt + r** or click the Restore Files button. The Cloud Backup - Restore from the Cloud dialog opens and a *Gathering Files from the Cloud. Please Wait...* message displays momentarily while Cloud Backup retrieves the user's information and displays the current computer name (the [computer name](#) comes from Cloud Backup if you rename it for Cloud Backup or it comes from Windows setup). The cloud retrieves the user's information and displays the files in an

expanded tree view based on the current user. If you have backed up from more than one computer, each computer name will display. To expand the view, click the plus sign (+) in front of the computer name and then continue to click the plus sign in front of each item to expand the view as needed to locate what you want to restore. The filename displays, the date the file was last backed up (uploaded) to the cloud and the size of the file.

The computer name is based on the computer name in Windows unless you have changed the name using the [Computer Name...](#) feature in Cloud Backup Settings dialog box.

3. To filter the display to only show a specific file type or file types for files you want to restore or delete from the Cloud, click the down arrow in the Filter field to display the list of file types.

To filter for a file type not listed or filter for multiple file types, select **Other** and type in the Filter field to filter for a different file type or to add multiple file types. Start each file type with a period followed by the extension and then type a semi-colon (;) and type the next file type extension. In the following screen shot, Cloud Backup Restore is being filtered for audio and steno x-ray2 files. In the following screen shot, Cloud Backup Restore is being filtered for audio and steno x-ray2 files.

4. You can select individual files and/or cases. If you select a case, all matching files types in the case will be selected unless the subfile is excluded in [Exclude Extensions...](#) list. To select a case or file, click the case/file name to put a check mark (☑) in front of the case/file. Select as many cases/files as you want to restore.

5. In the Restore Folder: field, click the down arrow (▼) to display the location options. The default setting is Original Location.

**Original Location** - restores the file/files to the same location from which they were backed up.

**Desktop** - restores the selected file/files to your computer's Desktop.

**Other** - allows you to navigate to a location on your computer and restores the file/files to that location.

6. In the Existing Files field, click the down arrow (▼) to display the action options if a file/case with the same name exists in the selected restore location.

**Rename** - will add a number to the end of the existing file name of the same file on your computer's hard

drive. For example, if you are restoring Jones04072016 from the Cloud and Jones04072016 exists on your computer's hard drive, once restore is complete you will have Jones04072016 (restored file) and Jones04072016\_1 (existing file on your hard drive). Rename is the default action.

**Overwrite** - the existing file on your hard drive will be overwritten by the restored file from the Cloud. Using the previous example, when restore is complete, you will have one Jones04072016 file on your hard drive.

Once you select the restore location and download action, your selections are displayed.

Restore To: Other Existing Files

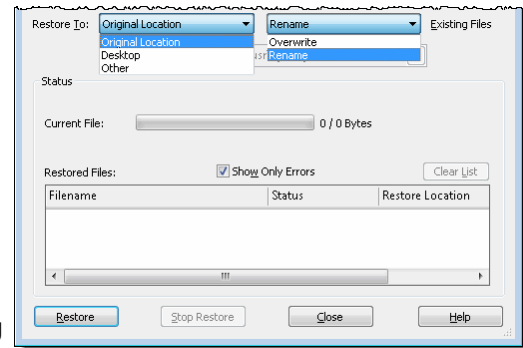

Please Note: If you just installed Case CATalyst and created the same CATalyst user name as you have on another computer, you most likely want to select Overwrite in this situation so you don't have your restored files and the CATalyst default files followed by a 1. For example, when you install Case CATalyst and create a user, by default you get a UserSettings file. If you select Rename, you will have UserSettings (your settings file) and UserSettings\_1 (default settings file).

7. In the Restored Files section, there is a Show Only Errors option which is selected by default. When this option is selected, only file names that experience an issue during restore will be listed. If no errors are encountered while restoring, the *No errors while restoring* message displays when the restore is complete. No file names display.

If you want to see the filenames, restore status and restore location of the files restored, deselect the Show Only Errors option. Once the files have been restored, you can use the Clear List button (**Alt + L**) to clear the list.

8. To begin the restoring of the selected files, press **Alt + r** or click the Restore button. The Current File: field displays the progress of the restored files and the Restored Files section displays information based on your selection in Step 6.

Once the selected files have been restored, the restore completed dialog box displays, press **Enter** (OK) to dismiss the dialog box.

9. If you are finished restoring files to your computer, press **Alt + c** (Close) to close the Restore dialog box.

Things to know:

- If you filter for a specific file type or files types and no matching file is found, the following dialog box displays:

- If you select to Close the dialog box while restore is still in progress, the *Files are being restored!* message displays.

Press **Enter** to stop the restore process.  
Click **No** to have the restore process continue.

- If you want to stop the restore process, press **Alt + s** (Stop Restore). The *Restore Canceled by User* message displays.

## Changing your Cloud Backup Password

Once you have created your Cloud Backup login, you can change your password at any time. File security is of the utmost importance so maintaining a secure password is a must. If you routinely change your password for all your online programs/services, you can easily do that for Cloud Backup too by clicking the Change Password button.

**Change your Cloud Backup Password:**

1. At Manage Jobs, press **Alt + u, k** or click the Cloud Backup  icon.
2. In the Cloud Backup Status dialog box, press **Alt + s** (Settings).

3. In the Settings dialog box, press **Alt + p** (Change Password).
4. Do the following:
  - a. In the Current Password field, type your current Cloud Backup password and press **Tab**.
  - b. In the New Password field, type your new password following the password requirements listed and press **Tab**.
  - c. In the Confirm field, type the same password you typed in the New Password field and press **Enter**.
5. The *Congratulations* message displays when all the information is correct and match. If the information doesn't match, a *An error occurred. Please Try Again* message displays. Go to **Step 4** and repeat.

## Forgotten Password

The Forgot Password feature may be needed when purchasing a new computer or [after changing the password](#) on one computer and then needing to login on another computer and you forgot the password you set up. Once you [create a Cloud Backup account](#), you can use that login name and password on multiple computers. For example, let's say you create a Cloud Backup account on your office computer. You logged in and uploaded all your Case CATalyst files. You primarily do all your work on your office computer but you just purchased a second computer for home. You set up the home computer, load Case CATalyst and when you click on Cloud Backup, you are prompted for the user e-mail and password. You can't remember the password you used so you use the Forgot Password feature and are up and running on your home computer too.

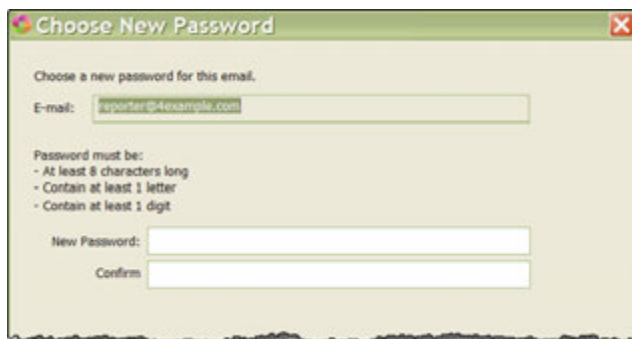

### Forgot Password

1. At Manage Jobs, press **Alt + u, k** or click the Cloud Backup  icon.
2. If you are logging in on a new computer, at the Cloud Backup Login type your e-mail associated with Cloud Backup and press **Alt + f** (Forgot Password).

3. At the E-mail prompt, type your e-mail address if prompted and press **Enter** (Next).
4. The Answer Security Questions dialog box displays two of your three security questions. Type the correct answers for each and press **Enter** (Next).

- If the answer match your original setup, the Choose New Password dialog box displays. In the New Password file, type your new password for you login and type the same password in the Confirm field and press **Enter**. The *Congratulations* message displays when the passwords match. If you have two computers, once you create a new password on this system, you will be prompted to change the password on the other system so the passwords match.

- If one or both of the answers don't match, the *An error occurred. Please try again* message displays. Press **Enter** (OK) to display the Answer Security Questions dialog box again with different security questions.

## Deleting Files from the Cloud

Files backed up remain in the Cloud until you delete them. The more files you store in the Cloud, the more storage space needed. Depending on your situation, you may want to increase the size of your Cloud Backup storage and/or you may want to delete old files from the cloud if they are no longer needed. Deleting files from the cloud has no effect on the files on your computer's hard drive. Deleting files on your computer has no effect on the files stored in the Cloud.

You can delete cases, individual files or individual subfiles from the Cloud. For example, let's say you backed up all your Case CATalyst audio files which, generally, requires a lot of space. You want to free up some space in the Cloud, so you decide to old audio files where the transcripts have been produced and the audio file is no longer needed. In the Cloud Backup Status dialog box you select Settings and the Permanently Delete... You then filter for audio files and you delete what files you no longer need.

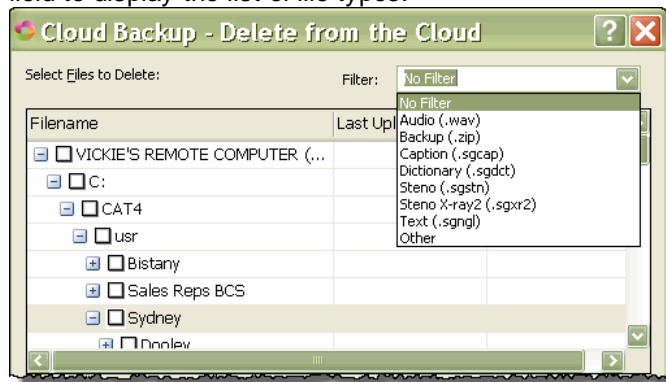

You have control of what gets backed up to the Cloud and what gets deleted from the Cloud.

#### To delete files from the Cloud:

1. To open the Cloud Backup Status dialog box, click the Cloud Backup icon  or press **Alt + u, k** (Functions, Cloud Backup). When using a [metered network connection](#), a message displays prompting you to continue or not with the delete.
2. In the Cloud Backup Status dialog box, click the **Settings** button or press **Alt + o**.
3. In the Cloud Backup Settings dialog box, click **Permanently Delete...**
4. The Cloud Backup - Delete files from the Cloud dialog box displays and a *Gathering Files from the Cloud. Please Wait...* message displays momentarily while the Cloud retrieves the user's information and displays the current computer name (the [computer name](#) comes from Cloud Backup if you rename it for Cloud Backup or it comes from Windows setup). The cloud retrieves the user's information and displays the files in an expanded tree view based on the current user. If you have backed up from more than one computer, each computer name will display. To expand the view, click the plus sign (+) in front of the computer name and then continue to click the plus sign in front of each item to expand the view as needed to locate what you want to restore. The filename displays, the date the file was last backed up (uploaded) to the cloud and the size of the file.

If you have more than one computer that you use for Case CATalyst and the computers have different names, you could see multiple computers listed in the Delete from the Cloud dialog box.

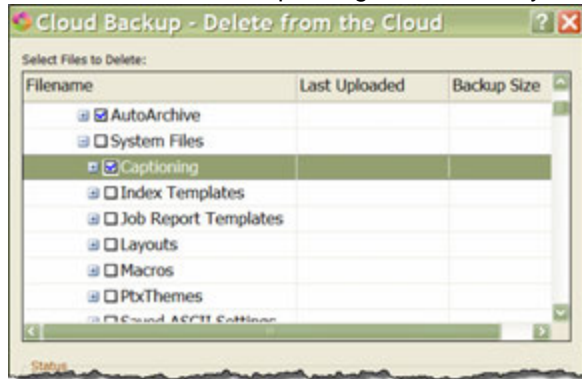

5. To filter the display to only show a specific file type or file types, click the down arrow in the Filter field to display the list of file types.

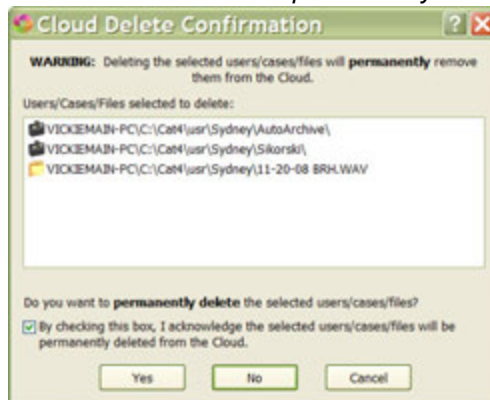

To filter for a file type not listed or filter for multiple file types, select **Other** and type in the Filter field to filter for a different file type or to add multiple file types. Start each file type with a period followed by the extension and then type a semi-colon (;) and type the next file type extension. In the following screen shot, Cloud Backup Restore is being filtered for audio and steno x-ray2 files. In the following screen shot, Cloud Backup Delete5 is being filtered for audio and steno x-ray2 files.

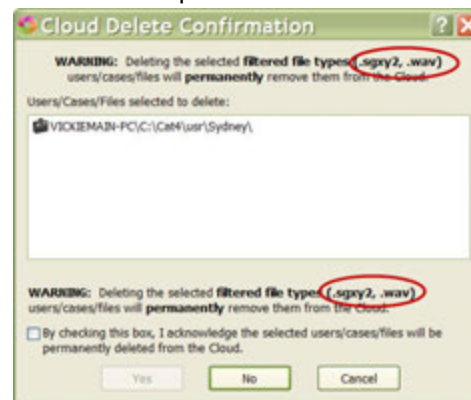

6. To select a case or file, click the case/file name to put a check mark (☒) in front of the case/file. When selecting a case, all subfolders and files will be selected. Select as many cases/files as you want to delete from the cloud. For example, let's say that you want to free up some space in the Cloud so you want to delete some of the a case content that you don't need such as the [AutoArchive](#) and the Captioning case in the System Files case.

7. Once you have selected the cases/files you want to delete, to begin deleting files from the Cloud press **Alt + d** (Delete). The Delete Confirmation dialog box displays. If you are deleting files from another's computer, make sure the computer is not currently uploading files. To permanently delete the selected items from the cloud, click the *By checking this box, I acknowledge the selected users/cases/files will be permanently deleted from the Cloud.* option and then click **Yes**.

*selected files/case*

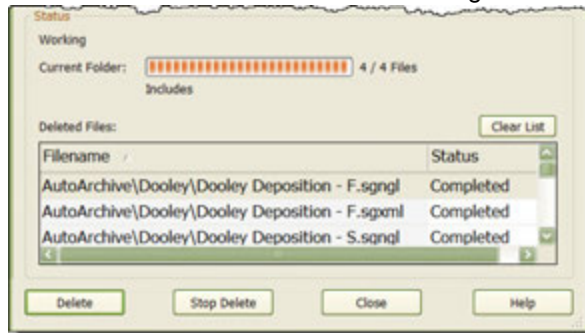

*selected files/cases filtered on file types*

The default settings for this box are that the *By checking this option...* option is unchecked and the cursor action is No. Even when you select the *By checking this box...* option, the default cursor action is No. You will need to click **Yes** or change the cursor focus to Yes and press Enter.

8. As the selected files are being deleted, you will see the name of the file being deleted and the progress bar reflects the progress. Once the selected files are deleted the Cloud Delete Completed dialog box displays and the Deleted Files section displays a list of the files deleted. Press **Enter** to dismiss the Cloud Delete Completed dialog box and press **Alt + c** (Close) to close the Cloud Backup

- Delete files from the Cloud Server dialog box.

Things to know:

- If you filter for a file type or files types and no matching files are found, the following dialog box displays:

- If files are being deleted and you press **Alt + c** (Close), the *Files are being deleted...* dialog box displays.

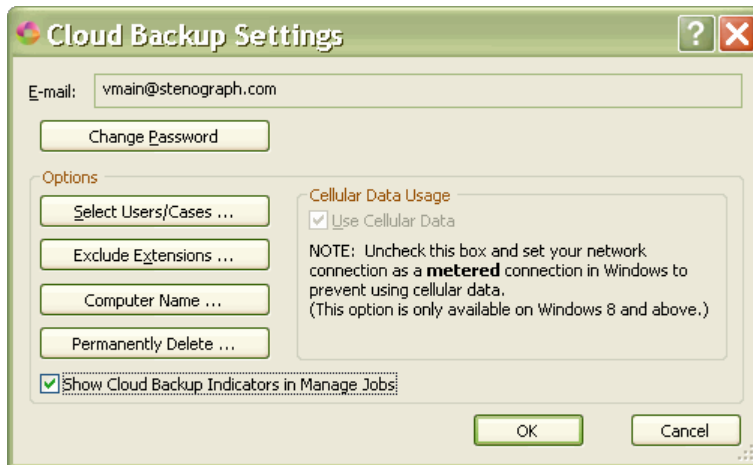

- To interrupt and stop the deleting of the selected files, press **Alt + s** (Stop Delete). The *Cloud Delete Canceled...* dialog box displays.

## Cellular Data Usage option

A Cellular Data Usage section is available on the Cloud Backup Settings dialog box along with a Use Cellular Data option. If you are using your cellular phone as a hotspot or using a MiFi® device for your internet connection, you may exceed your data plan usage and incur extra expenses if you are uploading and downloading many files. Cloud Backup is automatically paused when writing realtime, but once realtime is stopped, Cloud Backup is automatically active. Depending on your data plan, you could incur additional data usage charges especially if you are backing up audio files. If you are using Windows version 8 or higher, you can set your wireless network to be considered “metered” within Windows. Windows only allows access and modification to the metered WiFi connection setting if your Windows user has Windows administrator rights. Then, Cloud Backup will no longer automatically back up files while you are connected to that network and each time you manually backup, restore or delete items from Cloud Backup you will be warned that you are on a metered network. You can decide whether you want to proceed with the process or not. Or to always have Cloud Backup run regardless of the type of network, you can select the Use Cellular Data option. On Windows 8 operating systems and above, the option is unchecked by default so you will not use cellular data.

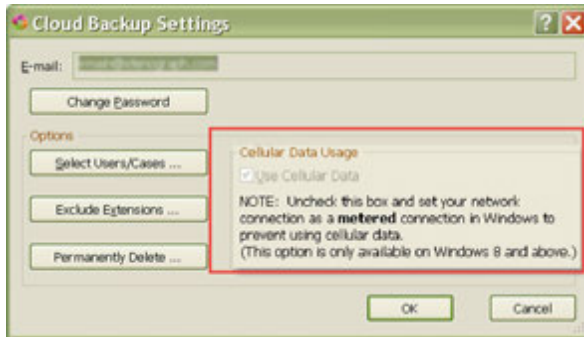

Setting your WiFi network to metered:

If the following instructions do not match your Windows version, please consult your Windows documentation/help. Windows only allows access and modification to the metered WiFi connection setting if your Windows user has Windows administrator rights.

- Windows 8 or 8.1, go to Settings > PC Settings > Network > Connections. Click the WiFi network connection you'd like to change, then toggle Set as Metered Connection to On.
- Windows 10 Home, go to Start> Settings > Network & Internet > Wi-Fi > Click the network name and turn on the Set as metered connection option.
- Windows 10 Pro, go to Start > Settings > Network & Internet > Wi-Fi. Under the Wi-Fi network > click Advanced Options. Turn on Set as metered connection.

**NOTE:** The Set as Metered Connection setting should be remembered; however, it is recommended that you confirm this after a Windows update.

On Windows 7 systems and below, the option is selected by default and grayed out (unavailable) so cloud backup runs whenever you are connected to the Internet. In other words, if you are connected to the internet via a cellular data plan, you may exceed your data plan if CATalyst is backing up many or large files and you are restoring or deleting many files from the Cloud. The metered network setting is not available in Windows 7 or below.

When you are using Windows 8 or higher and your network connection is set to “metered” (in Windows) and you have **deselected** the Use Cellular Data option, the Cloud Backup Status dialog box will display:

When using a metered network and selecting Cloud Backup – Permanently Delete, the following message displays:

- If you select Yes, the Cloud Backup – Delete dialog box displays and you can delete files from the Cloud. Depending on your cellular data plan, you may be charged extra.
- If you select No, the Cloud Backup Settings dialog box displays.

When using a metered network and selecting Cloud Backup - Restore, the following message displays:

- If you select Yes, the Cloud Backup – Restore dialog box displays and you can restore files from the Cloud to your local system. Depending on your cellular data plan, you may be charged extra.
- If you select No, the Cloud Backup Status dialog box displays.

When using a metered network and selecting Cloud Back Up Now, the following message displays:

- If you select Yes, Cloud Back Up Now backs up the selected file. Depending on your cellular data plan, you may be charged extra.
- If you select No, Cloud Back Up Now does nothing.

## Cloud Backup Computer Name

Cloud Backup stores files in the Cloud based on the location of the file when it was backed up. The location is based on the name of the computer and the file structure such as files in cases, etc. When accessing the Cloud Restore or Cloud Delete dialog boxes, the computer names display along with your users, cases and files. The naming of a computer usually occurs during the computer setup and the name might be user's initials, first name last name, or a random series of letters and numbers. Users may not recognize their computer name when going to the Cloud Restore/Delete dialog box and the computer name option allows you to change the display names of your computers in Cloud Backup. If you decide to change the name of your computer, it is only changed for Cloud Backup.

You can give your computer a different display name so it is easier to recognize your computer in Cloud Backup. For example, let's say you have three computers – you have your realtime laptop, your office computer and your backup/emergency computer. You have used Cloud Backup with all three computers. When you go to the Cloud Backup - Restore dialog box, you always have to stop and try to remember what computer has the final version of the file and which computer is which. You can rename your computers, for example, Reportername – realtime, Reportername – office and Reportername – backup (or whatever names you want) and you instantly recognize your various computers.

The Computer Name dialog box displays a Name of This Computer field that displays the current name of your computer. Changing the computer's name only affects Cloud Backup's dialog boxes. When you have multiple computers associated with Cloud Backup, all your computers will be listed in the Your Cloud Backup Computers list. In the Your Cloud Backup Computers section, the computer that you are currently using displays the computer name followed by (This Computer).

**To change the name of your computer display for Cloud Restore and Delete:**

1. Click the Cloud Backup icon on the Function Bar or press **Alt + u, k** (Function, Cloud Backup).
2. Click the Settings button or press **Alt + s** (Settings).
3. In the Cloud Backup Settings dialog box, click the Computer Name ... button.
4. In the Computer Name dialog box, the current computer name should be highlighted, simply type a new name.
5. To save and exit the dialog box, click **OK**. If you have multiple computers, follow the above steps on each computer.

## Cloud Backup Windows System Tray Icons

The Catalyst Backup System Tray application is installed with CATalyst. This application displays Cloud Backup's status with an icon in the System Tray area. If you hover your mouse over the Cloud Backup icon, a tooltip will display and in some cases, a Windows notification will display.

The Cloud Backup Status icon may display on the Taskbar in the System Tray area or may go to the hidden icons area (if you have the hidden icons area) of the System Tray. If the Cloud Backup Status icon displays in the hidden icons area and you want it to display on the taskbar, you will need to customize your taskbar settings. The following is general information on how to customize the taskbar.

**You may need to check your Windows documentation or search online for specific instructions based on your Windows version.**

**Windows 7/8.1** - click the "up" arrow in the system tray to show the hidden icons, click Customize and the Notification Area Icons dialog box should display. Locate the CATalyst Backup System Tray icon (white cloud with green dot in lower right hand corner of cloud if Cloud Backup is running) and on the right hand side under Behaviors, select Show icon and notifications. Click **OK** to save your settings.

**Windows 10** – right click the taskbar dialog and select Settings. This takes you straight to the Settings > Personalization > Taskbar dialog. Scroll down to the "Notification Area" section and click the "Select which icons appear on the taskbar" link. Scroll down until you locate the CATalyst Backup System Tray icon (white cloud with green dot in lower right hand corner of cloud if Cloud Backup is running), on the right hand side, click the Off icon to turn it On. Click the X in the upper right hand corner to close the Taskbar screen.

The following describes the Cloud Backup status, the status icons, the tooltip text and the notification text, if applicable.

Cloud Backup Status	Icon	Tooltip	Notification (if applicable)
Running		Running	
Paused		Paused	
Suspended on metered network	 (cycles)	Suspended on metered network	
Uploading	 (scrolling arrow)	Uploading: File name and progress percentage	
Downloading	 (scrolling arrow)	Downloading: File name and progress percentage	
90% or more storage used		Cloud Backup is nearly out of space. X GB of X GB used	Cloud Backup is nearly out of space. X GB of X GB used. Contact Stenograph to increase your storage space.
Attempting to login		Attempting to login	
Bad Credentials	 (exclamation flashing)	Error: Bad user name or password	Incorrect user name or password. Click here to launch Case CATalyst.
No Backup or Restore License	 (exclamation flashing)	Error: Not licensed for backup or restore	Cloud Backup has expired. Contact Stenograph to renew your Edge Contract.
No Backup License	 (cycles)	Error: Not licensed for backup.	Cloud Backup has expired. Contact Stenograph to renew your Edge Contract.
Out of storage space	 (exclamation flashing)	Error: Out of cloud storage space	Cloud Backup is out of storage space. Contact Stenograph to increase your storage space.
Not Running	 (cycles)	The Cloud Backup Service is NOT running. Right Click and choose start service.	Cloud Backup Service is NOT running. Click here to attempt to start the service.

You can right click the Cloud Backup status icon and do the following:

#### Pause Cloud Backup

then choose one of the Cloud Backup pause options: 1 Hour, 2 Hour, 4 Hour or until Reboot. Similar to pausing Cloud Backup from the Cloud Backup Status dialog box, if you are writing realtime and you end realtime, Cloud Backup will resume even if the "paused" time has not expired.

**Resume Cloud Backup**

this option only displays if Cloud Backup is paused. If Cloud Backup is paused, you can select to have it run again.

**Launch Case CATalyst**

allows you to start Case CATalyst and will display the Cloud Backup Status dialog box in the event you have not previously started Case CATalyst.

**About**

displays the Cloud Backup System Tray version.

**Quit**

stops the Cloud Backup System Tray application.

## Cloud Backup Indicators

The Cloud Backup Settings option, *Show Cloud Backup Indicators in Manage Jobs!* Manage Jobs, by default, displays the current Cloud Backup status of a file and/or subfile. These visual indicators let you instantly see that files and/or subfiles are backed up, waiting to back up or not selected to back up. The Cloud Backup status is displayed by one of two dots. You will either see no dot, a green dot or a yellow dot.

A green dot displays on a file and/or subfile if the file has been successfully uploaded to the Cloud. A yellow dot displays if the file is pending to be uploaded or if the file is currently in the cloud but has changed since the last upload. If a file extension is in Cloud Backup's Exclude Extensions list, the extension is ignored and no dot will display. If the file is in a directory/case that is ignored, no dot will display. If any of a job's subfiles displays a dot, then the job will also display a dot. If any of a job's subfiles displays a yellow dot, then the job will also display a yellow dot. If all of the job's subfiles display green dots, then the job will display a green dot.

For example, let's say you wrote a realtime job yesterday. Today, you look at Manage Jobs and see the job has a green dot which means it has been backed up. You look at the Job Details pane and see that two of the subfiles do not have a dot but the rest of the subfiles display a green dot. After checking your Cloud Backup settings, you understand that the .wav and .sgxray2 are in your Cloud Backup Exclude Extension list, so those two subfiles do not have a dot.

In another example, let's say you open the realtime file from yesterday to make sure that you included and filled out the Certificate page. Everything is filled in so you close the file. You then notice that the Job History subfile has yellow dot. Since you opened the file, the Job History subfile was updated so it has a yellow dot as it is pending backup. Once it is backed up, the dot will be green.

GREEN DOT	YELLOW DOT	NO DOT
Job: All subfiles have been backed up.	Job: One or more subfiles have not been backed up.	Job: All subfiles are excluded.
Subfile: The subfile has been backed up.	Subfile: The subfile has not been backed up.	Subfile: The subfile type is excluded.

**To change the Cloud Backup Indicators option:**

1. In your user name, press **Alt + u, k** (Functions, Cloud Backup). The Cloud Backup Status dialog box displays.
2. Press **Alt + s** or click the Settings button to display the Cloud Backup Settings dialog box.
3. Deselect or select the Show Cloud Backup Indicators in Manage Jobs option. By default, the option is selected. This settings is per user, not per system setting.

4. Press **Enter** or click **OK** to save your changes.

**Things to know:**

- The Show Cloud Backup Indicators in Manage Jobs option is defaulted **on**. To change the status of the option, click the Cloud Backup icon, in the Cloud Backup Status dialog box click the Settings button and then either select or deselect the *Show Cloud Backup Indicators in Manage Jobs* option and then click **OK** to save the changes.
- Files can be excluded because they reside in a case that is excluded or they are an excluded subfile type.
- A file/job that has been backed up and then modified and not yet backed up will display a yellow dot.
- If a file is deleted from the Cloud, the dots may still indicate the file has been backed up because it was backed up at one time.
- The Show Cloud Backup Indicators in Manage Jobs is a per user setting. In other words, if you have multiple users in CATalyst and you don't want to see the indicators in any user, you would need to go into each user and deselect the option.

## Translate & Edit

The Translate and Edit function matches steno outlines in a note file or during realtime writing to entries in the Personal Dictionary, update area, if selected for use, and any selected case and job dictionaries. Prior to translation, you can select the [layout](#) to apply for translation, dictionaries to use for translation, set the [dictionary priority](#) in which the dictionaries are applied during translation, define [fields](#), create a [Speaker List](#), and define [EZ Speakers](#). Once translation starts, you can begin editing.

The first time you translate you must set up your Translate options. Translate options allow you to customize certain features for each translation activity to meet your particular writing style and job needs. Translate options are grouped together in the same dialog box on tabs as follows: [Input](#), [Realtime](#), [Output to CaseView](#), [Output to ASCII/ANSI](#), [Output to Speche](#), [Output to Caption](#), [Output to StenoKeys](#) and [Output to Other Devices](#). Case CATalyst remembers the settings until Settings are retained until you change them. Once you click Apply on a tab in the Translate dialog box, option settings are retained even if you select Cancel. While translating (realtime or regular translate), message boxes that display that only require an Enter or click OK to dismiss the dialog box will display for 5 seconds and then automatically close as if you pressed Esc or clicked Cancel. The message boxes that will automatically close include actions such as Search or Scan item not found, Search reached the end of the transcript, Can't suggest a brief or an action is done.

If you do not set your options before translating, the following message displays and initiates the Translate Wizard: *"The first time you translate you must set up your options. Please either walk through this Wizard, or go back and click the Options button."* The Translate Wizard successively displays each of the translate options tabs for you to set your options. If you do not need to set options for a particular tab, click **Next**.

### Open Translate & Edit

- On the Function Bar, click Translate & Edit .
- Press **Ctrl + t**.
- Press **Alt + u, t**.
- From the Menu Bar, select **Function/Translate & Edit**.
- In Manage Jobs, double click on a Note file.

## Translate a Note File

1. Press **Ctrl + t (Functions/Translate & Edit)**. The Translate dialog box displays.
2. Make entries in the following fields:

### Saved Translate Options

Saved Translate Options allows you to save the current translate settings to a file which you can use for future translations. Settings saved include: translate options, layout selection, writer, output, dictionaries, and global tables used. For example, you can create a file to remember settings for realtime, [CART](#) work, court work or outputting to StenoKeys. Before translating, you load the settings file you want and Case CATalyst loads the translate options based on the selected settings file.

Case CATalyst also remembers the settings used for the last translation and stores them in the Lastusedsettings.ini file located in the Saved Translation Settings folder within the System Files case.

### Load Settings

Select this option to load a different set of Translate options for translation. The Saved Translation Settings dialog box displays where you can select a file to use. Choose the file and press **Enter (Open)** to load the settings.

If you choose a Settings file in which the selected layout for that settings file is no longer available, Case CATalyst uses the layout from the Lastusedsettings.ini file.

### Save Settings

Save the current Translate settings. The Save Translation Settings dialog box displays. Type a name in the File name field and press **Enter (Save)**. Case CATalyst saves the file in the Saved Translation Settings folder within the System Files case.

### Always Load Last Used

Check this box to always translate with the last settings file used.

### Steno Source

Select **File**.

When translating a steno file or re-translating a realtime file that contains AccelerWriters (macros invoked from the steno machine) and/or Power Defines, CATalyst will ignore the AccelerWriters and/or Power Defines and add the [Oops](#) format symbol (Oops10 category - CATalyst inserted) at the point where the AccelerWriter or Power Define was invoked. Since the AccelerWriter and/or Power Define steno outline did not translate, the steno displays in Vertical Notes and is not grayed out. You can use the [Hotspots pane](#) to locate all the locations of the Oops format symbol. Note: Power Defines include Scan Define, Create EZ Speakers and Text Defines made from the steno machine.

### Layout File

Select the page layout you want to apply to this job.

### Job

A list of existing cases and jobs for the current user that contain steno note files display in the window. Select a file to translate by clicking the name. The file name displays in the File field. To display files within a case, double click the case.

#### Show All Jobs

Display all job files and subfile types for the current user.

#### File

Select an existing job name by clicking the name in the job file window or typing the name. To select a job in a case, first double click the case.

### Additional Dictionaries

Check the box next to any dictionary and global table you want to use for translation. Case CATalyst automatically selects the Personal Dictionary for translation, although a check mark does not display before the name. The Power Define dictionary is not available for selection as it is automatically loaded when making a [Power Define](#) and removed from translation when the Power Define dialog box is closed.

#### Show Global Tables

Check this box to display global tables for selection. Global Tables are available for use in translation. Translating with a Global Table allows you to use previously created [E-Defines](#) in the selected Global Table along with any defines in the selected dictionaries.

### Show All Users

Check this box to display all Case CATalyst users. You can select a dictionary or global table from any user. When you select to display all users, Case CATalyst deselects the currently selected dictionaries and global tables and displays a warning message. Select **OK** to continue or **Cancel** to redisplay the current user.

### Dictionary Priorities

Change the [priority](#) in which dictionaries apply during translation.

### Options

Select the translate options you want to use.

The first time you translate, you must set up your translate options or the following message displays: "The first time you translate you must set up your options. Please either walk through this Wizard, or go back and click the Options button."

The Translate Wizard successively displays each tab. If you do not need to set options for a particular tab, click **Next**. You can also manually access each of the translate options.

### Create EZ Speakers

Use this feature to [identify](#) speaker names and steno to replace token variables in the EZ Speakers dictionary. Case CATalyst uses the names to create the speaker definitions for the job or case dictionary. Speaker names are automatically entered into the Speaker List.

### Speaker List

Use [Speaker List](#) independently or in conjunction with EZ Speakers to identify speaker names for translation. You can also [insert](#) speaker names from the Speaker List while editing a job.

### Define Fields

Define [fields](#) prior to translation that you want to use for this job during Edit. You can [define](#) fields, create new fields, remove fields, fill in fields and create field list groups.

3. Press **Enter (OK)** to start translation. You can begin editing as soon as translation starts. If you select an existing job name, a message displays. Select **one** of the following:

#### Append

Add the translated text to the existing job.

#### Overwrite

Replace the existing file. All subfiles are overwritten, including the audio file (.wav) if the job contains audio. An additional message displays prompting you to continue, using the existing file name and deleting the existing audio or to cancel the file name selection.

#### Cancel

Choose a different job name.

## Optimal Conversion of Numbers

Stenograph recommends the following dictionary definition guidelines for numbers to produce the best number conversion results when using [Number Conversion](#) and [Number Trigger](#) translate commands and [Automatic Number Conversion](#) translate feature:

- It is not necessary to define numbers written via the number bar as digits in your dictionary.
- Do not define hundred as 00 or thousand as 000 or ,000. If these entries exist and you plan to use Case CATalyst number conversion to combine hundred and thousand with other numbers, modify these entries to "hundred" and "thousand".
- Define text representing multiple numbers as digits. For example, define "double oh" as 00; and "triple 7" as 777.
- Define fractions, with or without hyphens using the <No Auto Convert> format symbol. For example, to create a dictionary definition to retain the hyphen for "-1/2", define as: -1/2<No Auto Convert>. To create a dictionary definition with a space before the fraction "1/2", define as: <No Auto Convert><Sticky Space>1/2.

## Advanced Translate Options

Advanced Translate Options **determine the default selection for certain options applied during translation in Case CATalyst. You can access the Advanced Translate Options:**

- each time you translate. In the Translate dialog box, select **Options**. On the Input tab, select **Advanced**.
- in Manage Jobs. From the **Tools** menu, select **Options/Translate**. On the Input tab, select **Advanced**.

### Advanced Translate Options

To make a change, click an option and select a choice from the drop down box. When finished with all your changes, select **OK**. The *Restore Default Settings* option returns all the Advanced Translate Options to their original Case CATalyst default selection.

#### Digits with words convert with commas up to - none/hundreds/thousands/millions

Select **hundreds**, **thousands** or **millions** to have Case CATalyst convert digits followed by the words "hundred," "thousand" or "million" to a number with commas when no automatic number keyword is written. This feature is useful if you want numbers (digits) written with the words "thousand" and "million" to format differently than when word numbers are written. For example, "5 thousand people" converts to "5,000" people. If you write "five thousand people," it does not convert. For example, 18 hundred converts to 1,800 and eighteen hundred converts to 1800.

Case CATalyst converts digits and words up to the option selected. For example, if you select thousands, Case CATalyst converts digits followed by the word "hundred" and "thousand" but not digits followed by the word "million." For example, 18 hundred converts to 1,800; 18 thousand converts to 18,000; but when you write 5 million no conversion occurs.

At least one number written must be a digit. For example, if you write eight hundred or eighteen thousand, no conversion occurs. If you write one hundred 50 thousand it converts to 150,000 because a digit number is written. However, if you write eighteen thousand and the [option](#) Otherwise Display As Digits is active, then the number translates as 18000 with no commas inserted.

This feature works in conjunction with Automatic Number Conversion. The Automatic Number Conversion [option](#) must be selected in Translate options.

If a keyword identified in the NumberConversion.ini follows the number written, then the number conversion format from the NumberConversion.ini takes priority. For example, "2 thousand four hundred dollars" converts to "\$2,400."

Select **None**, the default, if this option does not fit your number writing style.

### Automatically resolve EZ Choice Conflicts Yes/No

EZ Choice is a conflict resolution feature based on what conflicts you select while editing. Select **Yes** to have Case CATalyst automatically confirm conflicts selected by EZ Choice and add the resolution information to the conflict database. Resolution during translation is based on previous conflict selections while editing. Scan does not stop on the confirmed conflicts and the confirmed conflicts do not display in a conflict color. This option applies to EZ Choice selected conflicts only and has no effect on Second Choice selected conflicts.

Select **No** to confirm the selected conflicts manually while editing. No is the default.

### Default dictionary for Power Define

[Power Defines](#) allow you to open a dialog box where you can write the steno and the text definition all from your writing machine. Case CATalyst defaults to placing Power Define entries in the current job dictionary or a case dictionary if working within a case. You can change the dictionary to which the Power Define dictionary defaults. From the drop down list, select an alternate dictionary. If you select Other, you must also select a location in the *Other Path* field.

### Other Path

This field is active when Other is selected in the *Default dictionary for Power Define* field. Click the Browse  button to locate the dictionary you want as the default when making Power Defines.

### Insert Oops FS after aborted Power Define Yes/No

By default, an [<Oops 10>](#) (CATalyst Inserted Oops category) is inserted into the transcript where the Power Define, Scan Define, Text Define or Create EZ Speakers was aborted. Any steno written into the Power Define, etc., dialogs will appear grayed out in vertical notes at the Oops location. For example, you open the Power Define dialog box to define the name of a company and suddenly they go back on the record so you abort the Power Define. When you go back to that section in the file, you will see the [<Oops 10>](#) format symbol in Reveal Codes and you will see any steno that you wrote in the Power Define dialog box before aborting it in Vertical Notes grayed out. You can scan, search or use the [Hotspots pane](#) to find all locations of the Oops 10 format symbol. Select No, to prevent the Oops 10 format symbol from being inserted when a Power Define, Scan Define, Text Define or Create EZ Speakers is aborted.

### Default Action for Scan Define

The Scan Define command scans back in the transcript to the last untranslate/untranslates, opens the [Power Define](#) dialog box with the steno in the Steno Field and the cursor in the Text field. You can quickly define or replace the steno from your writing machine. The option defaults to creating a Job Dictionary entry unless the job is in a case, then it defaults to the Case Dictionary. You can select the default action for the Scan Define to be Personal, Job or Case Dictionary or Replace Only. The Replace Only action will only change the current occurrence and will not global the action. For example, while writing realtime some reporters feel it is safer to replace mistranslates rather than define them to the job dictionary and decide later. If you are one of those reporters, you can simply make the default action for Scan Define to be a Replace. If during the proceedings, you want to J-define something, using the Power Define dictionary commands, you can always change the action for that one time.

### Scan Define stop on Untranslates plus

By default, the Scan Define realtime command scans back in the transcript to the last untranslate(s), opens the Power Define dialog box, puts the untranslated steno in the Steno field and positions the cursor in the Text field. If you would like the Scan Define command to also stop on Drag/Drop translations and/or [Suffix Drag/Phrase Maker](#) translations, select Yes in the respective option.

**Drag/Drop** translations include translations as a result of the [Drag/Drop Analysis](#) option and [TrueStroke Drag/Drop](#) translations. Drag/Drop Analysis and/or TrueStroke Drag/Drop options must be selected in the [Translate Input](#) tab.

**Suffix Drag** translation includes translations as the result of dragging or tucking a suffix in a single stroke steno outline. The [Suffix Drag/Phrase Maker](#) option must be selected in the [Translate Input](#) tab.

### **Colloquy plus Answer plus Question = Auto By Line - Yes/No**

This option is usually only applicable to the Texas format. Select **Yes** to have Case CATalyst translates Colloquy + A + Q into a By Line. Select **No** to turn this option off. The default is No.

This option is usually only applicable to the Texas format. For example, you have:

<Colloquy>MR. JONES: The witness can answer.

<Answer>Yes.

<Question>Did you...

Using the Texas format produces:

<Colloquy>MR. JONES: The witness can answer.

<Answer>Yes.

Q. (BY MR. SMITH):

To have the "Texas" format to work correctly, set the following Case CATalyst Translate options:

**Select:** *Colloquy + Q = Auto By Line*

**Deselect:** *Colloquy plus A= THE WITNESS*

### **Tuck punctuation with quoted words - Yes/No**

Select **Yes** to automatically have period, comma or 's (apostrophe s - defined in a dictionary) automatically placed inside a dictionary defined quoted word or phrase when punctuation is written after the quoted word/phrase. For example, let's say you have a dictionary definition for "Spider Man" (definition includes the quotes). You write: Let's go see "Spider Man" followed by a period. The result is: Let's go see "Spider Man."

You can change the default Edit display color assignment for automatic punctuation by using the Colors feature. In Edit select View/Display/Colors. In the drop down list, select Auto Punctuation and then select a color.

To have apostrophe s ('s) work with this option, you must have steno defined in a dictionary as 's without format symbols.

Select **No** to allow period, comma and apostrophe to remain where written. The default is No.

### **Analyze numbers in a series - Yes/No**

Select **Yes** to have numbers written in a row convert to digits if they are separated by one or more spaces, a comma, dash, slash or the word "and," "or," "through," "to," or "of." For example, when selecting Yes, the display 10 and under as words option would normally result in "two to four things," the result will now be "2 to 4 things" and if the automatic number conversion result would have been "Page 2 of four," the result will now be "Page 2 of 4."

Select **No** to prevent Case CATalyst from converting numbers as a series when you use the above words or punctuation as separators. Numbers in a series are translated as digits when you write digits or if the Otherwise Display as Digits option is selected. The Display 10 and Under as Words option does not apply to digits in a series. The default setting is Yes.

This feature works in conjunction with Automatic Number Conversion. The Automatic Number Conversion [option](#) must be selected in Translate Input options.

#### **Number Triggers convert only when preceding a number - Yes/No**

Select **No**, the default, to have Number Trigger commands active for approximately three paragraphs after the Number Trigger is written. If Case CATalyst finds a number that matches the Number Trigger criteria within the following three paragraphs, the number converts according to the Number Trigger.

Select **Yes** to have Case CATalyst only apply the Number Trigger if a number, either word or digit, is written immediately after the Number Trigger stroke. Captioners may want to use this feature so the Number Trigger is applied immediately and removes the chance of a number changing later in the caption text.

#### **Add missing comma after year in {Month} number conversion - Yes/No**

Select **Yes**, the default, to insert a comma after the year when using the {MONTH} rule with Automatic Number Conversion. For example, "July two 2009" converts to "July 2nd, 2009," with a comma after the year.

Select **No** to prevent Automatic Number Conversion from placing a comma after the year. For example, "July two 2009" converts to "July 2nd, 2009" without a comma after the year.

#### **Quick Tran filename format**

Customize the [Quick Tran](#) file naming convention. The Quick Tran feature allows you to quick stop one realtime session and start a new realtime session without encountering any dialog boxes.

Position your cursor in the field on the right of the option and type the formula for Quick Tran filenames. The default file naming formula is: %Y%M%D\_%h%m%s. For example, 20091029\_104236.

Use any of the following format codes to customize the naming formula. You can also use spaces and underscores in the formula but should avoid using any characters that Windows recommends not to use in file names, such as \ / ? : \* " > < |.

If you add text to the formula, that text is included in each Quick Tran file name. For example, adding the word "Mattheson" to the formula, "Mattheson%Y%M%D\_%h%m%s" generates "Mattheson20091029\_104236". Mattheson is included all Quick Tran file names.

Quick Tran Filename Formatting Codes:

- %M = Month (2 digits)
- %D = Day (2 digits)
- %Y = Year (4 digits)
- %h = Hour (2 digits)
- %m = Minute (2 digits)
- %s = Seconds (2 digits)

- %# = Adds the next available number to the end of the file name.
- %a = Abbreviated weekday name (i.e. Mon)
- %A = Full weekday name (i.e. Monday)
- %b = Abbreviated month name (i.e. Nov)
- %B = Full month name (i.e. November)
- %C = Year with century (i.e. 2013)

### Phonetic untranslates display as words - Yes/No

Select **Yes** to phonetically translate single stroke untranslates during realtime using algorithmic logic to determine the intended pronunciation. Case CATalyst bases the logic on Stenograph Theory and the WinterTree Spell Check, Stedman's Medical and Black's Legal wordlists to create a word with the most accurate spelling of the phonetically sounded word. Phonetic translation applies when no dictionary match is found in any dictionary used for translation.

You can create an exclude file of words you do not want to phonetically translate when using the *Phonetic untranslates display as words* option. For example, you are reporting a meeting and displaying the realtime text via a projector and do not want to display inappropriate words. Using Windows Notepad or WordPad, list each word on a separate line or on single lines with a space between each word. The file must have the name, *phoneticexclude.txt*, and reside in your System Files case.

Select **No** to phonetically translate during realtime using the [Phonetic Table](#). Steno outlines that normally display as untranslates, translate phonetically based on the text equivalent entry in the table. No is the default.

### Example of CATalyst Phonetic Translation Methods

You write, SKWRAEUPLS, and are using the Phonetic Table. The translation is, "JAIMZ." When you use the Advanced Translate option, *Phonetic untranslates display as words*, the same steno outline translates as "James." In another example, you write, /PAEUPLT. The Phonetic Table translation is, "Payment." The algorithmic logic translation is, "payment."

You must select [Phonetic Translation](#) in Translate Options or use the [Toggle Phonetic Mode](#) during realtime to apply either method of phonetic translation methods during realtime. Phonetically translated words appear in the selected untranslate color. If your [Scan For Options](#) are set to stop on untranslates, then **F8 (Scan)** and **Shift + F8 (Scan Backward)** stop on phonetically translated words.

### Digits attach to {Glue} Alphabet - Yes/No

When set to Yes and CATalyst encounters alphabetic dictionary entries containing the {Glue} format symbol and undefined numbers either preceding or following the alphabetic character(s), CATalyst will attach the glued alphabet and the number(s). For example, let's say that you do not have your number bar numbers defined in your dictionary. You have W-FPLT defined in your dictionary as {Glue}W. You write /W-FPLT/2 and the result is W2. If you write 2/W-FPLT/3, the result is 2W3. If your {Glue} definition contains a hyphen or period, undefined numbers will also attach using the rule CATalyst has always used for {Glue} defines. So 2 followed by {Glue}-W would result in 2-W. The default setting is Yes.

### Use Higher Level Case Dictionaries - Yes/No

If you have a case within a case, select Yes to use the top level case dictionary and any subsequent case dictionaries when translating a steno file or writing realtime. The current case dictionary has the highest priority, the next case dictionary above the current case dictionary has the second highest priority, etc. The default setting is No.

**Second Chance Drag/Drop - Yes/No**

This feature works in conjunction with Translate's Drag/Drop Analysis feature. When this option is set to Yes and the Drag/Drop Analysis option is selected, and at least one steno character is selected as either a dragged or dropped character, if during translation the result of the Drag/Drop Analysis would still result in an untranslate, the Second Chance Drag/Drop feature will apply other steno characters in a dragged/dropped situation to find a match. When this options is set to No, if the result of the Drag/Drop Analysis will still result in an untranslate, the system will not attempt to find any further matches and the steno will remain as an untranslate. NOTE: If selected, this option takes priority over Phonetic translation.

**Force lowercase ordinal suffixes - Yes/No**

The *Force lowercase ordinal suffixes* option, by default, is set to No. If you are using the All Cap On format symbol to capitalize transcript text and you want ordinal suffixes (st, nd, rd, th) to be lower case, set this option to Yes. This option affects {Number Conversion}[\*Ordinal], {Number Trigger}[\*Ordinal] commands and selecting an ordinal conversion from Edit's Number Conversion dialog box.

**Show audio codec warning when starting translation - Yes /No**

Select whether or not you want a warning message to display when starting realtime and your audio codec setting is higher than 159 MB/hr. By default, this option is set to Yes. If your audio codec setting is higher than 159 MB/hr, when you start realtime the following message displays:

*Audio WAV files may not exceed 2GB. Based on your audio codec selection you will exceed this limit after X hours of realtime recording. Do you wish to change your audio codec selection? Yes / No*

Select Yes to change your audio codec selection. If you have started translation, translation will be canceled and the Translate dialog box displays.

Select No to continue with translation knowing the realtime time audio file size limitation.

If you select the *I understand the consequences of my actions. Please stop asking.* option, this option will be set to No and the warning message will no longer be displayed when starting realtime.

The warning message is dynamic based on the audio recording selection you make. If you select the 231 MB/hr option, your realtime recording cannot exceed 9 hours. If you select the 318 MB/hr or 346 MB/hr option, your realtime recording cannot exceed 6 hours.

This option has no effect on the warning message that displays when selecting an audio codec in the Audio section of Translate's Realtime tab. If you select an audio codec higher than 159 MB/hr, the following message displays after clicking OK or Apply:

*Audio WAV files may not exceed 2GB. Based on your audio codec selection you will exceed this limit after X hours of realtime recording. Do you wish to change your audio codec selection? Yes / No*

**Apply Personal Globals during translate**

The Personal Globals feature is a great way to have Case CATalyst automatically correct your common mistyped words while editing. Now, you can have Personal Globals apply during translation. For example, let's say you often mean to write "armed robbery," but end up writing "around robbery." With the *Apply Personal Globals during translate* option, you can have Case CATalyst automatically correct the occurrences of "around robbery" on-the-fly during translation. Correcting common grammar mistakes is also possible, such as writing "they're is" when you always want "there is." The *Apply Personal Globals during translate* option can be used when translating an existing steno file or when writing realtime.

Select Yes to have Case CATalyst apply your Personal Globals when translating an existing steno file or when writing realtime.

Select No to not have Case CATalyst apply your Personal Globals when translating an existing steno file or when writing realtime.

### Load Alternate User Settings when Realtime Tran Starts

You may want different settings to apply when you are writing realtime than when you are editing a transcript. For example, you may not want audio to begin playing automatically when clicking on an Oops or Untranslate in the Hotspots pane during realtime.

To use the Load Alternate User Settings when Realtime Tran Starts option, click the down arrow ▼ to the right and then select the settings file you would like to load automatically when translation starts.

### Load Alternate User Settings when Tran ends

You may want different settings to apply when you end realtime writing and begin editing a transcript. For example, when you press Ctrl + \ to end realtime or press end on your writing machine.

To use the Load Alternate User Settings when Tran ends option, click the down arrow ▼ to the right and then select the settings file you would like to load automatically when translation ends.

## Input Translate Options

Input translate options instruct Case CATalyst on how to handle certain translation features. For example, you can select options that affect specific formatting, number conversion, capitalization and conflict handling.

Once you have selected all your Translate options, you can save the current selections to a [Save Settings](#) file. This provides the ability to create a set of translation settings for different work situations. Once saved, you can quickly load the desired settings file from the Translate dialog box using the [Load Settings](#) option.

Access Input translate options:

- each time you translate. In the Translate dialog box, select **Options**.
- in Manage Jobs. From the **Tools** menu, select **Options/Translate**.

## Input Translate Options

The following list provides a summary of Input translate options along with a brief description of the feature. For detailed information, click the option name.

Set an option by performing the appropriate action: check the box to select it, uncheck the box to deselect it, choose an item from the drop down list or type an entry. After making changes, click **Apply**. Once you select Apply, the settings remain until you change them, even if you choose Cancel to exit the Translate function. When finished with changes on all the tabs, click **OK**.

Options	Description
<a href="#">Use Update Area for Translation</a>	Select this option to use entries in the Update Area to help translate the file along with your Personal Dictionary and any additional selected dictionaries. NOTE: D-defines made while translating or editing, by default, go to the Personal Dictionary. To have D-defines go to the Update Area, at Manage Jobs select Tools, Options, Dictionary and then Options...

### [Capitalize All Text](#)

Translate the text in all capital letters. If this option is selected and you do not want all the text capitalized, you will need to deselect this option and re-translate the file.

### [A An Resolution](#)

If you write the same steno outline for "a" and "an," select this option to use the rules of grammar to resolve a/an conflict. The dictionary definition must only be defined as "a". If you write the steno outline for 'a' different than the steno outline for 'an', there is no need to select this option.

### [Drag/Drop Analysis](#)

Case CATalyst analyzes untranslates that contain characters you 'tend' to drag or characters that are missing that you tend to drop in order to find a match to a steno outline in a dictionary being used to translate the file. If CATalyst finds a match, the translated text will be surrounded by Drag/Drop Begin and End format symbols. Specify the characters that you tend to drag and or drop in Drag/Drop Analysis Details.

While editing, if Drag/Drop Analysis has translated the untranslate correctly, you can press Enter to confirm the translation.

### [TrueStroke Drag/Drop](#)

Case CATalyst analyzes untranslates during realtime translation using [TrueStroke](#) data located in the Steno X-ray2 (.sgxr2) subfile to match a steno outline in a dictionary being used to translate. TrueStroke Drag/Drop analysis is based on how the steno outline was written and whether steno keys were depressed with intent and the timing of the keys. This feature works when using a Luminex or Diamante steno machine via a USB or WiFi connection or Wave steno machine via a USB connection. TrueStroke Drag/Drop has priority over Drag/Drop Analysis if both options are selected.

While editing, if TrueStroke Drag/Drop has translated the untranslate correctly, you can press Enter to confirm the translation.

### [EZ Link](#)

Attach prefixes and suffixes to the root word during translation using the rules spelling and check the newly formed words against the Spell Check Wordlists. If a [prefixsuffixrules.txt](#) file is available in the current user's System Files case, it will be used in conjunction with Spell Check.

### [Exclude Caps](#)

Do not apply EZ Link rules to an all cap or mixed case root word when it is immediately followed by a suffix. The root word remains unchanged when suffix attaches. For example, you would not want to write an acronym with a suffix and have the spelling rules applied such as double the constant or change a 'y' to 'i'.

[Suffix Drag/Phrase Maker](#)

Suffix Drag/Phrase Maker applies the suffix strokes -G, -S, -Z or -D to one stroke steno outlines that are not defined in the dictionary when the dragged letter is the last character in the outline. Optionally, apply -S, -Z or both for plural suffix. If also using TrueStroke Drag/Drop or Drag/Drop Analysis, TrueStroke Drag/Drop and then Drag/Drop Analysis takes priority.

The Word option, of the Suffix Drag/Phrase Maker feature, allows you to write phrases in a single stroke even when it is not defined in your dictionary. For example, let's say the steno stroke /WEBD is not defined in your dictionary. With the Word option in Suffix Drag/Phrase Maker, you can have /WEBD translate as "we said" even though it is not defined in your dictionary as a single stroke.

While editing, if Suffix Drag/Phrase Maker has translated the untranslate correctly, you can press Enter to confirm the translation.

[Colloquy + A=](#)

When a witness answers in a Colloquy exchange, many reporters format the witness' response as <Colloquy>THE WITNESS. Instead of writing WEUT/WEUT or another steno outlined defines as <Colloquy>THE WITNESS, the reporter simply writes the steno defined as <Answer>. Selecting this option will automatically format an Answer as Colloquy followed by the option's specified text when the Answer follows Colloquy or Colloquy and Parenthetical paragraph styles. The default text is THE WITNESS:<space>.

[Colloquy +Q=Auto By Line](#)

When the proceedings return to Q and A testimony after a Colloquy exchange, many reporters include a "BY" line to indicate who is asking the questions. Selecting this option will automatically format a <Question> as a By Line when the a steno stroke defined as <Question> is written immediately following Colloquy or Colloquy and Parenthetical format symbols. The By Line formatting is controlled by modifying the By Line [Paragraph style](#) the layout settings.

[Parenthetical + Q = Auto By Line](#)

Automatically format a Question as a By Line when a Question follows a Parenthetical paragraph style. The By Line formatting is controlled by modifying the By Line [Paragraph style](#) in your layout settings.

An additional Auto By Line option is available in the [Advanced Translate](#) Options dialog box. The Colloquy plus Answer plus Question = Auto By Line option is typically used when Texas formatted transcripts are required.

#### [Delete Repeated Q/A/C](#)

When this option is selected, if multiple empty Question, Answer or Colloquy paragraphs (with the same name) are written one right after another with no text in between, CATalyst will automatically delete the empty paragraphs so only one paragraph displays. For example, if you write the steno outline defined as <Question> five times in a row without text, only one Q, will display in the transcript. If this option is deselected, all five Q.s display in the transcript.

#### [Use Smart Quotes](#)

Selecting this option, you can have one dictionary definition for a quote mark. When you write the steno defined as a quote mark (") the first time in a paragraph, Case CATalyst makes it an opening quote. When you write that same steno outline again, CATalyst makes it a closing quote. If you wrote the steno defined as quote at the start of the paragraph and forgot to write it again to close the quotation, CATalyst automatically puts a closing quote at the end of the current paragraph style.

#### [Use Smart Parentheses](#)

Selecting this option allows you to have only one dictionary definition for a parenthesis or bracket ([ ]). When you write the steno defined as the open parenthesis or bracket the first time, Case CATalyst inserts an open parenthesis or bracket. When you write the same steno outline a second time in the same paragraph, Case CATalyst inserts a closed parenthesis or closed bracket. If you wrote the steno defined as open parenthesis or open bracket and write a new paragraph stroke, CATalyst automatically inserts the closing parenthesis or bracket at the end of the current paragraph.

#### [Numbers](#)

The following "Ignore" options only apply when using dictionary definitions that contain <Number Conversion> or <Number Trigger>. These options have no effect on automatic number conversion rules.

#### [Ignore 'and'](#)

Ignore the word "and" between numbers for number conversions and number triggers. Case CATalyst processes the numbers before and after the word "and" as one group. For example, if this option is selected and you wrote one hundred twenty three and fifteen and then wrote the proper dollar number conversion steno outline, the conversion would be \$123.15. If this option is deselected, then 123 would be considered one group of numbers and 15 would be considered another group of numbers.

[Ignore Commas](#)

Ignore commas that separate a group of numbers when translating number conversions and number triggers. Case CATalyst processes the numbers before and after the comma as one group. For example, if this option is selected and you wrote a series of numbers such as 123, 456, 789 and then wrote the steno outline for a 9 digit number conversion command, the number would be considered one group of numbers and be converted without the commas -- such as 123-45-6789. If this option is deselected, the groups of numbers separated by the comma would be considered individual groups of numbers.

[Ignore Periods](#)

Ignore periods that separate a group of numbers when translating number conversions and number triggers. Case CATalyst processes the numbers before and after the period as one group. For example, if this option is selected and you wrote a series of numbers such as 123. 456. 789. and then wrote the steno outline for a 9 digit number conversion command, the number would be considered one group of numbers and be converted without the periods -- such as 123-45-6789. If this option is deselected, the groups of numbers separated by the period would be considered individual groups of numbers.

[Ignore Word Numbers](#)

Ignore words that are numbers and do not process them as part of the number conversion or number trigger. When this option is selected, if a word number (ex. one, two, five) is written before a series of digits, then only the digits would be processed by the number conversion or trigger command. For example, "he had five 10 dollar bills." If a number conversion was written after "bills" the result would be "he had five \$10 bills." If this option is deselected, CATalyst would try and convert the word number and digits as one group of numbers.

[Squish Defined Numbers](#)

Select this option if you have individual numbers defined in your dictionary and when written you want them to translate as one large number without spaces. For example you have 1 through 10 defined individually in your dictionary. when you write the steno outlined for 1 and the steno outline for 5, you want the numbers to translate as 15. Deselect this option if want the above example numbers to translate as 1 5. Numbers not defined in a dictionary are automatically squished together without a space.

[Automatic Number Conversion](#)

Convert and format numbers based on keywords and conversion rules in the [NumberConversion.ini](#) file without writing an extra command to convert or format the numbers.

[With Thousands Separator](#)

Converts numbers with commas when followed by measurement keywords.

[Display 10 and Under as Words](#)

Translate numbers 1 through 10 as words when no keyword or number conversion rule controls the conversion.

[Otherwise Display as Digits](#)

Display all numbers as digits when no keyword or number conversion rule controls the conversion.

[Don't Convert Word Numbers](#)

Don't convert numbers written as words when a keyword follows. For example, if "dollars" is the keyword, writing two dollars remains two dollars and is not converted to \$2.

**Show**

[Phonetic Translation](#)

Prevents the display of untranslates by "phonetically" translating steno outlines based on the [Phonetic Table](#) entries located in the System Files case.

[Translate Statistics](#)

Displays status information such as [translation rate](#), number of conflicts, etc., in a dialog box about the file currently translating.

[Timers](#)

In some jurisdictions or types of proceedings, the court reporter is responsible for keeping track of the length of examination or proceedings. Selecting this option displays the Timer dialog box which shows which timers are being used in the file. [Timer](#) format symbols are included in EZ Speaker and/or dictionary entries in order to start and stop the timer feature.

**Conflicts**

[EZ Choice](#)

EZ Choice conflict resolution learns by saving the conflict choice you make along with the two words preceding it into the Conflict Database. The next time the same conflict along with the same two preceding words occur in a transcript, Case CATalyst uses the entry to resolve the conflict. EZ Choice is the most accurate conflict resolution option out of the three conflict resolution options and takes priority over the other options when selected.

[Second Choice](#)

Second Choice conflict resolution saves the conflict choice you make along with the "type of speech" word (verb, noun, adjective, etc.) before the conflict and the "type of speech" word (verb, noun, adverb) after the conflict into the Second Choice Conflict Database. The Second Choice option does not analyze the sentence to determine the type of speech of the words before putting it in the Second Choice Database. Second Choice may resolve conflicts quicker but the results are a less accurate resolution. If writing realtime, the conflict resolution does not take place until the second word after the conflict is written. When used in conjunction with EZ Choice, EZ Choice takes priority in conflict selection.

[Auto-Conflict](#)

If you never want a conflict to display in the translated file, select this option to have CATalyst automatically select the first choice of the conflict. If only this option is selected, the first choice is the conflict is automatically

selected. When used in conjunction with EZ Choice, EZ Choice takes priority in conflict selection.

### **EZ Speakers Dictionary**

#### [EZ Speakers Dictionary](#)

Select an EZ Speakers dictionary for translation. Case CATalyst recognizes any dictionary name that begins with EZ Speakers as an EZ Speakers dictionary. Case CATalyst saves the selection as part of the Saved Translation settings.

### **Use Alternate User Settings For Edit**

#### [Use Alternate User Settings For Edit](#)

Load a specific set of view settings to use in Edit following translation. If you use [CARTView](#), your saved Alternate User Settings will apply when you start translation. Case CATalyst saves the selection as part of the [Saved Translation](#) settings file.

#### [Advanced Translate Options](#)

Determine the default selection for additional options applied during translation.

## **A\_AnResolution**

A/An Resolution is a Translate option. When selected, Case CATalyst use the rules of grammar to resolve a/an when the steno outline for "a" and "an" is defined and written the same. An A/An resolutions displays in a user defined color on the Edit screen. You can [change](#) the color. To use this option, the steno stroke must be in a dictionary with the text portion of the definition defined only as a lower case "a" (and no quotes).

The "A" steno stroke translates using the following parameters:

- as "a" when followed by a word beginning with a consonant
- as "an" when followed by a word beginning with a vowel or the number 8.
- as "a" when followed by an untranslate

Case CATalyst takes into consideration the A/An resolution for words in a phrase. For example, in the dictionary, /HA is defined as "had a". In the job, /HA is written followed by the word "apple". The translation is "had an apple".

## **Auto-Conflict**

Auto-Conflict is a Translate option. When active, Case CATalyst automatically selects the first choice of the conflict during translation. When writing realtime, this prevents the display of conflicts on the screen. You can also use the [Toggle Auto Conflict Resolution](#) command when writing realtime to control the auto-conflict command from the writer.

Auto-Conflict selected conflicts display on the Edit screen in the same color as your conflicts. When the cursor is positioned immediately before the Auto-Conflict selection, the original conflict displays on the Status bar in the lower right hand corner of the Edit screen. When Scan For Options are set to scan to conflicts, the cursor stops on Auto-Conflict selected conflicts. To confirm (final resolve) the Auto-Conflict selection, press Enter. You can also select a different conflict choice by pressing the number for the corresponding conflict. Once you press Enter or select a different conflict, the selection is confirmed. To confirm all the Auto-Conflict selected conflict choices at one time, use [Resolve All Chosen Conflicts](#). Resolve All Chosen Conflicts also resolves all EZ Choice selected conflicts.

Auto-Conflict selected conflicts that contain a prefix or suffix display with a space between the root word and the prefix or suffix. Once you confirm the Auto-Conflict selection, Case CATalyst removes the space. For example, you have a conflict between <Suffix>ing and "go". With Auto-Conflict active, you write RUPB/G which results in "run ing". ^ go ^ <Suffix>ing. With the cursor on "ing" you press Enter resulting in "running". The next time you translate using EZ Choice or Auto-Conflict and the same conflict situation occurs, Case CATalyst displays "run ing" with "ing" in your conflict color. When you confirm the "ing" Case CATalyst displays "running."

Auto-Conflict selected conflicts that contain a format symbol display the format symbol with a space between the format symbol and the word. Once you confirm the Auto-Conflict selection, Case CATalyst applies the format symbol.

When exporting to RTF/CRE, unconfirmed Auto-Conflict selected conflicts export in the original conflict form, so a scopist, for example, can view the original conflict. Once you confirm the Auto-Conflict selected conflict, Case CATalyst exports it as normal text. Use Resolve All Chosen Conflicts to confirm all the Auto-Conflict selected conflict choices at once. Resolve All Chosen Conflicts also resolves all EZ Choice selected conflict.

You can use Auto-Conflict in conjunction with [EZ Choice](#). When EZ Choice is active, Case CATalyst first checks the conflict database for an entry to resolve the conflict. If the conflict is not in the database, then Auto-Conflict resolves the conflict.

## Automatic Number Conversion

Automatic Number Conversion is a Translate option that converts combinations of numbers and keywords such as time, dates, addresses and measurements to a specific format based on keywords and rules in the [NumberConversion.ini](#) file. The Case CATalyst NumberConversion.ini file contains formatting rules based on word and number combinations. For example, you write 50 dollars. Based on the keyword "dollars" and the dollar rule in the NumberConversion.ini file, Case CATalyst converts the 50 dollars to \$50.

Automatic Number Conversion converts numbers and number words to numbers or ordinal numbers and inserts punctuation when appropriate. For example, writing July two 2008 converts to July 2nd, 2008 or July 2, 2008 depending on your settings in the NumberConversion.ini file. The word "month" is a keyword in the NumberConversion.ini file. When you write a month followed by a two digit year conversion, Automatic Number Conversion automatically inserts an apostrophe in front of the year. For example, a credit card expiration date written as March 98 becomes March '98; January 09 becomes January '09. The exception to this rule is when the month is followed by numbers 10 - 31. These numbers are recognized as dates and an apostrophe is not automatically inserted before the two digit year. For example, January 10 does not convert and remains January 10. You must write an apostrophe preceding the year for Automatic Number Conversion to recognize the two digits as a year. For example, it is necessary to write "January '10."

Automatic Number Conversion, by default, inserts a comma after the year when using the {MONTH} rule. For example, "July two 2009" converts to "July 2nd, 2009," with a comma after the year. To prevent the insertion of the comma after the year, change the Advanced Translate option, [Add missing comma after year in {Month} number conversion](#), to No.

The word "point," although not a keyword in the NumberConversion.ini, works in conjunction with the Automatic Number Conversion feature. When you write the word "point" or the steno outline for "<Delete Space>" with numbers to the right or the left and right, Case CATalyst converts the number words to digits and converts "point" or "<Delete Space>" to a decimal point. For example, "six point five" or "6 .<Delete Space> five" converts to 6.5. Also, "point zero 8" converts to ".08."

Automatic Number Conversion does not convert an entry when a comma follows a keyword and precedes a number. For example, in your NumberConversion.ini file you have the word Page to initial cap if a number follows. You write the following: "the next page, 3 points I would like..." Case CATalyst does not initial cap the word "page" because a comma separates the word "page" and the number "3."

As always, there may be exceptions to the number conversion rules. There is a [<No Auto Convert>](#) format symbol that can be defined in a dictionary with or without a specific word to prevent a number conversion. For example, For example, let's say you write steno defined as "two ten dollar bills," Case CATalyst would see the numbers two and ten as part of one big number, and convert this to \$210 bills. However, if you write a <No Auto Convert> stroke after "two" and before "ten dollar bills," Case CATalyst would convert the number as "two \$10 bills."

### To select or deselect the Automatic Number Conversion Option

- From Manage Jobs, press **Alt + t, o, t** (Tools, Options, Translate) and then press **Alt + p** (Options button). On the Input tab, press **Alt + v** to select or deselect the Automatic Number Conversion feature.
- From the Translate dialog box, press **Alt + p** (Options button) and then on the Input tab, press **Alt + v** to select or deselect the Automatic Number Conversion feature.

**When the Automatic Number Conversion feature is selected, the following options are available:**

- [Number conversion button](#)
- [With Thousands Separators](#)
- [Display 10 and Under as Words](#)
- [Otherwise Display as Digits](#)
- [Don't Convert Word Numbers](#)

You can use specific number format dictionary entries containing [Number Conversion](#) or [Number Trigger](#) format symbols in conjunction with the Automatic Number Conversion feature. You can also apply [Automatic Number Conversion](#) in Edit. Also see the [Optimal Conversion of Numbers](#) topic.

## NumberConversion

Case CATalyst has an [automatic number conversion](#) feature that allows you to write numbers and/or word numbers followed by a keyword and have the number convert. For example, writing two dollars and 25 cents would convert to "\$2.25" based on the keywords "dollars" and "cents". The automatic number conversion keywords and rules are contained in the Numberconversion file which is stored in your System Files case. In addition to the keywords and rules, there are also Automatic Number Conversion options on Translate's Input tab.

The Translate Options Input tab contains an Automatic Number Conversion section. If you click the **numberconversion...** button, you will be prompted with the following message: *To view this file, the Translate dialog box needs to close. Apply changes and continue?* The default is set to Yes. If you press **Enter** or click Yes any changes will be saved and the Translate dialog box will automatically close and the numberconversion file will open. If you click No, the message box closes and the Translate Input dialog box displays.

If Case CATalyst cannot locate a numberconversion file in your System Files case, the **numberconversion...** option is not available.

## With Thousands Separators

With Thousands Separator is a Translate option that is available when [Automatic Number Conversion](#) is active. When selected, Case CATalyst converts digit and word numbers with commas when the numbers are followed by a measurement keyword. For example, one thousand miles converts to 1,000 miles. The word "miles" is a measurement keyword.

If Otherwise Display as Digits is also selected when With Thousands Separator is selected, numbers over a thousand and not followed by a keyword convert to digits with commas. For example, "one thousand parking tickets" converts to "1,000 parking tickets".

If With Thousands Separator is selected, Otherwise Display as Digits is not selected and the (new) Digits With words convert With commas Up To= option in the UserSettings.sgxml file is set to thousands or millions, then Case CATalyst converts digits followed by word numbers such as thousands and millions to numbers with commas. For example, 3 thousand 4 hundred people attended the concert would convert to 3,400. Conversion takes place without a keyword. If word numbers are written followed by word numbers, they do not convert. For example, three thousand four hundred people attended the concert would not convert.

### To select or deselect the With Thousands Separator Option

- From Manage Jobs, press **Alt + t, o, t** (Tools, Options, Translate) and then press **Alt + p** (Options button). In the Automatic Number Conversion section on the Input tab, select or deselect the With Thousands Separator option.
- From the Translate dialog box, press **Alt + p** (Options button). In the Automatic Number Conversion section on the Input tab, select or deselect the With Thousands Separator option.

## Display 10 and Under as Words

Display 10 and Under as Words is a Translate option that is available when [Automatic Number Conversion](#) is active. When selected, Case CATalyst converts digits 1 through 10 to words. For example, if you write "4 boxes", the result is "four boxes". This option only affects numbers 1 through 10 and does not apply to zero.

Automatic number conversion considers numbers to be in a series if they are separated by one or more spaces, a comma, dash, slash or the word "and," "or," "through," or "to." For example, if you write "two to four things," the result is "2 to 4 things." This prevents a mixture of numbers such as "2 to four things." Numbers in a series are translated as digits when you write steno outlines defined as digits or words. Display 10 and Under as Words does not apply to digits in a series even if selected. To disable the "numbers in a series" feature, change the Advanced Translate [option](#), *Analyze numbers in a series*, to No.

Automatic number conversion applies after translation. For example, you have Automatic Number conversion and Display 10 and Under as Words selected. You write: "Guilty of count 2." It translates as "Guilty of Count two." The word "Count" is not in your Number Conversion list but you have a dictionary definition for "Count 2." The translation is "Count two" because you selected Display 10 and Under as Words. To change the translation result you can put the word "count" with the appropriate category, {DIGITAFTER}{CAPWITHNUM} in your Number Conversion list; use the [<No Auto Convert>](#) format symbol, Count<No Auto Convert>2 in a dictionary definition; or deselect the Display 10 and Under as Words option.

### To select or deselect the Display 10 and Under as Words Option

- From Manage Jobs, press **Alt + t, o, t** (Tools, Options, Translate) and then press **Alt + p** (Options button). In the Automatic Number Conversion section on the Input tab, select or deselect the Display 10 and Under as Words option.
- From the Translate dialog box, press **Alt + p** (Options button). In the Automatic Number Conversion section on the Input tab, select or deselect the Display 10 and Under as Words option.

## Otherwise Display as Digits

Otherwise Display as Digits is a Translate option that is available when the Automatic Number Conversion option is active. When the *Otherwise Display as Digits* option is selected, Case CATalyst forces all word numbers, which are not controlled by a another number conversion keyword or rule, to automatically display as digits without commas. For example, "There were three thousand of them." translates as "There were 3000 of them." If you also select the With Thousands Separator option, then numbers, not controlled by a keyword, translate with commas, "There were 3,000 of them.". NumberConversion keywords and rules take priority over this option. For example, "There was three thousand dollars, converts to \$3,000 because of the keyword dollars.

You can use the Otherwise Display as Digits when the [Automatic Number Conversion](#) is active.

### To select or deselect the Otherwise Display as Digits Option

- From Manage Jobs, press **Alt + t, o, t** (Tools, Options, Translate) and then press **Alt + p** (Options button). In the Automatic Number Conversion section on the Input tab, select or deselect the Otherwise Display as Digits option.
- From the Translate dialog box, press **Alt + p** (Options button). In the Automatic Number Conversion section on the Input tab, select or deselect the Otherwise Display as Digits option.

## Don't Convert Word Numbers

*Don't Convert Word Numbers* is a translate option that works with Automatic Number Conversion. This option is located on the Translate Options tab. Selecting this option allows you to write word numbers along with a number conversion keyword and retain the word number rather than having it convert to a digit. This is a great option if you want to write a word number along with a number conversion keyword and not have it convert the word number to a digit and if you want to write a digit with a number conversion keyword and have the number conversion take place. For example, let's say in your NumberConversion file, you have "dollars" as a keyword that converts a number, if necessary, to a digit and puts the dollar sign (\$) immediately in front of the digit. With the *Don't Convert Word Numbers* option selected, if you write *two dollars*, it remains two dollars. If you write *2 dollars*, it converts to \$2. If you write *two million three hundred thousand dollars*, nothing converts. If you write *2 million 3 hundred dollars*, it converts to \$2,300,000.00.

If you write a word number and a number conversion keyword that would normally insert a hyphen between two words, there will be no hyphenation between the word number and the keyword when this option is selected. For example, you write two barrel shotgun, no hyphen would be placed between "two" and "barrel" when "barrel" is a keyword in the Numberconversion file.

## Capitalize All Text

Capitalize All Text is a Translate option. When active, Case CATalyst translates the text in all capital letters. If you select an Output option, such as CaseView, the text will sent to the receive system in all capital letters. This is not a display option, all the text is capitalized in the file. If you accidentally translated a file using the Capitalize All Text option, you will need to deselect the option and re-translate the file to have the text in mixed case.

If you want the display of text to be in all capital letters use the [All Caps On](#) and All Caps Off format symbol.

## Colloquy + A =

Colloquy + A = is a Translate option. When active, Case CATalyst automatically formats an Answer as Colloquy plus the specified text when the Answer follows Colloquy or Colloquy and Parenthetical format symbols. For example, let's say that the questioning attorney asks the witness a question and the attorney for the witness objects to the question.

Q. And what was the nature of the document you received?

MR. JONES: Objection.

MR. SMITH: The document is an admitted exhibit.

MR. JONES: The witness can answer.

THE WITNESS: I'm not sure...

Many reporters just write the steno outline for the Answer but want it formatted as Colloquy as the THE WITNESS. If that is what you want to happen when writing the steno for Answer after Colloquy or a parenthetical, select this option. If you check this option, you must also specify the text for the Colloquy in the field to the right. The default text is:

THE WITNESS:space. Check the Bold box to have the text translate in bold letters.

## Colloquy + Q = Auto By Line

Colloquy + Q = Auto By Line is a Translate option. When active, Case CATalyst automatically formats a Question as a By Line when the Question follows Colloquy or Colloquy and Parenthetical format symbols. Using a By Line dictionary definition, you write an initial By Line most likely when the examination begins. Then when you write colloquy and the proceedings return to Q & A, Case CATalyst automatically formats the By Line using the most recent By Line name. For example:  
DIRECT EXAMINATION

BY MR. JONES:

Q. Please state your name for the record.

A. Bill Williams.

Q. Please state your address.

A. 123 Red Bird Lane, Luck, IL

MR. JONES: Side bar.

THE COURT: Approach. (The reporter writes the steno defined as Q. and it formats as a by-line.)

BY MR. JONES:

Q.

The By Line paragraph style is controlled by your layout settings. Common single By Line formats include:

<By-line>By Attorney name

<Question>

<By-line>Q. (By Attorney Name)

<By-line>By Attorney Name: Q.

Some transcript layouts require more than one By Line format. You might have By Line text that follows an examination and other By Line text that follows Colloquy, indicating a return to testimony. Use the examples provided later in this topic, "Using Different By Line Formats With Colloquy + Q" to help you create dictionary definitions for using two different By Line format.

You must write an initial By Line definition in the transcript for the Auto By Line feature to work correctly. The By Line dictionary definition must use a By Line format symbol. Only a By Line format symbol is recognized by Case CATalyst as a By Line. You must also include a colon ( : ), closed parenthesis ( ) ) or Q included at the end of the By Line definition for Auto By Line to work correctly. Only a Parenthetical paragraph style can occur between the colloquy and the Q without affecting the performance of Colloquy+ Q = Auto By Line. For example, Colloquy + Q = Auto By Line does not work if you substitute <New Line Paragraph><Tab><Tab> for the formatting position of a Parenthetical paragraph style.

When using a By Line format with this feature, the By Line automatically uses the same name as the previous By Line provided no "examination" occurs in between the information. Case CATalyst inserts THE ATTORNEY: surrounded by Scanstop format symbols at the By Line paragraph setting when a previous By Line does not exist.

## Using a Single By Line Format with Colloquy + Q = Auto By Line

In this example, a By Line dictionary entry is defined as <By-line>BY MS.  
NAMEOFPERSON:<Question>. While writing, there is colloquy followed by question:

BY MS. TAYLOR:

Q. Where were you last night?

MR. JONES: Objection.

THE COURT: Overruled.

Q.

The result is:

BY MS. TAYLOR:

Q. Where were you last night?

MR. JONES: Objection.

THE COURT: Overruled.

BY MS. TAYLOR:

Q.

### Definition Guidelines

To achieve the results in the previous example, create By Line dictionary definitions in your [EZ Speakers](#) dictionary or another dictionary using the following examples as format guidelines:

#### EZ Speakers Dictionary Entry

<By-line>BY #01 space (or whatever is appropriate for your format)

#### Dictionary Entry

<By-line>BY ATTY 1 space (or whatever is appropriate for your format)

<By-line>BY SPEAKER1 space (or whatever is appropriate for your format)

<By-line>BY ^STPHAO space (or whatever is appropriate for your format)

## Using Different By Line Formats with Colloquy + Q = Auto By Line

In this example, a specific format for the first occurrence of a By Line following an Examination and a different By Line format following Colloquy requires two different By Line dictionary definitions. The By Line following the Colloquy contains the By Line format symbol and will be used for the Colloquy + Q = Auto By Line feature. Writing an initial By Line definition (the one with colloquy in this example) is necessary for the Colloquy + Q = Auto By Line feature to recognize the name in subsequent occurrences.

EXAMINATION

BY MS. RICHARDSON:

Q. What is your relationship with...

MR. ARNOLD: Objection.

THE COURT: Sustained.

Q. (By Ms. Richardson) Do you have a relationship...

In the above example, you write definition for the EXAMINATION and BY text for the formatting of the initial By Line. Then, when appropriate, you write your definition for Colloquy By Line once following an examination so the Auto By Line feature recognizes the format and text for subsequent occurrences.

### Definition Guidelines

To achieve the above results, create dictionary definitions in your [EZ Speakers](#) dictionary or another dictionary using the following examples as format guidelines. When using two different By Line formats with the Auto By Line feature, define the By Line following the Examination with a [User Defined Paragraph](#) format symbol. This formats the text as necessary when following an examination but is not used for this feature. Define the By Line format symbol with Colloquy so it will trigger the Auto By Line feature in subsequent occurrences. When using the [Search Next Missing By Line](#) feature, Case CATalyst recognizes a User Defined Paragraph style as a By Line when it is set as a By Line in the Layout, [For searching, this paragraph is](#) option.

Depending on your By Line requirements, you may want set the By Line margin setting to the same margin settings for your Question [paragraph](#) style. In the *Symbol* field type a Q and a period, if appropriate. In the *Ending Punctuation* field, type a ? (question mark).

### EZ Speakers Dictionary Entry

KPAPL/KPAPL/STPHAO/STKPWHR =<Centered Paragraph>EXAMINATION<User Defined Paragraph>BY #01:<Question>

### Dictionary Entry

KPAPL/KPAPL/STPHAO/STKPWHR = <Centered Paragraph>EXAMINATION<User Defined Paragraph>BY ^ STPHAO:<Question>

KPAPL/KPAPL/STPHAO/STKPWHR = <Centered Paragraph>EXAMINATION<User Defined Paragraph>BY SPEAKER 1:<Question>

KPAPL/KPAPL/STPHAO/STKPWHR = <Centered Paragraph>EXAMINATION<User Defined Paragraph>BY ^ ATTY1:<Question>

### EZ Speakers Dictionary Entry

<By-line>(BY #06) space (or whatever is appropriate for your format)

### Dictionary Entry

<By-line>BY (ATTY 1) space (or whatever is appropriate for your format)

<By-line>BY ( SPEAKER1) space (or whatever is appropriate for your format)

<By-line>BY (^ STPHAO) space (or whatever is appropriate for your format)

## Drag/Drop Analysis

Drag/Drop Analysis is a Translate option. When active, Case CATalyst analyzes steno outlines during translation. When no dictionary definition is found for a steno outline, it is checked against identified characters (keys) that you have a tendency to drag (push) or drop (leave out) when writing a correct steno outline. If Case CATalyst determines that adding one of the dragged letters to or removing one of the dropped letters from the steno outline, it can locate a match to a definition in any one of the dictionaries selected for translation, the untranslate becomes a word. You must [specify the keys](#) you drag or drop in Translate Options.

When an applied dragged or dropped letter results in an untranslate becoming a word, Case CATalyst puts the translated word in the [user defined](#) color for Drag/Drop. The word is "scannable" and you can define or replace the word the same as a visible untranslate. While editing, if Drag/Drop Analysis has translated the untranslate correctly, you can press Enter to confirm the translation.

Case CATalyst only examines steno outlines that have characters written on the same "side" as the dragged letter. For example, the final L is a dragged or dropped letter. The steno outline STK is written but no analysis occurs because no final letters were stroked. However, if PHROEULD is stroked, analysis occurs because L is a final letter on the right bank.

If you identify multiple characters for dragged or dropped, Case CATalyst looks for a match with the written steno outline and each identified dragged or dropped character. For example, if you specified the final L and D as "dragged" characters, Case CATalyst first tries to find a match with the steno outline and the final L. If no match is found, then Case CATalyst tries to find a match with the steno outline and the final D.

When applying a dragged or dropped letter results in an untranslate becoming a steno outline that invokes an Auto Include or AccelerWriter (macro) translation command, no analysis occurs and the steno outline remains an untranslate. However, if the Drag/Drop translation results in a [Suffix](#), [Prefix](#) or [Glue](#) translate commands, Case CATalyst applies the appropriate translation.

When an applied dragged or dropped letter results in a steno outline untranslate that creates a Format Symbol with text, conflict or number keyword, analysis occurs and the steno outline along with the dragged or dropped letter translates into the Format Symbol and text, conflict or number conversion. The translated text displays in the color selected for text or the color selected for conflicts. For example, if the result of the Drag/Drop analysis is a conflict, Case CATalyst applies, when active, EZ Choice and Second Choice conflict resolution.

Stenograph Luminex, Diamante® and Wave™ users may want to use the [TrueStroke Drag/Drop](#) Translate option which analyzes steno outlines during realtime translation using [TrueStroke™](#) data located in the Steno X-ray2 (.sgxr2) subfile. TrueStroke™ technology analyzes the timing, the direction of travel and the velocity for each steno key in each steno outline. This feature works when using a Diamante steno machine via a USB or WiFi connection or a Luminex or Wave steno machine via a USB connection.

You may want to try adjusting your steno keyboard before using the Drag/Drop Analysis feature. For more information on key contact adjustments, see your writer documentation.

If you are using the TrueStroke Drag/Drop translate option, TrueStroke Drag/Drop takes priority over Drag/Drop Analysis.

When editing, if the translation is a result of Drag/Drop Analysis and the translation is correct, you can press Enter to confirm the translation is correct, remove the Drag/Drop Begin and End format symbols that surround the translation in Reveal Codes and change the text color to your Text color selection.

## Identifying Characters for Drag/Drop Analysis

To use the [Drag/Drop Analysis](#) option, you must identify the characters (keys) on the writing machine that you have a tendency to drag (push) or drop (leave out) when writing a steno outline.

You may want to try adjusting your steno keyboard contacts before using the Drag/Drop feature. To make adjustments to your steno keyboard refer to your writer documentation.

To identify or modify dragged or dropped keys:

1. Press **Alt + u, t (Functions/Translate & Edit)**. The Translate dialog box displays.
2. Press **Alt + p (Options)**. The Translate Options dialog box displays.

3. Click the Drag/Drop Analysis **Details** button. The Dragged/Dropped Letter Analysis dialog box displays.
4. Make entries in the fields.

#### **Keys I tend to Drag**

Identify the letter or letters you tend to drag with other steno strokes. Do **one** of the following:

- Type the letters. You must put a hyphen before a letter to indicate its position on the right side of the keyboard. For example –G.
- Click the letters on the sample keyboard. Once a letter is selected, the sample keyboard indicates the selection by turning the letter blue.

#### **Keys I tend to Drop**

Identify the letter or letters you tend to drop from steno strokes. Do **one** of the following:

- Type the letters. You must put a hyphen before a letter to indicate its position on the right side of the keyboard. For example –G.
  - Click the letters on the sample keyboard. Once a letter is selected, the sample keyboard indicates the selection by turning the letter blue.
5. Press **Enter (OK)**. If not already selected, Case CATalyst automatically checks the Drag/Drop Analysis option.
  6. Press **Alt + a (Apply)** to apply the changes.

### **Parenthetical + Q = Auto By Line**

Parenthetical + Q = Auto By Line is a Translate option. When active, Case CATalyst automatically formats a Question as a By Line when the Question follows a Parenthetical format symbol. When you write a parenthetical paragraph style and the proceedings return to Q & A, Case CATalyst automatically formats the By Line using the name in the last By Line.

For example, if the proceedings go off the record and then return to Q & A, following the parenthetical the reporter writes the steno for Q and CATalyst automatically formats it as a By-Line with the last by line name filled in and Q.

The By Line paragraph style is controlled by your layout settings.

### **Common By Line Formats**

<By-line>By Attorney name  
<Question>

<By-line>Q. (By Attorney Name)

<By-line>By Attorney Name: Q.

An example of the use of a Parenthetical paragraph style would be:

<Parenthetical>(Discussion off the record.)

The Parenthetical + Q = Auto By Line option is similar to the Colloquy + Q = Auto By Line option. The [Colloquy + Q = Auto By Line](#) contains additional details on formatting By Lines.

## Delete Repeated Q/A/C

Delete Repeated Q/A/C is a Translate option. When active, Case CATalyst generates only one paragraph when two identical paragraph styles are written, one immediately after another, and the first paragraph has no text following it. When you write a Question or Answer, Case CATalyst displays the first paragraph and ignores any identical paragraphs that immediately follow. Text is placed in the first paragraph. For example, you write:

Q.

Q. Now,...

The result is:

Q. Now,...

When you write two colloquy paragraph styles, one immediately after another, Case CATalyst generates one paragraph only when the colloquy definition for the steno stroked is identical. If you stroke colloquy twice, one immediately following another and the definitions are different, then Case CATalyst generates both colloquy paragraphs. For example:

You have STPHAO defined as <Colloquy>MS. FERRO: You write:

BY MS. FERRO:

BY MS. FERRO:

The result is:

BY MS. FERRO:

You also have SKWRAO defined as <Colloquy>MS. ANDERSON: You write:

BY MS. FERRO:

BY MS. ANDERSON:

The result is:

BY MS. FERRO:

BY MS. ANDERSON:

## Exclude Caps

Exclude Caps is a Translate option available when EZ Link is active. When selected, Case CATalyst does not apply the EZ Link spelling rule to an all capped or mixed case root word when adding a suffix "s" that is written immediately after the word.

For example, let's say you write "The Brady {Suffix}s went on vacation." When this option selected, the result is "The Bradys went on vacation." Instead of applying the normal rules of spelling when a root word ends in "y" and a suffix "s" is added to automatically change the "y" to "i" and add "es," this option simply attaches the "s" suffix to the root word. If this option is not selected, then the result in the previous example would be "The Bradies went on vacation."

## EZ Choice

EZ Choice is a Translate option. When active, Case CATalyst resolves conflicts during translation based on your previous conflict selections when occurring in similar context. When you resolve a conflict in Edit or realtime, the conflict choice plus the two words preceding the conflict are entered into the Conflict Database file. EZ Choice then uses the Conflict Database entries to determine the conflict resolution in future jobs.

EZ Choice selected conflicts display on the Edit screen in the same color as your conflicts. When your cursor is positioned immediately before the EZ Choice selected conflict, the original conflict displays on the Status bar in the lower right hand corner of the Edit screen. When your Scan For Options are set to scan to conflicts, the cursor stops on EZ Choice selected conflicts. To confirm (final resolve) the EZ Choice selection, press Enter. You can also select a different conflict choice by pressing the number for the corresponding conflict. Once you press Enter or select a different conflict, the selection is confirmed. When confirmed, Case CATalyst changes the text from the conflict color to text color.

When Automatic Number Conversion applies to any part of a Second Choice chosen conflict, Case CATalyst automatically confirms the conflict selection. You can also change the Advanced Translate [option](#), Automatically resolve EZ Choice/Second Choice Conflicts, to have Case CATalyst automatically confirm the EZ Choice conflict and prevent Scan from stopping on the confirmed conflicts. When Case CATalyst automatically confirms the EZ Choice selection, the selection information is stored in the EZ Choice conflict database.

EZ Choice selected conflicts that contain a prefix or suffix display with a space between the root word and the prefix or suffix until confirmed. Once you confirm the EZ Choice selection, Case CATalyst removes the space. For example, you have a conflict between "go" and <Suffix>ing. You write STOP/G which translates as: stop ^ go ^ <Suffix>ing. You select "ing" resulting in "stopping". The next time you translate using EZ Choice or Auto-Conflict and the same conflict situation occurs, Case CATalyst displays "stop ing" with "ing" in your conflict color. When you select and confirm the "ing" Case CATalyst displays "stopping."

EZ Choice selected conflicts that contain a format symbol display the format symbol with a space between the format symbol and the word. Once you confirm the EZ Choice selection, Case CATalyst applies the format symbol.

When exporting to RTF/CRE, unconfirmed EZ Choice selected conflicts export in the original conflict form, so a scopist, for example, can view the original conflict. Once you confirm the EZ Choice selected conflict, Case CATalyst exports it as normal text. To confirm all the EZ Choice selected conflict choices at one time, use [Resolve All Chosen Conflicts](#). Resolve All Chosen Conflicts also resolves all Auto-Conflict selected conflicts.

You can use [Auto-Conflict](#) in conjunction with EZ Choice. When EZ Choice is active, Case CATalyst first checks the conflict database. If the conflict is not in the database, then Auto-Conflict resolves the conflict.

## EZ Link

EZ Link is a Translate option. When active, Case CATalyst attaches prefixes and suffixes to the root word during translation applying the rules of spelling in an attempt to correctly spell the combined word. Case CATalyst first checks the Spell Check wordlist for a match. If no match exists then Case CATalyst attaches the combined root word and suffix without any spelling changes. For example, you write STOP /-G. The dictionary define for the steno outline STOP is "stop" and -G is {Suffix}ing. The result is "stopping". You must define the prefix and suffix using the [{Prefix}](#) and [{Suffix}](#) symbols.

Case CATalyst resolves able/ible and er/or endings. For example, a dictionary entry {Suffix}er exists. You write the steno stroke for "tract" followed by the stroke for {Suffix}er. The strokes translate as "tractor" unless a dictionary entry exists as "tracter".

You can use the [Prefixsuffixrules.ini](#) file to enhance prefix and suffix handling when using the EZ Link translate option. The Prefixsuffixrules.ini file is located in your System Files case in your user name.

If you select the [Exclude Caps](#) option, EZ Link attaches the suffix without applying the EZ Link spelling rules to root words defined as all capped or mixed case.

## EZ Speakers Dictionary

The EZ Speakers Dictionary translate option allows you to select an [EZ Speakers](#) dictionary to use for creating EZ Speaker entries for the selected job. You can use any EZ Speakers dictionary that resides in the System Files case and begins with the name "EZ Speakers". When you use the Saved Translation Options in the Translate dialog box, Case CATalyst remembers the EZ Speakers dictionary selection along with other saved translation settings. The [saved translation settings](#) feature is helpful if you report different types or jobs and/or work for different firms or jurisdictions. You can save the layout, EZ Speaker dictionary, dictionaries selected for translate (i.e. CART dictionary or Court dictionary), translate options for each type of job. When you are setting up realtime you select the saved translation file that you need for that particular job.

Although the EZ Speaker Dictionary is saved as part of the saved translation settings, it is not used when translating a job, it is used to create the EZ Speaker entries before and during the job.

## Ignore "and"

Ignore "and" is a Translate Option that applies to [number conversion](#) and [number trigger](#) definitions. When active, Case CATalyst ignores the word "and" when it occurs between two numbers. Numbers before and after the word "and" are considered as one number for a number conversion or number trigger. For example, if you write one hundred and 50 and then write a dollar number conversion stroke, the result is \$150. If Ignore "and" is not active and you write the same text and conversion stroke, the result is one hundred and \$50.00.

If Ignore "and" is active during translation and the word "between" immediately precedes a number series, such as "between 50 and 100 minutes," and you write a dollar number conversion stroke, Case CATalyst recognizes the word "and" because of the word between. The result is "between 50 and \$100.

Number conversion and number trigger formats vary. You can customize the number conversion and trigger formats to match your writing style.

The Ignore "and" option does not affect the [Automatic Number Conversion](#) feature.

## Ignore Commas

Ignore Commas is a Translate Option that applies to [number conversion](#) and [number trigger](#) definitions. When active, Case CATalyst ignores any commas that separate a set of numbers and considers them as a group for the conversion or trigger. For example, if you write 303, 503,143 and then write the social security number conversion stroke, the result is 303-50-3143. If Ignore Commas is not active, the social security number conversion or trigger does not take action since Case CATalyst considers only the last three numbers for the conversion. A social security conversion or trigger format requires 9 digits or number words before taking action.

If Ignore Commas is active during translation and the word "between" immediately precedes a number series, such as "between 4,800 and 15,000 items", and you write the social security number conversion, Case CATalyst does not take action. The result is "between 4,800 and 15,000 items".

Number conversion and number trigger formats vary. You can customize the number conversion and trigger formats to match your writing style.

The Ignore Commas option does not affect the [Automatic Number Conversion](#) feature.

## Ignore Periods

Ignore Periods is a Translate Option that applies to [number conversion](#) and [number trigger](#) definitions. When active, Case CATalyst ignores any periods that separate a set of numbers and considers them as a group for the conversion or trigger. For example, "I would say fifty. Twenty-four people left immediately." Writing a number conversion stroke has no effect on "fifty" or "twenty-four."

The Ignore Periods option does not affect the [Automatic Number Conversion](#) feature.

## Ignore Word Numbers

Ignore Word Numbers is a Translate Option that applies to [number conversion](#) and [number trigger](#) definitions. When active, Case CATalyst ignores words that are numbers for the conversion. For example, you write "What is your social security number?". Then you write, "five five five two three four 789". The result is that the number trigger takes no action. If Ignore Word Numbers is not active, the result is 555-23-4789.

The Ignore Word Numbers option does not affect the [Automatic Number Conversion](#) feature.

## Phonetic Translation

Phonetic Translation is a Case CATalyst Translate option. When active, Case CATalyst phonetically translates steno outlines when no match is found in any dictionary used for translation. This prevents the display of untranslates on the captioning screen. Phonetic translation is based on your selection for the Advanced Translate option, [Phonetic untranslates display as words](#). You can choose to match steno outlines with the text equivalent entry in the [Phonetic Table](#) or to translate single stroke untranslates using algorithmic logic for the intended pronunciation. Using the Phonetic Table is the default.

You can create a dictionary definition to invoke the Phonetic Translation option from your writing machine using the [Toggle Phonetic Mode](#) translate command. A steno outline defined as {Toggle Phonetic Mode} must be in a dictionary used during captioning.

Phonetically translated words appear in the selected untranslate color. If your [Scan For Options](#) are set to stop on untranslates, then **F8 (Scan)** and **Shift + F8 (Scan Backward)** stop on phonetically translated words.

## SecondChoice

SecondChoice is a Translate option. When this option is active and you select a conflict choice in edit, Case CATalyst looks in a system file to identify the possible parts of speech for the word before and after the conflict. Case CATalyst places the conflict choice along with the before and after parts of speech information in the SecondChoice conflict database. When the same parts of speech appear before and after the same conflict in future translations, Case CATalyst selects the same conflict choice.

For example, in the conflict "Did you ^ Phillip ^ fill up the car on the way?" you select the second conflict. The word prior to the conflict is a noun. The word after the conflict is an article. Case CATalyst records the second choice selection for this conflict when it occurs between a noun and an article.

SecondChoice selected conflicts display on the Edit screen in the same color as your conflicts. When Scan For Options are set to scan to conflicts, using Scan Forward and Scan Backward stops the cursor on SecondChoice selected conflicts. To confirm the SecondChoice selection, press **Enter** or select a different conflict choice by pressing the corresponding conflict number. When Automatic Number Conversion applies to any part of a Second Choice chosen conflict, Case CATalyst automatically confirms the conflict selection.

You can use SecondChoice in conjunction with [EZ Choice](#). When EZ Choice is active, EZ Choice attempts to resolve the conflict. If no match is found in the EZ Choice conflict database, then SecondChoice attempts to resolve the conflict. Selecting both EZ Choice in combination with SecondChoice could be a great way to build your conflict database faster and result in more accurate conflict resolution. In addition, when EZ Choice resolves a conflict it is immediate as it does not have to wait until the entire conflict and word after the conflict is written. When only selecting SecondChoice as the conflict resolution feature, the resolution of the conflict is delayed when writing realtime because the conflict cannot be resolved until the word before the conflict, the conflict and then the word after the conflict is written.

Case CATalyst creates a Second Choice Conflict Database in your System Files case even if you do not select the SecondChoice conflict resolution option. The SecondChoice conflict database is user specific. The SecondChoice Conflict Database file cannot be edited.

## IMPORTANT

SecondChoice does not analyze any portion of the sentence for grammar. Case CATalyst determines the parts of speech for the words before and after the conflict by looking the word up in a system file.

## Squish Defined Numbers

Squished Defined Numbers is a Translate option. When active, numbers defined in the dictionary automatically translate with no space between them. For example, definitions exist in the dictionary for 1, 2, 3, and 4. You write #1/#2/#3/#4. With the Squished Defined Numbers option selected, the result is 1234. Without the option, the result is 1 2 3 4. When Squish Define Numbers is not active, any defined numbers translate with a space between them. Numbers not defined in a dictionary always translate with no spaces.

The Squish Defined Numbers option does not affect the [Automatic](#) Number Conversion feature.

## Suffix Drag/Phrase Maker

Suffix Drag/Phrase Maker is a Translate option. When active, Case CATalyst translates, by default, steno outlines accidentally stroked with a dragged letter -G, -S, or -D as a suffix or suffix letter tucked inside a steno outline. Suffix Drag/Phrase Maker allow allows you to select whether dragged steno should be considered a suffix or a word.

### Example of using Suffix Drag/Phrase Maker for dragged suffixes:

For example, you have "-D" defined as <Suffix>ed in your dictionary. You normally write the word "stopped" as STOP/-D. During testimony, however, you accidentally drag the final D into the first stroke, resulting in STOPD. With Suffix Drag/Phrase Maker active, Case CATalyst translates the word as "stopped". In another example, you have a dictionary definition for KHAT with the "-G" defined as <Suffix>ed. You stroke KHAGT. Since "-G" is not the last letter of the stroke, Suffix Drag/Phrase Maker does not apply. With the Tuckable option active for the steno outline "-G," if Case CATalyst does not find a definition for KHAGT in the dictionary, KHAGT translates as "chatting."

### Example of using Suffix Drag/Phrase Maker for dragged phrases:

For example, let's say the steno stroke /WEBD is not defined in your dictionary. However, you have /WE defined as "we" and /BD is set a Word type in your Suffix Drag/Phrase Maker Options as the word "said." With the Word option in Suffix Drag/Phrase Maker, you can have /WEBD translate as "we said" even though it is not defined in your dictionary as a single stroke.

Suffix Drag/Phrase Maker only applies to one-stroke words in which steno characters can be added as a suffix. [Suffix Drag/Phrase Maker options](#) allow you to add other steno characters you want Case CATalyst to consider a suffix. The [Plural Endings Options](#) allow you to use the final S, final Z or both for plural endings. To confirm the combined words are spelled correctly, set the Suffix Drag/Phrase Maker Spell Check option for the steno outline. When Case CATalyst applies Suffix Drag, the translated word displays in the user selected [color](#) on the Edit screen. While editing, if Suffix Drag/Phrase Maker has translated the untranslate correctly, you can press Enter to confirm the translation.

If Spell Check is active, Case CATalyst checks the newly combined word to confirm the combined word is spelled correctly. If a correctly spelled word is not found, Case CATalyst tries the next possible suffix to find an actual word. This may result in a correctly spelled word but not the word intended. If Case CATalyst does not find a correctly spelled word with an added suffix, the steno outline remains an untranslate and no conversion takes place. The Spellchecked option has no influence on phrases created by Suffix Drag/Phrase Maker.

If you are also using the [TrueStroke Drag/Drop](#) and/or [Drag/Drop Analysis](#) translate option, TrueStroke Drag/Drop takes priority over both Drag/Drop and Suffix Drag/Phrase Maker. If you are using the Drag/Drop Analysis translate option, Drag/Drop Analysis takes priority over Suffix Drag/Phrase Maker.

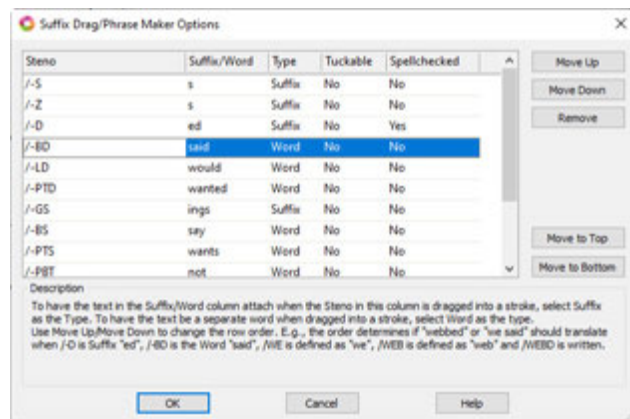

When editing, if the translation is a result of Suffix Drag/Phrase Maker and the translation is correct, you can press Enter to confirm the translation is correct, remove the Suffix Drag Begin and End format symbols that surrounds the translation in Reveal Codes and change the text color to your Text color selection.

## Suffix Drag/Phrase Maker Options

Use Suffix Drag/Phrase Maker Details button to add steno outlines for Suffix Drag/Phrase Maker to recognize as a suffix or word, activate the Tuckable option for a steno outline and set Spell Check to confirm the spelling of combined words.

To access Suffix Drag/Phrase Maker Details:

1. Press **Alt + u, t (Functions/Translate & Edit)**. The Translate dialog box displays.
2. Press **Alt + p (Options)**. The Translate Options dialog box displays.
3. Click the Suffix Drag/Phrase Maker **Details** button. The Suffix Drag/Phrase Maker Options dialog box displays.
4. Make entries in the fields. When finished, click **OK**.

### Steno

Type the steno outline for the suffix that, when written with a defined steno outline, translates as a combined word (Suffix) or Phrase (Word). Multiple steno characters are allowed, such as -GS or -GZ used for "ings."

**Suffix/Word**

Type the text for the suffix or word. For example, if the steno is /-D and the Type column is set to Suffix, you would type "ed" (without the quotes) for the suffix. For example, if the steno is /-BD and the Type is set to Word, you may type "said" (without the quotes) for the word.

**Type**

Select if the Suffix/Word text should behave as a Suffix or a Word. "Suffix" will be attached to the translated word when written in the same steno outline as a defined stroke. "Word" will be treated as a separate word following the define when written in the same steno as a defined stroke.

**Tuckable**

Select Yes to have Suffix Drag/Phrase Maker consider the steno as a suffix or a word even though it is not the last character of the steno outline. If No is selected, only the steno for suffixes or words that are written at the end of the steno outline will be considered suffixes or words.

**Spellchecked**

Select Yes to have Suffix Drag/Phrase maker check the newly combined word against Spell Check to confirm the combined word is spelled correctly. Select No to have Suffix Drag/Phrase Maker combine the suffix without checking it for spelling. This option has no influence when Type is set to Word.

➤ Note: Although, the Spellchecked column does not have any direct influence on the Word type entries in the Suffix Drag/Phrase Maker Options dialog, having Spellchecked set to Yes for the Suffix type entries may help resolve potential Suffix/Word conflicts. Let's say you have a dictionary define of /THEB "then" and you have /-D "ed" and /-BD "said" as a Suffix type and a Word type respectively in your Suffix Drag/Phrase Maker Options dialog. If the /-D "ed" suffix type is listed before the /-BD "said" entry, and the Spellchecked column for the /-D "ed" is set to No, the Suffix Drag/Phrase Maker translation will be "thenned." However, if you set the Spellchecked column to Yes, Case CATalyst will see that "thenned" is a misspelled word and will then move on in the Suffix Drag/Phrase Maker Options list to find the /-BD "said" Word type entry. The resulting Suffix Drag/Phrase Maker translation will be "they said."

**Move Up, Move Down, Move to Top, Move to Bottom**

Use these buttons to change the order of the entries in the Suffix Drag/Phrase Maker Options by clicking on the line of the entry you'd like to move and then the appropriate button for the direction in the list you'd like to move the entry. Case CATalyst uses the order the entries are listed (first to last) to resolve potential Suffix Drag/Phrase Maker conflicts during translation. For example, if you have /-BD as a Word Type of "said" and also have /-D as a Suffix Type of "ed." and you stroke /WEBD, with /WEB defined as "web," should Case CATalyst give you "webbed" or "we said" as the Suffix Drag/Phrase Maker translation result? The order of the entries in the Suffix Drag/Phrase Maker Options dialog will resolve this conflict for Case CATalyst. If /-BD is listed before /-D, the Suffix Drag/Phrase Maker translation result will be "we said." Otherwise, the result will be webbed. It is important to note that actual dictionary definitions always take priority over the Suffix Drag/Phrase Maker feature. In other words, Suffix Drag/Phrase Maker only applies when the steno written is not defined in any of the dictionaries being used for translation.

**Remove**

The Remove button allows you to remove (delete) any of the entries in the Suffix Drag/Phrase Maker Options. To Remove an entry, click on the entry line you'd like to remove and then click the Remove button.

## Show Timers Translate Option

Show Timers is a Translate option. When selected, the Timers dialog box automatically displays when translation begins. In some jurisdictions or specific types of proceedings, the court reporter is required to track the time of examinations or expert witness testimony. The [Timer](#) realtime commands are available to include in speaker definitions that automatically start a "timer" when the speaker definition is written which tracks how much time has elapsed since the timer started. You can also select to view and hide the Timers dialog box during edit by selecting **Alt + v, s, r (View/Show/Timers)**.

Timer definitions (which start a particular timer), including the Stop All Timers command can also be included in EZ Speaker definitions and parentheticals.

## Translate Statistics

Translate Statistics is Translate option. When this feature is active, the Translation Status dialog box automatically displays during translation. It provides the number of strokes written, number of untranslates, the number of conflicts, the number of conflicts resolved, the names of the job dictionaries being used to translate and more about the file which is currently translating. When you open the file in Edit following translation, Translate Statistics displays information from the last translation.

To have Translate & Edit always display the Translate Status dialog box, in the Case CATalyst Translate Options Input tab, select **Translate Statistics (Alt +r)**.

Use the [Show Translation Status](#) feature to toggle the display of the Translation Status dialog box On and Off. In Translate & Edit and Edit, press **Alt + v, s, n (View/Show/Translation Status)**.

## TrueStroke Drag/Drop

TrueStroke Drag/Drop is a Translate option that works with TrueStroke data that is created when using a Luminex or Diamante steno machine via a USB or WiFi connection or a Wave steno machine via a USB connection. When active, Case CATalyst analyzes steno outlines during realtime translation using TrueStroke data located in the Steno X-ray2 (.sgxr2) file. When the results of a steno outline is going to be an untranslate during realtime translation because no dictionary definition is found for that steno outline, Case CATalyst analyzes the TrueStroke data against the steno outline written to determine if there is a steno character that has been dragged or dropped. If TrueStroke determines a steno character or character appears to be dragged or dropped and finds a match to a definition in any one of the dictionaries selected for translation, the untranslate becomes a word/phrase. The translated word displays in the transcript with the [user defined](#) color for Drag/Drop. While editing, if TrueStroke Drag/Drop has translated the untranslate correctly, you can press Enter to confirm the translation. If the translation is incorrect, you can simply define or replace the word/phrase.

For example, you have STAF defined in your dictionary as "staff." You wrote "STAF" but the TrueStroke data indicates that you dragged the "E" resulting in "STAEF." The "E" registered but was lighter than the other letters. Since you do not have a dictionary definition for "STAEF," it translates as "staff" and displays in the color designated for Drag/Drop translations.

TrueStroke data contains information about the timing, direction of travel and velocity of each steno key in every steno outline written on the Luminex, Diamante and Wave. The data is written to the .sgxr2 subfile on the Stenograph Luminex™ and Diamante® Data SD card or to the Stenograph Wave memory along with the steno note file when the TrueStroke option is active on the writing machine. When you write realtime to Case CATalyst via USB cable or WiFi connection, the TrueStroke data is automatically sent to the job subfile, Steno X-ray2.

While editing, you can open Vertical Notes and double click a steno outline to display the TrueStroke Data. More information on viewing TrueStroke data is available in the [TrueStroke data topic](#).

If you are also using the TrueStroke Drag/Drop and/or [Drag/Drop Analysis](#) translate option, TrueStroke Drag/Drop takes priority over both Drag/Drop and [Suffix Drag/Phrase Maker](#). If you are using the Drag/Drop Analysis translate option, Drag/Drop Analysis takes priority over Suffix Drag/Phrase Maker.

When editing, if the translation is a result of TrueStroke Drag/Drop and the translation is correct, you can press **Enter** to confirm the translation is correct, remove the Drag/Drop Begin and End format symbols that surround the translation in Reveal Codes and change the text color to your Text color selection.

## Use Alternate User Settings for Edit

The Use Alternate User Settings for Edit translate option allows you to select a user setting file to be applied to Edit following translation. Using an alternate settings file for edit might also be helpful when editing a transcript and you want a different display of items (panes) when editing versus realtime. Or you are editing on a train or editing late at night and need a different view or different color scheme. This feature may be helpful when outputting to [CARTView](#) as you can select a saved setting file that has the font size, color, position, etc., for the CARTView window.

[Create](#) alternate user setting files in Edit using the Save Alternate User Settings command.

The Use Alternate User Settings for Edit field is located on the [Translate](#) dialog box Input tab. The file currently selected in the Use Alternate User Settings in Edit field is part of the Saved Translation Settings file, when you choose to save the translate settings. For example, you might want to create a Saved Translation Settings file for CARTView that includes specific job dictionaries based on the CART subject and then select an Alternate User Settings file that has specific font and color selections that fit the client and/or situation.

## Use Update Area for Translation

Use Update Area for Translation is a Translate option that allows you to use dictionary entries that you designated for the Personal Dictionary stored in the Update Area to help translate. The Update Area is a dictionary that holds D-defines until you review them and decide, if appropriate, to merge them into your Personal Dictionary. When the option is selected, Case CATalyst uses the [Update Area](#), if available, to help translate the job. The Update Area was very important in older CAT systems where you couldn't easily edit the dictionary. In other words, in some older CAT systems once you put a definition into your Personal Dictionary, you couldn't get it out. Since all CATalyst dictionaries can be easily modified, the Update Area may not be as necessary as before. Unless you change your Dictionary Options, by default all D-Defines made during translate or edit go to the Personal Dictionary and bypass the Update Area.

To use the Update Area for a temporary storage for new D-Defines, check the [Dictionary Option](#), *D-Define go to Update Area*. You can access Dictionary Options via the [All Options](#) feature or in the Personal Dictionary, select Tools, Dictionary Options. Using the Update Area allows you to review your entries before placing them in your Personal Dictionary.

**IMPORTANT:** If your Dictionary Options have D-defines going to your Update Area, make sure you review you Update Area regularly and add the entries you want to keep to your Personal Dictionary. Also, make sure you back up your Update Area when you do your regular weekly backup of your Personal Dictionary and other important CATalyst files.

## Use Smart Quotes

Use Smart Quotes is a Translate option that allows you to use one dictionary definition to create opening and closing quotes that append to a word. For example, let's say you create one dictionary entry for a quotation mark using the steno outline: KWS defined as quote ("). In a test file or job, you write KWS/TKPWAOD/KWS/WORBG. The result is "good" work. No need to have two different dictionary definitions - one for the open quote and one for the closed quote.

During translation, Case CATalyst looks for the steno outline in the definition you designated for quote. If Case CATalyst sees a steno outline for quote, it then looks for another existing steno outline for quote that occurs before the one it is currently reading. When no previous steno outline for quote is found, Case CATalyst automatically creates an opening quote. When a previous quote is found, Case CATalyst creates a closing quote. If the opening quote is written and then a new paragraph style is written without the steno for quote (excluding Continuation Paragraph), a close quote will automatically be inserted at the end of the current paragraph and a new paragraph is inserted.

To use the Smart Quote feature, the dictionary definition for quote must contain only the quote (") symbol. The quote definition should not have any text or format symbols as part of the definition.

To select or deselect the Use Smart Quote option, do the following:

1. Open the Translate dialog box by pressing **Ctrl + t** or clicking the Translate icon.
2. Press **Alt + o** or click the Options button.
3. Select or deselect the Use Smart Quote option.
4. Make any other changes and click **OK**.

If you start translation, this option will be part of your last used settings file. If you are not going to translate at the time of making this change, you will want to save the setting to a Saved Settings file.

## Use Smart Parentheses

*Use Smart Parentheses* option is available on the Input tab of the Translate Options. When this option is selected, you can write one stroke for the opening parenthesis and the same stroke for the closing parenthesis. For example, let's say the reporter needs to write text that is surrounded by parentheses. With this option selected, the reporter writes PARPB defined as an open parenthesis, *writes this text* and then writes PARPB again. The result is (writes this text).

This option works the same way for brackets [ ] also. For example, let's say your want to write text that is surrounded by brackets. With this option selected, the reporter writes PWRABGT defined as open bracket, *Witness nods.* and then write PWRABGT again. The result would be [Witness nods.]

If you want to use this option, you need to have only one dictionary definition for an opening parenthesis "(" or open bracket "[" and you write this same stroke for opening and closing parenthesis or bracket. No other punctuation or format symbols can be defined with the opening parenthesis or open bracket. When you select this option, you would write the opening parentheses or bracket, write the text and write the same stroke used for the opening parentheses or bracket and Case CATalyst will automatically know it is a closing paren or bracket. If the opening parentheses or bracket is written and then a new paragraph style is written without writing the stroke for paren or bracket (excluding Continuation Paragraph), a close parentheses or bracket will automatically be inserted at the end of the current paragraph and then the new paragraph is inserted.

To select or deselect the Use Smart Parentheses option, do the following:

1. Open the Translate dialog box by pressing **Ctrl + t** or clicking the Translate icon.
2. Press **Alt + o** or click the Options button.
3. Select or deselect the Use Smart Parentheses option.

4. Make any other changes and click **OK**.

If you start translation, this option will be part of your last used settings file. If you are not going to translate at the time of making this change, you will want to save the setting to a Saved Settings file.

## Translate Commands

Translate commands format text during translation. Some translate commands are specific to translation while you are writing realtime. These commands are invoked from the writing machine. The steno outlines can be defined in your dictionary before you begin a realtime session or can be added during realtime.

The [Realtime Commands Dictionary](#) provided with Case CATalyst contains predefined translate commands that you can use during realtime writing. You can add to or modify the steno outlines to reflect your writing style or, if desired, include the entries in another dictionary.

Timestamps generate automatically when writing realtime and, if selected, print when the job prints. Timestamps default to clock mode, the actual time of day. You can select the Use Elapsed Timestamps option (timestamps starting from xx hours, xx minutes, xx seconds) in Edit.

While translating (realtime or regular translate), message boxes that display that only require an Enter or click OK will display for 5 seconds and then automatically close as if you pressed Esc or clicked Cancel. The message boxes that will automatically close include actions such as:

- Search or scan item not found.
- Search reached the end of the transcript.
- Could not suggest a brief.
- A message box that advises an action is done.

## Translate Commands in Case CATalyst

Translate commands display in the Format Symbol dialog box with { } brackets. For a detailed description of the Translate command, click the name from the list.

You can also use [format symbols](#) to help you format text when you translate and edit a transcript.

Options	Description
<a href="#">Auto Include</a>	Automatically include a file at the point you stroke the steno outline for this symbol. The dictionary definition includes the steno and the name of the file you are including.
<a href="#">Cancel Active Dialogs</a>	Closes most active dialog boxes including message boxes, except Associate Audio File, Set Page Number, Make Exhibit Index Entries, Power Define, Scan Define, Text Define and Create EZ Speaker Entries from the steno machine. <i>If the Power Define or Text Define dialog box is in Suspend mode, you can write the steno for the Cancel Active Dialog command to close it.</i>
<a href="#">Cap Previous 1-9 Words</a>	Allows you to initial cap the previous words. If there is a word with this command as part of the definition, that counts as one word. For example, let's say you have the steno STR*

	define as <Cap Previous 2 Words>street, when used it will cap the word before "street" and the word "street."
<a href="#">Define</a>	Open the Power Define dialog box to define untranslates from the writing machine during realtime. Once the Power Define dialog box is open, use the <a href="#">Power Define Dictionary</a> entries to navigate the dialog box.
<a href="#">Define With LS1 - LS5</a>	Allows you to select a <a href="#">Live Suggestion</a> and define the steno outline(s) from your writing machine during realtime. The <a href="#">Realtime Commands Dictionary</a> located in your System File case contains a few Define With LS1 - LS3 entries.
<a href="#">Delete</a>	Deletes the previous steno outline.
<a href="#">EZ Speaker Define</a>	Allows you to open the Create EZ Speaker Entries dialog box from your steno machine. Use your <a href="#">Power Define dictionary</a> commands to navigate the Create EZ Speaker Entries dialog box.
<a href="#">Glue</a>	Define individual alphabetic letters as capital letters, lower case letters, with hyphens and/or periods for fingerspelling. <a href="#">Advanced Translate Options</a> contains an option where numbers can attach to glued alphabet.
<a href="#">Ignore Steno for LS</a>	Ignores the last untranslate, drag/drop or suffix drag/Phrase Maker steno for Live Suggestion feature for the current job. This command is usually used when intentionally writing an untranslate to be defined as brief.
<a href="#">Initial Cap Off</a>	Turns off the Initial Cap text formatting after the format symbol.
<a href="#">Initial Cap On</a>	Turns on the Initial Cap text formatting after the format symbol.
<a href="#">Number Conversion</a>	Looks back in the file to convert numbers into any number format. A definition for Number Conversion includes <NumberConversion> followed by the <a href="#">number format</a> in brackets. The <a href="#">Realtime Commands Dictionary</a> located in your System File case contains a few number conversion entries.
<a href="#">Number Trigger</a>	Convert numbers following the text associated with this realtime command such as "date of birth" or "social security number". For example, let's say you want a number trigger definition to convert 9 numbers to a social security format. The dictionary entry would look like: Social Security{Number Trigger}[NNN-NN-NNNN] Once this definition is written, CATalyst will look for 9 consecutive numbers in the text following and convert it to the <a href="#">format</a> in the definition.
<a href="#">Pause Audio</a>	Pause Audio (AudioSync synchronizes audio recording with text during realtime). If you manually pause AudioSync with

this command, you must use the Resume Audio command to start the audio recording again.

[Prefix](#)

Join a prefix with the following root word.

[Prefix Number](#)

Place the associated punctuation symbol in front of the last number written. The [Realtime Commands Dictionary](#) located in your System File case contains a few Prefix Number conversion entries.

[Replace With LS1 - LS5](#)

Allows you to select a Live Suggestion and replace the steno outline(s) with text from your writing machine. The [Realtime Commands Dictionary](#) located in your System File case contains a few Replace With LS1 - LS3 entries.

[Resolve Conflict, Choice 1-9](#)

Select the first through ninth conflict choice.

[Resume Audio](#)

Start or resume the audio recording (AudioSync) during realtime. If you manually pause AudioSync with the Pause Audio command, you must use the Resume Audio command to start the audio recording again.

[Scan Define](#)

Locate the last untranslate and open the Power Define dialog box during realtime. Scan Define options are available in the [Advanced Translate Options](#) dialog box to set the Scan Define to also stop on Drag/Drop and/or Suffix Drag/Phrase Maker translations.

[Set Job End Time Field](#)

Fills in the Job End Time field value with the computer time when the stroke is written.

[Set Job Start Time Field](#)

Fills in the Job Start Time field value with the computer time when the stroke is written.

[Start Timer](#)

Start the Timer for a specific speaker during realtime. The Start Timer command can be in part of speaker definitions and/or By Line definitions. Start Timer command can also be used in the EZ Speaker Dictionary definitions.

[Stitch Off](#)

Turns Off the stitch formatting characters for text following the symbol when the Stitch On command was written first.

[Stitch On](#)

Stitches the words or spelling letters following this symbol with the defined punctuation symbol. Turn it Off with the Stitch Off symbol.

[Stop All Timers](#)

Stop all the [Timers](#) in the job during realtime. This command can be in a dictionary definition or included in parentheses if time needs to stop for off the record discussions, breaks and exhibit marking.

[Suffix](#)

Join a suffix with a root word. If you are using Translate's [EZ Link](#) feature, the rules of spelling are applied when attaching a suffix.

[Text E-Define](#)

This command allows you to create E-defines from your steno machine during realtime. The {Text E-Define} is similar to the [Power Define](#) feature except it performs an E-define instead of a dictionary define. Once the Text Define dialog box is open, use the commands in the [Power Define Dictionary](#) to navigate in the dialog box.

[Toggle Auto Conflict Resolution](#)

Toggle On and Off the option to have Case CATalyst automatically select the first conflict choice in any conflict during realtime.

[Toggle Bench Mode](#)

Turn On bench mode for the text following this symbol during realtime. The text is not sent out to realtime receive systems and depending on your settings, may display in a different color on your screen so that you know you are in bench mode.

[Toggle Follow Realtime](#)

Move the cursor between the last realtime stroke and the last editing location during realtime. Using this command allows you to follow the realtime text and then on a break you can move to the beginning of the transcript to begin editing. When realtime starts again, you simply use this command again and your cursor is following realtime. During the next break, use this command again and it will place the cursor at your last editing position when you used this command.

[Toggle Phonetic Mode](#)

Turn On and Off the option to have Case CATalyst automatically phonetically translate any untranslates during realtime.

## Auto Include

Use the Auto Include command to automatically copy a file at the point you stroke the steno outline for this command. Once you create an Include file, you define a steno outline in your dictionary to automatically bring the file into the job during translation. For example, you have an Include file called CERT that contains your Certificate Page. You use the Certificate Page at the end of every job. In your Personal Dictionary, you define /SERT/SERT as @CERT. At the end of your job, you stroke /SERT/SERT. When you translate the job, Case CATalyst automatically includes the Certificate Page at the end of the job.

[Insert Auto Include](#) definitions directly into your Personal, Case, or job dictionary. The "@" symbol, @, designates the file as an Include file and must precede the file name when you create an Auto Include definition. If you also want to bring in the page layout for the Include file, type [Y] after the *filename*. For example: @title[Y]. The layout only applies to the Include file and does not affect the rest of the job.

## Cap Previous 1 - 9 Words

Cap Previous 1 Word through Cap Previous 9 Words are translate commands that allow you to initial cap the previous words. For example, writing the stroke for Cap-Previous 1 initial caps the last word written. Writing the stroke for Cap-Previous 2 initial caps the last two words written. You can define strokes for each Cap Previous command, enabling you to initial cap up to nine previous words.

The Cap Previous command does not capitalize the following words unless they are the *first* word of the text being capitalized: *a, an, as, at, by, in, of, on, or, to, vs, and, for, the*. It does, however, include these words when counting backwards. For example, you stroke *united states of america*. You would stroke Cap Previous 4 to get *United States of America*.

If you define a word or words along with the Cap Previous Word command, Case CATalyst caps the words in the definition and counts the word or words as part of the number of words you are capping. For example, you want to make a definition for "street" that caps the word "street" and the previous word. In your dictionary, you define the appropriate steno as "street {Cap Previous 2 Words}". In a job you write, "pine street". The result is Pine Street.

The Cap Previous command applies only to the words for this occurrence. It does not global the change.

The Cap Previous 1 - 9 Words translation commands are another method of initial capping words while writing realtime. The [InitialCap On and Off](#) translation commands are another method of initial capping words while writing realtime. Another method would be to write a steno stroke defined as the [Cap Next](#) format symbol before each word you want initial capped.

## Cancel Active Dialog

When writing realtime, the Cancel Active Dialog command, used in a dictionary definition, closes all active dialog boxes including message boxes. For example, you have an AccelerWriter that scans back and you get a message that says "scan has reached the beginning of the file". You write the steno outline for the Cancel Active Dialogs command. Case CATalyst cancels the message box. In another example, there is a pause in the proceedings. You begin a Spell Check session and are in the process of adding a word to a wordlist. The proceedings begin before you are able to close all the dialog boxes. You write the steno outline for the Cancel Active Dialogs command. The wordlist and Spell Check dialog boxes close.

The Cancel Active Dialogs command does not close the following dialog boxes:

- Associate Audio File
- Set Page Number
- Make Exhibit Index Entries
- Power Define, Scan Define, Text Define and Create EZ Speaker Entries from the steno machine. If the Power Define dialog box is in Suspend mode, you can write the steno for the Cancel Active Dialog command to close it.

**Note:** If you want one steno outline to cancel the Power Define, Scan Define, Text Define and Create EZ Speaker Entries dialog box and other dialog boxes, look at your Power Define dictionary and see what the steno is for the [ABORT] entry. Then open your Personal Dictionary and insert/modify the {Cancel Active Dialog} entry steno to be the same as the Power Define [ABORT] entry. For example if the:

Power Define default steno for [ABORT] is PWORT

Create a Personal dictionary (or whatever dictionary) definition Steno PWORT defined as {Cancel Active Dialog}.

## Define

Define is a translate command that allows you to define untranslates or create definitions "on the fly" from your writing machine during realtime and place them in a dictionary. Defining an untranslate from the writing machine is called a Power Define. The {Define} translate command opens the Power Define dialog box from which you can [create a Power Define](#) for any type of global dictionary definition. For example, there is a break in the proceedings and you want to quickly create a brief for a technical term that has come up in the job.

You can also create an E-define on the fly from your writing machine. The [{Text E-Define}](#) command opens the Power Text Define dialog box to allow you to global existing text to be something different.

A definition for the Define translate command must exist in a dictionary you are using for translation. This must be a dictionary other than the Power Define dictionary.

### Stroking the steno outline for the Define translate command:

1. Activates the Power Define dialog box and loads the [Power Define dictionary](#) as the highest dictionary priority. The Power Define dictionary contains definitions for navigating in the Power Define dialog box.
2. Positions the cursor in the *Steno* field. You write the steno for the dictionary definition from the steno keyboard and then use navigating commands to [complete the definition](#).
  - You can [suspend](#) the Power Define and continue writing into realtime and return to the Power Define dialog box to complete it when time permits. You need a steno stroke defined as [Suspend] defined in your Power Define dictionary.
  - You can cancel the Power Define without completing the Power Define by writing the steno for the Power Define [\[Abort\]](#) command. The steno written while in the Power Define dialog box appears grayed out in Vertical Notes. If you have the [Advanced Translation Option, Insert Oops FS after aborted Power Define](#) option set to Yes, then an [Oops](#) format symbol (Oops-10 category) is inserted into the text at the location the Power Define was aborted.

Power Defines automatically apply forward and backward in the realtime file and remain active for all new realtime data. The Power Define globals are not stored in the Global Table and are inactive if you re-translate a realtime session. When you finish translating, Power Defines placed in the Personal Dictionary move to the [Update Area](#), if you selected to use one. Power Defines placed in a case or job dictionary remain in the respective case or job dictionary.

The Power Define dictionary remains loaded as the highest priority while the Power Define dialog box is open. Once you complete the Power Define or abort the definition using the [ABORT] command, the Power Define dialog box closes and the Power Define dictionary unloads from translation.

## Creating Power Defines

Defining an untranslate from the writing machine is called a Power Define. When you stroke the steno outline for the [Define](#) or [Scan Define](#) translate command, the Power Define dialog box opens and the Power Define dictionary loads with the highest priority. Movement command definitions contained in the Power Define dictionary provide the ability to navigate the Power Define dialog box. The Power Define dictionary remains loaded as the highest priority while the Power Define dialog box is open. Once you complete the Power Define or abort the definition using the [ABORT] command, the Power Define dialog box closes and the Power Define dictionary unloads from translation. Since the dictionary automatically loads, you do not select it for realtime writing. It is recommended that you review the [Power Define dictionary](#) default navigation commands and parameters before creating Power Defines during realtime.

You can Power Define any type of global dictionary definition. Case CATalyst applies the rule for longest dictionary match when strokes are written in the *New Text* field of the Power Define dialog box. For example, you have /HRAOE defined as "<Suffix>ly". You also have /HRAOE/HRAOE defined as "Lee". During realtime you power define /STAEUT/HRAOE. In the *New Text* field the steno outlines display as "state <Suffix>ly" because there is another definition in the dictionary that begins with /HRAOE and Case CATalyst is waiting for the longest match. Although Case CATalyst is waiting for the longest dictionary match, you can correctly Power Define the entry by stroking the steno outline for [ENTER] to close and complete the entry. The define, "stately" is correctly entered into the dictionary and applied to the job.

If you don't have time to finish the Power Define, you can stroke the steno outline for the [SUSPEND] command which leaves the Power Define dialog box open but returns the cursor focus to the realtime job. Once you have time to finish the Power Define, just write the stroke defined as {DEFINE} to return the cursor focus to the Power Define dialog box. The Power Define dictionary remains loaded as the highest priority while the Power Define dialog box is open. If you need to close the Power Define dialog box for whatever reason without completing the define, abort the definition using the [ABORT] command while your cursor is in the Power Define dialog box or if the Power Define dialog box is in Suspend mode, you can write the steno for the [{Cancel Active Dialog}](#) command and the Power Define dialog box closes and the Power Define dictionary unloads from translation. Since the dictionary automatically loads, you do not select it for the captioning session. It is recommended that you review the [Power Define dictionary](#) default navigation commands and parameters before creating Power Defines during realtime.

At any point, you can stroke the steno outline for the [ABORT] command to close the Power Define dialog box and have nothing written to the job. The steno written while in the Power Define dialog box appears grayed out in Vertical Notes. If you have the Advanced Translation Option, *Insert Oops FS after aborted Power Define* option set to Yes, then an [Oops](#) category 10 format symbol is inserted into the text at the location the Power Define was aborted. If you look in Reveal Codes you will see <Oops 10> at the location and the grayed out steno that was written before the abort. The same thing will occur if you wrote too many strokes in the Steno or Text field and the Power Define automatically aborted.

Selecting the Another button or writing the [ACCEPTCONTINUE] command perform the same action. They apply the newly created definition and leave the Power Define dialog box open to define the next untranslate. If you invoke Scan Define to open the Power Define dialog box, the Another button is grayed out. The [ACCEPTCONTINUE] command continues to be active, however, writing [ACCEPTCONTINUE] does not continue to scan back to the last untranslate. The [ACCEPTCONTINUE] command may not be in your Power Define dictionary. To verify the availability of the definition, open your [Power Define dictionary](#) located in the System Files case. Add or modify the definition as necessary.

The Replace Only (No Define) option allows you to replace text and steno for a single occurrence without making a dictionary definition. It is only available when Scan Define is invoked and is listed last in the dictionary list.

## Creating Power Defines

1. Start a realtime session.
2. Write the steno outlines for the Scan Define or Define translate command to open the Power Define dialog box.
3. Do one of the following:

### Scan Define

The steno displays in the *Steno* field and the cursor defaults to the *Text* field. Write the text in the *Text* field as outlined in the next step. Write the steno outline defined as [TAB] in the Power Define dictionary to move from field to field. If the cursor or command does not respond at any position in the Power Define dialog box, verify the correct steno outline in the [Power Define dictionary](#).

### Define

In the *Steno* field, write up to 16 steno outlines to define. If you stroke more than 16 consecutive steno outlines in the *Steno* field, the Power Define aborts without creating any type of definition.

4. Write the steno outline defined as [TAB] in your Power Define dictionary to move to the *Text* field.
5. In the *Text* field, enter the text definition for the steno. Do **any** of the following:
  - "Finger spell" the definition by writing the steno outlines defined as the individual letters. If the Power Define dictionary contains these individual letters, when you fingerspell, no space occurs between the letters, such as "Emma".
  - Write a steno outline with an existing dictionary entry. For example, you misstroke an Answer outline that is not in your dictionary -FRBLTS. In the *Steno* field write -FRBLTS. In the *New Text* field you write a stroke for answer that has a dictionary definition. Case CATalyst puts <Answer> in the *New Text* field eliminating the need for you to stroke an steno outline for F4 and then an A for answer.
  - Use a combination of writing a word or phrase with finger spelling. For example, you write SKWROPB/SON (Johnson) in the *Steno* field. In the *New Text* field you write the stroke for "John" and then fingerspell "son" so the result is "Johnson". If you wrote the stroke for "John" and then the stroke for "son" the result would be "John son".
  - Insert a Format Symbol. Write the steno outline defined as [F4] followed by the steno outline for the letter of the format symbol. For example, you might write the steno outline for "c" as KR-RBGS. F4c indicates Colloquy.

Alternately, you can write the steno outline defined as [F4 LIST]. When the Format Symbol list displays, stroke the steno outline defined as [UP ARROW] or [DOWN ARROW] to highlight the selected symbol. Then stroke the steno outline defined as [ENTER] to insert the format symbol.

  - Insert a [Field](#) into the definition. In order to display the Insert Field dialog box, press **Alt + i** on your computer keyboard and navigate using your computer keyboard or mouse to insert a field. Once you close the Insert Field dialog box, you can return to using your steno machine to navigate the Power Define dialog box,
  - Insert a space between a word or after punctuation by writing the steno outline defined as [SPACE].
  - Backspace the last character or last stroke, depending on your option, by writing the steno outline defined as [DELETE].

6. In the *Global To* field, select the dictionary in which you want to place the definition. The default is the Job Dictionary. You can change the default in [Advanced Translate Options](#).

Do **one** of the following.

- Write the steno outline defined as the number for the dictionary.

- Stroke the steno outline defined as [TAB] to move to the list of dictionaries. Write the steno outline for [UP ARROW] or [DOWN ARROW] to highlight the selected dictionary.
  - Write the steno outline defined as [Replace Only (No Define)] to replace the current untranslate and not place it in a dictionary. This option is only available when using the Scan Define command.
7. Optionally, select the *Add to Cat Scratch* option to send the definition to the [Cat Scratch](#) pane. Write the stroke defined as [CAT SCRATCH]. The [CAT SCRATCH] command may not be in your Power Define dictionary. To verify the availability of the definition, open your [Power Define dictionary](#) located in the System Files case. Add or modify the definition as necessary. Sending the define to the Cat Scratch pane is optional.
8. Do **one** of the following:
- Write the stroke defined as [ENTER] to apply the define and close the dialog box.
  - Write the stroke defined as [ACCEPTCONTINUE] to apply the define and have the Power Define dialog box remain open, allowing you to create another power define. If you invoked Scan Define to open the Power Define dialog box, writing [ACCEPTCONTINUE] does not continue to scan back to the last untranslate. The [ACCEPTCONTINUE] command is not a default command. You must add it to your Power Define dictionary.
  - If you want to clear all of the text or steno from the text or steno field, write the steno outline defined as [CLEAR]. For example, if your cursor is in the New Text field of the Power Define or Scan Define dialog, meaning it is the active field, and you'd like to remove all of the text in the New Text field, simply write the stroke defined as [CLEAR] in the [Power Define dictionary](#).
  - If you need to leave the Power Define dialog box open and return to writing realtime, write the steno outline defined as [SUSPEND]. The Power Define dialog box flashes, the cursor focus changes to the realtime text and leaves the Power Define dialog box open. The Power Define dialog box flashes to indicate an action with the Power Define dialog box. You can write the Suspend command at any time the Power Define dialog box is open. To return the to the Power Define dialog box, write the steno outlined defined as {DEFINE}. If you want to cancel the Power Define while it is in Suspend mode, you can write a steno outline defined, in a dictionary being used to translate, as {Cancel Active Dialogs}. The Power Define dialog is closed and nothing is applied.
  - To cancel the Power Define, write the [ABORT] command to disregard what is in the Power Define dialog box and cancel the command. The steno written while in the Power Define dialog box appears grayed out in Vertical Notes. If you have the Advanced Translation Option, *Insert Oops FS after aborted Power Define* option set to Yes, then an [Oops](#) category 10 format symbol is inserted into the text at the location the Power Define was aborted.

**Note:** If you want one steno outline to cancel the Power Define, Scan Define, Text Define and Create EZ Speaker Entries dialog box and other dialog boxes, look at your Power Define dictionary and see what the steno is for the [ABORT] entry. Then open your Personal Dictionary and insert/modify the {Cancel Active Dialog} entry steno to be the same as the Power Define [ABORT] entry. For example if the:

Power Define default steno for [ABORT] is PWORT

Create a Personal dictionary (or whatever dictionary) definition Steno PWORT defined as {Cancel Active Dialog}.

## Invalid or Incomplete Defines

When you create an invalid define, the Power Define dialog box closes without any warnings and no global takes place. The steno written while in the Power Define dialog box appears grayed out in Vertical Notes. If you have the Advanced Translation Option, *Insert Oops FS after aborted Power Define* option set to Yes, then an Oops format symbol is inserted into the text at the location the Power Define dialog box closed. You can continue realtime writing and make the next Power Define as necessary.

An invalid define includes:

- No text in the *New Text* field and you write the steno outline defined as [ENTER].
- More than 1024 characters in the *Text* field.
- No steno outline in the *Steno* field and you write the steno outline defined as [ENTER].
- More than 16 steno outlines in the *Steno* field. The steno outlines written display in Vertical Notes as deleted steno.
- More than 16 consecutive steno outlines in the *Global To* field.

## Define With LS1 - LS5

The Define With LS1 through Define With LS5 are translate commands that are used to select a [Live Suggestion](#) from the Brief It pane and global the selected untranslate/text. Live Suggestions is an optional realtime feature that automatically offers translation suggestions when an untranslate(s) displays in the transcript. You have the power to review the suggestions and to pick the right one, replace or global, to fix the untranslates. Two to five suggestions will be offered in the [Brief It pane](#) in a blue background. When selecting to define a Live Suggestion, the global is applied to the entire file. Creating a dictionary entry to select and global the first Live Suggestion is as easy and defining a steno stroke as Define With LS1. You can create dictionary entries for all five Define With LS# translate commands. There are also five [Replace With LS1 - LS5](#) translation commands.

## Delete

Delete is a translate command that deletes the previous steno outline. To use the Delete translate command, you must define a steno outline, such as \* (asterisk) or \*# as {Delete}.

## EZ Speaker Define

The EZ Speaker Define command allows you to [create EZ Speakers](#) from your steno machine. When the {EZ Speaker Define} command is in a dictionary being used in realtime and the steno is written during realtime the Create EZ Speaker Entry dialog box displays. You use commands in your [Power Define](#) dictionary to navigate the Create EZ Speaker Entry dialog box. The default Realtime Commands Dictionary contains a SPEF/SPEF defined as {EZ Speaker Define} entry.

## Glue

Use the Glue translate command to define different spelling alphabets. Define steno strokes for any letters a - z upper and/or lower case, with hyphens or periods. For example, let's say a witness spells their name and you want to write steno outlines that with put hyphens between each letter of the witness' name. You have defined steno outlines for A-Z (using the letter written with -FPLT) with the Glue translate command and a hyphen. The witness' name is Smyth so you write /S-FPLT/PH-FPLT/KWR-FPLT/T-FPLT/H-FPLT and the result is S-M-Y-T-H. The Glue translate command is only used in a definition and is not used while editing. The Glue translate command must be defined with a alphabetical character and must be:

- the first character in a definition
- the only format command or symbol in the definition.

### Example 1

To have the letters IBM display together when you write the steno EU-FPLT, PW-FPLT, PH-FPLT, define /EU-FPLT as {Glue}I, /PW-FPLT as {Glue}B, and /PH-FPLT as {Glue}M. When you write /EU-FPLT /PW-FPLT /PH-FPLT, the translation is IBM.

### Example 2

To have the letters I-B-M display when you write the steno for \*EU, PW\*, PH\*, define /\*EU as {Glue}-I, /PW\* as {Glue}-B, and /PH\* as {Glue}-M. When you write /\*EU /PW\* /PH\*, the translation is I-B-M. The initial hyphen is dropped.

If your number bar numbers are not defined in your dictionary and you write a dictionary definition that contains a Glue translate command, the number and the glued letter will be attached. For example, let's say that you do not have your number bar numbers defined in your dictionary. You have W-FPLT defined in your dictionary as {Glue}W. You write /W-FPLT/2 and the result is W2. If you write 2/W-FPLT/3, the result is 2W3. If you write 2 followed by {Glue}-W would result in 2-W.

### Example 3

An alphabet to include letters surrounded by parentheses such as (a), (b), (c), and so on.

If you want a (letter) to appear and letters after the (letter) to glue to the (letter), but not to glue to the previous letter or number i.e. "We're talking Rule (b)143 here, right?" define the letters surrounded by parenthesis as follows: (a){Glue}, (b){Glue}, (c){Glue}, etc.

If you want other numbers or types of letters to attach before the (letter) -- for example, "We're talking about the money in your 401(k) -- or before and after: "I'm referring to Section 1(b)14" define each letter in this alphabet as {Glue}(a){Glue}, {Glue}(b){Glue}, {Glue}(c){Glue}, etc.

Also see the Advanced Translate option, [Digits attach to {Glue} alphabet](#) for more information.

[{Stitch On}](#) and {Stitch Off} translate commands are also available as an alternative to the {Glue} translate command.

## Insert into a Dictionary Definition

1. Open Manage Dictionary, press **Alt + u, d**.

2. If it is not already open, select the dictionary in which you want to make the entry. Do one of the following:
  - Personal Dictionary—press **Ctrl + d**.
  - Case Dictionary—press **Ctrl + k**. When the Open Existing Document dialog box displays, select the dictionary and press **Enter (Open)**. You can only open a case dictionary if the job is in a case.
  - Job Dictionary—press **Ctrl + j**. When the Open Existing Document dialog box displays, select the dictionary and press **Enter (Open)**.
3. Do one of the following:
  - Press **Ctrl + i** to open the Insert Dictionary Entry dialog box.
  - Search for a particular steno outline and then press **Ctrl + m** to open the Modify Dictionary Entry dialog box and modify the entry.
4. In the Steno field, type the appropriate steno for the definition.
5. In the New Text field, press **F4 g** and then type the appropriate punctuation symbol or letter.
6. Press **Enter (OK)** to insert the definition into the dictionary.

### Ignore Steno for LS

The Ignore Steno for LS realtime command allows you to ignore untranslated steno, drag/drop, suffix drag/Phrase Maker or phonetic text for Live Suggestions. In other words, Live Suggestions will not offer suggestions for that steno for the rest of the job. Once the command is written, Case CATalyst searches back for the last untranslate, drag/drop or phonetic text in the previous paragraph or page (whichever is larger) and will mark that steno to be ignored by Live Suggestions. You might use this command if you are intentionally writing a steno outline, that will create an untranslate, that you want to define as a brief, terminology, etc., and you do not want Live Suggestions to create suggestions.

For example: let's say you write PHA\*T/PHA\*T which you want to define the first time you get to be Matthew McConaughey. You write the steno outline defined as Ignore Steno for LS so Live Suggestions will ignore that steno for the rest of the job and will not offer suggestions. At the first chance, you quickly [Power Define](#) PHA\*T/PHA\*T to be Matthew McConaughey.

Using the above example, if you write PHA\*T along with another untranslate, drag/drop or suffix drag/Phrase Maker, Live Suggestions may offer a suggestion.

### Initial Cap On/Off

The Initial Cap On/Off translate commands allow you to turn on and off initial capitalization of words. . For example, you are providing realtime where a title of an article is mentioned. The article name contains common words that are generally not capped, but since it is article title you need to cap them. All the words are translating but in this job because the article title is referenced, you need to initial cap the string of words. The title of the article is subdural hemorrhage and intradural hemorrhage. You write your steno outline defined as {InitialCap On}, write the steno for subdural hemorrhage and intradural hemorrhage and then write your steno outline defined as (InitialCap Off). The result would be: Subdural Hemorrhage and Intradural Hemorrhage.

A word that is in your Advanced Edit *Words to suppress capping when found in middle of phrase* setting will not be initial capped unless it is the first word following the {InitialCap On} command. For example, let's say the word "the" is in your *Words to suppress capping...* option. Let's say you wrote the steno for {Initial Cap On} followed by "the winding road." The result would be: The Winding Road. The word "the" is initial capped because it is the first word in the phrase. On the other hand, if you wrote the steno for {Initial Cap On} followed by "walk for the cure," the result would be: Walk for the Cure. The word "the" is not initial capped because it appears in the middle of the phrase.

You can insert these entries into any dictionary. If you use the Realtime Commands Dictionary you may want to insert the entries into that dictionary or even your Personal Dictionary. These two realtime commands should be defined as individual definitions and not as part of or in the middle of a definition.

The InitialCap On/Off translation commands are another method of initial capping words during realtime. The [Cap Previous 1 - 9 Words](#) translation commands are another method of initial capping words while writing realtime. Another method would be to write a steno stroke defined as the [Cap Next](#) format symbol before each word you want initial capped.

### InitialCap On

1. Open a dictionary, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
4. In the Steno field, type the appropriate steno for the definition.
5. Press **Alt + f (Edit/Insert/Insert Format Symbol)**, to display the list of format symbols.
6. Use the Up and Down Arrow keys to locate **{InitialCap On}** and press **Enter** to insert the highlighted format symbol into the Text field.
7. Press **Enter (OK)** to insert the definition into the dictionary.
8. Press **Esc (Cancel)** to close the Insert dialog box.

### InitialCap Off

1. Open a dictionary, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
4. In the *Steno* field, type the appropriate steno for the definition.
5. Press **Alt + f (Edit/Insert/Insert Format Symbol)**, to display the list of format symbols.
6. Use the Up and Down Arrow keys to locate **{InitialCap Off}** and press **Enter** to insert the highlighted format symbol into the *Text* field.
7. Press **Enter (OK)** to insert the definition into the dictionary.
8. Press **Esc (Cancel)** to close the Insert dialog box.

### No Ending Punct

Use the No Ending Punct translate command in definitions to prevent the auto "generated" ending punctuation on the previous paragraph style when changing a paragraph style. For example, you want to define a steno stroke to begin quoted material within the current Question.

### **Example**

In the following example, the quoted Answer attributes are controlled by a User Defined Paragraph style. The text portion of the dictionary definition for the quoted Answer steno stroke might be: {No Ending Punct}<User Defined Paragraph n>

Q. In your deposition of October 20, 2006, am I correct that in response to the same question I just asked you, you testified as follows:

"A. I saw Sally Jones at 10:00 p.m. on the night of June 6, 2005."

### **Insert into a Dictionary Definition**

1. Open Manage Dictionary, press **Alt + u, d**.
2. If it is not already open, select the dictionary in which you want to make the entry. Do one of the following:
  - Personal Dictionary—press **Ctrl + d**.
  - Case Dictionary—press **Ctrl + k**. When the Open Existing Document dialog box displays, select the dictionary and press **Enter (Open)**. You can only open a case dictionary if the job is in a case.
  - Job Dictionary—press **Ctrl + j**. When the Open Existing Document dialog box displays, select the dictionary and press **Enter (Open)**.
3. Do one of the following:
  - Press **Ctrl + i** to open the Insert Dictionary Entry dialog box.
  - Search for a particular steno outline and then press **Ctrl + m** to open the Modify Dictionary Entry dialog box and modify the entry.
4. In the Steno field, type the appropriate steno for the definition.
5. In the New Text field, select **FS** and then select **{No Ending Punct}**. Following the {No Ending Punct} translate command, insert the desired paragraph format symbol . It is necessary to place the No Ending Punct translate command before the paragraph style format symbol in the dictionary definition.
6. Press **Enter (OK)** to insert the definition into the dictionary.

### **Number Conversion**

The Number Conversion translate commands is used in a dictionary entry along with number conversion formats to convert numbers to a specific number format such as dollars, social security number and phone number. Case CATalyst converts the number during translation when you write the steno outline for the definition containing the Number Conversion the translate command and the desired number conversion format. The numbers can be numerals, words or a combination of numerals and words, and include punctuation such as commas, periods, and hyphens. Number Conversion does not apply to a number you already converted once or applied the Prefix Number command.

Number Conversion definitions contain the format symbol: {Number Conversion}. The format symbol is followed by square brackets which enclose placeholders, such as [NNN NNNN] for a telephone number or [\*RomanUpper] for a number format command. You must determine the number conversion format and then define it with the designated phrase. There are a several common Number Conversion definitions contained in the Realtime Commands Dictionary. You can use this dictionary when translating or add these entries to your Personal, case, or job dictionary. Modify them as necessary using the number conversion [examples](#) and [guidelines](#) to create Number Conversion definitions with your own number conversion formats.

On the [Translate Options Input](#) tab select how Case CATalyst processes the word "and", commas, word numbers and spaces between numbers during translation.

Other number conversion translate features include [Number Triggers](#) and [Automatic Number Conversion](#).

## Insert a Number Conversion Format into a Dictionary Definition

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)**. The Insert Dictionary Entry dialog box displays.
4. In the *Steno* field, type the steno outline you are going to write to invoke the Number Conversion command.
5. In the *Text* field:
  - a. Press **Alt + f (FS)** to display the list of format symbols and select **{Number Conversion}** from the list.
  - b. Type an open square bracket (**[**) followed by the number format, as shown in the number conversion formatting [guidelines](#). For example, the format for a social security number:  
[NNN-NNN-NNNN]
  - c. Type the closed square bracket (**]**) to complete the Number Conversion definition:  
{Number Conversion}[NNN-NNN-NNNN]
6. Press **Enter (OK)**.
7. Press **Ctrl + s (File/Save)** to save the changes.
8. When you are finished making changes, press **Ctrl + F4 (File/Exit)** to exit the dictionary.

## Number Trigger

The Number Trigger translate command allows you to convert numbers to a specific number format when the number follows a designated phrase. When a phrase such as, "social security number" is written and it is followed by the specific number of digits or words that match the number format, that number converts. Case CATalyst holds the numbers until a non-number stroke is written before displaying the number. Number Triggers are an alternative to using the [Automatic Number Conversion](#) feature or writing a [Number Conversion](#) stroke. To have Number Trigger not apply to the next number, use Number Trigger off, {Number Trigger}[], with nothing entered between the brackets.

The Case CATalyst default is to have Number trigger commands active for approximately three paragraphs. If Case CATalyst finds a number that matches the Number Trigger criteria within the three paragraphs, the number converts according to the Number Trigger. Optionally, you can have Case CATalyst only apply the Number Trigger if a number, either word or digit, is written immediately after the Number Trigger stroke by changing the Advanced Translate [option](#), *Number Triggers convert only when preceding a number*.

Number Trigger definitions contain the format symbol: {Number Trigger}. The format symbol is followed by square brackets which enclose placeholders, such as [NNN NNNN] for a telephone number or [\*RomanUpper] for a format command. You must determine the number trigger format and then define it with the designated phrase. There are a several common Number Trigger definitions contained in the Realtime Commands Dictionary. You can use this dictionary when translating or add these entries to your Personal, case, or job dictionary. Modify them as necessary using the number conversion [examples](#) and [guidelines](#) to create Number Trigger definitions with your own number conversion formats.

On the [Translate Options Input](#) tab select how Case CATalyst processes the word "and", commas, word numbers and spaces between numbers during translation.

### Example

Number Trigger for a social security number:

social security number {Number Trigger}[NNN-NN-NNNN]

Q. What is your social security number?

A. 111111111 (converts to) 111-11-1111.

### Example

Number Trigger for a phone number:

{Number Trigger}[NNN-NNNN]phone number

phone number {Number Trigger }[NNN-NNNN]

## Insert a Number Trigger Format into a Dictionary Definition

1. From anywhere in Case CATalyst, press **Alt + f, o, d** (**File/Open/Dictionary**). From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i** (**Edit/Insert**). The Insert Dictionary Entry dialog box displays.
4. In the *Steno* field, type the steno outline you are going to write to invoke the Number Trigger command.
5. In the *Text* field:
  - a. Type the designated phrase to invoke the Number Trigger, such as "social security number."
  - b. Press **Alt + f (FS)** to display the list of format symbols and select **{Number Trigger}** from the list.
  - c. Type an open square bracket (**[**) followed by the number format, as shown in the [Number Conversion Format Guidelines](#). For example, the format for a social security number:  
[NNN-NNN-NNNN]
  - d. Type the closed square bracket (**]**) to complete the definition. For example, a completed social security Number Trigger definition:

social security number{Number Conversion}[NNN-NNN-NNNN]

6. Press **Enter (OK)**.
7. Press **Ctrl + s (File/Save)** to save the changes.
8. When you are finished making changes, press **Ctrl + F4 (File/Exit)** to exit the dictionary.

## Number Format Guidelines

Use the number format [examples](#) and these guidelines to create customized number formats for [Number Conversion](#) definitions, [Number Trigger](#) definitions [Number Conversion](#) in Edit. Number Conversion definitions contain the translate command: {Number Conversion}. Number Trigger definitions contain a designated phrase along with the translate command: {Number Trigger}. Letters, functioning as placeholders for converted numbers, follow the translate command. Square brackets enclose the placeholders, such as [nN/NX/nn].

You can use predefined entries from the [Realtime Commands Dictionary](#) which contains the most common number conversion formats. You can add these entries to your Personal, case, or job dictionary and modify them as necessary using the following guidelines.

You can also use [number formatting commands](#) in conjunction with a Number Conversion or Number Trigger command. Formatting commands allow you to convert the number to Roman numerals, words, ordinal and certain time formats.

## Number Format Placeholder Letters

### N (upper case)

Use an **N** whenever the number is mandatory. For example, the {Number Conversion}[n-nnn-NNN-NNNN] format is a telephone number in the United States. Currently, all telephone numbers have a minimum of seven digits: three digits followed by a hyphen followed by four digits. When an attorney or witness states a valid telephone number, they will always state at least seven digits. The capital letter N represents these mandatory numbers. In this example, the mandatory numbers are the seven digits of the telephone number.

### n (lower case)

Use an **n** whenever the number is optional and when the punctuation to the right of that number requires removal if the number is not used. For example, in the U.S. telephone number conversion format, {Number Conversion}[n-nnn-NNN-NNNN], an attorney or witness may or may not state the three-digit area code when they state a telephone number. When they do include the area code with the seven-digit phone number, there usually is punctuation between the area code and phone number. If no area code is given, no punctuation should appear to the left of the phone number. The lower case **n** represents an optional number that does not retain punctuation. In this example, the optional numbers are the single digit access code and the three digits for the area code.

### X or x (upper or lower case)

The **X** or **x** is used whenever the number is optional but the *punctuation* is mandatory. For example, the {Number Conversion}[\$nnn,nnn,nnn,nX.0N] format is a dollar conversion that indicates *cents*. An attorney or witness states "It was between fifty cents and one seventy-five". You want those numbers to convert to \$.50 and \$1.75, whether or not the speaker states a dollar amount, which requires a decimal point to the left of the second digit. The **X** or **x** represents an optional number that retains punctuation to the right of the **X** or **x**, whether or not a number is written for that space.

### 0 (zero)

Use the **0** whenever a number is optional and the number 1 through 9 replaces it and is retained if there is an **N** to the right of the zero. For example, in the dollar conversion format, {Number Conversion} [\$nnn,nnn,nnn,nnX.ON], if the attorney or witness states "It was five cents. No, it was two twenty-five. The result is \$.05 and \$2.25.

#### **\_ (underscore)**

An \_ (underscore) works the same as the **0** except it inserts a blank space instead of a zero.

#### **\ (backslash)**

Use the \ (backslash) whenever you want an "n", "0" (zero), or "x" to literally print in the converted number. For example, {Number Conversion}[\NnnNNN] results in N123.

### **Common Number Formats**

There are several [Number Conversion](#) and [Number Trigger](#) definitions contained in the Realtime Commands Dictionary. You can use this dictionary when translating or add these entries to your Personal, case, or job dictionary. Modify the entries as necessary using the [guidelines](#) to create customized number formats. All Number Conversion definitions contain the command: {Number Conversion}. All Number Trigger definitions contain a designated phrase and the command: {Number Trigger} plus text.

You can also use [number formatting commands](#) in conjunction with a Number Conversion or Number Trigger command. Formatting commands allow you to convert the number to Roman numerals, words, ordinal and certain time formats.

The [Number Conversion](#) feature in Edit allows you to convert number while editing. You can [customize](#) the default list for this feature using the same number formatting as Number Conversion and Number Trigger definitions.

### **Common Number Conversion Formats**

Description	Format
• Date with 1-digit month (1/29/66).	{Number Conversion}[nN/Nx/NN]
• Date with 2-digit month (11/10/64).	{Number Conversion}[NN/nn/Nn]
• Date with month and year with slash	{Number Conversion}[*Month/Year]
• Date with month and year with hyphen	{Number Conversion}[*Month-Year]
Converts 3, 4, 5 or 6 digits to a month number followed by a slash (/) or hyphen (-) year number date format. You can write digits or word numbers as long as it is a legitimate number for a month (1-12) and year. Writing ten two or 10 2 will result in 1/02, but writing 10 0 2 will result in 10/02.	
When you are writing a date using numbers that are defined in your dictionary, the numbers will not split across a colon, slash, backslash, dash, period or space. For example, if you write a stroke defined as 11, followed by a stroke defined as 1 and then a stroke defined as 98, the number translates as 11/1/98. If you write a stroke defined as 1, followed by a stroke defined as 11 and then a stroke defined as 98, the number translates as 1/11/98.	
• Dollars with commas.	{Number Conversion}[\$nnn,nnn,nnn,nnN]
• Dollars and cents with commas.	{Number Conversion}[\$nnn,nnn,nnn,nnX.ON]

- Number with commas. {Number Conversion}[n,nnn,nnn,nnX.NN]
- Number with dash, possibly a case number. {Number Conversion}[nnnnnnnnnX-NN]
- Number with decimal, possibly the caliber of a weapon. {Number Conversion}[nnnnnnnnnX.NN]
- Numbers with hyphens. {Number Conversion}[nn-nn-nN-nN]
- Numbers in parentheses. {Number Conversion}[(XXXXXXXXXN)]
- Telephone number with area code in parentheses. {Number Conversion}[X (XXn) NNN-NNNN]  
phone{Number Trigger}[X (XXn) NNN-NNNN]
- Telephone number with hyphens. {Number Conversion}[n-nnn-NNN-NNNN]
- Time with a minimum of two digits required and maximum of six. {Number Conversion}[nN:nn:Nn]  
Examples:  
12 = 1:2  
123 = 1:23  
1234 = 1:2:34  
12345 = 1:23:45  
123456 = 12:34:56
- Time with a minimum of three digits required and maximum of six. {Number Conversion}[NN:nn:Nn]  
Examples:  
123 = 12:3  
1234 = 12:34  
12345 = 12:3:45  
123456 = 12:34:56
- Time with a minimum of three digits. {Number Conversion}[nN:NN]  
123 = 1:23  
1234 = 12:34
- Social Security Number {Number Conversion}[NNN-NN-NNNN]  
social security number{Number Trigger}[NNN-NN-NNNN]  
(This command looks forward in the file for numbers that fit the number conversion format criteria.)
- Zip Code/Zip Code plus 4 {Number Conversion}[NNNNn-nnnn]  
zip code{Number Trigger}[NNNNn-nnnn]  
(This command looks forward in the file for numbers that fit the number conversion format criteria.)

## Roman, Ordinal, Time, Date Number Formats

Using the following numeric and time formatting commands in conjunction with either a [Number Conversion](#) or [Number Trigger](#) command in dictionary definitions. Formatting commands allow you to convert the number to Roman numerals, words, ordinal and certain time formats.

### Roman and Ordinal Numeric Conversion Formats

The [\*RomanUpper], [\*RomanLower] and [\*OrdinalWords] commands are one word. The text must be entered exactly as indicated for the feature to work correctly.

#### [\*RomanUpper]

For example, you want a number following the word "appendix" formatted as a Roman numeral. You create a dictionary definition for the word "Appendix" with a Number Trigger and Roman numeral conversion. Enter the text portion of the dictionary entry as:

Appendix{Number Trigger}[\*RomanUpper]

To write a steno outline that converts the previous number with Roman numeral format, create a Number Conversion dictionary definition. Enter the text portion for the number conversion definition as:

{Number Conversion}[\*RomanUpper]

#### [\*RomanLower]

For example, you want a number to follow the word "article" formatted as a Roman numeral in lower case. You create a dictionary definition for word "Article" with a number trigger and Roman numeral conversion. Enter the text portion of the dictionary entry as:

Article{Number Trigger}[\*RomanLower]

To write a steno outline that converts the previous number with Roman numeral format, create a Number Conversion dictionary definition. Enter the text portion for the number conversion definition as:

{Number Conversion}[\*RomanLower]

#### [\*Words]

Converts digits to words. For example, 250 converts to "two hundred fifty". Enter the text portion for the number conversion definition as:

{Number Conversion}[\*Words]

#### [\*OrdinalWords]

Converts digits to ordinal words. For example, 33 converts to "thirty-third". Enter the text portion for the number conversion definition as:

{Number Conversion}[\*OrdinalWords]

#### [\*Ordinal]

Converts a number to an ordinal digit. For example, 33 converts to 33rd. This option also converts a word number such as "one" to 1st. This option does not convert an ordinal word number such as "first" to 1st. Enter the text portion for the number conversion definition as:

{Number Conversion}[\*Ordinal]

In the [Advanced Translate Options](#) dialog box, there is a *Force lowercase ordinal suffixes* option. If you are using the All Cap On format symbol to capitalize transcript text and you want ordinal suffixes (st, nd, rd, th) to be lower case, set this option to Yes. This option affects {Number Conversion}[\*Ordinal], {Number Trigger}[\*Ordinal] commands and selecting an ordinal conversion from Edit's Number Conversion dialog box.

### **[\*Month/Year]**

Converts 3, 4, 5 or 6 digits to a month number followed by a slash (/) year number date format. You can write digits or word numbers as long as it is a legitimate number for a month (1 - 12) and year. Writing ten two or 10 2 will result in 1/02, but writing 10 0 2 will result in 10/02.

The following shows the conversion results based on the number of digits written:

3 digits = 1/13

4 digits = 12/13

5 digits = 1/2013

6 digits = 12/2013

### **[\*Month-Year]**

Converts 3, 4, 5 or 6 digits to a month number followed by hyphen (-) year number date format. You can write digits or word numbers as long as it is a legitimate number for a month (1 - 12) and year. Writing ten two or 10 2 will result in 1-02, but writing 10 0 2 will result in 10-02.

The following shows the conversion results based on the number of digits written:

3 digits = 1-13

4 digits = 12-13

5 digits = 1-2013

6 digits = 12-2013

## **Time Conversion Formats**

### **[\*Time]**

Converts a three or four digit time with a colon before the last two numbers. Enter the text portion for the number conversion definition as:

{Number Conversion}[\*Time]

### **[\*Time00]**

Converts one or two digit numbers (12 and under) with a colon after the number and adds two zeros. If a three or four digit number is written, places a colon before the last two numbers. Enter the text portion for the number conversion definition as:

{Number Conversion}[\*Time00]

## **Pause Audio**

Use the Pause Audio translate command to pause the AudioSync audio recording during realtime. When AudioSync is paused, the Audio Pulse meter turns gray. You can automatically pause the audio recording with the Auto Pause Audio feature set in [Realtime Translate Options](#).

AudioSync is an optional companion software package.

## Prefix

Use the Prefix translate command to join a prefix with a root word. When you insert the Prefix format symbol into a definition, the command applies during translation deleting the space between the prefix and the following root word. For example, in the dictionary the steno /PRE is defined as "pre{prefix}". In the job, you write the steno for "pre" and the steno for "defined". When translated, the result in Edit is the word "predefined". When Case CATalyst applies a Prefix, the translated word displays the [user selected](#) color on the Edit screen. If you select [EZ Link](#) in the Translation dialog box, the joined words are spell checked against the Spell Check dictionaries and rules of spelling are applied. Case CATalyst spell checks the prefix and root word.

## Prefix Handling Rules

Case CATalyst uses general non-hyphenation rules first and then spell checks. If Spell Check fails then Case CATalyst applies the following rules:

1. If the Prefix is "ex", "self", "half", "quasi", or "all" then place a hyphen between it and the word.
2. If the word following the Prefix starts with a capital letter but is not all caps, verified by checking the first and second letters only, hyphenate.
3. If the Prefix or the root is a single capital letter, separate the prefix from the word with a hyphen.
4. If the Prefix ends in a digit or the root starts with a digit, separate the prefix from the word with a hyphen.
5. If the root following a prefix starts with a capital and then a non-capital letter, hyphenate.
6. If the Prefix ends with the same letter that the root starts with, hyphenate.

## Insert into a Dictionary Definition

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
4. In the Steno field, type the appropriate steno for the definition.
5. In the New Text field, type the prefix text.
6. Press **F4 x**, to insert the {Prefix} command. For example, self{Prefix}.
7. Press **Enter (OK)** to insert the definition into the dictionary.
8. Repeat Steps 4 through 7 for additional definitions or press **Esc (Cancel)** to close the Insert dialog box

## Prefix Number

Use the Prefix Number translate command to place the associated punctuation symbol in front of the last number written. For example, when you write the stroke for {Prefix Number}[\$], Case CATalyst searches back for the last number written and puts the \$ in front of the number, such as \$50. You can use the Prefix Number command in the Reporter's Area.

Case CATalyst comes with six predefined {Prefix Number} definitions with punctuation. They are: #, \$, ' (apostrophe), + (plus), - (hyphen), ; (semi colon) and . (period). You can add as many as you want. The text portion of the definition must start with {Prefix Number} left square bracket punctuation right square bracket. For example, {Prefix Number}[\$].

The Prefix Number command does not apply to digits that have text or punctuation touching them except for digits that have a comma, period, hyphen or an open quote when the number immediately follows the quote. {Prefix Number}['] (apostrophe) will work on numbers followed by an "s". For example, if you wrote, "It was the 60s." and then wrote your steno for the {Prefix Number}['] definition, the result would be, "It was the '60s."

## Insert into a Dictionary Definition

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
4. In the Steno field, type the appropriate steno for the definition.
5. Press **Alt + f**, to display the list of format symbols.
6. Use the Up and Down Arrow keys to locate {Prefix Number} and press **Enter** to insert the highlighted format symbol into the Text field.
7. Type the open square bracket, [ followed by the punctuation or character you want inserted before the number. To finish, type the closed square bracket ]. For example, to define an apostrophe to be inserted before the last number, in the case of '99, define the steno outline of your choice as: {Prefix-Num}[']
8. Press **Enter (OK)** to insert the definition into the dictionary.
9. Press **Esc (Cancel)** to close the Insert dialog box.

## Replace With LS1 - LS5

The Replace With LS1 through Replace With LS5 are translate commands that are used to select a [Live Suggestion](#) from the Brief It pane and replace (change this occurrence only) the selected untranslate/text. Live Suggestions is an optional realtime feature that automatically offers translation suggestions when an untranslate(s) displays in the transcript. You have the power to review the suggestions and to pick the right one, replace or global, to fix the untranslates. Two to five Live Suggestions will be offered in the [Brief It pane](#) in a blue background. Creating a dictionary entry to select and replace the first Live Suggestion is as easy and defining a steno stroke as Replace With LS1. You can create dictionary entries for all five Replace With LS# translate commands. There are also five [Define With LS1 - LS5](#) translation commands.

## Resolve Conflict, Choice 1 - 9

Use the Resolve Conflict, Choice 1 – 9 translate commands to select a conflict choice. While writing realtime and following realtime, using the Resolve Conflict Choice # moves back to the last conflict or EZ Choice or Second Choice resolved conflict in the file to select the correct conflict choice based on the command written. For example, let's say you are writing realtime and you write R-ELG which is a conflict between "relating" and "regular". Writing the stroke for Choice 1 selects "relating" and resolves the conflict.

Writing the stroke for Resolve Conflict, Choice 1 selects the first conflict choice; writing the stroke for Choice 2 selects the second conflict choice, etc. You can define up to nine steno outlines enabling you to select up to nine conflict choices.

You can also use Choice 1 through Choice 9 commands on [Auto-Conflict](#) and [EZ Choice](#) resolved conflicts.

## Resume Audio

Use the Resume Audio translate command to start the AudioSync audio recording, when you want to begin recording after starting realtime, and when you want to restart AudioSync after it has been paused by the Pause Audio command.

When AudioSync is recording, an Audio Pulse meter displays on the Translate & Edit Status Bar. When you pause audio, the Audio Pulse meter is gray.

If you use the Resume Audio command to start AudioSync after starting realtime, the audio subfile is written to the last drive selected for AudioSync recording.

## Scan Define

Scan Define is a realtime command that allows you to define or replace untranslates, drag/drop and/or Suffix Drag/Phrase Maker translation "on the fly" from your writing machine during realtime and place them in a dictionary. By default, the Scan Define realtime command scans back to the last untranslated steno, opens the Power Define dialog box, puts the untranslated steno in the Steno field and then positions your cursor in the Text field. In the Advanced Translate Options dialog box, you can also select to have the Scan Define command scan back and stop on [drag/drop](#) and/or [Suffix Drag/Phrase Maker](#) translations and put the steno in the Steno field and position the cursor in the Text field. Use the [Power Define dictionary](#) entries to define the steno and navigate the Power Define dialog box. Scan Define options are available in the [Advanced Translate Option](#) dialog box.

At any point, you can stroke the steno outline for the [ABORT] command to close the Power Define dialog box and have nothing written to the job. The steno written while in the Power Define dialog box appears grayed out in Vertical Notes. If you have the Advanced Translation Option, *Insert Oops FS after aborted Power Define* option set to Yes, then an [Oops](#) category 10 format symbol is inserted into the text at the location the Power Define was aborted. If you look in Reveal Codes you will see <Oops 10> at the location and the grayed out steno that was written before the abort. The same thing will occur if you wrote too many strokes in the Steno or Text field and the Power Define automatically aborted. The Insert [Oops](#) FS after aborted Power Define option also affects Scan Defines.

Defining from the writing machine is called a Power Define. You can [create a Power Define](#) for any type of global dictionary definition. For example, there is an off the record discussion. You stroke the steno outline for Scan Define to quickly scan back to the last untranslate and create a J-Define from the steno keyboard.

**Using the Scan Define command:**

1. Write the steno for the dictionary entry defined as {Scan Define}. If you are using the Realtime Commands Dictionary to help translate the file, the default steno outline is **SKAPB/SKAPB**.
2. Depending on your [Advance Translate Option](#) settings, the Scan Define command scans back to the last untranslated steno, last drag/drop translation or Suffix Drag/Phrase Maker translation.
3. The [Power Define dictionary](#) is automatically loaded as the highest dictionary priority. The Power Define dictionary contains definitions for navigating in the Power Define dialog box.
4. The untranslated steno and/or the underlying steno of the drag/drop or Suffix Drag/Phrase Maker translation is inserted into the *Steno* field. If multiple untranslates occur consecutively, all the untranslates display in the *Steno* field.
5. The cursor is positioned in the *Text* field. You write and/or fingerspell the Text definition from your steno keyboard.
6. Use Power Define navigating commands to [complete the definition](#). Writing the Power Define [ENTER] stroke defaults the definition to the Job dictionary unless you have specified in the Advanced Translate Options a default dictionary when making a Power Define.

Power Defines automatically apply forward and backward in the realtime file and remain active for all new realtime data. The Power Define globals are stored in the Global Table and are active if you re-translate a realtime session. Power Defines placed in a case or job dictionary remain in the respective case or job dictionary. If you selected to use the [Update Area](#), Power Defines placed in the Personal Dictionary move to the Update Area.

The Power Define dictionary remains loaded as the highest priority while the Power Define dialog box is open. Once you complete the Power Define or abort the definition using the [ABORT] command, the Power Define dialog box closes and the Power Define dictionary unloads from translation. The steno written while in the Power Define dialog box appears grayed out in Vertical Notes. If you have the Advanced Translation Option, *Insert Oops FS after aborted Power Define* option set to Yes, then an Oops category 10 format symbol is inserted into the text at the location the Power Define was aborted.

A definition for the Scan Define translate command must exist in a dictionary you are using for translation. This must be a dictionary other than the Power Define dictionary.

Create Power Define

## Set Job End Time Field

The Set Job End Time Field allows you to create a realtime command that, when written during realtime (when the job ends) will automatically use the timestamp information to fill in the value for the [Job End Time field](#). Many reporters put the time the proceedings started and ended on their title page, certificate page, job reporter, etc. Once the Job End Time field is inserted on a title page, certificate page, job reporter, etc., the include file is inserted into the transcript and the Set Job End Time Field translate command was written in the job, the Job End Time field will automatically be filled in based on the time the Set Job End Time Field command was written. You simply define a dictionary entry as Set Job Start Time Field and when you are writing realtime and the proceedings start, write the steno outline defined as Set Job End Time Field. The [Set Job Start Time Field](#) translate command is available to fill in the Job Start Time field.

The Set Job Start Time Field and Set Job End Time Field commands can also be inserted manually during realtime by pressing **Alt + s, j** (Special Edit, Set Job Start Time Field) and **Alt + s, e** (Special Edit, Set Job End Time Field) or by assigning key combinations in a [keyboard map](#).

## Set Job Start Time Field

The Set Job Start Time Field allows you to create a realtime command that, when written during realtime (when the job starts) will automatically use the timestamp information to fill in the value for the [Job Start Time field](#). Many reporters put the time the proceedings started and ended on their title page, certificate page, job reporter, etc. Once the Start Job Time field is inserted on a title page, certificate page, job reporter, etc., the include file is inserted into the transcript and the Set Job Start Time Field translate was written in the job, the Job Start Time field will automatically be filled in based on the time the Set Job Start Time Field command was written. You simply define a dictionary entry as Set Job Start Time Field and when you are writing realtime and the proceedings start, write the steno outline defined as Set Job Start Time Field. The [Set Job End Time Field](#) translate command is available to fill in the Job End Time field.

The Set Job Start Time Field and Set Job End Time Field commands can also be inserted manually during realtime by pressing **Alt + s, j** (Special Edit, Set Job Start Time Field) and **Alt + s, e** (Special Edit, Set Job End Time Field) or by assigning key combinations in a [keyboard map](#).

## Start Timer

Use the Start Timer translate command to start the [Timer](#) for a specific speaker or event during realtime. You must create a dictionary definition to use this command. A Start Timer dictionary definition is necessary for each individual speaker or event for whom you want to track time. A number following the Start Timer command designates each Start Timer definition. For example, {Start Timer} [1].

The {Start Timer} command can easily be included in a speaker identification definition so that when you write the steno to change the speaker, the Timer tracking automatically changes. When you add the Start Timer command to a speaker definition, include the speaker information. For example, you are defining STPHAO. The text might be:

```
<Colloquy>MR. SMITH{Start Timer}[1]:  
SKWRAO as <Colloquy>MR. JONES{Start Timer}[2]:
```

Or when starting an examination with the following sample text:

```
<Centered Paragraph>EXAMINATION<By-line>BY [IEZ SPEAKER 00] {Start Timer}[0]:<Question>  
<Centered Paragraph>EXAMINATION<By-line>BY [IEZ SPEAKER 01] {Start Timer}[1]:<Question>  
<Centered Paragraph>EXAMINATION<By-line>BY [IEZ SPEAKER 02] {Start Timer}[2]:<Question>
```

Some transcript formatting uses a different By-line format at examinations then when returning to questioning from colloquy or parenthetical. To have the timer to be part of a By Line definition and work with the [Auto By Line](#) feature, you need to make sure the Start Timer command is placed before the colon or closing parenthesis. For example:

```
<By-Line>BY MR. SMITH{Start Timer}[1]:  
<By-Line>BY [IEZ SPEAKER 01]{Start Timer}[1]:  
<By-Line>{Start Timer}[1]<Question>(BY MR. SMITH)  
<By-Line>{Start Timer}[1]<Question>(BY [IEZ SPEAKER 01])
```

You can place Start Timer definitions in any dictionary as long as you use that dictionary when translating the job. If you use the Case CATalyst [Realtime Commands](#) Dictionary or [EZ Speakers](#) dictionary, you may want to add the Start Timer entries to them.

The Timer for a speaker stops when you write a Timer stroke for another speaker or when you write the steno outline for the [Stop All Timers](#) translate command. For example, you write the steno outline for Timer 1. After writing awhile, you write the steno outline for Timer 2. Case CATalyst automatically suspends the tracking of time for Timer 1 and starts tracking time for Timer 2. When you finish using Timers, you stroke the steno outline for the Stop All Timers command.

In addition to tracking individual speakers, you can also track the total time for multiple speakers. For example, there are two defense attorneys. You need to track the time for each attorney and the total time of the Defense team. You put the two defense attorneys into a Timer Group. Inserting [Timer fields](#) into the transcript or Include file allows you to view the cumulative time for each speaker. If you use Timer Groups, you can insert a TimerGroup field to view the cumulative time for a group of speakers.

## Create Start Timer Definitions

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Do one of the following"

### Create a New Dictionary Definition

Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.

### Modify an Existing Dictionary Definition

Highlight the dictionary entry and press **Ctrl + m (Edit/Modify)** to display the Modify Dictionary Entry dialog box.

4. In the *Steno* field, type the appropriate steno for the definition. For example: TAO\*EUPL/1 or a speaker identification such as STPHAO.
5. In the *Text* field, press **Alt + f**, to display the list of format symbols.
6. Use the Up and Down Arrow keys to locate **{Start Timer}** and press **Enter** to insert the highlighted format symbol into the Text field.
7. After {Start Timer} type [ (left bracket) followed by the Timer number, and then type ] (right bracket). For example: {Start Timer}[1]. If you add the Timer command to a speaker definition, include the speaker information. For example, you are defining the steno, STPHAO. The text might be:  
<Colloquy>MR. SMITH{Start Timer}[1]:  
If you want the timer to work with the [Auto By Line](#) feature, make sure the timer is placed before the colon or closing parenthesis if you don't use a colon. For example:  
<By-Line>BY MR. SMITH or EZ SPEAKER 01{Start Timer}[1]:  
or  
<By-Line>{Start Timer}[1]<Question>(BY MR. SMITH or EZ SPEAKER )
8. Press **Enter (OK)** to insert the definition into the dictionary.
9. Add additional definitions as necessary. Increment the Timer number by one for each additional speaker.
10. When finished, press **Esc (Cancel)** to close the dialog box.
11. Press **Ctrl + s (File/Save)** to save the dictionary.
12. Press **Ctrl + F4 (File/Close)** to close the dictionary.

## Stitch On/Off

Use the Stitch On/Off translate commands to separate letters or words with punctuation. For example, the witness spells his/her last name (Petersen) and you want to put a period between each letter. You have a dictionary definition for {Stitch On}[.], upper case alphabetical letters and a {Stitch Off} definition. You write {Stitch On}[.] /P/-E/T/-E/R/S/-E/TPH {Stitch Off} and the result is P.E.T.E.R.S.E.N.

When using the {Stitch On} command, it is followed by brackets to indicate what is separating the letters. For example, if [-] follows the {Stitch On} command, the letters will be separated by hyphens. For example, you write the steno {Stitch On} [-] A B C{Stitch Off} the translated result is "A-B-C". If you write the steno {Stitch On}[-] mother in law {Stitch Off}, the result is "mother-in-law."

You can add the [web] attribute after the {Stitch On} translate command to have all alpha characters translate as lowercase with no spaces between them until the {Stitch Off} command is written. This may be particularly useful in definitions for e-mail or web addresses. For example, /W/W/W {Stitch On}[web] www.<Delete Space>. You may also want to define a stroke for .com, .net, .org, etc. and include the {Stitch Off} format symbol. For example, .com{Stitch Off}.

## Insert the Translate Command

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

### Stitch On

#### Insert into a dictionary definition

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
4. In the *Steno* field, type the appropriate steno for the definition.
5. Press **Alt + f (Edit/Insert/Insert Format Symbol)**, to display the list of format symbols.
6. Use the Up and Down Arrow keys to locate **{Stitch On}** and press **Enter** to insert the highlighted format symbol into the *Text* field.
7. Do one of the following:

#### Separate letters or words with punctuation

Type **[** followed by the punctuation and then type **]**. To use Stitch On/Off as a "squish" command to remove spaces between letters or words, place nothing between the brackets, **[ ]**.

#### Keep all alpha characters lowercase

Type **[web]** and then type the text you want to have all lowercase alpha characters. Add any other necessary commands or text. For example, after the {Stitch On} command type, **[web] www.<Delete Space>**. The definition displays as {Stitch On}[web]www.<Delete Space>.

8. Press **Enter (OK)** to insert the definition into the dictionary.
9. Press **Esc (Cancel)** to close the Insert dialog box.

## Stitch Off

### Insert into a dictionary definition

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
4. In the *Steno* field, type the appropriate steno for the definition.
5. Press **Alt + f (Edit/Insert/Insert Format Symbol)**, to display the list of format symbols.
6. Use the Up and Down Arrow keys to locate **{Stitch Off}** and press **Enter** to insert the highlighted format symbol into the *Text* field.
7. Press **Enter (OK)** to insert the definition into the dictionary.
8. Press **Esc (Cancel)** to close the Insert dialog box.

## Stop All Timers

Use the Stop All Timers translate command to stop all active [Timers](#) in the realtime job such as when there is an off the record discussion, a break or at the end of the proceedings. A [Start Timer](#) translate command is used to start the Timer for a specific speaker during realtime. The Timer for a speaker stops when you write another speaker identification that includes a Start Timer command, a different Timer stroke or when you write the steno outline for the Stop All Timers translate command.

You must create a dictionary definition to use this command. You can place the Stop All Timers definition in any dictionary as long as you use that dictionary when translating the job.

### Create a Stop All Timers Dictionary Definition

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
4. In the *Steno* field, type the appropriate steno for the definition. For example ST\*PL.
5. In the *Text* field, press **Alt + f**, to display the list of format symbols.
6. Use the Up and Down Arrow keys to locate **{Stop All Timers}** and press **Enter** to insert the highlighted format symbol into the Text field. For example, you are defining the steno, ST\*PL. The text is, {Stop All Timers}.
7. Press **Enter (OK)** to insert the definition into the dictionary.
8. Press **Esc (Cancel)** to close the Insert dialog box.
9. Press **Ctrl + s (File/Save)** to save the dictionary when finished.
10. Press **Ctrl + F4 (File/Close)** to close the dictionary.

## Suffix

Use the Suffix translate command to join a suffix with a root word. For example, the dictionary define for the steno /-G is {Suffix}ing. In the job, you write the steno for "stop" and the steno /-G ({Suffix}ing). The result is "stopping". When Case CATalyst applies a Suffix, the translated word displays in the [user selected](#) color on the Edit screen. If you select [EZ Link](#) in the Translation dialog box, the joined words are spell checked against the Spell Check dictionaries and rules of spelling are applied. The result is "stopping". Selecting the EZ Link option includes able/ible and er/or resolution. In other words, if you write a word and write an "able" suffix and it should be an "ible" suffix, EZ Link will automatically change your written "able" to "ible". The same is true with "er" and "or" suffixes. If the resulting word is not in the Spell Check dictionaries, the original suffix will be attached to the root word and no rules of spelling will be applied.

## Suffix Handling Rules

Case CATalyst uses general non-hyphenation rules first and then spell checks. If Spell Check fails then Case CATalyst applies the following rules:

1. If the Suffix is "elect", hyphenate.
2. If the Suffix starts with a digit or has a root that ends with a digit, hyphenate. The exception is: st, nd, rd, and th. These do not hyphenate.

## Insert into a Dictionary Definition

The following instructions use the default shortcut key assignment. Substitute the appropriate shortcut key if you have changed the assignment in the [Format Symbol Options](#) table.

1. From anywhere in Case CATalyst, press **Alt + f, o, d (File/Open/Dictionary)**. From the dictionary menu, select the type of dictionary. The Open Existing Document dialog box displays.
2. Select the dictionary and press **Enter**. Verify the dictionary name on the Title Bar.
3. Press **Ctrl + i (Edit/Insert)** to display the Insert Dictionary Entry dialog box.
4. In the Steno field, type the appropriate steno for the definition.
5. In the Text field, press **F4 X** to insert the {Suffix} format symbol.
6. Type the text of the suffix after the format symbol.
7. Press **Enter (OK)** to insert the definition into the dictionary. Repeat Steps 4 - 7 as necessary and then go to Step 8.
8. Press **Esc (Cancel)** to close the Insert dialog box.
9. Save and close the dictionary.

## Text E-Define

The {Text E-Define} command allows you to create E-defines from your steno machine during realtime. The {Text E-Define} is similar to the [Power Define](#) feature except it performs an E-define instead of a dictionary define. For example, let's say you are writing realtime and the proceedings involve a store named Economart. When you first write Economart, your translation is "econo mart" (without the quotes). You know you may write it several ways as the proceedings continue. Instead of putting that define in one of your dictionaries, you quickly E-define, from your writer, "econo mart" (without the quotes) to be "Economart" (without the quotes). Then, if you write any steno outline/outlines that translate as "econo mart" (without the quotes) they will automatically change to Economart. For example, let's say you write the following steno outlines as "econo mart" (without the quotes) /AOE/KOPB/OE/PHART, /E/KOPB/O/PHART, or /AOE/KO/PHART. Because you used the {Text E-Define} command to E-define "econo mart" (without the quotes) to be "Economart" (without the quotes) regardless of the underlying steno, all instances of the text "econo mart" will change to "Economart" during this realtime session.

When the Text E-Define command is invoked, a Power Text Define dialog box displays which contains an Old Text field and a New Text field. Using your steno machine, write the old text in the Old Text field, "Tab" to the new Text field and write the new text in the New Text field and then write the stroke to complete the E-define. For example, let's say the proceedings involve a person named Zabell and you created a few job dictionary definitions for the name. During the realtime proceedings, you realize you have the incorrect spelling so you quickly invoke the {Text E-Define} command. In the Old Text field write your steno outline for Zabell and in the New Text field, fingerspell Zibell. Write your stroke for Enter to close dialog and all instances of Zabell will become Zibell.

The Power Define dictionary is automatically loaded as the highest priority dictionary when you write the {Text E-Define} command. You move between the text fields using your Power Define commands (located in the Power Define dictionary located in your System Files case). When you close the Power Text Define dialog box, the Power Define dictionary is unloaded. You can also access the Format Symbol list and the Insert Field list to include either or both in Old Text and/or New Text fields.

At any point, you can stroke the steno outline for the [ABORT] command to close the Power Define dialog box and have nothing written to the job. The steno written while in the Power Define dialog box appears grayed out in Vertical Notes. If you have the Advanced Translation Option, *Insert Oops FS after aborted Power Define* option set to Yes, then an [Oops](#) category 10 format symbol is inserted into the text at the location the Power Define was aborted. If you look in Reveal Codes you will see <Oops 10> at the location and the grayed out steno that was written before the abort. The same thing will occur if you wrote too many strokes in the Steno or Text field and the Power Define automatically aborted.

### To do a Text E-Define:

1. In a dictionary, [create a dictionary entry](#) to invoke the Power Text Define dialog box. Determine the steno you want to invoke the command and then select {Text E-Define} from the list. Save and close the dictionary.
2. Start a realtime session. Select the dictionary that contains the {Text E-Define} definition if it is not in your Personal Dictionary.
3. Write the steno outline defined as {Text E-Define} to open the Power Text Define dialog box.  
**Please note that all "commands" referenced in the following instructions refer to commands in the Power Define dictionary (located in your System Files case).**
4. In the *Old Text* field, using your steno machine, write the text and/or steno that you want to change in the *Old Text* field. You can write an existing word or phrase and fingerspell the word/or phrase. Do any of the following: "Finger spell" the text by writing the steno outlines defined as the individual letters or write a stroke/strokes defined in your dictionary to write a word or phrase.

- Insert a Format Symbol. Write the steno outline defined as [F4] followed by the steno outline for the letter of the format symbol. For example, you might write TPORPLT (default steno outline for [F4]) and then the steno outline for "c" as KR-RBGS. F4c indicates Colloquy.

Alternately, you can write the steno outline defined as [F4 LIST]. When the Format Symbol list displays, stroke the steno outline defined as [UP ARROW] or [DOWN ARROW] to highlight the selected symbol. Then stroke the steno outline defined as [ENTER] to insert the format symbol.

- Insert a [Field](#) into the definition. In order to display the Insert Field dialog box, press **Alt + i** on your computer keyboard and navigate using your computer keyboard or mouse to insert a field. Once you close the Insert Field dialog box, you can return to using your steno machine to navigate the Power Text Define dialog box,
  - Insert a space between a word or after punctuation by writing the steno outline defined as [SPACE].
  - Backspace the last character or last stroke, depending on your option, by writing the steno outline defined as [DELETE].
5. Write the steno outline defined as [TAB] to move to the *New Text* field.
6. In the *New Text* field, enter the text definition for the steno. Do **any** of the following:
- "Finger spell" the definition by writing the steno outlines defined as the individual letters or write a stroke/strokes defined in your dictionary to write a word or phrase.
  - Use a combination of writing a word or phrase with finger spelling. For example, you write SKWROPB/SON (Johnson) in the *Steno* field. In the *New Text* field you write the stroke for "John" and then fingerspell "son" so the result is "Johnson". If you wrote the stroke for "John" and then the stroke for "son" the result would be "John son".
  - Insert a Format Symbol. Write the steno outline defined as [F4] followed by the steno outline for the letter of the format symbol. For example, you might write the steno outline for "c" as KR-RBGS. F4c indicates Colloquy.
- Alternately, you can write the steno outline defined as [F4 LIST]. When the Format Symbol list displays, stroke the steno outline defined as [UP ARROW] or [DOWN ARROW] to highlight the selected symbol. Then stroke the steno outline defined as [ENTER] to insert the format symbol.
- Insert a [Field](#) into the definition. In order to display the Insert Field dialog box, press **Alt + i** on your computer keyboard and navigate using your computer keyboard or mouse to insert a field. Once you close the Insert Field dialog box, you can return to using your steno machine to navigate the Power Text Define dialog box,
  - Insert a space between a word or after punctuation by writing the steno outline defined as [SPACE].
  - Backspace the last character or last stroke, depending on your option, by writing the steno outline defined as [DELETE].
7. Do **one** of the following:
- Write the stroke defined as [ENTER] to apply the E-define and close the dialog box.
  - Write the stroke defined as [ACCEPTCONTINUE] to apply the define and have the Power Text Define dialog box remain open, allowing you to create another E-define.
  - If you need to leave the Power Text Define dialog box open and return to writing realtime, write the steno outline defined as [SUSPEND]. The Power Text Define dialog box flashes, the cursor focus changes to the realtime text and leaves the Power Text Define dialog box open. You can write the Suspend command at any time the Power Text Define dialog box is open. To return to the Power Text Define dialog box, write the steno outlined defined as {Text E-Define}.

If you want to cancel the Power Text Define while it is in Suspend mode, you can write a steno outline defined, in a dictionary being used to translate, as {Cancel Active Dialogs}. The Power Text Define dialog is closed and nothing is applied.

- To cancel the Power Text Define dialog box, write the [ABORT] command to disregard what is in the Power Text Define and close the dialog box. The steno written while in the Power Text Define dialog box appears grayed out in Vertical Notes. If you have the Advanced Translation Option, *Insert Oops FS after aborted Power Define* option set to Yes, then an [Oops](#) category 10 format symbol is inserted into the text at the location the Power Text Define was aborted.

**Note:** If you want one steno outline to cancel the Power Define, Scan Define, Text Define and Create EZ Speaker Entries dialog box and other dialog boxes, look at your Power Define dictionary and see what the steno is for the [ABORT] entry. Then open your Personal Dictionary and insert/modify the {Cancel Active Dialog} entry steno to be the same as the Power Define [ABORT] entry. For example if the:

Power Define default steno for [ABORT] is PWORD

Create a Personal dictionary (or whatever dictionary) definition Steno PWORD defined as {Cancel Active Dialog}.

## Toggle Auto Conflict Resolution

Use the Toggle Auto Conflict translate command to switch the automatic conflict selection mode On and Off during realtime. When Auto-Conflict is On, Case CATalyst automatically selects the first conflict choice in any conflict. The first conflict choice is based on the conflict order in the dictionary entry. This prevents a conflict displaying in the realtime text.

Auto Conflict works in conjunction with EZ Choice. When EZ Choice is On and Auto Conflict mode is On, the following occurs:

- EZ Choice resolves the conflict when there is an entry for it in the EZ Choice Conflict Database.
- Auto-Conflict selects the first choice in the conflict when there is no entry for it in the EZ Choice Conflict Database.

To invoke the Toggle Auto Conflict Resolution command from your writer, a steno outline defined as {Toggle Auto Conflict Resolution} must be in a dictionary used during realtime. The default [Realtime Commands Dictionary](#) contains the Toggle Auto Conflict Resolution dictionary entry. Modify the entry, as necessary, to accommodate your writing style.

## Toggle Bench Mode

Use the Toggle Bench Mode translate command to suspend and resume the display of text to the receive systems. Text written after Toggle Bench Mode On does not display on the receive systems, making the text *invisible*, until you Toggle Bench Mode Off. Use this command in situations when you want to prevent others from viewing the realtime translation, such as confidential bench conferences, in-chambers discussions, or when writing a note to a scopist or yourself.

Realtime text sent to CaseViewNet after turning Bench Mode On displays as /// on the CaseViewNet screen. Realtime text you write after turning Bench Mode Off displays on the CaseViewNet screen.

A "B" displays on the Translate & Edit Status bar when Bench Mode is On. To view the realtime text written after the Bench Mode On command, from the Translate & Edit Options menu, select **View/Show/Bench Text**.

To invoke the Toggle Bench Mode command from your writer, a steno outline defined as {Toggle Bench Mode} must be in a dictionary used during realtime. The Toggle Bench Mode dictionary entry is included in the default [Realtime Commands Dictionary](#). Modify the entry, as necessary, to accommodate your writing style.

## Toggle Follow Realtime

Use the Toggle Follow Realtime Translate command to position the cursor after the last realtime stroke or at the last editing location. The Toggle Follow Translate command can be invoked from the writer with a steno stroke or from the computer keyboard by pressing the default keyboard command, **Ctrl + Shift + I** (letter L).

For example, you start to write realtime with the cursor *following* the last steno stroke written. There is a break in the proceedings. You want to start editing the job so you write the steno outline for Toggle Follow Realtime. The cursor moves to the beginning of the job. You edit for about 15 minutes and then the proceedings resume. You stop editing on Page 9 Line 13 to start writing realtime again. You write the stroke for Toggle Follow Realtime and the cursor returns to following the last steno stroke written. There is another break in the proceedings. You return to the editing by stroking the steno outline for Toggle Follow Realtime. The cursor moves to the last editing position, Page 9, Line 13.

To invoke the Toggle Follow Realtime command from your writer, a steno outline defined as {Toggle Follow Realtime} must be in a dictionary used during realtime. When creating the Toggle Follow Realtime definition, you must select the format symbol from the Format Symbol list. You cannot type the format symbol into the definition.

The default Case CATalyst Realtime Commands Dictionary contains the Toggle Follow Realtime dictionary entry. If you choose to use this dictionary or copy the definition to another dictionary, modify the entry, as necessary, to accommodate your writing style.

## Toggle Phonetic Mode

The Toggle Phonetic Mode translate command switches the phonetic translation mode between On and Off during realtime. If Phonetic Mode is On, untranslates that normally display in a raw steno outline are phonetically translated based on your phonetic translation method. Phonetic translation is based on your selection for the Advanced Translate option, [Phonetic untranslates display as words](#). You can choose to match steno outlines with the text equivalent entry in the [Phonetic Table](#) or to translate single stroke untranslates using algorithmic logic for the intended pronunciation, which is the default.

To invoke the Toggle Phonetic Mode command from your writing machine, a steno outline defined as {Toggle Phonetic Mode} must be in a dictionary used during realtime. The Case CATalyst default [Realtime Commands Dictionary](#) contains the Toggle Phonetic Mode dictionary entry. Modify the entry, as necessary, to accommodate your writing style.

## Punctuation Handling During Translation

When a dictionary definition begins with a comma followed by text or a sequence of beginning comma, text and ending comma such as, ", yes sir," or ", Your Honor," **and** immediately follows a Question, Answer, Colloquy, semi colon, period or a question mark, Case CATalyst automatically removes the preceding comma of the definition. For example, let's say you have the dictionary definition: , Your Honor, (comma space Your Honor comma).

You write the following:

Q. Were you at the ballpark on the night of October 13th, 2017?

A. , Your Honor, do I have to answer that?

The result is:

Q. Were you at the ballpark on the night of October 13th, 2017?

A. Your Honor, do I have to answer that?

Case CATalyst also automatically removes the extra comma, if written, before the definition and deletes the ending punctuation. For example, you have the dictionary definition: , Your Honor,

You write the following:

MR. JONES: Please instruct the witness to answer, Your Honor,.

The result is:

MR. JONES: Please instruct the witness to answer, Your Honor.

In situations where you do not want Case CATalyst to automatically remove the comma, group define the steno. For example, in the phrase "45-, 50 mile-per-hour winds", you want to retain the comma. Group define the steno for the hyphen and the comma together.

## Speaker List

Use the Speaker List in the Translate function to identify speaker names for translation and/or to insert during Edit. During translation, the Speaker List works independently or in conjunction with EZ Speaker entries.

Speaker names are automatically added to the Speaker List when you use the [Create EZ Speakers](#) feature. If you use a Standard ID (specific steno in the entry) in the EZ Speakers dictionary, the speaker names display in the Speaker List with the associated speaker number. For example, you use STPHAO for #01 or [!EZ SPEAKER 01] and SKWRAO for #02 or [!EZ SPEAKER 02]. The speaker names display with the associated number, 01 and 02. If you use a Super ID (a placeholder for the steno in the entry) in the EZ Speakers dictionary, the speaker names display with consecutive numbers beginning with 101. For example, the first speaker name displays with 101, the second with 102, third with 103, etc. A total of 310 speakers can display in the [Speaker List pane](#).

Once populating the Speaker List using Create EZ Speakers, you can then access the list to assign a color to each speaker name for easier identification in the job. The text for the speaker translates in the selected speaker color if your EZ Speakers dictionary contains EZ Speaker fields. For example, you can display **MR. JONES** in red, **MR. SMITH** in blue; **MS. JENKINS** in purple, etc. If you insert a speaker from the Speaker List while editing, the speaker name displays in the color assigned in the Speaker List.

As an alternative, you can have speaker identification definitions in a dictionary and have them display in the Speaker List. For example, you can have /STPHAO defined as <Colloquy>[!EZ SPEAKER 01] and have the field automatically display in the Speaker List along with the designated steno and it can be locked into place so that steno is always associated with that EZ Speaker. Instead of using Create EZ Speakers feature, you simply fill in the EZ Speaker field name either in the transcript or in the Speaker List.

Optionally, you can type speaker names directly into the Speakers List, assigning the names and colors to an associated number and then use the Create EZ Speakers feature to build the job or case dictionary entries. When you type a number (Text Token Number) from the Speaker List, the steno and text fields fill in automatically based on the Speaker List entries.

You can also insert speaker names directly into the text during Edit using [Insert Speaker](#) or by [using](#) the Speaker List in Edit. When using the Speaker List in Edit, you can create a [seating chart](#) to graphically represent the position of speakers in the room.

[Brief it](#), when active, automatically creates a brief for a speaker when you create a new speaker using the Create EZ Speakers feature, insert a new speaker from the Speaker List dialog pane or modify a speaker name from the Speaker List. Briefs are not generated for Common speakers in the Speaker List.

## Identify Speaker Names Prior to Translation

1. From the Translate dialog box, select **Speaker List**.
2. Make necessary entries:

### Allcap Text

Check this box to have the speaker name in all capital letters when typing the name. Uncheck this box to enter the Speaker Name in upper and lower case letters.

### Show All

Check this box to display all the available speaker lines with associated token numbers. Uncheck this option to only display token numbers with assigned speaker names.

### Name

The defined speaker name or the name of the speaker field. Click the title bar to display the names in ascending or descending alphabetical order

### Number

The speaker number associated with the speaker name. Click the title bar to display the numbers in ascending or descending order.

### Steno

Type the steno, if any, you want to associate with the speaker. You can retain the association by checking the box in the *Locked* field. If you have your speaker identifications defined in a dictionary, most likely your Personal Dictionary, and you always want them to display in the speaker list, type the associated steno and select the Locked column. Instead of using the Create EZ Speakers feature, you will simply fill in the field in the transcript or Speaker List.

### Locked

Check this box to retain the association of the steno entered in the *Steno* field with the speaker number. If you have your speaker identifications defined in a dictionary, most likely your Personal Dictionary, and you always want them to display in the speaker list, type the associated steno in the Steno field and select the Locked column. Instead of using the Create EZ Speakers feature, you will simply fill in the field in the transcript or Speaker List.

### Fill in Speaker

Modify an existing speaker name. Highlight a field and select **Fill in Speaker**. Type the speaker name in the field and press **Enter**.

### New Speaker

Type a new speaker name. The Select EZ Speaker dialog box displays with the next sequential speaker number. Use the displayed number in the Enter Value field or type a new number and press **Enter (OK)**. Valid number are **1 - 99**. A new speaker name field displays with the assigned token number. Type the name in the field and press **Enter**.

### Change Color

Change the speaker name color. Highlight the field and select **Change Color**. The [Color](#) dialog box displays. Select a color and press **Enter (OK)**.

**OK**

Accept the changes and close the Speaker List dialog box.

**Cancel**

Close the Speaker List dialog box without making any changes.

**Help**

Display the Case CATalyst Help.

3. When finished, select **OK**.

## Set Dictionary Priorities for Translation

Set the order in which Case CATalyst uses dictionaries during translation. You can order the dictionaries each time you select a file to translate or when starting a realtime session. If you use [Translate's saved settings](#) feature, the selected dictionaries and their priority will be saved as part of the settings file.

### Set Dictionary Priority

1. Press **Ctrl + t (Functions/Translate & Edit)**. The Translate dialog box displays.
2. Select a file for translation.
3. In the Additional Dictionaries section, check the box next to any dictionary you want to use for translation. To select a dictionary from another user, check the Show All Users box. You can use any dictionary from any user. Your Personal Dictionary is automatically selected, although a check mark does not display before the name. If a job dictionary with the same name of the file exists or the job is in a case, the job and case dictionary is also automatically selected.
4. Select **Dictionary Priorities**. The Dictionary Priority During Translation dialog box displays with the list of selected dictionaries. The total number of additional dictionaries selected for translation displays at the bottom of the screen.
5. The dictionary priority order begins at the top of the list. To change the priority of a selected dictionary, highlight the dictionary and then use the **Move Up** and **Move Down** buttons as necessary. The Case CATalyst default uses the following dictionary order, one being the highest priority.
  - a. Job dictionary of the same name as the file.
  - b. Case dictionary if the job is in a case.
  - c. Selected job and case dictionaries in the order they were chosen.
  - d. Update area (if selected for use).
  - e. Personal Dictionary
6. When finished, press **Enter (OK)**.

## Define Fields

Define Fields is a Translate feature that allows you to define field values prior to translating a job. You can type the field values or use existing field values from a previous job. Access the **Define Field** from the Translate dialog box. Field values cannot exceed 1024 typed characters.

### Define Fields Prior to Translation

#### New Field

Create a new user defined field such as Plaintiff, Defendant or County. Case CATalyst inserts a new field using the default name FIELD followed by the next consecutive number, such as FIELD1, FIELD2, etc. In the highlighted area, type a name for the field such as County or Judge. After typing the name, press **Enter** or click anywhere in the dialog box.

#### Fill In Field

Define an existing field for this job. For example, you previously created a new field for Location. Highlight Location and select Fill In Field. The [Fill In Field](#) dialog box displays where you can type the value.

#### Add Next Field in List Group

Create another [field list group](#). For example, you are working on a big case which requires nine appearances and your current title page contains only four field list groups. A field list group includes ATTORNEY, FIRM, ADDRESS, etc. Case CATalyst assigns the next consecutive group number to the new field list group.

#### Use Other

Use other field values from a previous job. Display the Select Job for Other Field Values dialog box where you can choose to [use field values](#) from another job. You may want to use this option when continuing a previous job for which you have already defined fields. This option functions the same as the Use Other Field Values command in Edit.

#### Delete Field

Remove a user defined field from your field list. If the field is not appropriate for this job, you may not want to remove the field from the list, but instead leave the field value blank.

#### Close

Save the changes and close the dialog box.

## Realtime Writing

Realtime writing immediately translates the steno you write on your writing machine to your computer running Case CATalyst. You can write realtime via WiFi connection, USB cable or direct serial cable or Bluetooth adapter connecting your writing machine to your computer or another Case CATalyst system. You can also send realtime data to a CaseView® receive system or to an ASCII/ANSII file.

All editing commands are available in realtime. You can scroll back for readback, bring in include files, delete text, define steno, replace, etc. Using the Follow Realtime command, you can quickly toggle between the realtime data and to the last editing spot on the screen. You can also edit from your writing machine with [AccelerWriter](#) Keys. While translating (realtime or regular translate), message boxes that display that only require an Enter or click OK to dismiss the dialog box will display for 5 seconds and then automatically close as if you pressed Esc or clicked Cancel. The message boxes that will automatically close include actions such as Search or Scan item not found, Search reached the end of the transcript, Can't suggest a brief or an action is done.

If you select to show the Status Bar, then while writing realtime the Status Bar displays steno outlines, a CaseViewNet network/Cloud (if applicable) connection status indicator, AudioSync (if applicable) gauge and the last conflict (as long as you are following realtime).

All [translate commands](#) are available during realtime. Some translate commands, such as Scan Define and Toggle Bench Mode, are specific to realtime writing. Case CATalyst includes a realtime job dictionary, [Realtime Commands Dictionary](#), which contains predefined translate commands. The predefined translate commands consist of common number conversion, conflict resolution, Live Suggestion commands and a definition for Power Define and Create EZ Speakers. You can add to, modify, and delete entries in the Realtime Commands Dictionary or copy the entries to the Personal, case, or job dictionary. If you choose to use the Realtime Commands Dictionary, Stenograph recommends that you review the entries and modify the steno outlines to reflect your writing style and theory.

You can use the following steno machines to write realtime:

- Stenograph Writer Serial/Bluetooth  
This option includes Stenograph's Luminex, Diamante, Wave, élan Mira, élan Cybra, Stentura Fusion, Stentura Protégé, Stentura LX, Stentura, 200/400 SRT and SmartWriter.
- Stenograph Writer USB  
This option includes Stenograph's Luminex, Diamante, Wave, élan Mira, élan Cybra, Stentura Fusion and Stentura Protégé.
- Stenograph Writer WiFi  
This option includes Stenograph's Diamante and élan Mira A3.
- StenoRam III, III+, Ultra  
This option includes Xscribe's StenoRam III, III+ and Ultra with a serial connection.
- FlashWriter  
This includes ProCAT's Flash steno machine and any other steno writer that uses the Flash serial connection protocol.
- Baron TX  
This includes Baron Transcriptor X (TX) steno machine and any other steno writer that uses the BOLT serial connection protocol.

## Disable Power Saving Features

Stenograph strongly recommends you disable any power management features on your computer. Power Management features are settings in the BIOS that control when the BIOS powers down components such as the hard drive, monitor, and serial ports when it thinks there is no activity on your computer. When you are writing realtime, there usually is no keyboard or mouse activity because you are using your writing machine to input the text. Since the BIOS on your computer does not recognize any keyboard or mouse activity, it starts shutting down different components to conserve power. If the BIOS does not check for activity on the serial port, it shuts down the serial port and the CAT software may respond as if you have ended realtime or stopped writing. Case CATalyst software is most likely the *only* software on your system that can input data without any keyboard or mouse activity.

Turn Off the power management features through the Windows Control Panel. Locate the Power Management section and turn the power saving features Off. Because the BIOS itself contains power saving settings, you may also need to access the BIOS to fully disable power saving features on your system. Due to the constant changes to BIOS and hardware, Stenograph recommends you contact your hardware vendor for specific instructions to access and turn Off the power saving features in the BIOS on your computer.

### Disable Automated Power Saving Features

Stenograph also recommends you evaluate any software or system tools that are scheduled to run automatically. Look in the System Tray to see if any items are scheduled to run after a specific amount of time. For example, Scan disk, Find Fast, Task Scheduler, and anti-virus software.

### Set Clock Time Before Writing

If you are writing realtime along with a videographer, synchronize your computer time **before** starting a realtime file if you are using AudioSync. Do not change the clock time on your computer after starting realtime or have any operating system setting that could automatically updates your clock during realtime writing. Changing the clock time once realtime begins can affect the playback of the recording.

### Notebook Computers

If you are using a notebook computer, Stenograph recommends that you plug your computer into an outlet for full processing speed.

## Realtime Setup

Realtime setup involves establishing a connection between your writing machine and your computer running Case CATalyst by cable or via wireless communication. The connection method is determined by your writing machine and any optionally purchased hardware.

If you are using the Luminex, Diamante®, élan Mira or Stentura Fusion, you can connect to Case CATalyst for realtime writing via USB cable. The appropriate USB driver for the writing machine, must be loaded on Case CATalyst in order to use the USB cable. See the user guide for your writing machine for information about loading the USB driver. You can only use the USB cable between the Luminex, Diamante®, élan Mira or Stentura Fusion and Case CATalyst.

If you are using the Diamante or élan Mira you can connect via WiFi communication for realtime writing. Refer to your writing machine's user guide for additional information about WiFi requirements, setup and establishing realtime communication.

If you are using a Luminex, Diamante®, élan Mira or Stentura Fusion you can use Bluetooth technology for realtime writing. Refer to your writing machine's user guide and Stenograph's Bluetooth guide for additional information about wireless Bluetooth requirements, setup and establishing realtime communication.

## Beginning a Realtime Session

Preparing for realtime translation also involves determining dictionary priorities, setting Realtime options and setting other output options if applicable .

1. If you are using a serial or USB cable connection, be sure you connect your writing machine to the computer with a realtime cable and the writing machine is On. If your writing machine uses diskettes and is set to disk mode, insert a diskette in the drive.

If you are using wireless communication, be sure to follow the steps in your user guide to establish connection between your writing machine and Case CATalyst.

2. Press **Ctrl + t (Function/Translate & Edit)** to display the Translate dialog box. Make entries in the fields:

### Saved Translate Options

Saved Translate Options allows you to save your current translate options to a file which you can use for future translations. Settings saved include: translate options, layout selection, writer, output, dictionaries, and global tables used. For example, you can create a file to remember settings for realtime, [CART](#) work, court work or outputting to StenoKeys. Before translating, you load the settings file you want and Case CATalyst loads the translate options from the file.

Case CATalyst also remembers the settings used for the last translation and stores them in the Lastusedsettings.ini file located in the Saved Translation Settings folder within the System Files case.

### Load Settings

Select this option to load a different set of Translate options for translation. The Saved Translation Settings dialog box displays where you can select a file to use. Choose the file and press **Enter (Open)** to load the settings.

If you choose a Settings file in which selected layout for that settings file is no longer available, Case CATalyst uses the layout from the Lastusedsettings.ini file.

### Save Settings

Save the current Translate settings. The Save Translation Settings dialog box displays. Type a name in the File name field and press **Enter (Save)**. Case CATalyst saves the file in the Saved Translation Settings folder within the System Files case.

### Always Load Last Used Settings

Check this box to always translate with the last settings file used.

### Steno Source

Select **Writer**. The first time you set up realtime, you must select your writing machine type on the [Realtime tab](#), in the Case CATalyst Translate Options dialog box.

### Layout File

Select the page layout you want to apply to this job.

### Job

A list of existing cases and jobs for the current user that contain steno note files display in the window. To display files within a case, double click the case.

### Show All Jobs

Check this box to display all job files and file types for the current user.

### File

Do **one** of the following:

- To create a new realtime job, type the name of the job. You can use upper and lower case letters, numbers and spaces in a file name. The following symbols are also valid characters:  
' ~ ! @ # \$ % ^ & ( ) - \_ { }

Some character are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; . , | = < > ? \*

- To select an existing job, type the name or click the name in the Job field window.
- To select a job in a case, double click the case and then click job or type the job name.
- To create a new case for a new realtime job, type the case name followed by a backslash followed by the job name. For example, to create a case name RYAN with a job name 041202 DSMITH, type: RYAN\041202 DSMITH.

### Output To

Select one of the following:

#### None

You are not outputting the realtime data.

#### CaseView

You are writing realtime to CaseViewNet/ICVNet (network or internet) or to CaseView or a realtime data receive system via a serial connection that uses the CaseView protocol. If you are outputting to CaseViewNet via the Cloud, CaseView or Multiple

Outputs with CaseView selected in order for the Use Session Code option to be available. When sending via the CaseViewNet Cloud, a green dot displays on the realtime screen's Status bar (different location than the Speche indicator) to indicate a connection has been established.

#### ASCII/ANSI

You are writing realtime to an ASCII/ANSII file.

#### Speche

You are writing realtime to Speche or Speche protocol system. A green dot will display on the realtime's screen Status Bar to indicate a connection has been established.

#### Caption

You are writing realtime to a encoder to provide realtime closed captioning.

#### StenoKeys

You are writing realtime to another software application, such as MS Word and your steno machine is your keyboard.

**Other**

You are writing realtime to an electronic information display.

**Multiple Outputs**

You are sending the realtime data to multiple outputs. When you select this option, the Output Choices dialog box displays. Check the box next to the output choices you want to use. To change translate options, select [Options](#). When finished, press **Enter (OK)**.

**View or Change CVNet Passwords**

You can view, modify or create passwords for customer receiving the realtime feed via CaseViewNet and/or iCVNet (realtime receive iPad app). To access the CaseView passwords, click the Passwords button, the [CaseView Passwords](#) dialog box displays. If you are using a Session Code and sent realtime to previous clients using the same Session Code, it is highly likely that you will want to change your CaseViewNet passwords in order to prevent the previous clients from accessing this realtime session.

**Use Session Code**

Check this box if you are sending your realtime data to CaseViewNet/iCVNet/CaseViewNet Browser Edition clients who will be connecting via the internet. You need to check the User Session Code box and then type the Session Code. The Session Code will display in all capital letters regardless of the state of the Caps Lock key. Session Codes are not case sensitive. The Case CATalyst system must have internet access along with the CaseViewNet and/or iCVNet and/or CVNet Browser Edition clients connecting via the internet. You can send to locally connected clients via a network and send via internet clients at the same time. Internet clients need the Session Code and a password in order to connect, locally connected users need the network name and a password. The Case CATalyst user needs a CaseViewNet license in order to send realtime data via a network and/or internet. This option is not available unless the Output To: field displays CaseView or Multiple Outputs.. and CaseView is selected in the subsequent dialog box.

**Remember Output to Setting**

Check this box to have Case CATalyst remember the output setting.

**Record Audio**

Check this box to use AudioSync during realtime. You must also initially set the Audio options in the [Realtime tab](#). Once set, Case CATalyst remember the Audio options.

When you record audio, the audio pulse meter displays in the lower right hand corner of the realtime screen. Green indicates the audio is recording to the realtime file. Gray indicates the audio is paused. When you start writing, the Resume Audio picks up the last 5 seconds of the audio.

**IMPORTANT:** Do NOT change the clock time on your computer at any time during the realtime session or have any operating system setting that automatically updates your clock. Changing the clock time once Realtime begins affects the playback of the recording.

**Remember Record Audio Setting**

Check this box to have Case CATalyst remember your selection for the Record Audio option.

**Additional Dictionaries**

Check the box next to any dictionary you want to use for translation. Case CATalyst automatically selects the Personal Dictionary for translation, although a check mark does not display before the name. The Power Define dictionary is not available for selection as it is automatically loaded when making a [Power Define](#) and removed from translation when the Power Define dialog box is closed.

### Show Global Tables

Check this box to display global tables for selection. Global Tables are available for use in translation. Translating with a Global Table allows you to use previously created [E-Defines](#) in the selected Global Table along with any defines in the selected dictionaries.

### Show All Users

Display all Case CATalyst users. You can select a dictionary from any user.

### Dictionary Priorities

Change the priority in which dictionaries apply during translation.

### Create EZ Speakers

Identify speaker names and steno to replace variables in the [EZ Speakers dictionary](#). Case CATalyst uses the names to create the speaker definitions for the job or case dictionary. When using EZ Speaker fields in the selected EZ Speakers dictionary, CATalyst will look for existing field values in the job history. If the job history does not have EZ Speaker field values, CATalyst will look in the case history and automatically fill in the EZ Speaker fields. You can create EZ Speakers from the Translate dialog box before starting realtime and during realtime by selecting Tools and then Create EZ Speakers or creating EZ Speakers from your steno machine by writing a steno outline defined as {EZ Speaker Define}.

Case Dictionary should be selected when you are creating a job in a case where all the jobs are related and you want the EZ Speaker definitions to be used in all future jobs in this case.

Job Dictionary should be selected when you are creating jobs in a generic case where the jobs are not related other than date or type and you do not want the EZ Speaker definitions to be used in all future jobs in this case. You can also select the *Always default to Job dictionary* option for this case so all the EZ Speaker definitions go to the Job dictionary for this case.

### Speaker List

Use [Speaker List](#) independently or in conjunction with EZ Speakers definitions to identify speaker names for translation. You can also [insert](#) speaker names from the Speaker List while editing a job.

### RealTeam Invite

RealTeam is CATalyst's simultaneous editing feature. Selecting RealTeam Invite, automatically logs you in to RealTeam and displays your [RealTeam Contacts](#) dialog box allowing you to quickly invite your scopist(s) or proofreader(s).

### Options

You must set your translate options the first time you translate. If you do not set them before beginning translation, you are prompted by the Wizard to set them.

#### Realtime Tab

Verify the Realtime settings are correct on the [Realtime tab](#).

#### Other Translate Options Tabs

Select other translate options on the tabs as necessary.

## Define Fields

Define [fields](#) prior to translation that you want to use during Edit. You can [define](#) fields, create new fields, remove fields, fill in fields and create field list groups.

3. Press **Enter (OK)** to start realtime and begin writing. If you select an existing job name, a message displays prompting you to append the realtime steno file or steno and text files to the existing job; overwrite and replace the existing files; or cancel the selection allowing you to choose a different job name.

**NOTE:** When you select to use an existing file name that also contains audio and text, Case CATalyst deletes the steno (.sgstn) and text (.sgnpl) subfiles in the existing file if you select to overwrite and sends both files to the Windows Recycle Bin. An additional message displays prompting you to continue, using the existing file name and deleting the existing audio. If you accidentally overwrite an existing file when starting a session, you may be able to recover the steno and text subfiles by restoring them from the Windows Recycle Bin.

4. To stop realtime press **Ctrl + \** (backslash) (**File/Stop Translation**). Depending on your Edit options, a warning message may display. Select **Yes** to end realtime. When realtime ends, you remain in the Edit function.

## Save and Load Translate Options

Saved Translate Options allows you to save your current translate options to a file which you can use for future translations. Settings saved include: translate options, layout selection, writer, output, dictionaries, EZ Speaker dictionary, saved alternate user settings for edit and global tables used. For example, let's say that you do freelance jobs, court work and provide CART. You can set your translate options for your freelance jobs by selecting your layout, your output settings if sending to CaseView or other litigation programs and save those settings. Then you can set your translate settings for when you do court work with a different layout, perhaps a different EZ Speaker format, etc., and save those settings. And then when you provide CART, you can select the layout you want, output to [CARTView](#), dictionaries, and alternate user settings for edit (how the CART window displays) and save those settings. Then, depending on the job you are doing for that day, you open Translate, you simply load the saved translation setting and it reduces your setup time since you already have the options preset.

When outputting to [CARTView](#), once translation has started you can select the font, color, placement, etc., for the CART window and then use the [Save Alternate User](#) Setting command to save the placement and settings for the CART window. If you have different clients that like different colors or larger/smaller text, all of those settings are saved in the Alternate User Setting file. You can specify what Alternate User Settings for Edit file is saved in the Saved Translate Settings file and will be applied when translation begins.

Case CATalyst also remembers the settings used for the last translation and stores them in the Lastusedsettings.ini file located in the Saved Translation Settings folder within the System Files case.

### Saved Translate Options

Saved Translate Options allows you to save your current translate options to a file which you can use for future translations. Settings saved include: translate options, layout selection, writer, output, dictionaries, and global tables used. Before translating, you load the settings file you want and Case CATalyst loads the translate options from the file.

### Load Settings

Select this option to load a different set of Translate options for translation. The Saved Translation Settings dialog box displays where you can select a file to use. Choose the file and press **Enter (Open)** to load the settings.

If you choose a Settings file in which selected layout for that settings file is no longer available, Case CATalyst uses the layout from the Lastusedsettings.sgxml file.

### **Save Settings**

Save the current Translate settings. The Save Translation Settings dialog box displays. Type a name in the File name field and press **Enter (Save)**. Case CATalyst saves the file in the Saved Translation Settings folder within the System Files case.

### **Always Load Last Used Settings**

Check this box to always translate with the last settings file used.

## **Realtime Translate Options**

Use Realtime translate options to set Audio and Connection options when writing realtime. To use the Audio options, you must have AudioSync capabilities.

To access the Realtime translate options, from the Translate dialog box select **Options** and then select the **Realtime** tab.

### **Realtime Writer**

Select the type of writing machine you are using. If you are using a Luminex, Diamante, Wave, élan Mira, Stentura Fusion or Stentura Protégé, you can direct connect to Case CATalyst for realtime writing via USB cable. The appropriate USB driver for your writing machine must be loaded on Case CATalyst in order to use the USB cable. See the user guide for your writing machine for information about loading the USB driver.

### **Writing Machine Selection:**

- Stenograph Writer Serial/Bluetooth  
This option includes Stenograph's Luminex, Diamante, Wave, élan Mira, élan Cybra, Stentura Fusion, Stentura Protégé, Stentura LX, Stentura, 200/400 SRT and SmartWriter. Bluetooth is a wireless serial connection and may not be available for all writers listed.
- Stenograph Writer USB  
This option includes Stenograph's Luminex, Diamante, Wave, élan Mira, élan Cybra, Stentura Fusion and Stentura Protégé.
- Stenograph Writer WiFi  
This option includes Stenograph's Luminex, Diamante and élan Mira A3.
- StenoRam III, III+, Ultra  
This option includes Xscribe's StenoRam III, III+ and Ultra with a serial connection.
- FlashWriter  
This includes ProCAT's Flash steno machine and any other steno writer that uses the Flash serial connection protocol.
- Baron TX  
This includes Baron Transcriptor X (TX) steno machine and any other steno writer that uses the BOLT serial connection protocol.

### **Auto Connect Last WiFi Writer**

Select this option if you are writing realtime via a Luminex, Diamante or élan Mira A3 WiFi connection and when you use the [Quick Tran](#) command, you want CATalyst to automatically connect to the last Luminex/Diamante/Mira A3 that was connected via WiFi. If CATalyst cannot find the writer name of the last WiFi writer, you will be prompted to select a writer from the list of available WiFi writers. The Auto Connect Last WiFi Writer option is only available if the Stenograph Writer WiFi option is selected in the Realtime Writer Field. If you use the Save Settings feature, the status of this option is remembered in the saved settings file.

## Audio

The AudioSync feature synchronizes the recorded audio with the realtime transcript. The quality of the audio recording depends on a variety of things such as the quality of the sound card in your computer, the microphone, the environment and codec used. If you experience low or poor quality AudioSync recording and have made necessary adjustments to your [computer's settings](#), you may want to try a different or higher codec. Audio WAV files are limited to 2 GB. Select an audio codec setting that works for you but also does not exceed the file size limit based on the length of the realtime recording. For example, if you select the 32000Mz 231 MB/hr codec, you will exceed the 2 GB audio file size limitation if your realtime recording exceeds 6 hours. A higher audio codec may be appropriate if you have short jobs. Because of the differences in sound cards and microphones, Stenograph cannot recommend a standard codec to be used. It is necessary to test your equipment and determine the best setting for you.

To use the Audio features, your e-Key license must have AudioSync capabilities. In addition to setting the following Audio options, you must check the Record Audio option on the [Translate](#) dialog box. It is strongly recommended that you set up and [test the microphone](#) recording and audio playback prior to realtime writing.

**Important:** Do NOT change the clock time on your computer at any time during the realtime session or have any operating system setting that automatically updates your clock. Changing the clock time once Realtime begins affects the playback of the recording.

## Record To

When using AudioSync, select the folder where you want to write the audio portion of the file. The default is the current user folder. If necessary, use **Browse** to select another location.

## Codec

When using AudioSync, click the down arrow () to display the list of choices and select **one** of the following to indicate the compression rate of the audio recording. The default setting is ADPCM 8000Mz 15 MB/hr. This means for every hour of recording time it is going to take up 15 MB of space. The \* Hz number is the sampling rate and the MB/hr indicates the amount of space required for an hour of audio recording. 8000 Hz is standard telephone sampling rate. Typically, when the sampling rate number increases, so does the quality of the recording and amount of space required for the recording. Keep in mind that many factors contribute to the quality of audio recording, not just the compression rate. The X MB/hr information refers to the amount of space that will be required for an hour of audio recording. Audio WAV files cannot exceed 2GB. **NOTE:** The larger the audio files (using higher Hz options), the more time required to transmit/share/archive via the Internet and **are not** recommended when sending Work Units via the Internet.

GSM 6.10	8000 Hz	6. MB/hr
ADPCM	8000 Hz	15 MB/hr
PCM	8000 Hz	58 MB/hr

PCM	11025 Hz	80 MB/hr
PCM	16000 Hz	116 MB/hr
PCM	22050 Hz	159 MB/hr
PCM	32000 Hz	231 MB/hr (cannot exceed 9 hours of recording)
PCM	44100 Hz	318 MB/hr (cannot exceed 6 hours of recording)
PCM	48000 Hz	346 MB/hr (cannot exceed 6 hours of recording)

It is strongly recommended that you test the audio compression rate when recording and playing back audio especially if you will be recording on one computer and playing back on another. Some users have experienced incompatibility with some audio compression rates in reporter / scopist situations but have successfully experimented to find a compatible compression rate.

If you are writing realtime and recording audio, opening another transcript and playing back the audio in that transcript is fine as long as the audio was recorded using the same compression rate as the current realtime file. You may encounter undesirable results if you attempt to play back the audio in an opened transcript that was recorded at a different compression rate than the current realtime file.

**NOTE:** The larger the audio files (using higher Hz options), the more time required to transmit/share/archive via the Internet and **are not** recommended when sending Work Units via the Internet.

If you select an audio codec higher than 159 MB/hr, the following warning message displays when clicking OK or Apply:

*Audio WAV files may not exceed 2GB. Based on your audio codec selection you will exceed this limit after X hours of realtime recording. Do you wish to change your audio codec selection? Yes / No*

Select Yes to change your audio codec selection. If you have started translation, translation will be canceled and the Translate dialog box displays.

Select No to continue with translation knowing the realtime time audio file size limitation.

If you choose not to change your audio codec selection that is higher than 159 MB/hr, when you start translation, a warning message displays by default unless you have set the [Advanced Translation](#) Show audio codec warning when starting translations. option to No.

### Audio Input (Advanced)

By default, AudioSync uses the Windows setting for the recording device. If you have an audio feed already using the Windows default setting, it may be necessary to change the input location for AudioSync. For example, you can change AudioSync from the Microphone port to the Line In port. Use the drop down box to select an alternate recording input device.

ViaVoice voice translation uses the microphone port for recording dictation. It is necessary to select an alternative location for the AudioSync room noise.

### Auto Pause

Check this box to automatically pause the AudioSync recording after a specific period of time, when no new steno is input from the writing machine. You must enter a value in the After Seconds field. Using this feature can help conserve disk space when recording audio on jobs where long or frequent pauses occur.

AudioSync automatically resumes recording when you begin writing new steno when you use the Auto Pause feature. If you use the translation command {Pause Audio}, you must write the {Resume Audio} stroke to resume writing.

### **After Seconds**

When you check the box for Auto Pause Audio, you must type the number of seconds AudioSync waits before pausing when no new steno is being input from the writing machine.

## **Connection**

### **Comm Port**

Select the appropriate COM port on the Case CATalyst system for the serial realtime cable connection to the writing machine. For more information on COM or serial ports, refer to the user guide for your computer.

If you are using a USB serial adapter, confirm the correct COM port assignment through the Windows Device Manager. For more information on Device Manager, consult your Windows documentation.

This option does not apply when you select Diamante - USB, élan – USB or Fusion USB as the Realtime Writer and you are using a USB cable.

### **Direct (Cable)**

Select this option when you are writing realtime directly connected to the Case CATalyst system with a serial cable. This option does not apply when you select Stenograph Writer USB as the Realtime Writer.

### **Modem**

Select this option when you are writing realtime remotely over the phone lines. The writing machine is connected to a phone jack via a modem cable. The remote Case CATalyst system is connected to a phone jack via a modem cable.

#### **Call**

Have the Case CATalyst system call the writing machine modem. Type the phone number in the *Number* field below.

#### **Answer**

Have the writing machine call the Case CATalyst modem.

#### **Number**

When you select *Call*, type the telephone number of the remote writing machine. If applicable, include any numbers required to access an outside telephone line. For example, if you need to dial 9 to reach an outside line and 1 reach a different area code, the number would resemble the following: 9, 1, 123-456-7890.

## **Realtime Aids**

### **Brief It**

Check this box to use [Brief It](#); a translation feature that suggests conflict-free brief forms for words and phrases that you write during a realtime job. This option is selected by default.

### Live Suggestions

Check this box to use [Live Suggestions](#), a translate feature that offers suggestions for untranslates while you are writing. This option is selected by default. To see Live Suggestions in the [Brief It pane](#), you must select the Live Suggestions option in the Brief It Filter options.

### Work Units

Make necessary entries in the [Work Units](#) fields. Work Units break the realtime file into sections based on a specified length of time.

### Hold Strokes

When [Hold Strokes](#) is active, Case CATalyst holds the steno outlines before displaying the translated text on the Edit screen during realtime. This allows a reporter to make changes to a misstroke before it displays on the edit/realtime screen.

### Voice Engine

These options apply to voice translation. You must have the software for the selected voice engine installed on your computer and have your e-Key license include the CATalyst VP option. Select one of the following:

#### Dragon Naturally Speaking 8

Select this option when using Dragon Naturally Speaking Version 8.10 or higher for voice translation.

#### ViaVoice for Windows 10

Select this option when using ViaVoice for Windows 10 for voice translation.

## AudioSync

The AudioSync feature synchronizes the recorded audio with the realtime transcript. To use the AudioSync features, your e-Key license must have AudioSync capabilities and you need to select the Audio option in the [Translate Realtime tab](#). In addition to selecting the following AudioSync option, you have options as to where the audio is recorded, at what [compression rate](#) (quality/file size) and whether you want to use the Audio Pause feature. It is strongly recommended that you set up and [test the microphone](#) recording and audio playback prior to realtime writing.

If you are writing a videotaped proceeding, synchronize your computer time with the videographer **before** starting realtime. Changing your computer's clock after realtime has started could cause audio synchronization issues.

## AudioSync Codecs

The AudioSync feature synchronizes the recorded audio with the realtime transcript. To use the Audio features, your e-Key license must have AudioSync capabilities. In addition to setting the following Audio options, you must check the Record Audio option on the [Translate](#) dialog box. It is strongly recommended that you set up and [test the microphone](#) recording and audio playback prior to realtime writing.

The quality of the audio recording depends on a variety of things such as the quality of the sound card in your computer, the microphone, the environment and codec used. If you experience low or poor quality AudioSync recording and have made necessary adjustments to your [computer's settings](#), you may want to try a different or higher codec. Audio WAV files are limited to 2 GB. Select an audio codec setting that works for you but also does not exceed the file size limit based on the length of the realtime recording. For example, if you select the 32000Mz 231 MB/hr codec, you will exceed the 2 GB audio file size limitation if your realtime recording exceeds 6 hours. A higher audio codec may be appropriate if you have short jobs. The larger the audio files (using higher Hz options such as 116MB/hr and higher), the more time required to transmit/share/archive via the Internet and **are not** recommended when sending Work Units via the Internet. Because of the differences in sound cards and microphones, Stenograph cannot recommend a standard codec to be used. It is necessary to test your equipment and determine the best setting for you.

The Opus 13kbps 6MB/hr and Opus 32kbps 15MB/hr audio codecs provide a high quality audio recording with smaller audio file sizes. Opus is a great choice for your everyday AudioSync recording and Stenograph highly recommend using an Opus codec when using [RealTeam](#). \*Opus is the Stenograph recommended codec. *The Opus codecs are not backward compatible with files previous to Case CATalyst V20.*

**Important:** Do NOT change the clock time on your computer at any time during the realtime session or have any operating system setting that automatically updates your clock. Changing the clock time once Realtime begins affects the playback of the recording.

### Record To

When using AudioSync, select the folder where you want to write the audio portion of the file. The default is the current user folder. If necessary, use **Browse** to select another location.

### Codec

When using AudioSync, click the down arrow (▼) to display the list of choices and select **one** of the following to indicate the compression rate of the audio recording. The default setting is ADPCM 8000Mz 15 MB/hr. This means for every hour of recording time it is going to take up 15 MB of space. The \* Hz number is the sampling rate and the MB/hr indicates the amount of space required for an hour of audio recording. 8000 Hz is standard telephone sampling rate. Typically, when the sampling rate number increases, so does the quality of the recording and amount of space required for the recording. Keep in mind that many factors contribute to the quality of audio recording, not just the compression rate. The X MB/hr information refers to the amount of space that will be required for an hour of audio recording. Audio WAV files cannot exceed 2GB. **NOTE:** The larger the audio files (using higher Hz options), the more time required to transmit/share/archive via the Internet and **are not** recommended when sending Work Units via the Internet.

Opus	13kbps	6 MB/hr
GSM 6.10	8000 Hz	6. MB/hr
*Opus	32kbps	15 MB/hr (Stenograph recommended)
ADPCM	8000 Hz	15 MB/hr
PCM	8000 Hz	58 MB/hr
PCM	11025 Hz	80 MB/hr
PCM	16000 Hz	116 MB/hr

PCM	22050 Hz	159 MB/hr
PCM	32000 Hz	231 MB/hr (cannot exceed 9 hours of recording)
PCM	44100 Hz	318 MB/hr (cannot exceed 6 hours of recording)
PCM	48000 Hz	346 MB/hr (cannot exceed 6 hours of recording)

It is strongly recommended that you test the audio compression rate when recording and playing back audio especially if you will be recording on one computer and playing back on another. Some users have experienced incompatibility with some audio compression rates in reporter / scopist situations but have successfully experimented to find a compatible compression rate.

If you are writing realtime and recording audio, opening another transcript and playing back the audio in that transcript is fine as long as the audio was recorded using the same compression rate as the current realtime file. You may encounter undesirable results if you attempt to play back the audio in an opened transcript that was recorded at a different compression rate than the current realtime file.

**NOTE:** The larger the audio files (using higher Hz options such as 116MB/hr and higher), the more time required to transmit/share/archive via the Internet and **are not** recommended when sending Work Units via the Internet.

If you select an audio codec higher than 159 MB/hr, the following warning message displays when clicking OK or Apply:

*Audio WAV files may not exceed 2GB. Based on your audio codec selection you will exceed this limit after X hours of realtime recording. Do you wish to change your audio codec selection? Yes / No*

Select Yes to change your audio codec selection. If you have started translation, translation will be canceled and the Translate dialog box displays.

Select No to continue with translation knowing the realtime time audio file size limitation.

If you choose not to change your audio codec selection that is higher than 159 MB/hr, when you start translation, a warning message displays by default unless you have set the [Advanced Translation](#) Show audio codec warning when starting translations. option to No.

### Audio Input (Advanced)

By default, AudioSync uses the Windows setting for the recording device. If you have an audio feed already using the Windows default setting, it may be necessary to change the input location for AudioSync. For example, you can change AudioSync from the Microphone port to the Line In port. Use the drop down box to select an alternate recording input device.

ViaVoice voice translation uses the microphone port for recording dictation. It is necessary to select an alternative location for the AudioSync room noise.

### Auto Pause

Check this box to automatically pause the AudioSync recording after a specific period of time, when no new steno is input from the writing machine. You must enter a value in the After Seconds field. Using this feature can help conserve disk space when recording audio on jobs where long or frequent pauses occur.

AudioSync automatically resumes recording when you begin writing new steno when you use the Auto Pause feature. If you use the translation command {Pause Audio}, you must write the {Resume Audio} stroke to resume writing.

### After Seconds

When you check the box for Auto Pause Audio, you must type the number of seconds AudioSync waits before pausing when no new steno is being input from the writing machine.

## Hold Strokes

Hold Strokes is a Translate option on the Realtime tab. When active, Case CATalyst holds the steno outlines before displaying the translated text on the Edit screen during realtime. Case CATalyst holds the steno until based on the setting in the Longest match plus X strokes option. Once the number of strokes written exceeds the Longest match plus X strokes option, Case CATalyst re-translates the steno outlines to display the longest match text. If no longest match is found, translation holds the strokes written for the specified amount of seconds, then pushes any translated text or steno on the screen.

For example, let's say your Longest match plus X strokes option is set to 3 and the Held for X seconds option is set to 6. You write a four stroke word which is a longest match plus three more strokes. When the longest match plus the additional strokes are written, CATalyst pushes out the translation. If translation isn't done with the longest match, it will hold back the translation for the X number of seconds specified.

When outputting, the Longest match plus X strokes affects the amount of strokes you can delete. If you have this option set to plus 4 strokes, you can delete 3 steno strokes because once you write the Delete stroke, it counts as the 4th stroke. If you have this option set to 7, you can delete 6 steno outlines.

Use the Hold Strokes option when you want a "smooth" translation. For example, you do not want partial strokes and misstrokes to display on the realtime screen or output screen when stroking a multiple stroke outline or phrase that would result in a "re-translation" on the screen once the longest match is reached.

You can set separate values for the Longest match plus X strokes held to the Edit screen and the other output options (ASCII/ANSI, Other Devices and StenoKeys). You can only set one value, however, for the number of seconds Case CATalyst waits if no strokes are made before displaying the translated text. In other words, once you change the Held for X seconds on one of the output tabs, it changes the Held for X seconds option on all of the output tabs.

## Set Hold Stroke Options

To hold strokes to the realtime output, make entries in the fields:

### Longest match plus \_ strokes

Check this box to hold strokes to the Edit screen during realtime. Enter the number of strokes Case CATalyst holds before displaying the translated text. Valid entries are **0-9**.

You can set separate values for the Longest match plus X strokes option on the Realtime tab held to the Edit screen and other output options (ASCII/ANSI, Other Devices and StenoKeys).

### Held for \_ seconds

Enter the number of seconds Case CATalyst waits, when no steno is written, before displaying the translated text or steno outlines. Valid entries are **0-9**.

You can only set one value, however, for the number of seconds Case CATalyst waits if no strokes are made before displaying the translated text. In other words, once you change the Held for X seconds on one of the output tabs, it changes the Held for X seconds option on all of the output tabs.

## Work Units

When translation's Create Work Units option is active, Case CATalyst creates a separate copy of the realtime file and places it into consecutively numbered files, or work units, as you write. The work units are generally used in a network situation, daily copy or during events where reporters take turns using the same computer. The Create Work Units option on the Case CATalyst Translate Options, Realtime tab should be selected or you can use the Create Work Unit command (File, Create Work Unit) after translation has started.

A user designated length of time determines the length of the work unit. When the specified work unit of time elapses, the work unit is created at the end of the current paragraph. Case CATalyst creates the last work unit of the realtime file with the actual amount of time, even if it is less than the specified work unit length when you end realtime by pressing Ctrl + \, selecting File/Stop Translation or ending the file on the writing machine. The realtime file's field values, layout information and wordlist entries are copied into each work unit. You can also select to create work units with audio. A [Create Work Unit](#) command is also available to create a Work Unit on demand. If, while writing realtime you want to see what text has been sent to a Work Unit, select View, Show, Work Unit Area. Text that is sent to a work unit will have a color shaded background. You can also change the color of the background by selecting View, Display, [Colors](#).

The original realtime file remains as one contiguous file in Case CATalyst. Case CATalyst names each work unit using the original file name plus a number, such as Smith\_1, Smith\_2, Smith\_3. To use the edited work units, you must manually merge the sections together in Edit.

When selecting the With Audio option, multiple text files (work units) are created but only one audio file exists. All the work unit text files are linked to one audio file. For example, you are writing the Smith job and creating work units. You have Smith\_1, Smith\_2, Smith\_3 and Smith.wav. To maintain audio synchronization in the work units, do not merge the work units together until the transcript is finalized. It is important to be aware of the audio codec you are using when sending work units. The larger the audio files (using higher Hz options such as 116 MB/hr and higher), the more time required to transmit/share/archive via the Internet and are not recommended when sending Work Units via the Internet.

## Set Work Unit Options

**In the Translate dialog box, click Options, Realtime tab and then set the following options:**

### Create Work Units

Check this box to have Case CATalyst save the realtime file in time incremented files. Case CATalyst breaks the realtime file into separate files, called work units. Indicate the length of the work unit by making an entry in the *Every # Minutes* field.

### Every Minutes

When you check *Create Work Units*, you must indicate the length of the work units by entering the number of minutes. Enter a number between **1** and **999**. When the specified work unit time elapses, the next work unit starts with the next paragraph.

### Save To A Different Folder

When you check *Create Work Units*, you can optionally save the work units to a different folder. Check this box to save the work units to a different folder, such as a shared network drive or synchronization service, and then use the Browse button to select another location. The path name displays in the field below.

### With Audio

When you check *Save To A Different Folder*, you can optionally save the accompanying audio (.wav) file, if one exists. Check this box to save the audio file with the work units to a different folder. The larger the audio files (using higher Hz options such as 116MB/hr and higher), the more time required to transmit/share/archive via the Internet and **are not** recommended when sending Work Units via the Internet.

## Create Work Unit

The Create Work Unit feature creates a work unit on demand while writing realtime instead of waiting for the work unit settings [timed increment](#). For example, let's say you have your Translate Realtime Create Work Units set to every 50 minutes. As you are writing, you decide you want your scopist to see that text as soon as possible. You can press Alt + f, k (File, Create Work Unit) or write a steno outline to invoke macro to create a work unit immediately rather than waiting for the 50 minutes. When the Create Work Unit command is invoked, the work unit is created with the next consecutive number at the point the command is invoked and the work unit timer is reset. When a work unit is created based on the time increment setting, CATalyst attempts to end the work unit at the end of the current paragraph. When a work unit is created by invoking the Create Work Unit feature, the work unit is ended exactly where the command is written.

If you have started realtime and forgot to select the Create Work Units option, you can press Alt + f, k (File, Create Work Unit) or write a steno outline to invoke macro to create a work unit which displays the [Start Work Unit](#) dialog box and allows you to start work units after realtime has started. When the Create Work Unit command is invoked, the work unit is created with the next consecutive number at the point the command is invoked and the work unit timer is reset.

This option is grayed out if you are not in a current realtime session.

1. Start a realtime file.
2. Select File, Create Work Unit (**Alt + f, k**).

You can record a macro to create a work unit and assign it to a steno outline in your dictionary to invoke the Create Work Unit from your steno machine. A macro that is invoked by a dictionary definition is called an [AccelerWriter](#).

  - a) If the Create Work Units option was selected before starting realtime, a new work unit is created.
  - b) If the Create Work Units option was not selected before starting realtime, the Start Work Units dialog box displays. Do any of the following:
    - Change the time interval for work units.
    - Change the *Save to a different folder* option.
    - Change the Save location.
    - Deselect the With Audio option if you do not want to create an audio file with the work units. If the With Audio option is grayed out, audio is not currently being recorded in the realtime file and the option cannot be changed.
3. To save the changes and start creating work units, invoke the Create Work Unit command again. Whatever changes you made are saved and become the default setting for the Create Work Unit feature. That includes having the Create Work Units option selected.

Keyboard Map Function: Create Work Unit

## Start Work Units after realtime has started

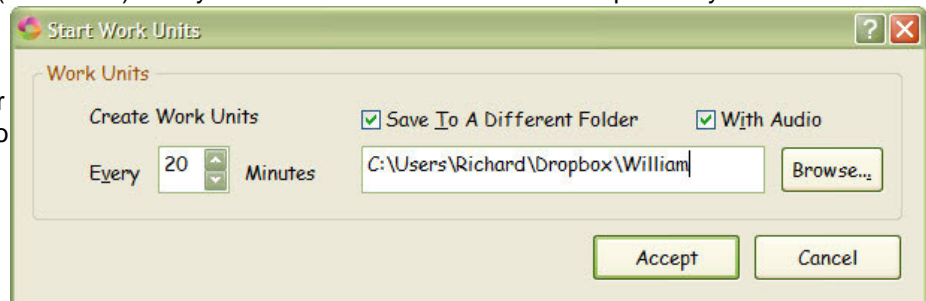

The Create Work Unit command (File, Create Work Unit) has been enhanced to provide two different actions. If you have started realtime and are creating work units, then using the [Create Work Unit](#) command creates a work unit regardless if it is at the incremented time or not. If you have started realtime and did not select to create work units, using the Create Work Unit command will display the Start Work Unit dialog box. The dialog box is "modeless" which means if you invoke the command and need to continue writing realtime, simply continue writing realtime. When you get a minute, you can return to the dialog box and make any changes you need to make.

The Start Work Unit dialog box looks like the Work Units section of the Translate Options Realtime Tab and displays all the current settings. By invoking the command, Create Work Units is automatically turned on and you can change the save location and the save interval time. The With Audio option is grayed out if audio is not being recorded. All changes you make here are saved to the Translate Options Realtime tab. In other words, the next time you start realtime these settings will be the default settings and the Create Work Units option will be selected. Once you have made your changes, use the Create Work Unit command again to accept your changes and start work units. To cancel the action, click the Cancel button or write the steno outline defined as {Cancel Active Dialogs}.

The Create Work Unit command can be invoked from the File menu (**Alt + f, k**), a keyboard map assignment or a macro.

### To start work units after realtime starts:

1. Start a realtime file where the Create Work Unit option is not selected.
2. Invoke the Create Work Unit Command.
  - Press **Alt + f, k** (File, Create Work Units).
  - Invoke a macro (if available) from your steno machine or from the computer keyboard.
  - Press a key combination assigned in your keyboard map to Create Work Unit.
3. Do any of the following:
  - Change the time interval for work units. Valid numbers are 1 to 999.
  - Change the *Save to a different folder* option.
  - Change the Save location.
  - Deselect the With Audio option if you do not want to create an audio file with the work units. If the With Audio option is grayed out, audio is not currently being recorded in the realtime file and the option cannot be changed.
4. To save the changes and start creating work units, invoke the Create Work Unit command again.

Whatever changes you made are saved and become the default setting for the Create Work Unit feature. That includes having the Create Work Units option selected.

## Troubleshooting the Realtime Connection

If Case CATalyst cannot establish connection with the writing machine, a message displays indicating the number of attempts to connect. Do the following:

### Direct Connect (Serial Cable) Realtime Connection

- Verify the realtime (serial) cable is connected to the CAT system and, if applicable, you are using the correct adapter.
- Verify the realtime (serial) cable is connected to the writing machine , if applicable, you are using the correct adapter.
- Verify the writing machine is On.
- Verify the correct COM port is selected and is working. If you are using a USB to serial adapter, confirm the COM port assignment to the adapter. Go to Help and select Open Device Manager to verify the correct COM port assignment and if the drivers are properly installed.
- You may not have a proper connection. Close the realtime session and write a few strokes before starting another realtime session. Writing a few strokes before starting realtime helps ensure a proper connection between the writing machine and Case CATalyst.

### USB Realtime Connection with Luminex, Diamante, élan Mira and Stentura Fusion

- Verify the USB cable is connected to the CAT system.
- Verify the writing machine is On. Verify the USB cable is connected to the writing machine.
- Be sure you have loaded the appropriate USB driver for your writing machine on your computer. Go to Help and select Open Device Manager to verify the USB drives are properly installed.
- If you are able to establish a connection, but no steno strokes display on the Edit screen, you may not have a proper connection. Close the realtime session and write a few strokes before starting another realtime session. Writing a few strokes before starting realtime helps ensure a proper connection between the writing machine and Case CATalyst.

### Wireless Realtime Connection

Refer to the appropriate wireless communication guide that came with your Stenograph wireless communication package.

## Create EZ Speakers methods

There are three ways to Create [EZ Speakers](#) during realtime. The [Create EZ Speakers](#) feature is a quick way to create speaker identifications without having to include format symbols and additional punctuation. A default EZ Speakers with Fields dictionary is available in your System Files case and can be customized to match your writing theory and formatting needs. The EZ Speakers with Fields dictionary acts as a template when using the Create EZ Speakers functions. You can also create EZ Speakers while in a realtime job or in a dictionary.

When creating EZ Speakers before starting translation, the Case dictionary is only available if you are starting the job in a case. If you are in a case and select Case dictionary, then the EZ Speaker definitions are stored in the Case History file and will be used for all future jobs in this case. For example, the Case is an on-going proceeding and you expect the same attorneys to be present at each deposition or trial. Selecting Case dictionary retains the speaker names for all future jobs in the case. A [Clear All Speakers](#) command is available in a job's Speaker List when EZ Speakers are created using fields and you no longer want those speakers available in the current job or future jobs in a case.

If you do not want the speakers you create to be used for all future jobs in the case, select Job dictionary and select the *Always default to job dictionary* option in the Create EZ Speakers dialog box. For example, the Case you create is named August and you are putting all the jobs you write during the month of August in this case. Since the jobs will be unrelated, you want the EZ Speaker definitions to go into the individual job dictionaries rather than the case.

A Clear All Speakers command is available when EZ Speakers are created using fields and you no longer want those speakers available for future jobs in a case.

### Translate dialog box Create EZ Speakers button

1. In the Translate dialog box, press **Alt + c** open the Create EZ Speakers Entries dialog box.  
A file name must display in the File: field for the Create EZ Speakers button to be active.
2. Select Job or Case dictionary as the destination for the speaker entries.
3. Type the speaker number in the Text Token Number field.  
Depending on your EZ Speaker dictionary entries, the Steno field may be populated with your speaker steno. Go to Step 5.
4. In the Steno field, type the steno outline(s) you will write for the speaker.
5. In the Text field, type the name of the speaker and press Enter.  
The speaker is added and the dialog box displays with empty fields.
6. Press **ESC** or **Alt + e** to close the dialog box when you have finished creating speaker identifications.  
This method of creating EZ Speakers can be used when translating a steno file or writing realtime.

### Tools, Create EZ Speakers during realtime

1. Press **Alt + t, z** (Create EZ Speaker Entries...)
2. Select Job or Case dictionary as the destination for the speaker entries.
3. Type the speaker number in the Text Token Number field.  
Depending on your EZ Speaker dictionary entries, the Steno field may be populated with your speaker steno. Go to Step 5.
4. In the Steno field, type the steno outline(s) you will write for the speaker.

5. In the Text field, type the name of the speaker and press Enter.  
The speaker is added and the dialog box displays with empty fields.
6. Press **ESC** or **Alt + e** to close the dialog box when you have finished creating speaker identifications.  
This method of creating EZ Speakers can be used when writing realtime.

[Keyboard Map](#) Function: Create EZ Speakers

### Create EZ Speakers from the steno machine

1. Write the steno outline defined in one of your dictionaries being used to translate as {EZ Speaker Define}. The default Realtime Commands Dictionary contains the definition for {EZ Speaker Define} using the steno SPEF/SPEF.  
Once the Create EZ Speakers Entries dialog box displays, you will write the steno outline(s) in your [Power Define dictionary](#) to navigate the dialog box. You can modify the steno entries in the default Realtime Commands Dictionary to better match your steno theory.
2. In the Text Token Number field, write the steno defined as a digit for the speaker you want to created and then write the steno outline defined in your Power Define dictionary as [TAB].  
Depending on your EZ Speaker dictionary entries, the Steno field may be populated with your speaker steno. If so, go to Step 4.
3. In the Steno field, type the steno outline(s) you will write for the speaker and then write [TAB].
4. In the Text field, type the name of the speaker using dictionary definitions and/or fingerspelling.
5. Do any of the following:
  - To complete the EZ Speaker entry, write the steno outline defined in the Power Define dictionary as [ENTER]. The speaker is created and added to the appropriate dictionary, speaker list and [seating chart](#).
  - To change an option, write [TAB] to put the cursor focus on the option and then write the steno outline defined in the Power Define dictionary as [SPACE] to select or deselect an option.  
If you want to access the Insert Field function, press **Alt + i** on the computer keyboard or click the button with a mouse.
  - If you need to leave the Create EZ Speaker Entries dialog box open and return to writing realtime, write the steno outline defined as [SUSPEND] in the Power Define dictionary. The Create EZ Speaker Entries dialog box flashes, the cursor focus changes to the realtime text and leaves the Create EZ Speaker Entries dialog box open.  
You can write the Suspend command at any time the Create EZ Speaker Entries dialog box is open. To return to the Create EZ Speaker Entries dialog box, write the steno outline you wrote to open the Create EZ Speaker Entries dialog box.
  - To cancel the creation of the current EZ Speaker and close the dialog box, write the steno outline defined in the Power Define dictionary as [ABORT]. The steno written while in the Power Define dialog box appears grayed out in Vertical Notes. If you have the Advanced Translation Option, *Insert [Oops](#) FS after aborted Power Define* option set to Yes, then an [Oops](#) category 10 format symbol is inserted into the text at the location the Power Define was aborted.
  - To close the dialog box, write [TAB] until your cursor focus is on the Close button and write the steno outline defined as [ENTER].

## Brief It

Brief It is a translation feature that suggests conflict free brief forms for words and phrases that you write during a realtime job. When you write three or more steno strokes, Case CATalyst generates a brief form or reminds you of an existing brief form in one of your dictionaries or personal briefs and displays it in the Brief It dialog pane. You can write the suggested/reminder brief to reduce multiple stroke outlines.

There are three types of briefs: Reminder, Personal and Suggested. All brief types display in the Brief It dialog pane in color coded backgrounds to easily identify the type of brief: Personal, Suggested and Reminder. Personal briefs have a light orange background, Suggested briefs have a light yellow background and Reminder briefs have a light green background. The more often the same brief is suggested without being written/used, the darker the background color. If you write a Suggested brief, the background color for the brief turns gray and the used brief moves to the end of the list.

Brief It will try to offer a singular form of a word/phrase brief along with the plural brief form when a plural word/phrase is written. For example, "world financial centers" is written, Brief It may offer W\*FBG for "world financial center" and W\*FBGS for "world financial centers". The singular version brief is displayed first and then the plural brief. If you want to use a suggested brief, you do what you always do to take one. They are not taken as a pair. Brief It uses your Plural Endings option from Edit (Tools, Options, Plural Endings...) to determine if it should offer an -S or -Z at the end of the suggested brief for plurals. If you allow both -S and -Z, Brief It will first check to see if a -S can be added to the outline to make it plural and if not, it will then try the -Z. For example, you write "provide answers" and Brief It suggests PA\*EUS. If PA\*EUS is defined in your dictionary, then Brief It will attempt to add the -Z to the steno outline and may suggest PA\*EUZ.

Brief It feature will also attempt to recognize plural versions of proper names and only provide a plural version of the brief. For example, you write "Upper Saddles" several times and Brief It offers you \*UPZ as a brief. Brief It analyzes the words to see if the first letter is upper case and the second letter is lower case and since the criteria is met, Brief It doesn't offer a singular brief to go with the plural brief for the proper name.

NOTE: If you have the double first syllable option checked, that logic takes priority over offering the singular brief along with the plural brief.

[Brief It options](#) allow you to customize Brief It. You can, for example, show briefs in phonetic steno. For example, if you wrote "large exemption" the suggested steno would display as "LARJ" instead of "HRARPBLG". You can also select to show only Reminders and Personal Briefs, change the default dictionary when writing/using a Suggested brief and customize the Suggested briefs that Brief It generates.

You can [search the Brief It pane](#) for specific text or steno in the event you want to find a brief suggestion. There also may be times when you want to clear all unused briefs from the Brief It pane. For example, you have multiple witnesses and the testimony was very fast and now you want to remove all the unused briefs that were suggested so they can be recycled for the next witness. The [Clear/Recycle Unused Briefs](#) command is available when you right click in the Brief It pane.

The *Brief It* option on the Translate Options [Realtime tab](#) must be checked for the Brief It feature to be active. By default, the Brief It feature is active and opens the Brief It dialog pane when starting realtime. To display the Brief It dialog pane in Edit, select **View/Brief It**. Brief It remains active even when the Brief It dialog pane is hidden.

You can [search/filter dictionaries](#) based on Used Briefs criteria to review the briefs you have used.

## Brief Types

## Reminder Briefs

Reminder briefs are existing dictionary entries which contain fewer steno strokes than what is written. The existing entries are located in dictionaries used for the current realtime translation.

## Personal Briefs

Personal briefs are entries you create prior to translation. These may be briefs forms you find in books, on a forum or when exchanging ideas with other court reporters. Personal briefs are stored in the [Briefs file](#) located in the System files case. Creating entries in the Briefs.txt file allows you to store words and phrases along with the brief form without placing them in a dictionary. Personal briefs only display when they do not conflict with an entry in a dictionary currently being used for translation.

The first time you write three or more steno strokes for a word or phrase contained in the Briefs file, Brief It displays the Personal brief form. For example, you have a dictionary entry for "Microsoft" as PHAOEUBG/ROE/SOFT. At a seminar, you hear about the brief PHOFT for Microsoft. You are uncertain into which dictionary you want to place the entry but you would like it available for future jobs. You open Briefs file (Alt + f, o, i, r (File, Open, List/Table, Personal Briefs). Press Ctrl + i (Insert) and in the Brief Text field, type: **Microsoft**. In the Brief Phonetic Steno section, press Ctrl + n and type: **PHOFT**. The first time you write Microsoft as PHAOEUBG/ROE/SOFT during the job, the Brief It dialog pane displays PHOFT.

## Suggested Briefs

Suggested briefs are generated by Brief It during realtime. When no brief exists in a dictionary currently used for translation or in the Brief It file for a word or phrase written with three or more steno strokes, Case CATalyst uses complex algorithms and intelligent analysis to generate a brief. Entries in your [Steno Shortcut Table](#) are used as part of the analysis. It is recommended that you review the Steno Shortcut table to ensure accurate suggestions based on your writing style. If you do not like a Suggested brief form, you can reject it and have Brief It suggest another brief.

Suggested briefs only display when they do not conflict with an entry in a dictionary currently used for translation. For example, during the job you write AB/OT/HRAB/TOERS for the name "Abbott Laboratories." A job dictionary currently in use for translation contains the entry A\*L defined as "Mr. Allen." Brief It does not suggest A\*L for the Abbott Laboratories brief but creates and suggests a brief that does not conflict, such as A\*LT.

When five or more strokes are written that produce a word with no spaces, such as finger spelling a company name or acronym, Brief It suggests a brief when no shorter stroke definition exists in a dictionary being used for translation. For example, you use a dictionary with an alphabet where each letter is capitalized and defined with the [Glue translate symbol](#). In the current job, you finger spell the acronym, "SSBTC" as /S\*/S\*/PW\*/T\*/KR\* for State Street Bank and Trust Corporation. Brief It recognizes it as an acronym and suggests SPW\*T for SSBTC. When a single word is created with two or more hyphens, such as finger spelling a name with each letter separated by hyphens, Brief It suggests a brief with the hyphens removed and initial caps the word. For example, you write, K-U-R-K-O-W-S-K-I. Brief It suggests "Kurkowski."

Brief It does not suggest briefs for certain words and punctuation. The [CommonWords.txt](#) file, which you can modify, contains a list of words that Brief It does not consider when looking for words and phrases for brief suggestions. Brief It also does not suggest a brief when a phrase contains a question mark or exclamation that is followed by a space or when a phrase with a period (.) is followed by two spaces. For example, "...high impact. Exercise..." When Brief It encounters a phrase with a period (.) followed by one space, Brief It may suggest a brief. For example, titles with surnames such as Mr. Washburn, Dr. Skaare, Ms. Kurkowski, etc. This is a built-in feature of Brief It and does not require selecting an option.

By default, when you write the steno outline for a Suggested brief, Case CATalyst moves it to the end of the Brief It list and automatically adds it to the case or job dictionary. If you write the stroke by mistake or do not want to use it, you can write the {Delete} command to remove the steno and text from the transcript. Using the Delete command does not remove the define from the dictionary. For example, you misstroke a steno outline which is the same steno as a Suggested brief. Instead of the misstroked steno outline being an untranslate, it translates as text. The brief is also added to the case or job dictionary because it was written. You use the {Delete} command to remove the Suggested brief text from the transcript. Use the Undo Last Global command to remove the brief from the dictionary. The define remains in the Global table.

Using the [Suggest a Brief](#) command, you can force Brief It to suggest a brief while writing realtime or editing. For example, in Edit, before proceedings start you can highlight existing words or type a word or phrase and use Suggest a Brief to create a brief. The Suggest a Brief command works well in an AccelerWriter to force briefs on previously written text. For example, you create a macro that selects the two previous words and invokes the Suggest a Brief command and then create an AccelerWriter definition. In a realtime file, you write "fibromyalgia syndrome." You then write the stroke to invoke the Suggest a Brief AccelerWriter. Brief It displays the Suggested brief in the Brief It dialog pane.

You can automatically populate the Brief It dialog pane with Suggested briefs using the [Text List Brief It](#) or [Transcript Brief It](#) Edit features. Text List Brief It analyzes a text file and creates Suggested briefs based on your Brief It options. This may be helpful when preparing for a particular type of job with unfamiliar terminology or subject matter. Transcript Brief It analyzes the open transcript to create briefs based on your Brief It options. This may be useful for an upcoming job related to a previously taken job. For example, you can open the previous job and run Transcript Brief It to create briefs related to the job.

When using the [Create EZ Speakers](#) feature or creating a speaker in the Speaker List, Brief It automatically creates a brief for the speaker and displays it in the Brief It dialog pane. Brief It inserts a Sticky Space format symbol between the title and surname and initial caps each word. When a letter contained in the name is lower case, then Brief It initial caps the following letter. For example, you create the speaker MS. McLAUGHLIN. Brief It creates the brief, Ms. <Sticky Space>McLaughlin. When you create a speaker for MR. MCGREE, Brief It creates a brief for Mr. <Sticky Space>Mcgree. Briefs are not generated for Common speakers listed in the Speaker List.

Brief forms can be reviewed any time during realtime or while editing. The contents of the Brief It dialog pane stay with the job. For example, you may be curious about some of the Reminders that displayed during realtime and want to see how often the entry was used. You can Suggest a Brief on words or define Suggested briefs so you can write them in the future and do not have to wait for a brief to be suggested.

## Brief It on the Luminex and Diamante

The Luminex and Diamante V2.0 or higher has optional Brief It functionality designed for situations in which you are not writing realtime to Case CATalyst or do not want to use the Case CATalyst Brief It feature. If you do write realtime on Case CATalyst V13 or higher with the Diamante Brief It option is active, defines, including briefs, are automatically exchanged between the systems. If Brief It is active on both Case CATalyst and the Diamante, Suggested briefs may not match. **It is strongly recommended to only use the Brief It feature on your Diamante or Case CATalyst but not both locations.**

If you choose to use the Brief It feature on the Luminex or Diamante with Case CATalyst, selecting to Undo a global, Undo Last Global or delete a global in Case CATalyst does not remove the definition from dictionary in Luminex or Diamante memory or the job dictionary for the file on the Luminex or Diamante. Refer to the Luminex or Diamante User Guide for information on removing J-Defines from the Luminex or Diamante.

Suggest A Brief

## Navigating the Brief It pane

The [Brief It](#) translation feature suggests conflict free brief forms for words and phrases that you write during a realtime job. When you write three or more steno strokes, Case CATalyst generates a brief form or reminds you of an existing brief form and displays it in the Brief It dialog pane. The Brief It option on the Case CATalyst Translate Options [Realtime tab](#) must be checked for Brief It to be active during realtime writing. By default, the option is active. [Live Suggestions](#) are also displayed in the Brief It pane.

[Brief It Options](#) determine certain customized settings that control how Case CATalyst suggests briefs in the Brief It dialog pane during realtime. You can create Personal Briefs, include and exclude keys in suggested briefs, suggest only one stroke briefs, identify common words that occur at the beginning or end of phrases to prevent a brief from being suggested, select the default dictionary for the brief you write, whether you want briefs for numbers and allowing double of first syllable for briefs. You may want to customize Brief It before beginning translation.

The Brief It window defaults to displaying the steno portion of the brief. You can adjust the font size for the Brief It pane and the steno portion will automatically adjust to show you the entire steno of the brief. You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to

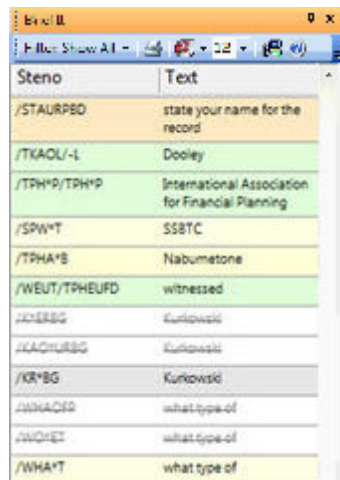

move) of the pane, your cursor will change to a horizontal double arrow (  ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen.

Access the Brief It dialog pane in Edit. Press **Alt + v, e, t (View/Panes/Brief It)**. The Brief It dialog pane can be set to float or be docked anywhere on the screen. You can also [search the Brief It pane](#) for specific text or steno.

## Brief It Dialog Pane

The briefs in the dialog pane have a color-coded background for easy identification. The more often the same brief is offered and not used, the darker the background color.

Steno	Text
/STAURPBO	state your name for the record
/TKAOL/-L	Dooley
/TPHP/TPHP	International Association for Financial Planning
/SPW*T	SSBTC
/TPHA'S	Nabumetone
/WEUT/TPHEUD	witnessed
/XERBG	Kurkowski
/XACHURBG	Kurkowski
/XR*BG	Kurkowski
/XHAQED	what type of
/XQHET	what type of
/WHA*T	what type of

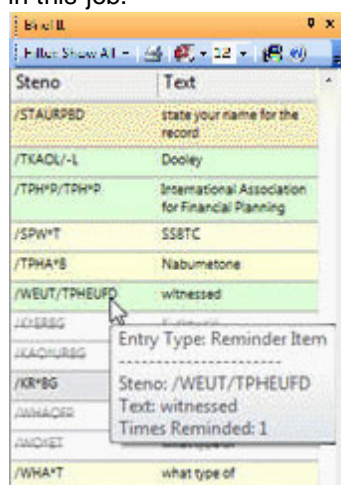

Brief It dialog pane colors include:

- Green — indicates a Reminder brief. This is a brief that exists in a dictionary being used for translation.
- Yellow — indicates a Suggested brief. This is a brief Case CATalyst generates.
- Orange — indicates a Personal brief. This is a brief you created and entered in the Briefs.txt file.
- Gray — indicates a Used brief. This is any type of brief displayed in the Brief It dialog pane you used in this job.
- White with strike out — indicates a Rejected brief. A rejected brief occurs when you use the Reject Suggestion or New Suggestion command.
- Live Suggestions (if active) display entire the next Live Suggestion is displayed in the Brief It pane.

## Brief Details

Rest the cursor on an entry in the dialog box to display information about the brief, including the type of brief, the steno and text contained in the brief, and how often the brief has been suggested in this job.

## Managing Briefs

Right click a single entry in the Brief It dialog pane to take an action on the brief. Available actions depend on the type of brief selected. To take an action on multiple entries at once, use Windows conventions to highlight multiple briefs. Only actions applicable to all the selected entries are available. For example, if you highlight a Reminder brief and a Suggested brief, the only feature available is, Send to Cat Scratch. If you highlight several Suggested briefs, the available actions include, Send to Cat Scratch, J-define Suggestions, Reject Suggestions and New Suggestions.

### Entry Type

Identifies the type of brief: Reminder, Personal, Suggested or Used.

### Send to Case Cat Scratch

Depending on your [Cat Scratch](#) pane scope, Send to Job Cat Scratch, Send to Case Cat Scratch or Send to Cat Scratch displays. If the Brief It [Show Phonetic Steno](#) option is selected, briefs sent to Cat Scratch display phonetically.

### Lookup Steno

Displays the entry in the dictionary where the existing brief entry is located. This action only displays for Reminder entries. The dictionary, that contains the entry, opens with the entry highlighted.

### J-Define Suggestion

[Create a J-Define](#) from the brief. Displays the Add Dictionary Definition – Job Dictionary dialog box with the brief form in the Steno field and the definition in the Text field. This action is available for Suggested and Personal briefs.

If you have the Brief It Option, *Define to Case Dictionary*, selected, right click displays K-define Suggestions.

### J-Define Rejection

[Create a J-Define](#) from a rejected brief. Displays the Add Dictionary Definition – Job Dictionary dialog box with the brief form in the Steno field and the definition in the Text field. **This action only displays for rejected briefs.**

### Reject Suggestion

Reject the Suggested brief. Case CATalyst strikes through the brief form, changes the background to white and makes the brief unavailable. This action is available for Suggested and Personal briefs.

### New Suggestion

Automatically rejects the brief and suggests a new brief; or suggests a new brief for a brief already rejected. This action is available for Suggested and Personal briefs.

### Send Text to No Nag List

The Brief It feature allows you to put words/phrases that you have identified that Brief It should no longer offer as a suggestion, a reminder or display from the Personal Briefs file. For example, your dictionaries contain perfectly stroked entries along with some misstrokes for the same text. You may want to [put misstrokes in the No Nag List](#) so your aren't reminded of them.

### Clear/Recycle Unused Briefs

The Clear/Recycle Unused Briefs command removes the steno of the unused brief suggestions and Personal Briefs from the Brief It pane. The unused briefs are recycled and made available for another word or phrase in the same translation session. Reminders and Live Suggestions are not affected by this command and remain in the Brief It pane after using the Clear/Recycle Briefs command.

## Dialog Pane Features

### Filter Type

Filter allows you to display the briefs by category or with specific criteria. Click the down arrow to select the type of entries to display. A check mark next to the item indicates it is selected to be included in the filter. Filter hides the display of specified items in the Brief It dialog pane. It does not remove them. All entries display when you return to Show All. By default, the Filter is set to Show All entries. [Live Suggestions](#) is a filter option that allows you to see Live Suggestions in the Brief It pane while you are writing realtime. In order to see Live Suggestions, this option must be selected.

If you write a brief generated by Brief It that is not displayed in the Brief It dialog pane because the Filter is hiding the entry, Case CATalyst job defines the brief as Suggested.

### Print

Display the Print dialog box allowing you to print the list of briefs. If you select to print to PDF, by default Case CATalyst uses the current job name followed by "\_Brief It.pdf". You can modify the name.

### Send to No Nag List

The Brief It feature allows you to put words/phrases that you have identified that Brief It should no longer offer as a suggestion, a reminder or display from the Personal Briefs file. For example, your dictionaries contain perfectly stroked entries along with some misstrokes for the same text. You may want to [put misstrokes in the No Nag List](#) so your aren't reminded of them.

### **New Suggestion**

Automatically rejects the brief and suggests a new brief; or suggests a new brief for a brief already rejected. This action is available for Suggested and Personal briefs.

### **Select Font Type**

Select a font type from the drop down list to affect all the steno and text in the Brief It dialog pane. Depending on the font style selected, briefs in the Brief It pane may wrap. Two stroke briefs wrap the second steno stroke after the slash (/). If a format symbol exists, the text wraps after the format symbol.

### **Select Font Size**

Select a font size from the drop down list to affect all the steno and text in the Brief It dialog pane. Depending on the font style selected, briefs in the Brief It pane may wrap. Two stroke briefs wrap the second steno stroke after the slash (/). If a format symbol exists, the text wraps after the format symbol.

### **Options**

Display the Realtime Aids Options dialog box which provides access to [Brief It](#) and [Live Suggestions](#) options. Brief It options allow you to customized settings that control how Case CATalyst suggests brief, where the brief definition goes when you take a brief, whether you allow briefs for numbers and more. You also have access to the Live Suggestions options which allows you to customize the number of Live Suggestions that display, where live suggestion definitions go, etc.

### **[Export to CSV](#)**

Allows you to export the contents (whatever type of briefs are displaying in the Brief It pane) to a CSV (comma separated value) file type which can be opened in Microsoft Excel or a compatible file type.

### **Case CATalyst Help**

Display the Case CATalyst help.

### **Toolbar Options**

Click the down arrow on the right side of the toolbar to add or remove icons from the Brief It toolbar.

## Brief It Options

Brief It is a translation feature that suggests conflict free brief forms for words and phrases that you write during a realtime job. When you write three or more steno strokes, Case CATalyst generates a brief form or reminds you of an existing brief form in one of your dictionaries (or your Personal Briefs file) and displays it in the Brief It dialog pane. You can write the suggested/reminder brief to reduce writing multiple stroke outlines.

[Brief It](#) options (Realtime Aid Options dialog box) contain certain customized settings that control how briefs are suggested, what briefs are displayed, where used briefs go, what steno characters are included/excluded in briefs and how briefs are displayed in the Brief It dialog pane during realtime. [Live Suggestions](#) options are also available in the Realtime Aid Options dialog box when selecting Brief It options. The Brief It and/or [Live Suggestions options](#) need to be selected on the Case CATalyst Translate Options [Realtime tab](#) in order for Brief It and/or Live Suggestions to be active. By default, the Brief It and Live Suggestions options are checked and active.

Brief It options affect both regular CATalyst translation and CATalyst BCS captioning.

Access Brief It Options:

- at Manage Jobs. Press **Alt + t, o, e, b** (**Tools/Options/Edit/Brief It**).
- at Manage Jobs or anywhere in Case CATalyst. Click the All Options icon () in the All Options dialog box select Edit Panes and then Brief It.
- at Manage Jobs. Press Alt + t, select All Options, in the All Options dialog box select Edit Panes and then Brief It.
- in Edit. Press **Alt + t, o, b** (**Tools/Options/Pane Options/Brief It**).
- in the Brief It dialog pane. Click the Brief It Settings  icon.

## Brief It Options

### Max Words Per Brief

Set the maximum number of words for a brief that Brief It suggests. Select between 1 and 10 words. For example, if the setting is 7 and you write "...first date you contacted Rockford Credit Union," a brief may be generated for the entire phrase. If the setting is 3, a brief might be suggested for "Rockford Credit Union." The default is 5.

This setting is also used when generating phrases for the [Case Prep](#) feature.

This option does not affect marking a phrase and using the Suggest a Brief command.

### Show Phonetic Steno

When selected, this option will change steno character combinations into the "phonetic" sound of the combined letters when offering a suggestion. The option simply changes the display of the steno characters and still keeps the normal Brief It logic. For example, let's say you select the Show Phonetic Steno option and you write the phrase "large imbalances", Brief It would display the suggestion as "LARJ" instead of "HRARPBLG." Another example might be if you wrote "to the extent that" and Brief It offered "TO\*EX" instead of "TO\*EBGS".

The Show Phonetic Steno option includes two options for words starting with Z and ending with X. The options are selected by default. If the SWR=Z option is selected, then suggested briefs for words/phrases starting with Z will display as Z. If the option is deselected, suggested briefs for words/phrases starting with Z will display as SWR. If you write SWR for the Z sound, then you most likely will leave the option selected. Since the initial Z sound can be written differently depending on the steno theory, if you write different steno for the initial Z, you may want to deselect the option. For example, let's say the reporter doesn't write SWR for the initial Z and the option is selected. During the job the name "Zimmerman" (STKEUPL/ER/PHAPB) is written several times and Brief It suggests Z\*IM. Since the reporter doesn't write SWR for initial Z (the reporter writes STK for Z), the reporter automatically writes STK\*EUPL (not SWR\*EUPL) and the steno does not translate as Zimmerman because CATalyst is expecting SWR\*EUPL. The reporter can deselect the SWR=Z option and when a Brief It suggests a brief for a word/phrase starting with Z, the steno will display SWR instead of showing a Z.

With the BGS=X option selected, suggested briefs for words/phrases ending in the X sound will display an X. If the option is deselected, the suggested briefs for words/phrases ending in the X will display as BGS (KS). For example, let's the reporter writes the word "hoax" several times or the reporter uses the Suggest a Brief command to get a brief suggestion. If the BGS=X option is selected, Brief It might display a suggestion using an X like HO\*X. If the BGS option is deselected, the suggestion might display as HO\*KS.

The Show Phonetic Steno option can be selected or deselect at any time. During realtime or in previous jobs, you can open the Brief It pane, then select Options and select or deselect the Show Phonetic Steno option to see the difference in how the suggestions display. The option also affects how steno outlines display in the Text/Steno section of the Cat Scratch pane.

While writing realtime with the Show Phonetic Steno option selected, Personal Briefs display the steno outline(s) as it appears in the Personal Briefs table. For example, if you have an entry such as "as a result of the accident" with the steno "SRUFBGS" that is how the steno will appear in the Brief It pane during realtime. If you close the realtime file and reopen it, the Personal Brief steno will display phonetically since the Personal Brief table is only used during realtime. For this example, when reopening the file, the steno for "as a result of the accident" will display as "VUFX".

**Note:** If you decide to change the status of one or both of the Show Phonetic Steno options during a session, the already suggested briefs will not change/display the suggested steno differently.

### Only Suggest 1 Stroke Briefs

Check this box to have Brief It suggest only one stroke Suggested briefs. By default, Brief It always suggests a one stroke brief with the asterisk before suggesting a two stroke brief. Selecting this option also affects Reminder and Personal briefs. For example, you write "neurotoxicity" in 4 or 5 strokes. When this option is active, Brief It does not remind you that you have "TPHEOR/TOX" in your Personal Dictionary as a two stroke entry for "neurotoxicity."

### Write Twice to Define

Brief It, by default, automatically creates a J-Define or a K-Define (Define to Case Dictionary) the first time you use a Suggested brief. Checking this box requires you to consecutively write a brief twice before Brief It creates a J-Define or K-Define. You may want to use this option to try a Suggested brief before making it a definition.

For example, Brief It suggests /A\*BT for "Abbott Labs." If the Write twice to Define option is active, you would need to write /A\*BT/A\*BT to have Case CATalyst create the define, /A\*BT for "Abbott Labs." Once defined, you write A\*BT for "Abbott Labs" for the remainder of the job. By default, this option is not active.

When you have the Write Twice to Define option selected and the Allow Double First Syllable option selected, if the suggested brief has two identical strokes, Brief It will behave as if "Write Twice to Define" option was not active. (In other words, you do not need to write the brief 4 times to use it.) If the brief is one stroke or is multiple (not identical) strokes, briefs will need to be written twice to be used.

### **Define to Case Dictionary**

Check this box to place a Suggested brief in the case dictionary once it is written. This is the default. If the current job is not in a case, then the brief is placed in the job dictionary.

### **Personal/Reminders Only**

Check this box to display only Reminder (shorter definitions in your Personal Dictionary) and Personal (entries in your Personal Briefs file) briefs in the Brief It dialog pane. Suggested briefs are not created. When using the Suggest a Brief, Transcript Brief It or Text List Brief It commands, Brief It only displays Reminders or Personal Briefs. When using Suggest a Brief and no Reminders or Personal Briefs are available, a message displays indicating that a brief cannot be suggested.

### **1 Stroke Reminders for 2 Strokes**

Check this box to have Brief It offer one stroke Reminders or Personal briefs when writing two stroke entries. For example, you write "you don't" in two strokes and there is a one stroke version in your Personal Dictionary. Brief It shows the one stroke brief as a Reminder. If Brief It finds two one stroke dictionary entries for the matching text, Brief It suggests the most frequently used matching one stroke entry. If the matching one stroke entries have been used the same many times, then Brief It suggests the matching one stroke entry with the least amount of steno keys.

### **Auto Open Brief It**

Check this box to automatically display the Brief It dialog pane when starting realtime. By default, this option is selected.

### **Send Used Briefs To Cat Scratch**

Check this box to automatically send a Suggested brief you use to the Steno/Text section of the [Cat Scratch](#) dialog pane.

### **Steno Include/Exclude**

Displays the Brief It Options table where you can [modify](#) the Require and Exclude entries. If you select Steno Include/Exclude, you will be prompted to save your changes and Brief It options open. The Require entry contains the steno character or steno combination that you want included in every Suggested brief Brief It generates. There is only one Require entry. By default, the asterisk (\*) is set as a required character.

Exclude entries contain steno characters or steno combinations to exclude from every Suggested brief. In other words, you can add steno characters or steno combinations that may be difficult for you to write or you don't want offered in a suggestion. You can have multiple Exclude entries.

### **Personal Briefs**

Display the Briefs.txt file where you can [create](#) and [modify](#) Personal brief entries. If you select Personal Briefs, you will be prompted to save your changes and the Realtime Aid Options dialog box will close and the Personal Briefs file will open. Personal briefs are brief forms you create which contain words and phrases along with the steno. These may be briefs received from magazines or another reporter which you did not want to put in a dictionary. Brief It does not use a personal brief that conflicts with dictionary entries.

### **CommonWords**

The CommonWords list contains words that prevents Brief It from suggesting a phrase that begins or ends with any word in the list. For example, let's say you write "after all was said" several times in the transcript but a brief is not suggested. If you look in the CommonWords list you see that all the words in the phrase are in the CommonWords list. Display the [CommonWords.txt](#) file in Notepad or WordPad to review, delete, add or [modify](#) entries. This file is also used for [Case Prep](#).

### **Allow Briefs with Numbers**

An Allow Briefs with Numbers option has been added to Brief It. Perhaps you have been in that court proceeding or deposition where Bates numbers or dollar amounts are repeated and you wished Brief It would give you a brief for those repeated number sequences. An additional option is available in the Steno Include/Exclude list, where a Required for Numbers entry is available. The Required for Numbers entry allows you to specify particular steno characters that will be included in the number brief suggestion. For example, let's say that the Required for Numbers entry is EU. You write 23925 several times throughout the transcript, Brief It might suggest 23EU9 incorporating the first, second and third numbers along with the required entry steno characters for numbers. By using the Required for Numbers entry, you will have a consistent steno outline with a suggested numbers brief. By default, EU is the steno assigned to the Required for Numbers entry in the Brief It Include/Exclude List. The Required for Numbers steno can be modified to fit your writing style or deleted so that no steno is required for numbers.

Brief It will remove the digits and use the normal Brief It logic for a suggestion and if no suggestion is found, Brief It will suggest a brief using up to 3 digits that were written in the order the digits were written (along with the required steno from your Brief It options) and if no suggestion is found, Brief it will continue to suggest numbers written in order with non-digit sounds or digits in any order with non-digit sounds.

By default, the following number/steno key combinations are excluded in the Brief Include/Exclude Options:

#1K, #2K, #3W, #4R, #6-R, #7-B, #8-G, #9-S

To prevent any number bar number from being suggested, press **Ctrl + i** and type **#** and press **Enter**.

### **Allow Double First Syllable**

Many reporters learned to brief speaker names and terminology by writing the first syllable of the name/terminology twice. For example, let's say the word "neurotoxicity" is used multiple times in the transcript. A reporter might write "neurotoxicity" as TPHUR/OE/TOBGS/EUS/TEU and since it is appearing multiple times in the job, the reporter might write TPHAO\*UR/TPHAO\*UR as a brief. The Allow Double First Syllable option has been added to the Brief It feature for those reporters that might want Brief It to offer the first syllable twice as a suggestion. When the Allow Double First Syllable option is selected, Brief It may offer the first syllable of the text (single word or phrase) written twice as the suggested brief. For example, the word "fluorescent" is used multiple times in the transcript. You write "fluorescent" in multiple strokes and Brief It suggests TPHRAOU/TPHRAOU. In other words, it suggests doubling the first syllable of the word "fluorescent."

When you have the Write Twice to Define option selected and the Allow Double First Syllable option selected, if the suggested brief has two identical strokes, Brief It will behave as if "Write Twice to Define" option was not active. (In other words, you do not need to write the brief 4 times to use it.) If the brief is one stroke or is multiple (not identical) strokes, briefs will need to be written twice to be used.

When this option is selected, it has the highest priority over other selected options for words and a later priority for phrases.

To select or deselect the Allow Double First Syllable option, do any of the following to display the Realtime Aid Options dialog box:

- At Manage Jobs, select Tools, Options, Edit, Brief It.

- During realtime, click the Options icon on the Brief It toolbar.
- Select Tools, Options, Pane Options, Brief It...

**PLEASE NOTE:** If you do not want the asterisk (\*) as a part of any double first syllable brief suggestions, you need to put the asterisk in as an exclude stroke in the Steno Include/Exclude table. Excluding the asterisk means that asterisk will not be a part of any brief suggestion.

## Live Suggestions

### Insert Oops when replacing with a live suggestion

By default, when you select to replace an untranslate and/or text with a Live Suggestion, an [Oops](#) format symbol (Oops-10 category) is inserted into the transcript at the location of the replacement. If you use the [Hotspots](#) pane, you can display all locations of the Oops format symbols in the transcript or you can set your [Scan For](#) options to stop on Oops format symbols. If you do not want the Oops format symbol inserted when replacing an untranslate and/or text with a Live Suggestion, deselect this option.

If you define an untranslate and/or text with a Live Suggestion, the Oops format symbol is not inserted into the transcript at the location. The define will be in the transcript's Global Table.

### Number of suggestions

By default, up to three Live Suggestions will display in the Brief It pane. You can adjust the number of suggestions that display from 2 to 5. To make a change, use the up/down arrows to increase or decrease the amount of Live Suggestions that display for a particular untranslate.

### Dictionary Defines go to:

Select the destination dictionary you want a defined suggestions to go to when using the Define With LS1 - LS5 commands. When this option is set to Case dictionary, if the transcript is not in a case, the destination dictionary is the job dictionary. When defining a Live Suggestion, the global is applied to the entire file. When defining with a Live Suggestion, the definition is placed in the transcripts Global Table in addition to the respective dictionary. If your [Dictionary Options](#) are set to have D-defines go to the Update Area, then if this option is set to Personal Dictionary, the Live Suggestion definitions will go to the Update Area.

### Show "translated" text as first Live Suggestion

By default, this option is active and Drag/Drop, Suffix Drag/Phrase Maker and phonetic translated text will be the first choice in the Live Suggestions list (and Quick Suggest). If Spell Check thinks the "translated" text is misspelled and this option is selected, the misspelled translation will not be offered as the first suggestion. If you do not want the Drag/Drop, Suffix Drag/Phrase Maker or phonetic "translated" text offered in the Live Suggestion and Quick Suggest list, deselect this option.

### Live Suggestions Favor

By default, the Live Suggestions feature is set to Balanced. Depending on many factors, you may want to adjust the Live Suggestions Favor option. For example, let's say you have a very fast computer and you want to improve the quality of your Live Suggestions, you may want to try the Quality setting. Or, let's say your realtime is a little sluggish on your old notebook, you may want to try the Speed setting to reduce the time Live Suggestions looks for suggestions.

- **Quality**  
Quality settings are set to spend up to 5 seconds looking for suggestions and will wait up to 5 steno strokes before ending the search for suggestions.

- **Balanced**  
Balanced is the default setting with settings to spend up to 2 seconds looking for suggestions and will wait up to 3 steno strokes before ending the search for suggestions.
- **Speed**  
Speed settings are set to spend up to 1 second looking for suggestions and will wait up to 3 steno strokes before ending the search for suggestions. If you are running Case CATalyst on older hardware and your realtime is a little sluggish and you want to use Live Suggestions, you may want to try this setting.

## Search the Brief It pane

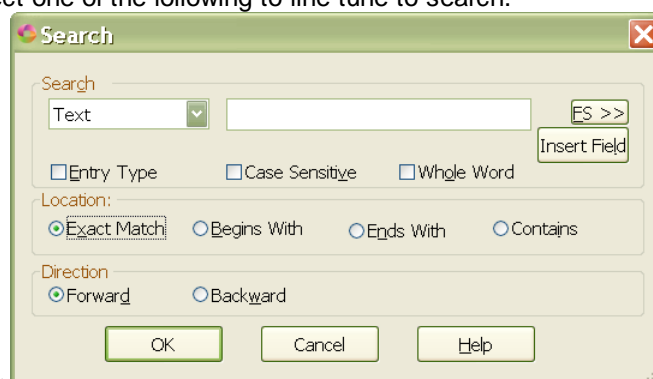

You have the ability to search the Brief It pane for a particular brief that you might have seen fly by because it is a fast and furious proceeding. Perhaps you thought you saw what could be a great brief or you just love to see the briefs that are generated and want to review them after the proceedings. Search in Brief It allows you to quickly and easily find the brief you want. Whether you want to search when there is a break in the proceedings to find the briefs you want to instantly incorporate, or you want to wait to the end of the proceedings and find the perfect briefs, Brief It search is at your fingertips. You can search for either text or steno outlines.

### How to search:

- with your cursor focus in the Brief It pane, press **Ctrl + f**.
- click the Search icon (  ) on the Brief It toolbar, your cursor focus is in the Brief It pane.

### Search dialog box opens:

1. In the Search field (**Alt + c**), select whether you want to search for Text or Steno. To select Steno, click the down arrow in the Search field and select Steno. When searching for Steno, the steno characters always display regardless if you have selected the Show Phonetics option. For example, when you select Steno and type a "J" in the search field, the steno will display as SKWR regardless of whether your Brief It steno displays as SKWR or J.
2. Type the text or the steno outline to search.
  - Search defaults to a **Text** search. Select one of the following to fine tune to search.
    - Entry Type -- although available, most types do not apply to Brief It searches.
    - Case Sensitive -- allows you to search for occurrences of the text based on upper or lower case.
    - Whole Word -- allows you to search for occurrences of the text when it only the whole word.
    - FS>>> - displays the list of Format Symbols.
    - Insert Field - displays the list of fields.
  - Selecting Steno search.
    - When searching for steno, select the Partial Stroke option to search for only a part of a steno stroke/outline. For example, you know the suggested steno for the brief started with J/SKWR but you don't know the entire suggested steno outline. You can select Partial

Stroke to find the entry or entries that start with or contains J/SKWR depending on the Location option you select.

3. To narrow your search, do **one** of the following:
  - Exact Match - searches for an exact match of the text or steno in the Search field.
  - Begins With - searches for text or steno stroke that begins with the text or steno specified in the Search field.
  - Ends With - searches for text or steno stroke that ends with the text or steno specified in the Search field.
  - Contains - searches for text or steno stroke that contains the text or steno specified in the Search field.
4. To specify the search direction, do **one** of the following:
  - Forward - searches forward from the current position in the Brief It pane. If it reaches the end and does not find the text/steno, a message displays that the text/steno was not found and *"Would you like to restart from the top?"* Select Yes to continue the search from the top of the Brief It pane or No to stop the search.
  - Backward - searches backward from the current position in the Brief It pane. If it reaches the top and does not find the text/steno, a message displays that the text/steno was not found and *"Would you like to restart from the bottom?"* Select Yes to continue the search from the bottom of the Brief It pane or No to stop the search.
5. Press **Enter** or click OK to begin the search.

**Things to know:**

- The Brief It pane must have cursor focus in order to search.
- If there are Live Suggestions in the Brief It pane, if appropriate, search may stop on a Live Suggestion.
- There are some options that are available for selection that may not apply to searching in the Brief It pane such as some Entry Type items, FS>>> within most briefs and Fields.

## Making J-Defines from Brief It Pane

The easiest way to make a J-define (or K-define) of a brief in the Brief It pane is to write the Suggested brief. When you write the steno for a Suggested brief, Case CATalyst automatically adds it to the job dictionary or case dictionary, depending on your [Brief It Options](#).

If during a break or after finishing realtime, you want to make a J-Define (or D, K or O define) of a brief, you can define directly from the Brief It dialog pane.

## Create a J-Define

1. Right click a Suggested or Personal brief in the dialog pane.
2. Select J-Define Suggestion. If your Brief It Options are set to K-Define Suggestion and the transcript you are editing is in a Case, the option will be K-Define Suggestion. The Add Dictionary Definition - Job Dictionary (or Case Dictionary) dialog box displays.
3. Make necessary entries:

**Steno (Alt + s)**

The steno for the brief form.

### **Text (Alt + t)**

The definition for the brief. Add format symbols, fields or extended characters as necessary. Press **F9** to add [extended characters](#).

### **FS (Alt + f)**

Display the list of available [format symbols](#). To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can also use [shortcut keys](#) to insert a format symbol.

To always display the format symbol list, check the box, Always Show Format Symbols. You can insert a format symbol at any point in the text entry.

### **Insert Field (Alt + i)**

Display the [Insert Field](#) dialog box from which you can select a field to insert into the text portion of the definition.

### **Endings (Alt + n)**

Case CATalyst analyzes the word in the *Text* field to see if a final " G", " S" or " D" can be added to the steno outline to create additional dictionary entries for active, plural or past tense versions of the word. If so, then Case CATalyst activates the Endings button. The Global Endings dialog box displays when the Endings button is selected. You can choose any of the suggested definitions to add to your dictionary. For example, you have REPT in the Steno field and type "represent" in the Text field. The following suggested entries display when you select Endings:

REPTD = represented

REPTS = represents

The word "representing" is not suggested because the final "g" comes before the final "t" in the original steno outline.

### **Global Type (Alt + g)**

The Global type defaults to J-Define. To select a different type of global define choose from the drop down box, or press **one** of the following key combinations. When you D-Define, K-Define, or J-Define the entry, the correct steno must display in the Steno field.

- Alt + d (D-Define)
- Alt + k (K-Define) -- if the file is in a case.
- Alt + j (J-Define)
- Ctrl + o (Other Dictionary -- send job dictionary defines to an alternative dictionary).

### **Pick Other Dictionary (Alt + p)**

This field is available if you select Other Dictionary in the Global Type field. You can send the Brief It Suggestion to an alternative dictionary when making an O-Define. Select a current dictionary from the drop down list or use **Browse** to choose another dictionary. Depending on your [Global options](#) settings, Case CATalyst remembers your selection for the current session or for every job. This field displays when you select Other Dictionary in the Global Type field.

### **Generate All Possible Misstrokes (Alt + m)**

Check this box to have Case CATalyst generate definitions in the designated dictionary based on all the possible misstrokes of the original steno outline. Only the original steno outline goes into the current Global Table. All misstrokes are available for future translations.

Case CATalyst generates a definition provided the generated misstroke does not conflict with an existing entry in the Personal Dictionary. For example, you define /SROEUS as "voice" with Generate All Possible Misstrokes selected. Case CATalyst also creates a dictionary definition for the following steno outlines as "voice": /SROUS, SROES, and /SROS. The steno outline, /SRAOEUS already has a definition in your Personal Dictionary as "vice", so Case CATalyst did not generate /SRAOEUS as a misstroke.

By default, this option is not selected. You can [change](#) the default so that this options displays selected. A separate default setting for D-Defines, J-Defines, and K-Define can be set in [Global Options](#).

### Add 2 Cat Scratch (Alt + 2)

Send the definition to the [Cat Scratch](#) dialog pane in addition to the Global Table and selected dictionary. Depending on the Cat Scratch scope, the entries are sent to the job, case or user Cat Scratch pane.

4. Press **Enter (OK)** to apply the definition.

## Modify Steno Include & Exclude Entries

The Brief It Options table contains two types of entries that Case CATalyst considers when generating Suggested briefs: the Require entry and Exclude entries. The [Require](#) entry contains the steno character or steno combination that Case CATalyst includes in every Suggested brief. You can only have one *Require* entry.

[Exclude](#) entries contain specific steno characters or steno combinations that you want Case CATalyst to exclude from every Suggested brief form. You can have multiple exclude entries.

## Modify Brief It Options Table Entries

1. Do one of the following to display the Brief It Options dialog box:
  - In Manage Jobs, press **Alt + t, o, e, b** (**Tools/Options/Edit/Brief It**).
  - In Edit, press **Alt t, o, b** (**Tools/Options/Brief It**)
  - From the Brief It dialog pane, click the Settings  button.
2. Click the **Steno Include/Exclude** button. The Brief It Options table displays.
3. Do any of the following:

### Require Entry

By default, the asterisk ( \* ) is specified as the included character. To modify the Require entry:

- a. Highlight the Require entry and press **Ctrl + m** (**Edit/Modify**). The Modify Require Steno dialog box displays.
- b. In the *Steno* field, type the character to always include in Suggested brief forms. If you do not want to specify a character in Suggested briefs, delete the existing character. Case CATalyst displays the entry as *None*.

### Exclude Entries

By default, there are twelve Exclude entries: -TD, SD,-TZ,-SZ, #1K, #2K, #3W, #4R, #6-R, #7-B, #8-G, #9-S.

To insert new and modify existing Exclude entries:

- a. Do one of the following:
    - To insert an entry, press **Ctrl + i (Edit/Insert)**. The Insert Excluded Steno dialog box displays.  
If you use the Allow Briefs with Numbers option select and you want to prevent any number bar number from being suggested, type # and press **Enter**.
    - To modify an entry, highlight the entry and press **Ctrl + m (Edit/Modify)**. The Modify Excluded Steno dialog box displays.
  - a. In the *Steno* field, type the steno character or steno combination to always exclude from Suggested brief forms. To indicate a final letter or letters, type a hyphen before the characters. Case CATalyst uses the Steno Shortcut table when inserting steno into the *Steno* field. For example, if you type an "n," Case CATalyst generates the steno "TPH" to indicate an initial "n."  
  
To delete an entry, highlight the entry and press **Delete**. Select **Yes** when prompted with the delete confirmation message.
4. Press **Enter (OK)**.
  5. Press **Ctrl + s (File/Save)**.

## Creating Personal Briefs

Personal briefs are entries you create prior to translation and are stored in the Briefs.txt file located in the System files case. A default Personal Briefs file exists for each user. Creating entries in the Personal Briefs file allows you to store words and phrases along with the brief form without placing them in a dictionary. Personal briefs display during realtime writing when the steno for the brief does not exist for an entry in a dictionary being used for translation. You can [combine Personal Briefs](#) using the Include command.

The first time you write three or more steno strokes for a word or phrase contained in the Briefs.txt file, Brief It displays the Personal brief form. For example, you have a dictionary entry for Microsoft as PHAOEUBG/ROE/SOFT. At a seminar, you hear about the brief PHOFT for Microsoft. You are uncertain into which dictionary you want to place the entry but want to make it available for future jobs. You open Personal Briefs file and insert: Microsoft in the Brief Text field and PHOFT In the Suggested Steno section. The first time you write Microsoft as PHAOEUBG/ROE/SOFT during the job, the Brief It dialog pane displays PHOFT.

### 1. Access the Personal Briefs file:

- from the File menu, press **Alt + f, o, i, r** (Open/List Table/Personal Briefs).
- in Manage Jobs, select Tools/Options/Edit/Brief It/. Select Personal Briefs.
- in Edit, select Tools/Options/Panes/Brief It. Select the Personal Briefs option.
- anywhere in CATalyst, select Tools/All Options/Edit Panes/Brief It/Personal Briefs.
- From the Brief It dialog pane. Click the Settings  button and then select the Personal Briefs option.

### 2. The list of Personal Briefs display. Do any of the following:

- To insert an entry, press **Ctrl + i**. The Insert Brief dialog box displays. In the Brief Text field, type the text of the brief. In the Suggested Steno section, press **Ctrl + n** and type the steno for

the brief. Add any additional steno outlines for the brief text. A word or phrase can have multiple steno outlines and can be prioritized. When there are multiple steno outlines for a word or phrase, if the first entry conflicts with an entry in a dictionary being used, Brief It will try the next steno outline, etc.

- To modify an existing entry, highlight the entry and press **Ctrl + m**. Do any of the following:
    - In the Brief Text field, modify the existing text of the brief, if necessary.
    - In the Suggested Steno section, press **Ctrl + n** to create a new entry. A word or phrase can have multiple steno outlines and can be prioritized. When there are multiple steno outlines for a word or phrase, if the first entry conflicts with an entry in a dictionary being used, Brief It will try the next steno outline, etc.
    - In the Suggested Steno section, click  to delete an entry.
    - In the Suggested Steno section, highlight an existing steno outline and click  to move the entry to a higher priority in the list.
    - In the Suggested Steno section, highlight an existing steno outline and click  to move the entry lower in priority.
  - To search for the particular text or steno of an entry, press **Ctrl + f**. In the Search field type the text or the steno to which you want to find, select any additional options and click **OK**.
3. Click **OK** to save the changes in the Insert or Modify Brief dialog box.
  4. To delete an existing entry, highlight the entry and press **Del**. At the "Are you sure" prompt, press **Enter** (Yes).
  5. Save (**Ctrl + s**) and close (**Alt + f, c**) the Briefs.txt file.

## Combine Personal Briefs.txt

The Briefs.txt (Personal Briefs) file displays as a grid display (similar to a wordlist) and allows you to [insert](#), modify, delete and search entries. You can also combine Briefs.txt files by including (F9) another briefs.txt file into the current file. For example, a co-worker reviews the JCR each month, adds the suggested briefs from the JCR to her Briefs.txt file and now has a very extensive briefs.txt file. Rather than overwrite your existing briefs.txt file, you can now include her Briefs.txt file into yours. Duplicate entries, same text and same steno, are not created. A word or phrase can have multiple steno outlines and the steno outlines can be prioritized. When there are multiple steno outlines for a word or phrase, if the first entry conflicts with an entry in a dictionary being used, Brief It will try the next steno outline, etc.

1. To open your Briefs.txt file, press **Alt + f, o, l, r** (File, Open, List/Table, Personal Briefs). You can also click the Options button on the Brief It toolbar and click Personal Briefs or double click Briefs.txt located in your System Files case.
2. To include a Personal Briefs (Briefs.txt) file, press **F9**, browse to the location of the Briefs.txt file, highlight the file and press **Enter**. Include performs a validity check on the steno portion of an entry. If the entry does not pass the validity test, the entry is not included and no message displays.
3. Press **Ctrl + s** to save changes and then **Alt + f, c** to close the file.

## Change Personal Briefs font

The font type and size for the body and heading text in the Personal Brief table are customizable. The font type and size applies equally to the body and heading text.

## Modify the Font:

1. Press **Alt + f, o, i, u** (**File, Open, List/Table, Personal Briefs**).
2. When the personal briefs displays, do either of the following:
  - If the Dictionary/List Toolbar () is displaying, go to Step 3.
  - If the Dictionary/List Toolbar is not displaying, right click a toolbar and select Dictionary/List Toolbar.
3. Do any of the following:
  - Click the Font style icon () to change the font type.
  - Click the Font size icon () to change the font size.
4. Closing the Personal Briefs table saves the font change information. If you have made other changes, you will be prompted to save your changes.

## Export Briefs to CSV file

The contents of the Brief It pane can be exported to a CSV (comma separated values) file format which displays text in a table structure format and is compatible with Microsoft Excel. You can filter the Brief It pane to display only the items you want to see and that is what will be exported to the CSV file. Although you could always print the contents of the Brief It pane, users wanted a more flexible file format to study and practice the briefs. Some users requested the ability to export the contents of the Brief It pane for each job into an Excel compatible format.

To export the Brief It pane to CSV format:

1. With the transcript open, display the Brief It pane. Use the Filter feature to display only the types of briefs you want to export. For example, if you only want to export Suggested briefs, make sure Suggested is the only item selected in the Filter menu.
2. On the Brief It title bar, click the Export to CSV  icon.
3. In the Save As dialog box, the default naming convention is: Nameofjob\_BriefIt.csv and the save location defaults to the Documents folder. You can change the file name and/or save location and click Save.

**Please note:** if you save the file to your Case CATalyst user, CATalyst will interpret the file type as a Fill-In-Field list and will not displays as you may expect. If you open Excel and then select Open, you may need to change the file type to "Text" in order for Excel to look for the CSV file type.

## Exclude Common Words

Brief It does not suggest briefs for certain words and punctuation. The CommonWords.txt file contains a list of words that Brief It does not consider when looking for words and phrases for brief suggestions. If a phrase is written that begins or ends with a word from the CommonWords.txt file, no brief is suggested. For example, by default the word "about" is in the CommonWords.txt file. When a phrase is written that begins or ends with the word "about," and no Reminder or Personal brief exists for the word or phrase, Brief It does not suggest a brief.

Brief It does not suggest a brief if a question mark or exclamation is followed by a space in a phrase. When Brief It encounters a phrase with a period (.) followed by two spaces, Brief It does not suggest a brief. For example, "...high impact. Exercise..." When Brief It encounters a phrase with a period (.) followed by one space, Brief It may suggest a brief. For example, titles with surnames such as Mr. Washburn, Dr. Skaare, Ms. Kurkowski, etc. This is a built-in feature of Brief It and does not require selecting an option.

The CommonWords.txt file is automatically created the first time you translate with the [Brief It](#) option or you use the [Case Prep](#) feature. You can modify the file.

### Modify CommonWords List

1. Open the CommonWords.txt file:
  - From the File menu, select press **Alt + f, o, i, c** (**Open/List Table/CommonWords**).
  - From the Brief It dialog pane, click the Settings  button and then click the **CommonWords** button.  
  
To access the Brief It dialog pane in Manage Jobs, select **Tools/Options/Edit/Brief It**; or in Edit, select **Tools/Options/Brief It**.
2. The CommonWords.txt file opens in Notepad or WordPad. Do the following:
  - To add an entry, create a blank line by pressing **Enter**. Each entry must be on a separate line. Type the word. There is no limit to the number of entries.
  - To delete an entry, highlight the word and press **Delete**. If a blank line remains, delete the blank line.
3. Press **Ctrl + s** (**File/Save**).
4. Press **Alt + f, x** (**File/Exit**).

### Brief It Keyboard Commands

There are several Brief It functions available for keyboard [assignment](#). Some of the Brief It functions are ideally designed for realtime use by pressing the assigned key combination or recording a macro and invoking it using an [AccelerWriter](#) from your writing machine. For example, during a break you can quickly display only Brief It Suggestions to determine if there are any you want to implement or display only Used briefs to remind yourself of a specific brief.

You can also [right click in the Brief It pane](#) to access similar commands.

### Brief It Keyboard Map Functions:

**Add Last Brief to No Nag**

**Brief It - Clear/Recycle Unused Briefs**

Whether the realtime session was fast and furious or your file contains multiple witnesses – there may be times when you want to clear out all the unused briefs in the Brief It pane to reduce clutter or free up the steno outlines for other suggestions later in the session. A Clear/Recycle Unused Briefs command is available when right clicking in the Brief It pane or assigning the command to a key combination in a Keyboard Map. The Clear/Recycle Unused Briefs command removes the steno of the unused brief suggestion and Personal Briefs from the Brief It pane. The unused briefs may be recycled and made available for another word or phrase in the same translation session. Reminders and Live Suggestions are not affected by this command and remain in the Brief It pane after using the Clear/Recycle Briefs command.

For example, let's say you have back to back witnesses. The attorneys are talking a mile a minute to ensure they get both witnesses deposed. You find yourself hanging on for dear life as you report the first witness. The Brief It pane is full of suggested briefs that you didn't use. You are about to start the second witness, so you use the Clear/Recycle Briefs command to remove all the unused suggested briefs/personal briefs and recycle them so they are available for brief suggestions for the next witness. This command is available in Translate and Edit.

**To use the Clear/Recycle Unused Briefs command:**

- Position your cursor in the Brief It pane. **Right click** and select **Clear/Recycle Unused Briefs**. The unused brief suggestions and personal briefs are removed from the Brief It pane.
- Assign the Clear/Recycle Unused Briefs command to a key combination in keyboard map function and/or record the key combination as part of a macro, assign it to a dictionary definition and invoke the command from your writer during realtime.

**Brief It: Filter**

Filter the display of the Brief It dialog pane. How the pane filters depends on the Brief It Filter command invoked. It is necessary to assign a key combination to each filter command you want to use. The filter commands remains in effect until you apply another filter commands or select to unfilter the display.

- Brief It - Filter Personal Only
- Brief It - Filter Reminders Only
- Brief It - Filter Suggestions Only
- Brief It - Filter Used Only
- Brief It - Unfilter
- Brief It - Filter Live Suggestions

**Brief It: J-define Current**

Insert the current brief, which is the last listed brief, into the current job's dictionary while writing realtime. This keyboard command is designed for use during realtime translation. To J-Define a Suggested or Personal brief while editing, right click the brief and select *J-Define Suggestion* from the menu. You can select any destination dictionary.

**Brief It: New Suggestion for Current**

Reject the most recent brief suggestion and generate a new brief. This keyboard map command is available during realtime translation and during Edit, but only applies to the most recent brief. To have Brief It make a new suggestion for a specific brief, right click the brief and select *New Suggestion* from the menu. The new brief displays at the bottom of the list.

**Brief It: Reject Current**

Reject the most recent brief suggestion. This keyboard map command is active during realtime and during Edit but only applies to the most recent brief suggested. When you use the reject current or reject suggestion commands, the steno and text brief combination will not be suggested again during the current realtime session. To reject a specific brief suggestion, right click the brief and select *Reject Suggestion* from the menu.

### **Send Last Brief to Cat Scratch**

Send the last brief in the Brief It pane directly to the [Cat Scratch](#) locked Steno/Text section. With the Cat Scratch pane displayed, you can see briefs you have previously used in this jobs and possibly previous jobs depending on the Cat Scratch scope. If the Brief It [Show Phonetic Steno](#) option is selected, briefs sent to Cat Scratch display phonetically.

### **Send Selected Brief to Cat Scratch**

Highlight a brief in the Brief It pane and send it directly to the Cat Scratch locked Text/Steno section. If the Brief It Show Phonetic Steno option is selected, briefs sent to Cat Scratch display phonetically.

### **Suggest a Brief**

Force Brief It to suggest a brief while writing realtime or while editing. You can use this command on text with underlying steno or typed text from the keyboard. This may be helpful when preparing for a particular type of job with unfamiliar terminology or subject matter.

### **Text List Brief It**

Analyze the selected text file, that has no underlying steno, and create Suggested briefs based on your Brief It options. For example, as you are preparing for an upcoming job, you can have text List Brief It analyze words from a list of words, a job core list or an ASCII file of terminology from another reporter or website. Text List Brief It displays the Open dialog box allowing you to navigate to the text file.

### **Transcript Brief It**

Analyzes the current transcript containing underlying steno and creates Suggested briefs based on your Brief It options. You may want to use this feature to generate briefs.

### **View Brief It Pane**

Toggle the display of the Brief It dialog pane. If the Brief It dialog pane is closed when you invoke this command, the Brief It dialog pane displays. If the Brief It dialog pane is open, the command closes it. If the Brief It dialog pane is set to Auto Hide when you use this keyboard map command, it closes the pane.

## **Brief It Right Click Commands**

When the Brief It pane is displayed, you can right click and access several commands such as defining a suggestion, sending a brief to the Cat Scratch pane, reject a suggestion and more. There are also [keyboard commands](#) available. The following Brief It actions are available in the Brief It pane.

### **Send to Job Cat Scratch**

Send the highlighted brief directly to the [Cat Scratch](#) locked Text/Steno section. With the Cat Scratch pane displayed, you can see briefs you have previously used in this jobs and possibly previous jobs depending on the Cat Scratch scope. If the Brief It Show Phonetic Steno option is selected, briefs sent to Cat Scratch display phonetically.

### **J-Define Suggestion**

Opens the Add Dictionary Definition dialog box with the current brief suggestion text in the Text field. By default, the destination dictionary is set to the current job's dictionary although you can change the destination dictionary.

### **J-Define Rejection**

[Create a J-Define](#) from a rejected brief. Displays the Add Dictionary Definition – Job Dictionary dialog box with the brief form in the Steno field and the definition in the Text field. **This action only displays for rejected briefs.**

### **Reject Suggestion**

Reject the highlighted brief suggestion and generate a new brief.

### **New Suggestion**

Reject the highlighted brief and automatically have Brief It create a new suggestion for the word or phrase. The new brief displays at the bottom of the list.

### **Send Text to No Nag List**

The Brief It feature allows you to put words/phrases that you have identified that Brief It should no longer offer as a suggestion, a reminder or display from the Personal Briefs file. Your dictionaries contain perfectly stroked entries along with some misstrokes for the same text. You may want to [put misstrokes in the No Nag List](#) so your aren't reminded of them.

### **Clear/Recycle Unused Briefs**

The Clear/Recycle Unused Briefs command removes the steno of the unused brief suggestions and Personal Briefs from the Brief It pane. The unused briefs are recycled and made available for another word or phrase in the same translation session. Reminders and Live Suggestions are not affected by this command and remain in the Brief It pane after using the Clear/Recycle Briefs command.

## **Brief It No Nag List**

The Brief It feature allows you to put words/phrases into a [No Nag List](#) that you have identified that Brief It should no longer offer as a suggestion, a reminder or display from the Personal Briefs file. Your dictionaries contain perfectly stroked entries along with some misstrokes for the same text. You may want to [put misstrokes in the No Nag List](#) so your aren't reminded of them. For example, you write 'associated with' and Brief It reminds you of your dictionary entry "SOET/W-D" which is a misstroke. You don't want to be reminded of that misstroke but you also don't want to delete it from your dictionary.

You can now add "associated with" to the No Nag List. Another example might be that you have 'STAURPL' defined in your dictionary as 'state your name' and you almost always write that stroke. But there are few times when you write each word out but you don't want to be reminded of your dictionary definition of 'STAURPL' because you know that steno outline and write it more often than not. You can add 'state your name' to the No Nag List.

The NoNag list is located in the System Files case which contains text entries you have sent to the No Nag List. Each word or phrase is placed on its own line. There are a variety of ways you can [add words or phrases in the No Nag list](#). During Translate and Edit / Edit, you can review your Brief It pane, right click a Brief It entry or highlight multiple entries, right click and select Send Text to No Nag List, click the Options icon on the Brief It toolbar and select No Nag List and type the text portion of the Brief It entries or you can open the NoNag file and type words/phrases directly into the file.

You can also create an AccelerWriter to quickly add the last brief to the No Nag List.

Keyboard Map Function: Add Last Brief To No Nag

## Add entries to the Brief It No Nag List

Entries added to the [No Nag List](#) prevent Brief It from offering those words/phrases as a suggestion, a reminder or entry from the Personal Briefs file. In most cases, your dictionaries contain perfectly stroked entries along with some misstrokes for the same text. You may want to put misstrokes in the No Nag List so your aren't reminded of them. For example, you write 'associated with' and Brief It reminds you of your dictionary entry "SOET/W-D" which is a misstroke. You don't want to be reminded of that misstroke but you also don't want to delete it from your dictionary so you add it to the No Nag List. Another example might be that you have 'STAURPL' defined in your dictionary as 'state your name' and you almost always write that stroke. But there are few times when you write each word out but you don't want to be reminded of definition 'STAURPL' because you know that steno outline. You can add 'state your name' to the No Nag List.

**To add entries to the No Nag List, do any of the following:**

- During Translate and Edit / Edit, you can review your Brief It pane, right click a Brief It entry or highlight multiple entries, right click and select Send Text To No Nag List.
- You can open the NoNag list file in your System Files case and type words/phrases directly into the file.
- Assign a key combination to the Add Last Brief To No Nag keyboard map function.
- Create an AccelerWriter to quickly add the last brief to the No Nag List from your steno machine.

Keyboard Map Function: Add Last Brief To No Nag

## Add/Remove Dictionaries During Realtime

Add/Remove Dictionaries is a Translate and Edit feature that allows you to add or remove dictionaries used for translation and change the dictionary priority during realtime translation. The Personal dictionary, by default, has the lowest priority. A job dictionary of the same name as the job, by default, has the highest priority. If the job is in a case, then the case dictionary, by default, has the second highest priority. In the Add/Remove Dictionaries dialog box, you can change the priority of any dictionary.

You can open and modify a dictionary that is in use for realtime translation, save the changes and the modifications are immediately available in the realtime job. The translating dictionary can remain open, you just need to save any changes to have them available in the realtime file.

### Add or Remove Dictionaries

1. From the Tools menu, press **Alt + t, d (Add/Remove Dictionaries)**. The Dictionary Selection and Priority During Translation dialog box displays.
2. Use the options as necessary:

#### Choose Dictionaries

### Show All Users

Check this box to display all the Case CATalyst users. You can select a dictionary from any user. Choosing a user after selecting dictionaries, deselects the selected dictionaries. To use keyboard commands, press **Alt + u** to select or deselect the Show All Users option.

### Dictionaries

To use keyboard commands to position the cursor in the list of dictionaries, press **Alt + d**. Do any of the following:

- Check the box next to any dictionary you want to use for translation. To select a dictionary from another user, check the Show All Users box to display a list of users. Choosing a user after selecting dictionaries, deselects the checked dictionaries
- Uncheck the box next to any dictionary you no longer want to use for translation.
- You can use your up/down arrows to navigate to a dictionary. To move the list right or left, press **Alt + left/right arrow**. Once a dictionary name is highlighted, press **Spacebar** to select or deselect the dictionary.

### Set Dictionary Priorities

Case CATalyst uses dictionaries for translation in priority order. The dictionary at the top of the list has first priority; the second dictionary listed has second priority, etc. When you add a dictionary, Case CATalyst places it as the first available priority before the Personal Dictionary and, if selected for use, the [Update Area](#). To use keyboard commands, press **Alt + p** to put the cursor focus in the Dictionary Priorities section.

### Count

The total number of dictionaries selected for translation.

### Move Up/Move Down

To change the dictionary order, highlight a dictionary and then use the buttons as necessary. Once a dictionary is highlighted, you also press **Alt + m** to move the dictionary up (higher priority) in the list. Or press **Alt + w** to move the dictionary down (lower priority) in the list.

### Remove

Highlight a dictionary and click **Remove** to remove it from the priority list. Once a dictionary is highlighted, you can also press **Alt + r** to remove the dictionary from the list.

### Move to Top

Highlight a dictionary and click Move to Top to quickly move the dictionary to the top of the priority list. Once a dictionary is highlighted, you can also press **Alt + t** to move the dictionary to the top of the list (highest priority).

### Move To Bottom

Select a dictionary and click Move to Bottom to quickly move the dictionary to the bottom of the priority list. If you click Move to Bottom without selecting a dictionary, the dictionary in the highest priority moves to the lowest priority. Once a dictionary is highlighted, you can also press **Alt + b** to move the dictionary to the bottom of the list.

3. Do **one** of the following:

- Press **Enter (OK)** to accept the changes.

- Press **Esc (Cancel)** to cancel any changes and close the dialog box.

[Keyboard Map](#) Function: Add or Remove Translation Dictionaries

## Extended ASCII & Greek Characters in CART Work

The easiest way to use extended ASCII and Greek characters when doing CART work with Case CATalyst is to create an include file for each character. For example, you may need to use Greek characters for a specific class during a semester or year. Use the chart of Greek symbol font equivalents for the English alphabet to assist you. Create an include file for a character following the steps below. You can then create a [macro](#) and an [Auto Include](#) definition to insert the symbol from your writing machine.

**Please Note:** The extended ASCII and Greek characters will display correctly in the CATalyst file but will not display correctly on the [CARTView](#) window if you are outputting via the CARTView (local display) option.

You may want to use the Edit feature, [Insert Extended Characters](#) if you use extended ASCII characters occasionally.

### Greek Symbol Font Equivalents

Standard Fixed-Width Font	Symbol Font		Standard Fixed-Width Font	Symbol Font
a	α		A	Α
a	β		B	Β
c	χ		C	Χ
d	δ		D	Δ
e	ε		E	Ε
f	φ		F	Φ
g	γ		G	Γ
h	η		H	Η
i	ι		I	Ι
j	φ		J	Θ
k	κ		K	Κ
l	λ		L	Λ

Standard Fixed-Width Font	Symbol Font		Standard Fixed-Width Font	Symbol Font
m	μ		M	Μ
n	ν		N	Ν
o	ο		O	Ο
p	π		P	Π
q	θ		Q	Θ
r	ρ		R	Ρ
s	σ		S	Σ
t	τ		T	Τ
u	υ		U	Υ
v	ϖ		V	Ϛ
w	ω		W	Ω
x	ξ		X	Ξ
y	ψ		Y	Ψ
z	ζ		Z	Ζ
'	ε		"	ΰ
@	≅		\$	Ξ
^	⊥			

### Create an Include File for an Extended ASCII or Greek Character

1. Open a new text file in Case CATalyst with the same layout you use for CART work.
2. Switch to **Page View**.
3. Type the English letter equivalent for the ASCII or Greek character for which you want to create an include file. For example, type the letter **p** for the Greek symbol pi.
4. Highlight the character and press **Alt + o, f (Format/Font)**. The Font dialog box displays.
5. In the Font field, select **Symbol** and press **Enter**.
6. Press **Alt + s (File/Save)** to save the file.
7. Press **Alt + f, x (File/Exit)** to close and exit the file.

8. Repeat the previous steps for each character needed, creating a separate include file for each character.
9. To insert the character from Edit, press **F9** to display the Include dialog box. Select the appropriate file and press **Enter** (**Open**).

## Create an Auto Include for each Include File

To insert a character from your writing machine, create an Auto Include definition for each include file.

1. Open a file in Case CATalyst.
2. [Record](#) and save a macro using the Define After Saving option to create an AccelerWriter that allows you to insert the character from your writer. Do this for each include file you created.
3. Set up a CART session and test the new entries.

## Follow Realtime

Follow Realtime **Ctrl + Shift + I** (letter L) is an realtime command that allows you to toggle the position of the cursor between the last realtime stroke and the last editing location in the file. When using the Follow Realtime command, you can continue to write realtime regardless of the position of the cursor. The text is added to the end of the file.

For example, you start to write realtime with the cursor following the last steno stroke written. There is a break in the proceedings. You want to start editing the job so you press **Ctrl + Shift + L** for Follow Realtime. The cursor moves to the beginning of the job. You edit for about 15 minutes when the proceedings resume. You stop editing on Page 9 Line 13 to start writing realtime again. You press **Ctrl + Shift + L** and the cursor returns to following the last steno stroke written. There is another break in the proceedings. You return to the last editing position by pressing **Ctrl + Shift + L**. The cursor moves to Page 9, Line 13.

[Split Screen](#) is an Edit feature that also allows you to follow realtime by switching the screen from a single window display to a double window display.

## Follow Realtime Command

Do one of the following

- From the computer keyboard, press **Ctrl + Shift + I** (**Tool/Follow Realtime**). Press **Ctrl + Shift + I** again to toggle Follow Realtime on and off.
- Using a steno stroke, use the assigned AccelerWriter from your writing machine to invoke the [Toggle Follow Realtime](#) command.

A check mark in front of Follow Realtime on the Tools menu indicates the option is active. The Case CATalyst default is to follow the realtime data.

[Keyboard Map](#) Function: Toggle Follow Realtime

## Live Suggestions

Live Suggestions is an optional realtime feature that automatically offers translation suggestions when an untranslate(s) displays in the transcript. You have the power to review the suggestions in the Brief It pane and to pick the right one, replace or global, to fix the untranslates. At least four translated words/phrase needs to be written after the untranslate before a Live Suggestion will be offered. For example, let's say you write "HOUPBG /TKU /WORBG /AT /THA /KOPB /TKPWHROFPL /RAT" which translates as "how long did you work at that couldn't /TKPWHROFPL rat?" You write three more stroke and Live Suggestions displays "conglomerate" as the first suggestion, "glom" as the second suggestion and "gloom" as the third suggestion. You select the first suggestion as the word is "conglomerate." The final F in the second stroke made it an untranslate.

Two to five suggestions may be offered in the [Brief It pane](#) in a blue background. The feature uses a similar \*suggestion\* method as Global Suggest but displays the suggestions in the Brief It pane to view at a glance as you are writing realtime. The feature looks at the individual untranslated steno and steno outlines before and/or after the untranslate to offer suggested translations. The Live Suggestions displays the steno outline, the number of the Live Suggestions and the suggested translated text. When you see a Live Suggestion that you want to use, there are realtime commands to do a replace or global of a Live Suggestions. You can also do a keyboard command to replace or global with one of the Live Suggestions or highlight a Live Suggestion, right click a Live Suggestion, select to Replace with this Suggestion or Define this suggestion. You can also double click a Live Suggestion to replace the steno/text with that suggestion. Once you select a Live Suggestion, the selected suggestion's background color turns gray and the remaining Live Suggestions appear crossed out. If you want to hide the live suggestions that were not selected (appear crossed out), in the [Brief It pane](#) Filter option deselect the Rejected option. Briefs that have been rejected and Live Suggestions that were not selected no longer show in the Brief It pane.

When using the TrueStroke Drag/Drop, Drag/Drop Analysis and/or Suffix Drag/Phrase Maker features, CATalyst may display a translation in the text based on one of those features. If translations based on these features tend to be correct the majority of the time and you may want to define the translation, you can select the *Show "translated" text as first Live Suggestion* option so these translations are always listed first in the list of suggestions. By Default, this option is not selected and TrueStroke Drag/Drop, Drag/Drop Analysis and/or Suffix Drag translations are not available in the Live Suggestions list.

The Live Suggestion feature ignores the steno mark (character created by pressing the Mark button on your steno machine) alone or before/after an untranslate and will not include it as steno for a Live Suggestion suggestion.

Live Suggestions display until the next Live Suggestions display. In other words, you will only see one set of Live Suggestions in the Brief It pane and you will not be able to see Live Suggestions once you stop realtime. An editing feature has been added that is similar to Live Suggestions, called [Quick Suggest](#).

The Live Suggestion feature is active by default. In order to see the Live Suggestions, in the Brief It pane you may need to select Filter and select Shows All.

If you select to global a Live Suggestion, the global is applied to the entire file. If you undo a globalized Live Suggestion, if Case CATalyst determines the Live Suggestion can be globalized again or replaced, the Live Suggestion along with the original suggestions will redisplay in the Brief It pane. If CATalyst determines no action can be taken on the Live Suggestion, you can still undo the global but it will not redisplay in the Brief It pane.

You can customize the [Live Suggestion options](#), assign key combinations in a keyboard map to [replace or define](#) the untranslate and/or text with a specific suggestion. [Translate commands](#) are available to global a Live Suggestion on the fly.

There is also a [Request a Live Suggestion](#) feature on the Global menu that you can use during realtime when there isn't an untranslate in a group of words that should be one word or a phrase.. You can highlight X number of words and request live suggestions.

#### How to see Live Suggestions:

1. Confirm the Live Suggestion option is selected in the Realtime Aids section of Translate's Realtime tab.
2. Start realtime and display the [Brief It pane](#) by pressing **Alt + v, e, t** (View, Panes, Brief It).
3. Click the [Filter down arrow](#) and confirm that the Live Suggestions option is selected and if not, select it.
4. To review the [Live Suggestions options](#), click the Settings icon (  ) to the Live Suggestions options.
5. Continue writing realtime.
6. To replace or define a Live Suggestion, do any of the following:
  - a. To replace the steno/text, double click the Live Suggestion you want as replacement text.
  - b. Right click a Live Suggestion and select Replace with this Suggestion or Define this suggestion.
  - c. If you have created dictionary definitions for the [Replace With LS1 - 5](#) or [Define With LS1 - LS5](#), write the steno associated with the Live Suggestion you want to replace or define.
  - d. If you have assigned a key combination in a keyboard map for the Replace With LS1 - LS5 or Define With LS1 - LS5 commands, press the appropriate key combination.

#### Examples of Live Suggestions screen shots:

The following is an example of an untranslate in the transcript:

15        **Q**    Is he still #23I8 IAITYed with the company?  
 16        **A**    No.

The Brief It pane displays the Live Suggestions for the untranslate:

Brief It	
Filter: Custom   10  	
Steno	Text
/TA*UBG	talking about
/THAEUZ	that's a
/#23EU8	[1] affiliated
/KWRAEUT/-D	
/#23EU8	[2] affiliate
/KWRAEUT	
/KWRAEUT/-D	[3] yachted
/KWRAEUT/-D	[4] equated
/KWRAEUT/-D	[5] crated

If the user hovers his cursor over a Live Suggestion, a tool tip displays:

The user writes a steno outline to define or replace the untranslate with the first Live Suggestion:

15      **Q**    Is he still affiliated with the company?  
 16      **A**    No.

The Brief It pane displays only the selected Live Suggestion:

Only the selected Live Suggestion shows in the Brief It pane as the user is not showing rejected briefs which also affects Live Suggestions.

[Keyboard Map](#) Function:

- Replace With Live Suggestion 1
- Replace With Live Suggestion 2
- Replace With Live Suggestion 3
- Replace With Live Suggestion 4
- Replace With Live Suggestion 5
- Define Live Suggestion 1
- Define Live Suggestion 2
- Define Live Suggestion 3
- Define Live Suggestion 4
- Define Live Suggestion 5
- Filter Live Suggestions

## Live Suggestions Options

The Live Suggestions Options are located in the Realtime Aid dialog box that also contains the [Brief It Options](#). These settings affect both regular CATalyst translation and CATalyst BCS captioning.

**Live Suggestion options:**

There are a few Live Suggestion options. From Manage Jobs, select Tools, Options, Edit, Brief It. While translating and/or editing, select Tools, Options, Pane Options, Brief It. If you have the Brief It pane open, you can click the Options () icon and the Realtime Aid Options dialog box displays. If you make changes and click OK, the changes take effect.

### **Insert Oops when replacing with a live suggestion:**

Select this option to automatically insert an [Oops](#) (category 10 format symbol - CATalyst inserted) when replacing untranslate/text with a Live Suggestion. If you want to review each Live Suggestion replacement you made, you can then [scan](#) to the Oops format symbol or display the [Hotspots](#) pane to show all occurrences of the Oops format symbols along with context.

### **Number of suggestions:**

Select the maximum number of Live Suggestions for an untranslate. A valid numbers 2 - 5. Although you may have 5 selected, you may not always see 5 suggestions for an untranslate. Depending on the untranslate, surrounding steno outlines and dictionaries being used to translate, Live Suggestions may suggest less than 5.

### **Dictionary Defines go to:**

Job Dictionary, Case Dictionary, Personal Dictionary/Update Area

Select the destination dictionary you want a defined suggestions to go to when using the Define With LS1 - LS5 commands. When this option is set to Case dictionary, if the transcript is not in a case, the destination dictionary is the job dictionary. When defining a Live Suggestion, the global is applied to the entire file. When defining with a Live Suggestion, the definition is placed in the transcript's Global Table in addition to the respective dictionary. If your [Dictionary Options](#) are set to have D-defines go to the Update Area, then if this option is set to Personal Dictionary/Update Area, the Live Suggestion definitions will go to the Update Area.

### **Show \*translated\* text as first Live Suggestion**

By default, this option is active and Drag/Drop, Suffix Drag and phonetic translated text will be the first choice in the Live Suggestion list. If Spell Check thinks the \*translated\* text is misspelled and this option is selected, the misspelled translation will **not** be offered as the first suggestion.

If you do not want the Drag/Drop, Suffix Drag or phonetic \*translated\* text offered in the Live Suggestion list, deselect this option.

### **Live Suggestions favor: Quality    Balanced    Speed**

- Quality settings are designed for faster computers. Using this setting, Live Suggestions will spend a little more time looking for a suggestion and will search more steno outlines for a longer match.
- Balanced is the default setting. Live Suggestions takes less time and fewer steno outlines then the Quality option to look for suggestion.
- Speed settings are designed for slower computers. Using this setting, Live Suggestions will take minimal time searching for a suggestion and minimal steno outlines for the longest match. If you are running Case CATalyst on older hardware and your realtime is a little sluggish and you want to use Live Suggestions, you may want to try this setting.

## **Live Suggestions Dictionary Translate Commands**

The following Translate commands are available for dictionary definitions to take action on a [Live Suggestion](#). Depending on your Live Suggestions option settings, you can have anywhere from 2 - 5 Live Suggestions display in the [Brief It pane](#). When a Live Suggestion is a match to what you have written and you have created dictionary definitions to Replace and/or Define with LS#, you can write the steno outline defined in the dictionary. When a Define With LS# command is used, the global is applied to the entire file. The [Realtime Commands Dictionary](#) located in your System Files case may have some predefined entries that you can use or modify based on your steno theory.

**Available Translate Commands for Replacing Live Suggestion:**

Replace With LS1  
Replace With LS2  
Replace With LS3  
Replace With LS4  
Replace With LS5

**Available Translate Commands for Defining Live Suggestion:**

Define With LS1  
Define With LS2  
Define With LS3  
Define With LS4  
Define With LS5

## Output Options

Output options allow you to determine settings for realtime output to another format such as ASCII/ANSI, electronic information displays, StenoKeys, realtime captioning or CaseViewNet. Depending on the output selected, the output location can be another location on your system, a remote location or both. Output to:

- [ASCII/ANSI](#) format.
- An encoder for [Captioning](#).
- [CaseViewNet and CaseView II](#).
- [Other Devices](#) for output to electronic information displays.
- [Speche](#) for distribution of CaseView output via the internet.
- [StenoKeys](#) for output to another application on your computer.
- [CARTView](#) (local display) to send realtime to a separate window.

## Output to ASCII/ANSI

You can send the realtime output in ASCII/ANSI format to another location on your system, to a remote location or both. You might use this feature if you are sending to a third-party software package or LED sign that requires this type of output. Line feeds only occur in the output file when a new paragraph is written.

In addition to setting the following Output to ASCII/ANSI options, you must select ASCII/ANSI in the [Output To](#) field in the Translate dialog box. To have Case CATalyst remember the output destination, check the accompanying box, Remember Setting.

### ASCII/ANSI Options

To access the ASCII/ANSI options, from the Translate dialog box select **Options** and then select the **Output to ASCII/ANSI** tab.

#### Connection

**Output over comm port**

Check this box to send the realtime output to a remote location.

### **Comm Port**

Select the appropriate COM port on the Case CATalyst computer for the cable connection between the Case CATalyst system and the receive system. You must select a different COM port than the one selected on the Realtime tab for connecting the writing machine to the Case CATalyst system. For more information on COM or serial ports, refer to the user guide for your computer.

In situations when you must output to multiple ports, select the appropriate COM ports from the drop down list. For example, you are outputting to ASCII/ANSI via a serial connection and you also need to send to LiveNote Streaming Text which requires a serial connection.

### **Direct (Cable)**

Select this option when you connect the Case CATalyst system and the receive system with a realtime cable.

### **Modem**

Select this option when you connect the Case CATalyst system to the receive system remotely over the phone lines. The Case CATalyst system is connected to a phone jack via a modem cable. The receive system is connected to a phone jack in the remote location via a modem cable.

### **Call**

Have the Case CATalyst system call the receive system remotely. Enter the phone number in the *Number* field.

### **Answer**

Have the receive system call the Case CATalyst system.

### **Number**

When you select *Call*, type the telephone number for the location of the receive system. If applicable, include any numbers required to access an outside telephone line. For example, if you need to dial 9 to reach an outside line and 1 reach a different area code, the number would resemble the following: 9, 1, 123-456-7890.

### **Wrap Lines at margin**

This option will automatically wrap lines (new line inserted) based on the file's margins. If you want the ASCII/ANSI output file lines to only wrap (new line inserted) when there is a new paragraph, deselect this option. When outputting to a remote display via StreamText, best results may be achieved by deselecting this option. This option is selected by default.

### **Output to file**

Check this box to send the ASCII/ANSI realtime output to a file which you can store or send electronically. Use the **Browse** button to display the ASCII Output Filename dialog box, where you can name and select a destination location for the file. Once selected, the location path displays in the field.

## **Options**

### **Hold Strokes**

Use the Hold Strokes option when you want a "smooth" translation. For example, you do not want partial strokes and misstrokes to display on the realtime screen or on the system displaying the ASCII/ANSI feed when stroking a multiple stroke outline or phrase that would result in a "re-translation" once the longest match is reached.

When active, Case CATalyst holds the steno outlines before displaying the translated text on the ASCII/ANSI window. Case CATalyst holds the steno until based on the setting in the Longest match plus X strokes option. Once the number of strokes written exceeds the Longest match plus X strokes option, Case CATalyst pushes the longest match text to the display. If no longest match is found, translation holds the strokes written for the specified amount of seconds, then pushes any translated text or steno on the screen.

For example, let's say your Longest match plus X strokes option is set to 3 and the Held for X seconds option is set to 6. You write a four stroke word which is a longest match plus three more strokes. When the longest match plus the additional strokes are written, CATalyst pushes out the translation. If translation isn't done with the longest match, it will hold back the translation for the X number of seconds specified.

When outputting, the Longest match plus X strokes affects the amount of strokes you can delete. If you have this option set to 4, you can delete 3 steno strokes because once you write the Delete stroke, it counts as the 4th stroke. If you have this option set to 7, you can delete 6 steno outlines.

Enter a value in the following fields to [hold strokes](#) to the realtime output.

#### **Longest match plus \_ strokes**

Check this box to hold strokes to the output screen during realtime when outputting to ASCII/ANSI. Enter the number of strokes, after the longest match, you want Case CATalyst to hold before displaying the translated text. Valid entries are 0-9.

You can set separate values for the Longest match plus X strokes held to the Edit screen and the other output options (Realtime, Other Devices and StenoKeys).

#### **Held for \_ seconds**

Enter the number of seconds you want Case CATalyst to wait, when no steno is written, before displaying the translated text or steno outlines. Valid entries are 0-9.

You can only set one value, however, for the number of seconds Case CATalyst waits if no strokes are made before displaying the translated text. In other words, once you change the Held for X seconds on one of the output tabs, it changes the Held for X seconds option on all of the output tabs.

## **Output to Other Devices**

Output to Other Devices allows you send realtime data to electronic information displays. Electronic information displays are used in theaters, baseball parks, train stations, etc. Use Output to Other Devices to send realtime data to the following electronic information device: Daktronics Venus Matrix.

In addition to setting the following Output to Other Devices options, you must select Other in the [Output To](#) field in the Translate dialog box. To have Case CATalyst remember the output destination, check the accompanying box, Remember Setting.

## **Other Devices Options**

To access the Other Devices options, from the Translate dialog box select Options and then select the Output to Other Devices tab.

### **Connection**

### Output over comm port

Check this box to send the realtime data over the COM port to an electronic information device. Designate the COM port by making an entry in the Comm Port field.

Uncheck this box to view the Preview Window while writing but not sending to an electronic information device. You may want to do this to practice.

### Comm Port

Select the appropriate COM port on the Case CATalyst system for the cable connection between the Case CATalyst system and the electronic information device. For more information on COM or serial ports, refer to the user guide for your computer.

### Direct (Cable)

Select this option when you directly connect the Case CATalyst system to the electronic information device with a realtime cable. For more information on the connecting the electronic information device, see the user's guide for your device.

### Modem

Select this option when you are writing to an electronic information device remotely over the phone lines. The Case CATalyst system is connected to a phone jack via a modem cable. The electronic information device is connected to a phone jack in the remote location via a modem cable. For more information on connecting the encoder, see the user's guide for your encoder.

### Call

Select this option if the Case CATalyst system is calling the electronic information device remotely. Enter the phone number in the *Number* field below.

### Answer

Select this option if the electronic information device is calling the Case CATalyst system.

### Number

When you select to have the Case CATalyst system call the electronic information device via modem, you must indicate the number to call. Type the phone number of the location of the receiving electronic information device. When typing a number, remember to put any access numbers you must use to get an outside line, if applicable. For example, if you need to dial 9 to reach an outside line, the number might look like 9, 123-123-1234.

### Hold Strokes

Use the Hold Strokes option when you want a "smooth" translation. For example, you do not want partial strokes and misstrokes to display on the realtime screen or on the receive system when stroking a multiple stroke outline or phrase that would result in a "re-translation" once the longest match is reached.

When active, Case CATalyst holds the steno outlines before displaying the translated text on the Daktronics/TransLux/LED sign. Case CATalyst holds the steno until based on the setting in the Longest match plus X strokes option. Once the number of strokes written exceeds the Longest match plus X strokes option, Case CATalyst pushes the longest match text to the display. If no longest match is found, translation holds the strokes written for the specified amount of seconds, then pushes any translated text or steno on the screen.

For example, let's say your Longest match plus X strokes option is set to 3 and the Held for X seconds option is set to 6. You write a four stroke word which is a longest match plus three more strokes. When the longest match plus the additional strokes are written, CATalyst pushes out the translation. If translation isn't done with the longest match, it will hold back the translation for the X number of seconds specified.

When outputting, the Longest match plus X strokes affects the amount of strokes you can delete. If you have this option set to 4, you can delete 3 steno strokes because once you write the Delete stroke, it counts as the 4th stroke. If you have this option set to 7, you can delete 6 steno outlines.

### **Longest match plus \_ strokes**

Check this box to hold strokes to the output screen during realtime when outputting to Other Devices. Enter the number of strokes, after the longest match, you want Case CATalyst to hold before displaying the translated text. Valid entries are 0-9.

You can set separate values for the Longest match plus X strokes held to the Edit screen and the other output options (Realtime, ASCII/ANSI and StenoKeys).

### **Held for \_ seconds**

Enter the number of seconds you want Case CATalyst to wait, when no steno is written, before flushing the strokes being held. Valid entries are **0-9**.

You can only set one value, however, for the number of seconds Case CATalyst waits if no strokes are made before displaying the translated text. In other words, once you change the Held for X seconds on one of the output tabs, it changes the Held for X seconds option on all of the output tabs.

## **Device Options**

### **Device**

Select the device from the drop down list.

#### **Number of Lines**

Select the number of rows to display. Choose a number between **1** and **8**.

#### **Characters Per Line**

Select the number of characters on each line. Choose a number between **16** and **48**.

#### **Indent**

Indicate the number of spaces to indent all lines. Choose one of the following numbers: **0, 4, 8, 12, 16, 20, 24, 28, 32** or **36**.

## **Translate Options**

During realtime writing to electronic information devices, the following options take priority over the same options set on another Translate Options tab. The options can also be triggered by realtime commands.

### **Phonetic Untranslates**

Phonetically translate steno outlines when no match for the steno occurs in any dictionary used for translation. This prevents the display of untranslates on the realtime screen. The phonetic translation is based on the entries in the Phonetic table. On the Case CATalyst screen, the "phonetically" translated word is the color of an untranslate to indicate the use of the [Phonetic table](#).

You can toggle the Phonetic Translation On and Off during realtime if you have a dictionary entry defined as Toggle Phonetic Mode.

### **Auto-Conflict**

Use [Auto-Conflict](#) to automatically select the first choice of the conflict during translation. This prevents the display of conflicts on the screen. You can also use the Toggle Auto Conflict Resolution command when writing realtime to control the auto-conflict command from the writer.

You can use Auto-Conflict in conjunction with EZ Choice. When EZ Choice is active, Case CATalyst first checks the Conflict Database. If the conflict is not in the database, then Auto-Conflict resolves the conflict.

### **Use EZ Choice**

Use [EZ Choice](#) to resolve conflicts during translation based on previous conflict selections when occurring in similar context. When you resolve a conflict in Edit or realtime, the conflict choice plus the two words preceding the conflict are entered into the Conflict Database file. EZ Choice then uses the conflict database to determine the conflict resolution in future jobs.

### **Use Second Choice**

SecondChoice resolves conflicts during translation using the Second Choice Conflict Database. When a conflict is selected in Edit, Case CATalyst uses a system file to identify the possible parts of speech for the word before and after the conflict and places the conflict choice along with the system file information in the SecondChoice conflict database. When the same parts of speech appear before and after the same conflict in future translations, Case CATalyst selects the same conflict choice. When used in conjunction with EZ Choice, EZ Choice has priority.

### **Use EZ Link**

Use [EZ Link](#) to attach prefixes and suffixes to the root word during translation applying the rules of spelling in an attempt to correctly spell the combined word. Case CATalyst first checks the Spell Check wordlist for a match. If no match exists then Case CATalyst attaches the combined root word and suffix.

### **Exclude Caps**

Exclude Caps is a Translate option available when EZ Link is active. When selected, Case CATalyst attaches the suffix but does not apply the EZ Link rule to root words defined as all capped or mixed case. Case CATalyst instead attaches the suffix directly to the word without altering the root word. For example, you write, "The Brady<Suffix>s went on vacation..." The EZ Link result is "Bradies." When Exclude Caps is active the result is "Bradys".

### **ALL CAPS**

Display the realtime text in all capital letters.

## **Output to Speche**

Speche allows for realtime distribution of your CaseView output via the internet. The CaseView signal is sent via your Internet connection to Speche Communications where it is converted to a standard Internet format (http) and delivered instantly to your intended audience. Remote participants use an Internet connection and browser to view the file. They do not need CaseView.

You can send the CaseView signal alone or in addition to any standard local CaseView hookups you are providing. Use this service to include remote participants in a deposition, courtroom proceeding, CART application or Internet broadcast event.

An agreement is required with Speche Communications in order to facilitate this realtime capability. Please contact Speche at (877) 823-9080 or visit Speche at [www.speche.com](http://www.speche.com) for more information.

In addition to setting the following Output to Speche options, you must select Speche in the [Output To](#) field in the Translate dialog box. To have Case CATalyst remember the output destination, check the accompanying box, Remember Setting.

## Speche Options

To access the Speche options, from the Translate dialog box select Options and then select the Output to Speche tab.

### Host

The IP address necessary to communicate with Speche. Speche Communications provides IP information during setup.

### Port

The port Speche uses to communicate with the reporter's system. Port 4000 is the default port and cannot be changed.

### User

Identifies your configuration type and custom options selected during setup. Speche Communications assigns a user name during the scheduling of the event or session. This user name and the password are required to facilitate connection with Speche.

### Password

Allows access to Speche. Speche Communications assigns a password during setup. This password and the user name are required to facilitate connection with Speche.

## Output to Caption

Output to Caption allows you to write realtime and [send](#) the realtime text directly to an encoder for realtime captioning. All realtime data is sent to the encoder. The use of pre-scripted text is not compatible with this feature.

Special [captioning realtime commands](#) allow you to control certain captioning functions, such as setting the encoder on or off-line, setting the number of characters per line and changing text color. You create dictionary definitions with captioning format symbols to control these commands. It is necessary to define a stroke as <Caption: Block> and use that stroke to begin the realtime session.

All captions are sent in roll-up mode. The first line displayed on the screen rolls off the screen as the next line of text written displays at the bottom. For example, you set the number of lines to display as 3 so that three lines of text always display on the caption screen. When you write the fourth line, the first line rolls off the screen to make room for the fourth line on the caption display. Generally, captions are displayed in all caps. If you select the ALL CAPS options and a name requires lower case, use the {case} format symbol before the text definitions.

You must have captioning software to perform post production captioning. You cannot do post-production captioning by sending the realtime text directly to an encoder.

## Captioning Options

In addition to setting the following [Output to Caption](#) options, you must select Caption in the [Output To](#) field in the Translate dialog box. To have Case CATalyst remember the output destination, check the accompanying box, Remember Setting.

## Caption Options

To access the Caption options, from the Translate dialog box select **Options** and then select the **Output to Caption** tab.

### Connection

#### Output over comm port

Check this box to send the realtime data over the COM port to an encoder. Designate the com port by making an entry in the *Comm Port* field.

Uncheck this box to view the Closed Caption Preview Window while writing but not sending to an encoder. You may want to do this to practice.

#### Comm Port

Select the appropriate COM port on the Case CATalyst system for the encoder cable connection to the computer. For more information on COM or serial ports, refer to the user guide for your computer.

#### Direct (Cable)

Select this option when the Case CATalyst system connects to the encoder with a realtime cable. For more information on connecting the encoder, see the user's guide for your encoder.

#### Modem

Select this option when you are writing to an encoder remotely over the phone lines. The Case CATalyst system is connected to a phone jack via a modem cable. The encoder is connected to a phone jack in the remote location via a modem cable. For more information on connecting the encoder, see the user's guide for your encoder.

#### Call

Select this option if the Case CATalyst system is calling the encoder remotely. Enter the phone number in the *Number* field below.

#### Answer

Select this option if the encoder is calling the Case CATalyst system.

#### Number

When you select to have the Case CATalyst system call the encoder via modem, you must indicate the number to call. Type the telephone number for the location of the receive system. If applicable, include any numbers required to access an outside telephone line. Insert commas between numbers to have the system pause a second before dialing the next number. This allows the system to receive a dial tone before sending the next number. For example, if you need to dial 9 to reach an outside line and 1 to reach a different area code, the number would resemble the following: 9, 1, 123-456-7890.

### Hold Strokes

#### Longest match plus \_ strokes

Check this box to hold strokes to the output screen during captioning. This is sometimes known as "smooth" translation. Enter the number of strokes, after the longest match, you want Case CATalyst to hold before displaying the translated text. Valid entries are **0-9**.

When active, Case CATalyst holds the steno outlines before displaying the translated text on the realtime Caption Preview window. Case CATalyst holds the steno until based on the setting in the Longest match plus X strokes option. Once the number of strokes written exceeds the Longest match plus X strokes option, Case CATalyst pushes the longest match text to the display. If no longest match is found, translation holds the strokes written for the specified amount of seconds, then pushes any translated text or steno on the screen.

For example, let's say your Longest match plus X strokes option is set to 3 and the Held for X seconds option is set to 6. You write a four stroke word which is a longest match plus three more strokes. When the longest match plus the additional strokes are written, CATalyst pushes out the translation. If translation isn't done with the longest match, it will hold back the translation for the X number of seconds specified.

### **Held for \_ seconds**

Enter the number of seconds you want Case CATalyst to wait, when no steno is written, before flushing the strokes being held. Valid entries are **0-9**.

## **Encoder Options**

### **Encoder Model**

Select an encoder from the drop down list. The most common model of encoders are listed. If the model you are using is not listed, try the EEG Compatible option.

### **Captioning Options**

The following captioning options can also be set or modified using the [captioning realtime commands](#).

#### **Number of Lines**

Select the number of captioning rows to display. Choose a number between **2** and **4**.

#### **Characters Per Line**

Select the number of characters on each caption line. Choose a number between **16** and **32**.

#### **Baseline**

Select the line where the bottom line of the caption is placed. Choose a number between **1** and **15**. For example, if you select line 4 and you are using 4 caption lines, the bottom line of the caption displays on line 4.

To place the captions on the top of the screen, select line 1. To place the captions on the bottom of the screen, select line 15.

#### **Indent**

Indicate the number of spaces to indent all caption lines. Choose one of the following numbers: **0, 4, 8, 12, or 16**.

#### **Language**

When using encoder model, Subtitle Encoder NEWFOR, select the language in which you want the subtitles to display. You must first enter a valid teletext page in the *Teletext* field.

The *Language* field is only available when using Subtitle Encoder NEWFOR.

### Teletext

When using encoder model, Subtitle Encoder NEWFOR, type the teletext page to which you are writing. Verify the correct language selection in the *Language* field.

The *Teletext* field is only available when using Subtitle Encoder NEWFOR.

## Options

During captioning, the following options take priority over the same options set on another Translate Options tab. The options can also be triggered by realtime commands.

### Phonetic Untranslates

Phonetically translate steno outlines when no match for the steno occurs in any dictionary used for translation. This prevents the display of untranslates on the realtime screen. The phonetic translation is based on the entries in the Phonetic table. On the Case CATalyst screen, the "phonetically" translated word is the color of an untranslate to indicate the use of the [Phonetic table](#).

You can toggle the Phonetic Translation On and Off during realtime if you have a dictionary entry defined as [Toggle Phonetic Mode](#).

### Auto-Conflict

Auto-Conflict automatically selects the first choice of the conflict during translation. This prevents the display of conflicts on the screen. You can also use the [Toggle Auto Conflict Resolution](#) command when writing realtime to control the auto-conflict command from the writer.

You can use Auto-Conflict in conjunction with EZ Choice. When EZ Choice is active, Case CATalyst first checks the Conflict Database. If the conflict is not in the database, then Auto-Conflict resolves the conflict.

### Use EZ Choice

EZ Choice resolves conflicts during translation that occur in context similar to a previous conflict selection. When you resolve a conflict in Edit or realtime, the conflict choice plus the two words preceding the conflict are entered into the Conflict Database file. EZ Choice then uses the conflict database to determine the conflict resolution in future jobs.

### Use Second Choice

SecondChoice resolves conflicts during translation using the Second Choice Conflict Database. When a conflict is selected in Edit, Case CATalyst uses a system file to identify the possible parts of speech for the word before and after the conflict and places the conflict choice along with the system file information in the SecondChoice conflict database. When the same parts of speech appear before and after the same conflict in future translations, Case CATalyst selects the same conflict choice.

When used in conjunction with EZ Choice, EZ Choice has priority.

### Use EZ Link

EZ Link attaches prefixes and suffixes to the root word during translation applying the rules of spelling in an attempt to correctly spell the combined word. Case CATalyst first checks the Spell Check wordlist for a match. If no match exists then Case CATalyst attaches the combined root word and suffix.

### Exclude Caps

Exclude Caps is a Translate option available when EZ Link is active. When selected, Case CATalyst attaches the suffix but does not apply the EZ Link rule to root words defined as all capped or mixed case. Case CATalyst instead attaches the suffix directly to the word without altering the root word. For example, you write, "The Brady<Suffix>s went on vacation..." The EZ Link result is "Bradies." When Exclude Caps is active the result is "Bradys".

### **ALL CAPS**

Display the realtime text in all capital letters.

## **Captioning Realtime Commands**

Use dictionary definitions that include the captioning format symbols to control the captioning commands when writing realtime and sending to an encoder. The text, Caption: identifies the captioning format symbols in the Insert Format Symbol dialog box and in a dictionary definition. When Reveal Codes is active, captioning format symbols display in the Reveal Codes window.

The following captioning format symbols are available for dictionary definitions in Case CATalyst. Additional captioning format symbols found in the format symbol list apply only to the optional CATalyst BCS software.

## **Case CATalyst Caption Format Symbols**

### **Baseline**

Determines the vertical placement of the captions. The Set Caption Baseline dialog box displays where you can select a valid number between 1 and 15. You can create dictionary definitions to change the placement of your captions from your writer.

### **Block**

Prevents all upstream captions, such as commercial, from being sent to the encoder. Block mode is used when you are writing realtime to the encoder. Use the Block command when starting captioning to ensure the encoder is in the correct mode. It is necessary to define a stroke as <Caption:Block> and use that stroke to begin the session. You may also use this command at other times during the session, for example to switch from PASS mode to BLOCK mode.

### **Chars**

Determines the number of characters allowed on a caption line. The Set Caption Chars Per Line dialog box displays where you can select a valid number between 8 and 32. You may want to create dictionary entries to change the length of characters on a caption line.

### **Clear**

Removes all the text from the video screen and the Caption Preview window. You may want to create a dictionary entry to remove the captions from the screen. This is useful immediately before going to a commercial to ensure that captions are not overwritten.

### **Color**

Determines the text color for the caption word or remaining text on the line until the next line wrap. The Choose Caption Color dialog box displays. Select a color and press Enter (OK). The selected color displays until the next line wrap and then defaults back to white.

To use the Color format symbol for a specific word or phrase, insert the Color format symbol with the selected color before the word or phrase. Then insert the Color format symbol after the word or phrase using White selected as the color.

### Column

Determines the horizontal indent of the caption. The Caption Column dialog box displays where you can select a valid number between 1 and 25. You may want to create a dictionary entry to change the indentation of captions when writing.

### Flush

Releases any pending realtime text held and forces it to the encoder and Caption Preview window. You may want to create a dictionary definition to manually force text to the encoder. This is useful immediately before a commercial break to make sure the viewer sees the entire caption.

### KeepCaseNext

Inserts the KeepCaseNext format symbol into a dictionary definition which retains the next character's case. For example, to retain the small "c" in McLaughlin, create a dictionary entry: type M<Caption: KeepCaseNext>cLaughlin. When outputting in all caps, the "c" remains in lower case while all the other letters are capitalized, McLAUGHLIN.

### KeepCaseOff/On

Inserts the KeepCaseOff/On format symbols into a dictionary definition which retains the case of multiple characters. For example, to retain the upper and lower case of character in Case CATalyst create a dictionary definition: <Caption: KeepCaseOn>Case CATalyst<Caption: KeepCaseOff>. When outputting in all caps, the word displays as "Case CATalyst."

### Musical Note

Displays one music note on the video screen and the Caption Preview window to indicate music. You may want to create a dictionary entry to place a musical note in the caption or to create multiple musical notes.

### Pass

Allows all upstream captions, such as captioned commercials and other information to go to the encoder. Pass takes the realtime off-line to allow other captions to be sent to the encoder. You may want to create a dictionary entry to send the Pass command.

### Rollup Rows

Determine the maximum number of caption lines that appear when using the Roll-up style. The Set Roll-up Rows dialog box displays where you can select a valid number between 1 and 4. You may want to create a dictionary entry to change the number of roll-up rows.

### Transparent Space

Allow the video or picture to be seen behind the caption.

## Send to an Encoder for Captioning

You can send realtime captions using the Output to Caption feature without having CATalyst BCS. [Realtime caption](#) commands are available and a caption preview window displays so you have an visual indication of how the captions are appearing. You can set the number of lines of captions and their placements. Sending pre-scripted text line by line is not available in CATalyst's realtime captioning function. For more information about CATalyst BCS, you can read CATalyst BCS in this Help/Manual or please contact Stenograph Sales Department.

### To send realtime captions:

1. Connect your writing machine to your Case CATalyst system and connect the Case CATalyst system to the encoder or if sending remotely, to the modem. For more information on the connecting the encoder, see the user's guide for your encoder.
2. In Case CATalyst, press **Ctrl + t (Function/Translate & Edit)** to display the Translate dialog box.
3. Confirm your writer selection, layout and enter a job name. In the Output To field, select **Caption**. To have Case CATalyst remember Caption as the output destination, check the accompanying box, **Remember Setting**.
4. Press **Alt + p (Options)** and select the [Output to Caption](#) tab. Make necessary entries.
5. Press **Enter (OK)**. Option settings remain until you change them. The Translate dialog box displays.
6. Press **Enter (OK)** to start realtime and begin writing. If you select an existing job name, a message displays asking if you want to Append, Overwrite, or Cancel. Select **one** of the following

**Append**

Add the realtime steno file or steno and text files to the existing job.

**Overwrite**

Replace the existing files.

**Cancel**

Choose a different job name.

7. Once translation begins, the Closed Caption Preview Window displays. This allows you to preview the text that displays on the captioning screen. If necessary, you can move, resize or close the window. Once you close the window, you cannot reopen it during the current session. When you start another captioning session, the window displays.
8. To stop translation press **Ctrl + \ (backslash) (File/Stop Translation)**. Depending on your Edit options, a warning message may display. Select **Yes** to end realtime. You remain in the Edit module.

**Output to CaseView**

CaseViewNet is a free down-loadable realtime receive software program that provides courtroom and deposition participants instant access to testimony using a network (LAN) or Cloud (internet) connection with encryption and password. CaseViewNet receive participants can read, scroll, search and mark current and past text. iCVNet is a free down-loadable iPad app available from the Apple® App Store. iCVNet users can read, scroll, search and mark current and past text. If the user has save rights, the transcript can be e-mailed. You can also send realtime to any compatible browser using CaseViewNet Browser edition ([www.caseviewnet.com](http://www.caseviewnet.com)).

You can send to realtime viewing software that accepts the CaseView II protocol and CaseViewNet receive computers simultaneously. To send to CaseViewNet via wireless and Cloud communications, you must activate CaseViewNet on your Case CATalyst computer. When using a Cloud connection (CaseView via the internet or CVNet Browser edition) you will need a Session Code. Contact Stenograph Sales Department, 1.800.323.4247 or 1.630.532.5100, for more information.

CaseViewNet can also provide instant access to testimony using serial communications. CaseViewNet serial communications is available in CaseViewNet version 2.1.0 or higher. To download the free CaseViewNet viewer, go to <http://www.stenograph.com/cvn-downloads>. CaseViewNet activation is not required to send via serial communications to CaseViewNet.

## CaseViewNet Options

Access [CaseViewNet](#) options from the Translate dialog box. Select **Options** and then select the **Output to CaseView** tab. In addition to setting the Output to CaseView options, you also need to select to output to CaseView on the main Translate dialog box.

In addition to setting options on the Output to CaseView tab, be sure to select the [Output To](#) option in the Translate dialog box to **CaseView**. This allows the realtime output to be sent to the receive systems regardless of the receive system software.

## CaseViewNet Options

### Server Comments

Information in this field is available in the CaseViewNet Login dialog box if an invalid password is used. If an invalid password is used, a client can click the Show More link in the CaseViewNet Login dialog box to display the Server Comments.

### Notifications

Notification messages only apply to CaseViewNet clients connected via wireless communication.

#### Notify when user connects

Check this box to have Case CATalyst display a brief notification message in the lower right corner of your computer screen during realtime when a client connects to your Case CATalyst server.

#### Notify when user disconnects

Check this box to have Case CATalyst display a brief notification message in the lower right corner of your computer screen during realtime when a client disconnects from your Case CATalyst server.

#### Notify when user's rights change

Check this box to have Case CATalyst display a brief notification message in the lower right corner of your computer screen during realtime when password permissions change for a client connected to your Case CATalyst server.

## CaseViewNet Serial Connection Options

In the CaseView II Options section of the Output to CaseView tab, set options for CaseViewNet serial cable connected receive systems. Not all options apply to CaseViewNet.

### Output over comm port

Check this box to send the realtime data over the COM port. If you are sending to both CaseViewNet and CaseView II or sending to CaseViewNet via serial cable, check this box. Designate the COM port by making an entry in the *Comm Port* field. If this box is checked and no serial port is available, a *Cannot send to CaseView* message displays for 5 - 10 seconds and then automatically closes.

Uncheck this box if you are only sending to CaseViewNet through a wireless router.

### Comm Port

Select the appropriate COM port on the Case CATalyst computer for the cable connection between the Case CATalyst system and the CaseView II or CaseViewNet serial cable connected receive system. If your writing machine is connected to the Case CATalyst system via serial connection, you must select a different COM port than the one selected on the Realtime tab. For more information on COM or serial ports, refer to the user guide for your computer.

In situations when you must output to multiple ports, select the appropriate COM ports from the drop down list. For example, you are outputting to CaseViewNet via a serial connection and you also need to send to LiveNote Streaming Text which requires a serial connection.

### **Direct (Cable)**

Select Direct (Cable) when you connect the Case CATalyst system and the receive system with a serial realtime cable. Use this option when you connect the Case CATalyst system to a Multi-Line Block or Digital Sharing Device (DSD) for multiple receive systems.

### **Modem**

Select this option when you connect the Case CATalyst system to the receive system remotely over the phone lines. The Case CATalyst system is connected to a phone jack via a modem cable or digital sharing device (DSD). The receive system is connected to a phone jack in the remote location via a modem cable.

#### **Call**

Have the Case CATalyst system call the receive system when using a modem. Enter the phone number in the *Number* field below.

#### **Answer**

Have the receive system call the Case CATalyst system.

### **Number**

When you select *Call*, type the telephone number for the location of the receive system. If applicable, include any numbers required to access an outside telephone line. Follow the number with a comma. For example, if you need to dial 9 to reach an outside line and 1 reach a different area code, the number would resemble the following: 9, 1, 123-456-7890.

### **CaseView II Same PC**

Check this box to display CaseView II on the as the Case CATalyst computer. You must have CaseView II V1.02i to use this feature.

This option does not apply to CaseViewNet.

### **Save CaseView File**

Check this box to allow the CaseView II receive systems to save the realtime text, notes and marked text. This option only affects CaseView II receive systems and does not apply to other receive systems including CaseViewNet.

Uncheck this box to have the CaseView II receive systems save only notes and marked text.

### **Password Protection**

Check this box to allow the CaseView II receive systems to save the realtime text when the client enters a password. You must also select the *Save CaseView File* option to use this feature. Password Protection only applies when sending to CaseView II receive systems and does not apply to other receive systems including CaseViewNet.

Case CATalyst generates the CaseView II password and displays it when you begin the realtime session. You can view the password in Edit after realtime has begun by selecting **View/CaseView Options/CaseView Passwords**. The password displays in the lower left corner of the CaseView Password dialog box. This is a Case CATalyst-generated password that cannot be modified.

### Max Marked Lines

Type a number to determine how many lines can be marked on the CaseView II receive system. A password is not required to be able to mark lines. This option does not apply to other receive systems including CaseViewNet.

### Starting Page Number

Check this box and enter a page number to change the starting page number for realtime text on the CaseView II receive system. If you are appending the realtime text to an existing job, Case CATalyst creates a new section and applies the new page number to the realtime text.

When connected to CaseViewNet via serial cable connection, all CaseViewNet files start with page 1. You cannot change the starting page number.

### Time Stamps

Choose **one** of the following options to determine how the CaseView II and CaseViewNet serial cable connected receive system displays timestamps. If you are using the CaseView II synchronization feature, you must send timestamps to the receive system.

#### None

Do not send timestamps. No timestamps display on the receive system. CaseViewNet receive system connected via serial cable displays its own timestamps.

#### Clock

Send timestamps in actual time format (1:30:25).

#### Elapsed

Send timestamps to in elapsed format: starting 00 hours, 00 minutes, 00 seconds. Elapsed is not available for CaseViewNet serial cable connected receive systems.

## CaseViewNet Passwords

Click **Passwords** on the Output to CaseView tab to display the CaseView Passwords dialog box. Here you can verify and modify the passwords used by CaseViewNet clients connected via network (LAN) or Cloud (WAN - internet) communication. The CaseViewNet user needs to have a password in order to receive the realtime file securely. If you are sending to CaseViewNet or iCVNet via a Cloud connection, you want to make sure to change your passwords so previous clients that have connected using the same Session Code are not allowed to connect to unauthorized realtime sessions. You can size the dialog box to make all the column headings visible.

Passwords do not apply to CaseViewNet clients connected via a serial realtime cable.

Make entries in the fields. When finished, select **OK**.

### Allow Save

Create a password configuration to allow the client to save the CaseViewNet file using the password indicated in the Password field. A check mark indicates the Allow Save feature is active.

## Connections

Select one of the following:

- **Single LAN User** - the first CaseViewNet client to connect to your Case CATalyst server/network (not Internet connection) using the designated password is the only one allowed to use the password. You may want to use this setting when sending realtime to your judge via network connection and you could set the Expiration to Never so your judge never needs to sign in. This If you are sending via an Internet connection,
- **Multiple Users** - allow multiple CaseViewNet clients to receive your realtime feed using the same password. This connection option can be used for both network or cloud connections.

## Expiration

Set a password expiration date. Click in the field and select one of the following:

### Today

The password expires at midnight tonight.

### Never Expires

The password can be continually used without expiring.

### Specific Date

Select a specific date on the calendar for the password expiration date. The password expires at midnight of the selected day. For example, if you are in a five-day trial, CaseViewNet clients can use the same password throughout the five days of trial.

## Password

Specify the password that allows clients to connect to your Case CATalyst server and receive the realtime feed through CaseViewNet. The CaseViewNet client is prompted for a password when connecting to the Case CATalyst server. The password you give the CaseViewNet client determines whether or not they can save the realtime file.

Use the current password, generate a new password in the I Want To field or type a new password. Passwords must be 4 - 64 characters. You can create separate passwords for clients allowed only to view the realtime file and for clients allowed to view and save the realtime file.

## I Want To

### Clone

Make a copy of the password and associated information. A new line displays at the bottom of the list. Use this feature to create separate "Save" passwords for each client or to create a new password with a different expiration.

### Delete

Deletes the current password and associated information. You can also highlight the password you want to delete and click the Delete Password button at the top of the dialog box.

### Set Expired

Set the password to inactive. The message "Expired" displays in the Expiration field. This prevents clients from accessing the network with the password. To reactivate the password, select an option in the Expiration field.

### Generate Password

Generate a new password. If a password already exists, Case CATalyst displays a confirmation message. Select **Yes** to change the password. You can also click the New Password button at the top of the dialog box. Case CATalyst generates a new password with default settings.

### Browser Link

You can [generate a link](#) that your CaseViewNet clients can use to automatically open their default web browser to [www.caseviewnet.com](http://www.caseviewnet.com) with the Session Code and Password login fields already populated. This makes it easier for you and your clients to connect for CaseViewNet Browser Edition. The CaseViewNet Browser Edition Link will avoid Session Code and Password typing mistakes by clients and provides you with an easy method for communicating the necessary login information.

## CaseView II TCP/IP or Internet Connection

Send the CaseView feed to a specified TCP/IP address and port. Requires a serial to TCP/IP converter. CaseView software cannot currently receive input via TCP/IP.

### iCVNet options

There are no specific iCVNet options but the following CaseViewNet Options apply to iCVNet. The following items are used by iCVNet:

- Session Code (if using the CaseViewNet Cloud service)
- Password (Multiple Users passwords)
- Notifications (connects, disconnects, rights change)

## CaseView II Options

In the CaseView II Options section of the Output to CaseView tab, set options for CaseView II. From the Translate dialog box, select **Options** and then select the **Output to CaseView** tab.

In addition to setting options on the Output to CaseView tab, you must select the [Output To](#) option in the Translate dialog box to **CaseView**. This allows the realtime output to be sent to the receive systems.

## Set CaseView II Options

### Output over comm port

Check this box to send the realtime data over the COM port. If you are sending to both CaseViewNet and CaseView II or sending to CaseViewNet via serial cable, check this box. Designate the COM port by making an entry in the *Comm Port* field.

Uncheck this box if you are only sending to CaseViewNet through a wireless router.

If the Output over comm port option is selected and Case CATalyst cannot output over the selected COM port, the *Could not start CaseView II output. Data will not be output to CaseView II.* message displays for 5 - 10 seconds and then closes.

### Comm Port

Select the appropriate COM port on the Case CATalyst computer for the cable connection between the Case CATalyst system and the CaseView II or CaseViewNet serial cable connected receive system. If your writing machine is connected to the Case CATalyst system via serial connection, you must select a different COM port than the one selected on the Realtime tab. For more information on COM or serial ports, refer to the user guide for your computer.

In situations when you must output to multiple ports, select the appropriate COM ports from the drop down list. For example, you are outputting to CaseViewNet via a serial connection and you also need to send to LiveNote Streaming Text which requires a serial connection.

### **Direct (Cable)**

Select Direct (Cable) when you connect the Case CATalyst system and the receive system with a serial realtime cable. Use this option when you connect the Case CATalyst system to a Multi-Line Block or Digital Sharing Device (DSD) for multiple receive systems.

### **Modem**

Select this option when you connect the Case CATalyst system to the receive system remotely over the phone lines. The Case CATalyst system is connected to a phone jack via a modem cable or digital sharing device (DSD). The receive system is connected to a phone jack in the remote location via a modem cable.

#### **Call**

Have the Case CATalyst system call the receive system when using a modem. Enter the phone number in the *Number* field below.

#### **Answer**

Have the receive system call the Case CATalyst system.

### **Number**

When you select *Call*, type the telephone number for the location of the receive system. If applicable, include any numbers required to access an outside telephone line. Follow the number with a comma. For example, if you need to dial 9 to reach an outside line and 1 reach a different area code, the number would resemble the following: 9, 1, 123-456-7890.

### **CaseView II Same PC**

Check this box to display CaseView II on the as the Case CATalyst computer. You must have CaseView II V1.02i to use this feature.

This option does not apply to CaseViewNet.

### **Save CaseView File**

Check this box to allow the CaseView II receive systems to save the realtime text, notes and marked text. This option only affects CaseView II receive systems and does not apply to other receive systems including CaseViewNet.

Uncheck this box to have the CaseView II receive systems save only notes and marked text.

### **Password Protection**

Check this box to allow the CaseView II receive systems to save the realtime text when the client enters a password. You must also select the *Save CaseView File* option to use this feature. Password Protection only applies when sending to CaseView II receive systems and does not apply to other receive systems including CaseViewNet.

Case CATalyst generates the CaseView II password and displays it when you begin the realtime session. You can view the password in Edit after realtime has begun by selecting **View/CaseView Options/CaseView Passwords**. The password displays in the lower left corner of the CaseView Password dialog box. This is a Case CATalyst-generated password that cannot be modified.

### Max Marked Lines

Type a number to determine how many lines can be marked on the CaseView II receive system. A password is not required to be able to mark lines. This option does not apply to other receive systems including CaseViewNet.

### Starting Page Number

Check this box and enter a page number to change the starting page number for realtime text on the CaseView II receive system. If you are appending the realtime text to an existing job, Case CATalyst creates a new section and applies the new page number to the realtime text.

When connected to CaseViewNet via serial cable connection, all CaseViewNet files start with page 1. You cannot change the starting page number.

### Time Stamps

Choose **one** of the following options to determine how the CaseView II and CaseViewNet serial cable connected receive system displays timestamps. If you are using the CaseView II synchronization feature, you must send timestamps to the receive system.

#### None

Do not send timestamps. No timestamps display on the receive system. CaseViewNet receive system connected via serial cable displays its own timestamps.

#### Clock

Send timestamps in actual time format (1:30:25).

#### Elapsed

Send timestamps to in elapsed format: starting 00 hours, 00 minutes, 00 seconds. Elapsed is not available for CaseViewNet serial cable connected receive systems.

## CaseView II TCP/IP or Internet Connection

Send the CaseView feed to a specified TCP/IP address and port. Requires a serial to TCP/IP converter. CaseView software cannot currently receive input via TCP/IP.

## CaseViewNet WiFi Connection

CaseViewNet allows courtroom and deposition participants WiFi wireless access to realtime testimony. While writing realtime, you transmit text from your Case CATalyst version 8.20 or higher computer using a wireless access point. Client computers with wireless communication capabilities and CaseViewNet loaded onto their systems can read, scroll, search and mark testimony. Communication is secured using encryption and password protection. For additional information about wireless configuration and establishing the CaseViewNet connection, see the *CaseViewNet Router Installation Guide*. CaseViewNet must be activated on your computer before you can send the realtime to CaseViewNet clients. Contact Stenograph Sales Department, 1.800.323.4247 or 1.630.532.5100, for more information.

You can send to both CaseView II and CaseViewNet receive computers simultaneously. If you are sending to both CaseViewNet and CaseView II, connect the Case CATalyst system to the CaseView II receive system, multi-line block, or digital sharing device and confirm the COM port assignment for the output of the CaseView feed before beginning realtime.

Anti-virus and firewall settings protect your computer against unauthorized users but may also restrict the flow of data. Often, [changing a setting](#) in the software firewall can eliminate the restriction.

## CaseViewNet Activation & Expiration

The Case CATalyst server must have a valid CaseViewNet activation certificate in order to send realtime data to the CaseViewNet client computers using a network connection. A CaseViewNet activation certificate is not necessary when sending realtime data to CaseViewNet clients using a serial connection.

As the CaseViewNet certificate approaches its expiration date, a reminder window displays when Case CATalyst opens. The reminder message indicates the number of days until the expiration date. Set the reminder message to display again before the expiration date by selecting a number from the drop down menu in the *Remind me* field.

It is necessary to renew the activation certificate annually, at a discounted rate. A Case CATalyst support agreement, which also provides support for CaseViewNet, is required to purchase or renew a CaseViewNet activation certificate. Contact the Stenograph sales department at 1.800.323.4247 or 1.630.532.5100 for additional information. The purchased CaseViewNet certificate is downloaded from the Stenograph web site, [www.stenograph.com](http://www.stenograph.com), and secured on the hard drive of your Case CATalyst computer.

## Start a CaseViewNet WiFi Session

1. Plug in your configured router.
2. Turn on your Case CATalyst computer and wait until it is fully booted.
3. Verify the wireless capability on your computer is enabled.
4. Connect to the wireless network you are using with CaseViewNet. This is the network identified during the router configuration.

Windows automatically connects to your network if it was the last network connected to on this computer, the wireless network is set as default or if it is the only available network in range. If your computer does not connect automatically, right click the appropriate wireless icon in the SysTray and select Connect to a network from the menu. Select your network and click **Connect**. For additional information about connecting to your network for the first time, see the "*CaseViewNet Router Installation Guide*".

A switch or access to your computer vendor's application may be required. If Windows does not manage the wireless networking on your computer, a message displays. For additional information, refer to the user guide for your computer or contact the computer manufacturer.

**Important:** Microsoft ended Windows Vista support as of April 2017. Case CATalyst is no longer supported when running Windows Vista.

5. Start Case CATalyst.
6. Connect your writing machine to your Case CATalyst system. Do any of the following as appropriate:
  - If you are using a serial cable between your Case CATalyst system and your writing machine, connect the cable and confirm the COM port.
  - If you are using Bluetooth communication between your Case CATalyst system and your writing machine, confirm the COM port.

- If you are sending to both CaseViewNet and CaseView II, connect the Case CATalyst system to the receive system, multi-line block, or digital sharing device. Confirm the COM port assignment for the output of the CaseView feed.
7. Turn the writing machine On.
  8. Press **Alt + u, t (Function/Translate & Edit)**. The Translate dialog box displays.
  9. In the Output To field, select **CaseView** as the output destination.
  10. Press **Alt + p (Options)**. The Translate Options dialog box displays.
  11. Select the **Output to CaseView** tab. To have Case CATalyst always remember the Output To destination, check the accompanying box, *Remember Setting*.
  12. On the [Output to CaseView](#) tab, set CaseViewNet options and passwords. If you are sending to both CaseViewNet and CaseView II, check the Output over comm port box and make necessary [CaseView II Options](#) entries. Set translate options on the other tabs as necessary.
  13. When finished setting Translate options, press **Alt + a (Apply)** and then press **Enter (OK)**. Option settings remain until you change them. The Translate dialog box displays.
  14. Type or select a File name. Select a layout, dictionaries and create EZ Speakers or create a Speaker List as necessary.
  15. Press **Enter (OK)** to start realtime and begin writing.

If you select an existing job name, a message displays prompting you to Append, Overwrite, or Cancel. Select **one** of the following:

### **Append**

Add the realtime file to the existing job.

### **Overwrite**

Replace the existing files.

### **Cancel**

Choose a different job name.

16. You can view and modify [CaseViewNet passwords](#) and view and manage [user connections](#) during realtime.
17. To stop realtime press **Ctrl + \ (backslash) (File/Stop Translation)**. Depending on your Edit options, a warning message may display. Select **Yes** to end realtime. You remain in the Edit module.

## **CaseViewNet Client WiFi Connection**

CaseViewNet allows the client computer to connect via WiFi to the CaseViewNet realtime session by using one of three connection methods: the CaseViewNet Client Connection Wizard, specifying the Case CATalyst computer/server connection information or discovering the Case CATalyst computer/server for each session. Review each of the methods to determine the optimal connection type for your CaseViewNet clients.

CaseViewNet also allows the CaseViewNet client to connect via serial cable. Refer to [Starting a CaseViewNet Serial Session](#) for details on connecting serially.

## **Use the Connection Wizard**

Use the CaseViewNet Client Connection Wizard when the CaseViewNet client is unsure of how they receive the realtime data. Each time the client selects to connect in CaseViewNet, the Connection Wizard prompts for the connection type and steps you through the connection process.

Use the Connection Wizard when receiving the realtime data via a serial port, such as from a non-Case CATalyst reporter or through the network connection from different Case CATalyst reporters having different Case CATalyst computer/servers.

To set CaseViewNet System Options to use the Connection Wizard:

1. In CaseViewNet, select **Options/System Options**. The System Options dialog box displays.
2. In the System Options dialog box under the CaseViewNet Settings section, click **Connection**.
3. In the Use Connection Wizard field, select **Yes**. Yes is the default setting.
4. Click **OK** to save the settings.
5. To start the realtime session, click the Connect  icon. The Connection Wizard displays.
6. The Connection Wizard prompts the client through the connection process.
7. Click **Finish** on the last screen. The Connection Wizard closes and the realtime data scrolls on the screen when an active connection is made. When you use cursor movements to perform tasks, the [Follow Realtime](#) mode is temporarily disabled. Click the Follow Realtime icon to continue following realtime.
8. When proceedings are complete, select **Realtime/Disconnect**.

## Specify Connection Information - No Wizard

Specify the CaseViewNet client connection information when the CaseViewNet computer always connects to the same network or the same IP address. This connection method may be appropriate for judge's computer where the network and reporter are the same.

To set CaseViewNet System Options with specific connection information:

1. In CaseViewNet, select **Options/System Options**. The System Options dialog box displays.
2. In the System Options dialog box under the CaseViewNet Settings section, click **Connection**.
3. In the *Use Connection Wizard* field, select **No**. Yes is the default setting.
4. In the *Connection Type* field, select **Network/Internet**.
5. Set any other necessary Network/Internet Options.

### Network/Internet Options

#### IP Address

No entry is necessary in this field unless the realtime feed being sent requires a specific IP Address as indicated by the reporter. A default entry in this field may prevent CaseViewNet from receiving the realtime feed.

#### Port

CaseViewNet, by default, uses port 443. It is not recommended that you change this port setting unless you are using a specific IP Address and port setting.

### Name

Type a name in the field to identify yourself to the reporter during realtime. This name displays on the reporter's Case CATalyst computer to inform the reporter you have successfully connected to the realtime feed.

### Organization

Type a name in the field that identifies your organization to the reporter during realtime. This is an optional field.

### Password

Type the assigned password provided by the reporter. The password provided by the reporter allows your CaseViewNet computer to receive the realtime data via wireless network. Depending on the user rights assigned to the password provided to you, the password also allows you to view the realtime file or allows you to view and save the realtime file. Enter only the password indicated by the reporter. Passwords vary between realtime sessions.

6. Click **OK** to save the settings.

7. To start the realtime session, click the Connect  icon. The CaseViewNet Connection Status screen displays momentarily and the realtime data scrolls on the screen when an active connection is made. If CaseViewNet cannot find the specified Case CATalyst computer/server, the Find Server dialog box displays. Select the server and click **Connect**.

When you use cursor movements to perform tasks, the [Follow Realtime](#) mode is temporarily disabled. Click the Follow Realtime icon to continue following realtime.

8. When proceedings are complete, select **Realtime/Disconnect**.

## Discover Server for Each Connection - No Wizard

Use this method if the CaseViewNet computer always uses the same connection type, such as *Network*, but the Case CATalyst computer/server changes. For example, you work with the same reporting firm all the time and each of their reporters provide a WiFi realtime feed. Since each reporter from the firm has their own router, the IP address varies.

To set the CaseViewNet System Options to discover the server for each connection:

1. In CaseViewNet, select **Options/System Options**. The System Options dialog box displays.
2. In the System Options dialog box under the CaseViewNet Settings section, click **Connection**.
3. In the *Use Connection Wizard* field, select **No**. Yes is the default setting.
4. In the *Connection Type* field, select **Network/Internet**.
5. In the Network/Internet Options section select **Prompt Available Servers**.
6. Click **OK** to save the settings.

7. To start the realtime session, click the Connect  icon. The CaseViewNet Connection Status screen displays momentarily and then the Find Server dialog box displays.
8. Select the server and click **Connect**. The realtime data scrolls on the screen when an active connection is made. When you use cursor movements to perform tasks, the [Follow Realtime](#) mode is temporarily disabled. Click the Follow Realtime icon to continue following realtime.

9. When proceedings are complete, select **Realtime/Disconnect**.

## Anti-Virus and Firewall Settings

Most anti-virus software installed on computers contain a firewall. A firewall is a system that secures the wireless network, shielding it from access by unauthorized users. It can also restrict data from flowing in and out of the network from both the Case CATalyst network computer and the CaseViewNet client computers. Often, changing a setting in the software firewall can eliminate the restriction.

Stenograph has tested several anti-virus software packages and provides recommended settings for the Case CATalyst and CaseViewNet computers to help ensure unrestricted data flow. The latest CaseViewNet anti-virus information can be found on the Stenograph Help Desk. If you have an internet connection, from the Help menu, select Support Help Desk. In the *Keyword* field type, **caseviewnet virus protection**. To apply any of the recommended actions, consult your anti-virus software documentation or vendor.

## Locate Anti-Virus and Firewall Information

1. Do one of the following:
  - In Case CATalyst, press **Alt + h, s** (**Help/Support Help Desk**).
  - Using your Internet browser, go to the Stenograph web site, [www.stenograph.com](http://www.stenograph.com). Click **Support/Help Desk**.
2. In the *Keyword* field type, **caseviewnet virus protection**.
3. To apply any of the recommended actions, consult your anti-virus software documentation or vendor.

## CaseViewNet Server Startup Error

If you are running Case CATalyst 9.x or higher, a startup error message may display when starting realtime and outputting to CaseViewNet. The message indicates the name of a program that is currently using the same port Case CATalyst uses to output to CaseViewNet.

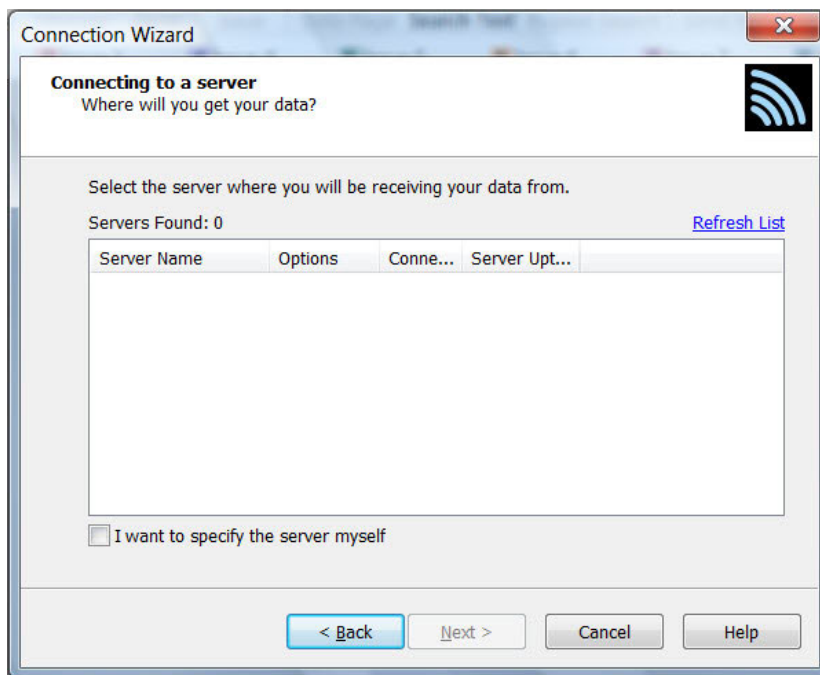

At this time, two programs, Skype and Pando are known to interfere with the CaseViewNet output. It is possible there are other programs that block the CaseViewNet data output. Skype is currently the only known program you can use while running CaseViewNet by starting the program after beginning realtime.

### Action

1. Close the indicated program.
2. Restart realtime and establish the communication between Case CATalyst and CaseViewNet. Depending on the third party program, you may be able to start it again.

## Case CATalyst Server Does Not Display

The CaseViewNet computer cannot find the Case CATalyst server name after a reasonable period of time.

### Action

1. On the CaseViewNet computer, click **Refresh List** in the Find Server dialog box. If the server displays, click Connect to establish the connection.
2. Verify there is an active realtime session on the Case CATalyst computer. A realtime file must be started and at least one steno stroke written to establish a realtime connection in Case CATalyst.
3. In Case CATalyst, be sure that **CaseView** was selected in the *Output To* field when beginning translation. It may be necessary to stop the realtime translation and restart realtime to ensure **CaseView** is selected in the *Output To* field.
4. Confirm that the CaseViewNet computer is connected to the realtime reporter's wireless network. The CaseViewNet computer must first be connected to the reporter's wireless network before CaseViewNet can establish a connection to the Case CATalyst server.
5. If CaseViewNet continues to be unable to establish a connection to the Case CATalyst server, be sure that CaseViewNet activation on the Case CATalyst computer is current. CaseViewNet activation is valid for one year. Without current CaseViewNet activation, no CaseViewNet connection is possible and the Case CATalyst server is not available.

### WiFi Connection Drops

A WiFi card continually looks for the strongest signal with the purpose of connecting to the Internet. When it finds a stronger signal, the WiFi card “jumps” to the stronger connection without checking that the current connection is in use. This can result in a lost connection. Case CATalyst displays a notification if the connection is lost or jumps to another access point and prompts you to reconnect to the original access point.

### Action

Change the wireless settings on the CaseViewNet computer and the realtime reporter's Case CATalyst computer/server to help prevent the WiFi card from “jumping” to another network. Depending on your operating system, these instructions may vary.

1. From the Start Menu, select **Control Panel**.
2. Depending on your Windows operating system and view setting, click **Network and Internet** and then click **Networks and Sharing Center**; or double click either **Networks** or **Networks and Sharing Center**.
3. Select **Manage wireless networks**. The dialog box for managing wireless connections displays.
4. Double click the realtime reporter's network name. For the realtime reporter, this is the network name identified during the router configuration which is used by the Case CATalyst computer/server to send realtime data to CaseViewNet computers. For the CaseViewNet user, it is the network name provided by the realtime reporter for wireless CaseViewNet connection to their network.
5. The Wireless Network properties dialog box for your network name displays. If necessary, click the **Wireless Properties** button to display the Wireless Network properties dialog box.
6. Check the option, *Connect automatically when this network is in range*.
7. Click to **OK** to save your changes.
8. Identify any other stored wireless profiles, if any, that may be in range of your wireless connection. Double click the network name and verify the option, *Connect automatically when this network is in range*, is not checked.
9. Close any open manage wireless network dialog boxes when finished.
10. If applicable, verify with the realtime reporter the correct network name and password.

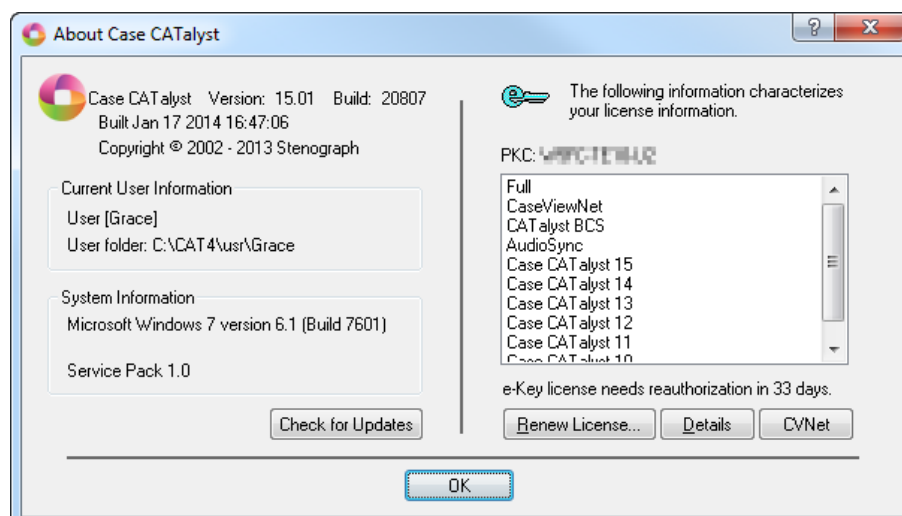

## CaseViewNet Certificate Messages

Although rare, it is possible to receive a message that there is something wrong with the CaseViewNet certificate or the CaseViewNet certificate is invalid. The solution is that the certificate needs to be reinstalled. There are two possible course of actions which are explained below. The most common solution is listed first.

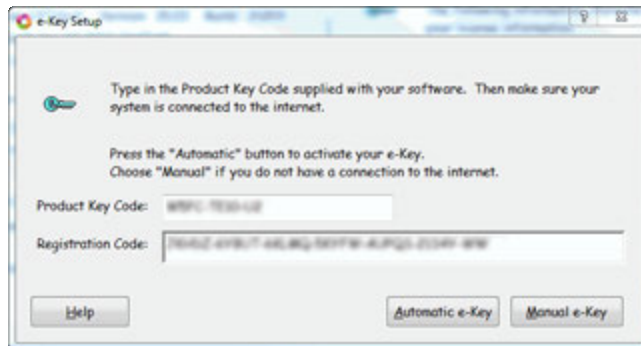

### Renew your e-Key activation

In most cases an invalid CaseViewNet certificate can be repaired by renewing your e-Key activation. To renew your e-Key, do the following:

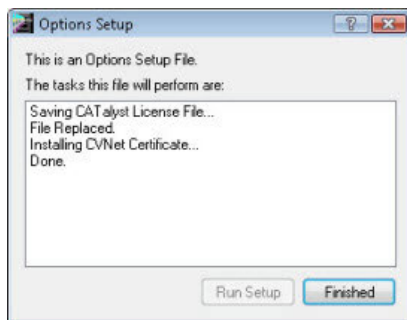

1. In Case CATalyst, click **Help** and then **About Case CATalyst**. The *About Case CATalyst* dialog displays.

2. Click the **Renew License...** button. The *e-Key Setup* dialog displays.

3. Click the **Automatic e-Key** button. One of the follow messages displays:
  - A message displays prompting to please wait while the license is downloaded.
  - The message, *The option file does not give or extend any options beyond your current license. Do you want to install it anyway?* displays. Click **Yes**.

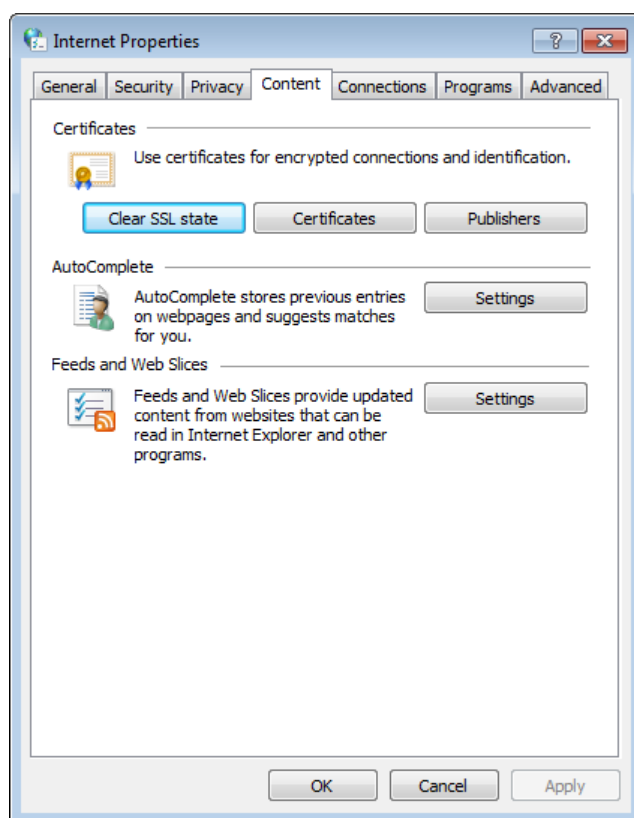

4. Click the **Finished** button and then click **OK** to close the About Case CATalyst dialog.
5. Close and reopen Case CATalyst. Start a test realtime file with the CaseView output option selected.  
If a CaseViewNet Certificate is Invalid message displays, follow the steps below to delete the CaseViewNet certificate.

### Delete the CaseViewNet Certificate before reinstalling

1. With Case CATalyst closed, click **Start, Control Panel, Network and Internet** and then **Internet Options**. The Internet Properties dialog displays.  
Depending on your version of Windows, you may click Start, Control Panel and then Internet Options.

2. Click the **Content** tab and then click the **Certificates** button. The Certificates dialog displays.

3. Highlight **CATalyst\_CVNet** and click the **Remove** button. A Removal confirmation message displays, click **Yes**.
4. Click the **Close** button to exit the Certificates dialog.
5. You will now need to reinstall your CaseViewNet Certificate. Go to the *Renew your e-Key activation* section at the top of this topic and follow the instructions.

## CaseViewNet Cloud (internet) Connection

CaseViewNet allows courtroom and deposition participants access to realtime testimony with an internet (Cloud) connection. While writing realtime, you transmit text from your Case CATalyst version 8.20 or higher computer using a wireless access point. Client computers with an internet connection and CaseViewNet loaded onto their systems can read, scroll, search and mark testimony. Realtime can also be received on an iPad using iCVNet and/or any device that can access a compatible browser using CaseViewNet Browser Edition ([www.caseviewnet.com](http://www.caseviewnet.com)). You can mark, search, and e-mail the transcript. Communication is secured using encryption and password protection. CaseViewNet must be activated on your computer before you can send the realtime to CaseViewNet clients. Contact Stenograph Sales Department, 1.800.323.4247 or 1.630.532.5100, for more information.

Anti-virus and firewall settings protect your computer against unauthorized users but may also restrict the flow of data. Often, [changing a setting](#) in the software firewall can eliminate the restriction.

## CaseViewNet Activation & Expiration

The Case CATalyst computer must have a valid CaseViewNet license in order to send realtime data to the CaseViewNet client computers, iCVNet and/or CaseViewNet Browser Edition using a Cloud connection. A CaseViewNet license is not necessary when sending realtime data to CaseViewNet clients using a serial connection.

As the CaseViewNet license approaches its expiration date, a reminder window displays when Case CATalyst opens. The reminder message indicates the number of days until the expiration date. Set the reminder message to display again before the expiration date by selecting a number from the drop down menu in the *Remind me* field.

It is necessary to renew the license annually, at a discounted rate. A Case CATalyst support agreement, which also provides support for CaseViewNet, is required to purchase or renew a CaseViewNet license. Contact the Stenograph sales department at 1.800.323.4247 or 1.630.532.5100 for additional information. The purchased CaseViewNet license is downloaded from the Stenograph web site, [www.stenograph.com](http://www.stenograph.com), and secured on the hard drive of your Case CATalyst computer.

## Start a CaseViewNet Cloud (internet) Connection

To send realtime via the CaseViewNet Cloud or CaseViewNet Browser Edition you need a CaseViewNet license and a Session Code (available at <http://www.stenograph.com/caseviewnet-information>). Use the following instructions to start a realtime file with a CaseViewNet Cloud connection. These instructions assume you have already purchased your Session Code.

CaseViewNet Browser Edition allows clients to use any computer, phone, tablet, etc. that can open a browser. Then go to [www.caseviewnet.com](http://www.caseviewnet.com) and fill in all the fields and click Connect.

1. Turn on your Case CATalyst computer and wait until it is fully booted.
2. Connect to the internet.
3. Start Case CATalyst.
4. Turn the steno machine On.

5. Connect your writing machine to your Case CATalyst system. Do **any** of the following as appropriate:
  - If you are using a WiFi connection between your Case CATalyst and your steno machine, make sure your steno machine is connected to the same network as Case CATalyst.
  - If you are using a USB connection between your Case CATalyst and your steno machine, connect the USB cable to both the Case CATalyst computer and steno machine and confirm the USB drivers are installed.
  - If you are using a serial cable between your Case CATalyst and your steno machine, connect the cable and confirm the COM port.
  - If you are using Bluetooth communication between your Case CATalyst system and your writing machine, confirm the COM port.
  - Confirm the Cloud (internet) clients have connected to the internet and have the correct Session Code and password. The Session Code is not case sensitive and will automatically display in all caps when typed in the Session Code field in Case CATalyst, CaseViewNet and/or iCVNet and CaseViewNet Browser Edition regardless of the state of the Caps Lock key.
6. Press **Alt + u, t (Function/Translate & Edit)**. The Translate dialog box displays.
7. In the Output To field, select **CaseView** as the output destination.
8. Check the Use Session Code option and type the Session Code in the text box, if necessary. If the Remember Setting check box is selected, CATalyst will remember the last Session Code used. The Session Code is not case sensitive and will automatically display in all caps. This option is not available unless the Output To: field displays CaseView or Multiple Outputs.. and CaseView is selected in the subsequent dialog box.

9. Press **Alt + p (Options)**. The Translate Options dialog box displays.
10. Select the **Output to CaseView** tab. To have Case CATalyst always remember the Output To destination, check the accompanying box, *Remember Setting*.
11. On the [Output to CaseView](#) tab, set CaseViewNet options and passwords. Set translate options on the other tabs as necessary.
12. When finished setting Translate options, press **Alt + a (Apply)** and then press **Enter (OK)**. Option settings remain until you change them. The Translate dialog box displays.
13. Type or select a File name. Select a layout, dictionaries and create EZ Speakers or create a Speaker List as necessary.
14. Press **Enter (OK)** to start realtime and begin writing.

If you select an existing job name, a message displays prompting you to Append, Overwrite, or Cancel. Select **one** of the following:

#### Append

Add the realtime file to the existing job.

#### Overwrite

Replace the existing files.

### Cancel

Choose a different job name.

When you output using the CaseViewNet Cloud, a message box displays prompting you to confirm that you want to send to the CaseViewNet Cloud. This confirmation message was implemented in the event you have the Use Session Code option selected along with Remember Settings and you may have forgot to deselect it or forgot it was selected and/or you don't want to send the realtime to the CaseViewNet Cloud. If you select No, the realtime session will continue but nothing will be sent to the CaseViewNet Cloud. If you select Yes, CATalyst will send the realtime via the Cloud and your available days, if applicable, associated with your Session Code may be affected.

If you no longer want to see the confirmation message, select the *I understand the consequences of my actions. Please stop asking.* option. To enable or disable the confirmation message, go to Tools, Options, [Warnings...](#)

15. You can view and modify [CaseViewNet passwords](#) and view and manage [user connections](#) during realtime.

A green light displays on the Status Bar to indicate a Cloud connection.

A yellow light indicates the Cloud is currently trying to make a connection with the CaseViewNet Cloud.

A red light indicates there is no Cloud connection.

16. To stop realtime press **Ctrl + \** (backslash) (**File/Stop Translation**). Depending on your Edit options, a warning message may display. Select **Yes** to end realtime. You remain in the Edit module. The CaseViewNet and/or iCVNet clients connected via the Cloud will receive a message that realtime has ended.

## Connection via Cloud (internet) message

The following transcript text may display in CaseViewNet and iCVNet in specific situations when a client connects via the Cloud.

## 1

1                                \* \* \* \* \*

2             You received this transcript page because either the Court

3     Reporter has not started the realtime session yet or you have

4     used the wrong session code. Do one of the following:

## End Realtime Job

When writing realtime and sending to CaseViewNet via the Cloud, the following message displays on the CaseViewNet receive systems when the court reporter ends the Case CATalyst realtime file. If the court reporter ends realtime for a lunch break, for example, and after lunch appends the afternoon session to the morning session, CaseViewNet will automatically append the afternoon to the morning session.

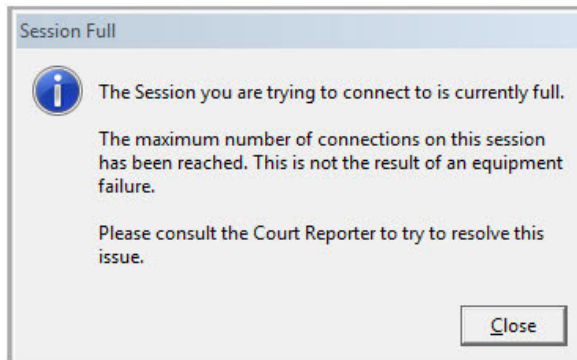

When sending to iCVNet via the Cloud, no message displays in iCVNet but the connection is disconnected and iCVNet will not automatically attempt to reconnect. If the court reporter ends realtime for a lunch break, for example, and after lunch appends the afternoon session to the morning session, once the iCVNet user connects, iCVNet transcript will include the morning and afternoon session.

**Session Full**

When purchasing a Session Code to send realtime via the CaseViewNet Cloud, you select the number of connections for each CaseViewNet Cloud session. If a client attempts to connect using a Session Code that already has the maximum number connections, the client and the Court Reporter receive messages.

The Case CATalyst receives the following message:

The message displays for 5 seconds to possibly 30 seconds and then automatically closes. You can continue with the realtime session with the current connections or you can stop the realtime session and use a Session Code that allows more connections or purchase a new Session Code that allows for more connections. Communicate the new Session Code to all the interested parties and start a new realtime session using the new Session Code.

The CaseViewNet and/or iCVNet client receives the following message:

### Session Code in Use

When you start a realtime session outputting to the Cloud, realtime will start, you will be prompted to confirm you want to output to the Cloud (if the warning is active) and then CaseViewNet Cloud checks to see if the Session Code is already being used. If it is, the following message displays:

The above message could display if you just disconnected from an earlier output to the Cloud session and you are using the same Session Code. If you select Yes to continue trying to use this connection, CATalyst will check every 15 seconds to see if the Session Code is free. If you select No, realtime will continue but you will not be outputting to the Cloud.

## CaseViewNet Cloud Availability Error

If you attempt to output via the CaseViewNet Cloud and no internet connection is available or the current internet connection is unstable, the following message displays:

Check your internet connection and make sure you have a constant stable connection. Click OK and try again.

## View CaseView Options

CaseView Options is located on the View menu. When selecting CaseView Options, you can view and/or change [CaseView Passwords](#) one the fly and/or display the [Connected Users](#) dialog pane.

If you are currently outputting to CaseViewNet via a network or cloud (session code) connection, the following actions are available:

### Notify when user connects

Select this option to have Case CATalyst display a brief notification message in the lower right corner of your computer screen during realtime when a client connects to your Case CATalyst server. Deselect this option to disable the notification.

### Notify when user disconnects

Select this option to have Case CATalyst display a brief notification message in the lower right corner of your computer screen during realtime when a client disconnects from your Case CATalyst server. Deselect this option to disable the notification.

### Notify when user's rights change

Select this box to have Case CATalyst display a brief notification message in the lower right corner of your computer screen during realtime when password permissions change for a client connected to your Case CATalyst server. Deselect this option to disable the notification.

## CaseViewNet Serial Connection

CaseViewNet serial connection allows courtroom and deposition participants access to realtime testimony via direct serial cable connection. Serial communications is compatible with any current CAT system that can send realtime data using the CaseView protocol.

Stenograph Realtime Send and Receive adapters and a crossover serial cable are used to connect the Case CATalyst realtime computer with the CaseViewNet receive systems. If multiple CaseViewNet system are receiving realtime data via serial cable, a multi-block (MLB) or digital sharing device is used. If your computer does not have a serial port, a USB to serial adapter may be used to create a serial port.

Some feature differences exist between a CaseViewNet WiFi and serial connection. Review the [WiFi/Serial Connection and Feature Comparison](#) for details.

## Establish cable connection

To help ensure a successful connection:

1. Verify the following adapter and cable connections:
  - If there is only one receive computer, a blue Send adapter for the CAT system attaches to a crossover cable connected to a red Receive adapter attached to your CaseViewNet computer.
  - If there are multiple receive systems, the blue Send adapter attached to the CAT system attaches to the cable connected to the multi-line block (MLB). A gold Receive adapter on each CaseViewNet receive computer attaches to a crossover cable. Each crossover cable is connected to the multi-line block.
2. If you are using a USB to serial adapter to create a serial port, verify the device driver for the adapter is installed on the computer. If you plug the USB to serial adapter into a USB port and the New Hardware Found message displays, it is necessary to load the device driver for the adapter. Device drivers are found on the vendor supplied CD that comes with the adapter or on the vendor's web site. Follow the vendor's installation instructions. Depending on your operating system, you may need an updated driver. When the device driver is successfully installed a brief message displays confirming the installation.
3. When the device driver is successfully installed, [verify the COM port](#) assignment for the USB port to which the USB adapter is connected. After verification, confirm the COM port assignment in CaseViewNet System Options.

## Set CaseViewNet Connection Options

Complete the following steps to set CaseViewNet options for serial communication:

1. Start CaseViewNet on the client computers.
2. In CaseViewNet, click the **Options** menu and then select **System Options**.
3. Click **Connection** and verify the following options. When finished, click **OK**.

### Connection Type

Select **Direct**.

### Baud Rate

Verify the settings is **2400**. 2400 is the default setting in Case CATalyst and in CaseViewNet. The send and receive systems baud rates must match. 2400 is the recommended baud rate.

### COM Port

Select the COM port that will receive the realtime data on the CaseViewNet computer.

## Begin the Realtime Session on Case CATalyst

Complete the following steps to begin the realtime session for output to CaseViewNet via serial communication.

1. Start Case CATalyst.
2. Turn your writing machine On.
3. Connect your writing machine to your Case CATalyst system. If you are using a serial cable or Bluetooth communication with your writing machine, confirm the COM port.
4. Confirm the COM port assignment in Case CATalyst for the output of the CaseView feed.
1. Start CaseViewNet on the receive system. CaseViewNet clients connected via serial cable receive the transcript at the point the realtime connection is made. If the realtime connection is established after the realtime session has begun, the client only receives the transcript from the point of connection forward.
2. In Case CATalyst, press **Ctrl + t (Function/Translate & Edit)** to display the Translate dialog box.
3. In the *Output To* field, select **CaseView**. To have Case CATalyst always remember CaseView as the output destination, check the accompanying box, *Remember Setting*.
4. Press **Alt + p (Options)**. The Translate Options dialog box displays.
5. Select the **Output to CaseView** tab.
6. On the Output to CaseView tab, verify the following options:

#### **Output over comm port**

Check this box to send the realtime data via serial cable. Designate the COM port by making an entry in the *Comm Port* field.

#### **Comm port**

Select the appropriate COM port on the Case CATalyst computer for the serial cable connection between Case CATalyst and the CaseViewNet receive system. If your writing machine is connected to the Case CATalyst system via serial cable, select a different COM port than the one selected on the Realtime tab.

#### **Direct (cable)**

Select this option to send the realtime data via serial cable.

#### **Timestamps**

Choose **one** of the following options to determine how CaseViewNet displays timestamps.

##### **None**

Do not send timestamps. No timestamps display on the receive system. A CaseViewNet receive system connected via serial cable displays its own timestamps.

##### **Clock**

Send timestamps in actual time format (1:30:25).

##### **Elapsed**

Elapsed is not available for CaseViewNet serial cable connected receive systems.

Passwords do not apply to CaseViewNet clients using a serial cable connection. They have all rights.

7. When finished setting Translate options, press **Alt + a (Apply)** and then press **Enter (OK)**. Option settings remain until you change them. The Translate dialog box displays.
8. Type or select a File name. Select a layout, dictionaries and create EZ Speakers or create a Speaker List as necessary.
9. Press **Enter (OK)** to start realtime and begin writing. If you select an existing job name, a message displays prompting you to Append the realtime file to the existing job, Overwrite the existing file or Cancel to choose a different job name.  
  
Changes made to the last five lines of the transcript by the reporter during realtime display in the CaseViewNet file.
10. To stop realtime press **Ctrl + \ (backslash) (File/Stop Translation)**. Depending on your Edit options, a warning message may display. Select **Yes** to end realtime. You remain in the Edit module. When you stop realtime with a serial cable connection, CaseViewNet does not display a lost connection message.

## CaseViewNet Client System

Realtime begins on the CaseViewNet computer when the CaseViewNet client clicks the Connect

icon. CaseViewNet opens a new file unless there is an open file. If a file is already open, CaseViewNet prompts you to append to the open file or start a new file. New files always start with page 1. The CaseViewNet transcript displays in Tahoma 12-point font. It is recommended to use Normal View to display the transcript.

If communication is lost during realtime on the CaseViewNet side, for example the USB to serial adapter is removed, a lost connection message displays in CaseViewNet. CaseViewNet automatically attempts to reestablish the connection. Reconnect the adapters. If the connection re-establishes using the same COM port, the CaseViewNet user can select **Retry**.

## WiFi/Serial Connection Comparison

In a situation where a CaseViewNet computer does not have built in WiFi capability, a NIC port, CaseViewNet has not been activated on the Case CATalyst system or you are not using Case CATalyst 8.05 or higher software, you can establish a serial connection between the CAT computer and the CaseViewNet client computers.

Certain CaseViewNet features are limited or not available when connected via serial connection. Review the following chart for connection and feature comparisons. Features not listed perform the same for WiFi or Ethernet cable and Serial connections.

### LAN (WiFi or Ethernet) or WAN (Internet) Connection

RapidRefresh; all editing changes the reporter makes to the realtime file are immediately reflected on the CaseViewNet computer. No command is necessary to refresh the CaseViewNet computer.

### Serial Connection

Changes made by the Case CATalyst reporter within the last 5 lines of realtime text display on the CaseViewNet screen. Changes the reporter makes that affect lines prior to the last 5, are not reflected in CaseViewNet.

## LAN (WiFi or Ethernet) or WAN (Internet) Connection

Password is required to establish a connection.  
Session Code and Password required for WAN connection.

Password option to control CaseViewNet client save rights in addition to establishing a secure communication. Ability to limit save rights.

Upgrade Password capability during realtime.

Lost connection message displays on the Case CATalyst computer if the CaseViewNet computer loses communication with the realtime reporter's Case CATalyst computer/network server.

Auto Reconnect. The CaseViewNet computer automatically attempts to reconnect, based on the specified number of times, to the realtime reporter's Case CATalyst computer/network server, if connection is lost. If connection to the Case CATalyst server is not reestablished, a lost connection message display on the CaseViewNet computer.

Connection Info displays the current connection type and the Case CATalyst server name. CaseViewNet client connection information is also available on the Case CATalyst computer.

Ability to save realtime text in all file types:

- \* CaseViewNet (.sgcvn)
- \* LiveNote Portable Transcript File
- \* ASCII (.txt)
- \* TextMap Portable Transcript File
- \* Summation

## Serial Connection

Password protection option when the realtime reporter uses Case CATalyst. No password protection when the reporter uses another CAT system and client has full save rights

Password option available to limit CaseViewNet client to viewing the realtime file only when the reporter uses Case CATalyst. No ability to limit save rights when the reporter uses another CAT system.

Upgrade password is not available.

No lost connection message displays on the Case CATalyst computer if the CaseViewNet computer loses communication with the realtime reporter's Case CATalyst computer/network server.

Auto Reconnect. The CaseViewNet computer only attempts to reconnect to the COM port when the COM port connection is lost, such as the USB to serial adapter is removed while receiving realtime data. A lost connection message only displays when a connection cannot be made to the COM port.

Connection Info about the last connection, COM port, baud rate and the connection type, CaseView II displays on the CaseViewNet computer. No connection information is available on another CAT system.

Ability to save realtime text in all file types:

- \* CaseViewNet (.sgcvn)
- \* LiveNote Portable Transcript File
- \* ASCII (.txt)
- \* TextMap Portable Transcript File
- \* Summation

**LAN (WiFi or Ethernet) or WAN (Internet)  
Connection**

\* Amicus (.txt)

Ability to generate reports.

**Serial Connection**

\* Amicus (.txt)

Ability to generate reports.

**Cannot Receive Realtime Data Via Serial Cable**

The CaseViewNet computer is connected to the Case CATalyst computer via serial cable and CaseViewNet is unable to receive the realtime data.

**Serial Cable with USB to Serial Adapters**

When no physical serial port is available, cable connection between the computers is accomplished using a serial cable and a USB to serial adapter to establish a serial port. The USB to serial adapter inserts into a USB port on the computer.

**Action**

1. Verify that the device driver for the adapter is installed on each computer. If you plug the USB to serial adapter into a USB port and the New Hardware Found message displays, it is necessary to load the device driver for the adapter. Device drivers are found on the vendor supplied CD that comes with the adapter or on the vendor's web site. Follow the vendor's installation instructions. Depending on your operating system, you may need an updated driver. When the device driver is successfully installed a brief message displays confirming the installation.
2. When the device driver is successfully installed, [verify the COM](#) port assignment for the USB port to which the USB adapter is connected. After verification, confirm the COM port assignment in Case CATalyst on the Translate Options Output to CaseView tab and in the Connection section of CaseViewNet System Options.
3. Verify **Direct** is selected in the Connection section of CaseViewNet System Options.

**Serial Cable with Serial Connector**

Cable connection between the computers is accomplished using a serial cable that connects to the Send and Receive adapters and plugs directly into the serial port on the computer.

**Action**

1. In Case CATalyst, verify that CaseView is selected in the *Output To* field in the Case CATalyst Translate dialog box.
2. In Case CATalyst Translate Options on the Output to CaseView tab:
  - Verify that **Direct (cable)** is selected.
  - Verify that the correct COM port is selected. Verify the COM port assignment, if necessary.

3. In CaseViewNet under System Options in the Connection section:
  - Verify that **Direct** is selected.
  - Verify the correct COM port is selected. Confirm the COM port assignment if necessary.
4. Verify the correct Receive adapter is used on the CaseViewNet computer.
  - If there is only one receive computer, a blue Send adapter for the CAT system attaches to a crossover cable connected to a red Receive adapter attached to your CaseViewNet computer.
  - If there are multiple receive systems, the blue Send adapter attached to the CAT system attaches to the cable connected to the multi-line block (MLB). A gold Receive adapter on each CaseViewNet receive computer attaches to a crossover cable. Each crossover cable is connected to the multi-line block.

## CaseViewNet Serial Connection Lost

CaseViewNet is not receiving realtime data when connected via serial cable. One of the following may have occurred:

## Realtime Stops

### Action

- Verify the CaseViewNet client is in Follow Realtime mode.
- When realtime transmission ends, no lost connection message displays.

## USB to Serial Adapter Disconnected

When the COM port connection is lost, for example the USB to serial adapter is removed from the computer, a lost connection message displays in CaseViewNet. CaseViewNet automatically attempts to reestablish the connection.

### Action

Reconnect the adapters. If the CaseViewNet connection re-establishes using the same COM port, select **Retry**.

## CaseView II Connection

CaseView II provides courtroom and deposition participants instant access to current and past testimony using serial communication. While writing realtime, you can instantly transmit text to one or more CaseView II receive computers. The user on the receive systems can read, scroll back, search, and mark text for later reference. For additional information about connecting CaseView receive systems, see the *CaseView II* documentation.

CaseViewNet users, follow the steps in [Starting a CaseViewNet Session](#), to begin a CaseViewNet session.

## Begin CaseView II Session

1. Start Case CATalyst.

2. Connect your writing machine to your Case CATalyst system. If you are using a serial cable or Bluetooth communication with your writing machine, confirm the COM port.
3. Connect the Case CATalyst system to the receive system, multi-line block, or digital sharing device. Confirm the COM port assignment for the output of the CaseView feed.
4. Turn your writing machine On.
5. Start CaseView II on the receive systems.
6. In Case CATalyst, press **Ctrl + t (Function/Translate & Edit)** to display the Translate dialog box.
7. In the Output To field, select **CaseView**. To have Case CATalyst always remember CaseView as the output destination, check the accompanying box, **Remember Setting**.
8. Press **Alt + p (Options)**. The Translate Options dialog box displays.
9. Select the **Output to CaseView** tab. To have Case CATalyst always remember the Output To destination, check the accompanying box, *Remember Setting*.
10. On the Output to CaseView tab, set [CaseView II options](#) and [verify the Com](#) port setting. Set translate options on the other tabs as necessary.
11. When finished setting Translate options, press **Alt + a (Apply)** and then press **Enter (OK)**. Option settings remain until you change them. The Translate dialog box displays.
12. Type or select a File name. Select a layout, dictionaries and create EZ Speakers or create a Speaker List as necessary.
13. Press **Enter (OK)** to start realtime and begin writing. If you checked the CaseView II option, [Password Protection](#), Case CATalyst displays the password. You can also view the password during realtime by selecting **View/CaseView Options/CaseView Passwords**.

If you select an existing job name, a message displays prompting you to Append, Overwrite, or Cancel. Select **one** of the following:

### **Append**

Add the realtime file or steno and text files to the existing job.

### **Overwrite**

Replace the existing files.

### **Cancel**

Choose a different job name.

14. To stop realtime press **Ctrl + \ (backslash) (File/Stop Translation)**. Depending on your Edit options, a warning message may display. Select **Yes** to end realtime. You remain in the Edit module.

## **Cannot Start CaseView**

The following message displays for approximately 5 - 10 seconds when you select CaseView in the *Output To* field in the Translate dialog box and the COM port specified in the Output to CaseView tab is not available or you select File instead of Writer in the Steno Source field.

## Action

1. In the Translate dialog box, verify your *Steno Source* and *Output To* selection.
2. In the Case CATalyst Translate Options dialog box, on the Output to CaseView tab, verify your *Comm Port* selection.

## Output to StenoKeys

Output to StenoKeys allows you to use the writing machine to send text to another application on your computer, such as Microsoft Word. When you select Output to StenoKeys, the software package that is currently active on the computer screen is the application of "focus" and receives the translated text output. This is similar to Stenograph's RapidWrite Pro® software. You can use Output to StenoKeys for writing e-mails, medical transcription, letters, etc.

To use another application on your computer for the StenoKeys output, the program you are using must display on the screen and be the active selection. For example, you have Case CATalyst and MS Word open. You select to use Output to StenoKeys and start translation. In order to send the text to MS Word, you must switch the active focus to MS Word. While MS Word has the focus, Case CATalyst writes all text to the MS Word file and a Case CATalyst text file. If you switch the focus to Case CATalyst, the text is only written to the Case CATalyst text file.

You may want to create a job or case dictionary specifically for the StenoKeys Output function and for the application to which you are writing. The dictionary would contain [entries](#) to control cursor movement and invoke keyboard commands from the writer. For example, to italicize text in MS Word, the command is **Ctrl + i**. In an e-mail program, the command to italicize text may be different. While the steno outline may be the same in both dictionaries, the text portion of the definition is likely to be different. A job or case dictionary for each application may be necessary.

In addition to setting the following Output to StenoKeys options, you must select **StenoKeys** in the [Output To](#) field in the Translate dialog box. To have Case CATalyst remember the output destination, check the accompanying box, Remember Setting.

## StenoKeys Options

To access the StenoKeys options, from the Translate dialog box select **Options** and then select the **Output to StenoKeys** tab.

### Hold Strokes

The [Hold Strokes](#) options are also available when writing realtime and when outputting to realtime, ASCII/ANSI and Other Devices.

Use the Hold Strokes option when you want a "smooth" translation. For example, you do not want partial strokes and misstrokes to display on the realtime screen or on the receive system when stroking a multiple stroke outline or phrase that would result in a "re-translation" once the longest match is reached.

When active, Case CATalyst holds the steno outlines before displaying the translated text on the active window. Case CATalyst holds the steno until based on the setting in the Longest match plus X strokes option. Once the number of strokes written exceeds the Longest match plus X strokes option, Case CATalyst pushes the longest match text to the display. If no longest match is found, translation holds the strokes written for the specified amount of seconds, then pushes any translated text or steno on the screen.

For example, let's say your Longest match plus X strokes option is set to 3 and the Held for X seconds option is set to 6. You write a four stroke word which is a longest match plus three more strokes. When the longest match plus the additional strokes are written, CATalyst pushes out the translation. If translation isn't done with the longest match, it will hold back the translation for the X number of seconds specified.

When outputting, the Longest match plus X strokes affects the amount of strokes you can delete. If you have this option set to 4, you can delete 3 steno strokes because once you write the Delete stroke, it counts as the 4th stroke. If you have this option set to 7, you can delete 6 steno outlines.

### **Longest match plus \_ strokes**

Check this box to hold strokes to the active screen during realtime. This is sometimes known as "smooth" translation. Enter the number of strokes, after the longest match, you want Case CATalyst to hold before displaying the translated text. Valid entries are **0-9**.

You can set separate values for the Longest match plus X strokes held to the Edit screen and the other output options (Realtime, ASCII/ANSI and Other Devices).

### **Held for \_ seconds**

Enter the number of seconds you want Case CATalyst to wait, when no steno is written, before flushing the strokes being held to the translated text or steno outlines. Valid entries are **0-9**.

You can only set one value, however, for the number of seconds Case CATalyst waits if no strokes are made before displaying the translated text. In other words, once you change the Held for X seconds on one of the output tabs, it changes the Held for X seconds option on all of the output tabs.

## **Creating Dictionary Definitions for StenoKeys**

The case or job dictionary for the [Output to StenoKeys](#) will contain certain entries that differ from your Case CATalyst dictionary. It is necessary to have a separate dictionary which contains entries that invoke commands, functions or special punctuation definitions in the software application to which you are writing. For example, to bold text in Case CATalyst is F4 B. In Microsoft® Word it is Ctrl + b. Output to StenoKeys uses several characters in the text portion of the dictionary entry to denote a specific instruction. For example, you are using MS Word as your StenoKeys application. To italicize text in Microsoft Word, you use the command **Ctrl + i**. Output to StenoKeys uses the ` (grave) character in the dictionary definition to denote the Ctrl (Control) key.

**Note:** If you are using a full size keyboard that has a Numeric Keypad, for best results make sure the Num Lock is inactive (disabled) on the Numeric Keypad.

## **Modifier and Special Command Keys**

The Control, Alt and Shift keys on a computer keyboard are called modifier keys. These keys change the function of other keys when they are pressed together. For example, to italicize in Microsoft Word, you press Ctrl + i. Ctrl is the modifier key. In the StenoKeys dictionary, the text portion of the dictionary entry to italicize in Microsoft Word would be {`i}. The grave accent (`) indicates the Ctrl key. You can place multiple command sequences in the text portion of a dictionary entry. Output to StenoKeys uses the following characters as modifiers to indicate special instructions:

Character	Instruction
` (grave accent)	Indicates Ctrl
%	Indicates Alt
+	Indicates Shift
{ }	Indicates a special command key or used to surround a modifier key and a text character
( )	Is used to surround multiple text characters

A special command key is a command not associated with text characters. For example, you want to write a steno stroke that invokes Help in Microsoft Word. Pressing F1 in Microsoft Word invokes the Help function so you define the text portion of the entry as {F1}. The braces are used to indicate a specific command. You can create other special commands, such as {UP}, {DOWN}, {RIGHT}, {LEFT}, {ENTER}, {BACKSPACE}, {HOME}, {END}, etc. Special commands can be combined with modifier keys. For example, { HOME} indicates Ctrl + Home, which moves the cursor to the beginning of the file. In Case CATalyst, special commands translate as text. For example, if you write the stroke defined as { HOME}, the text { HOME} displays in the Case CATalyst file.

When defining a text character with a modifier key, surround the modifier and text character with braces {}. You can also use a modifier with several text characters, for example, boldface and underlining text. When defining a modifier with several text characters, surround the text characters with parenthesis () and surround the modifier and text characters in the parenthesis with braces. For example, to create a dictionary definition for bold and underline, the text definition is: {(bu)} space. You can use capital or lower case letters to indicate the text characters.

## StenoKeys Dictionary Definition Guidelines

Use the following guidelines when modifying or inserting text for Output to StenoKeys dictionaries:

- Type the text exactly as you want it to translate.
- To indicate the dictionary entry is using the Ctrl key, use ` (grave). For example, a dictionary definition that contains {`b} indicates Ctrl + b.
- To indicate the dictionary entry is using the Alt key, use %. For example, a dictionary definition that contains {%F4} indicates Alt + F4.
- To indicate the dictionary entry is using the Shift key, use +. For example, a dictionary definition that contains {+m} indicates Shift + m.
- You can use multiple modifier keys. For example, a dictionary entry such as {(t)}space indicates Ctrl + Alt + t.
- Add "space" (without the quotes) either before the command or after to ensure a space between text. For example, to bold text the definition should either be space{`b} or {`b} space.

- To indicate a special command key, use { } around the command key. For example, a dictionary entry such as {BACKSPACE} indicates the command should move the cursor back one space.  
**NOTE:** To define a space, in the Text portion of the dictionary entry press the Spacebar. **Do not define a space** as {SPACEBAR} as that is not a special command key.
- To indicate a special command key and a modifier key, put the modifier command inside the {}. For example, Ctrl + Home would be defined as {HOME}.
- Punctuations symbols, with the exception of modifier keys, translate the same in Case CATalyst and Output to StenoKeys. To use punctuation in Output to StenoKeys, it is recommended you place the definitions in your Personal Dictionary.
- When making a StenoKeys definition to delete, it is recommended to use the StenoKeys delete definitions. Using the DEL or Delete key on the keyboard, may not work as intended.
- To display the actual text character of a modifier key, create the following definitions. Since these characters perform differently and are defined specifically for Output to StenoKeys than in Case CATalyst, it is recommended that you place these definition in a job dictionary to use with Output to StenoKeys.

Character	StenoKeys Dictionary Definitions
` (grave accent)	` -- if you want the grave accent to attach to the following word, define as ` <delete space&gt;<="" td=""></delete>
%	% -- if you want the percent symbol to attach to the following word/number, define as %<Delete Space>
+	+ -- if you want the plus symbol to attach to the following word/number, define as +<Delete Space>
(	(
)	)
{	space{
}	}space

## Sending to StenoKeys

To send realtime to another application using [Output To StenoKeys](#):

1. Open the application you are using to display the realtime output for Output to StenoKeys.
2. Open Case CATalyst. Press **Ctrl + t (Function/Translate & Edit)** to display the Translate dialog box.
3. Confirm your writer selection, layout and enter a job name. In the *Output To* field, select **Output to StenoKeys**. To have Case CATalyst remember StenoKeys as the output destination, check the accompanying box, **Remember Setting**.
4. Press **Alt + p (Options)** and select the **Output to StenoKeys** tab. Make entries as necessary to [hold strokes](#):

**Longest match plus \_ strokes**

Check this box to hold strokes to the active screen during realtime. This is sometimes known as "smooth" translation. Enter the number of strokes, after the longest match, you want Case CATalyst to hold before displaying the translated text. Valid entries are **0-9**.

When active, Case CATalyst holds the steno outlines before displaying the translated text on the active window. Case CATalyst holds the steno until based on the setting in the Longest match plus X strokes option. Once the number of strokes written exceeds the Longest match plus X strokes option, Case CATalyst pushes the longest match text to the display. If no longest match is found, translation holds the strokes written for the specified amount of seconds, then pushes any translated text or steno on the screen.

You can set separate values for the strokes held to the Edit screen during realtime set on the Translate Options Input tab and for the strokes held in the ASCII/ANSI output set on Output to ASCII/ANSI tab.

#### **Held for \_ seconds**

Enter the number of seconds you want Case CATalyst to wait, when no steno is written, before flushing the strokes being held to the translated text or steno outlines. Valid entries are **0-9**.

5. Press **Enter (OK)**.
6. Switch to the application to which you want to write. The application you are using must display on the screen and be the active selection.

## **Output to CARTView**

CARTView (local display) is available in the Output To: field in the Translate dialog box. Outputting to CARTView displays a separate window which can display on your computer or you can drag the window to another monitor or computer screen. The CARTView window displays text with no toolbars or menus. You can [customize the display](#) by changing the color of the text, background, font style and size, background transparency, line spacing and the position of the window. You can save the CARTView settings to the Alternate User Settings feature. You can have multiple saved Alternate User Settings files for different clients or different types of CART work. When selecting to translate, you can select the [Alternate User Settings](#) file to load saved settings, such as text color, font size, placement, etc., for the CART session.

Editing changes to the realtime screen are reflected on the CARTView screen. If the CARTView window is displayed on another monitor/computer, you can use editing features that display dialog boxes on the realtime screen without displaying the dialog boxes on the CARTView window. For example, you can use the Power Define feature to easily define from your writing machine without displaying the dialog box on the CART window.

A Case CATalyst CARTView Settings Icon () is available in the Windows System Tray. When selected, the icon displays the CARTView screen settings such as font, transparency, color, etc. The system tray icon makes it very easy to control the CARTView settings when you do not have instant access to the CARTView window. For example, let's say you are in the back of a large convention room with CARTView displaying on a large screen in the front of the room when you realize you need to change the color or the size of the text to make it more readable. By clicking the Case CATalyst CARTView Settings icon you'll instantly have access to the CARTView settings. No need to go to the front of the room to make adjustments.

To create a blank line on the CARTView window, define a steno outline as <New Line>. You can write the <New Line> definition to create a blank line or write it multiple times (if applicable) to clear the CARTView screen. To create musical notes, define a steno outline as the <Caption: Musical Note> format symbol. The euro symbol (€) displays in the in CARTView window as long as you are using a font that supports the euro symbol.

When ending punctuation is written at the end of a line in the CATalyst file, the CARTView window will make a new line before continuing. CATalyst sends the data to the CARTView window as an ASCII format. Since CARTView doesn't have information about when a paragraph follows or doesn't follow, the assumption is made that when a line ends in the CATalyst file with ending punctuation, what follows should be on a new line. This assumption works the majority of the time, but occasionally, the assumption can cause a new line when it isn't wanted.

You can output to [CARTView and have scripting capability](#) by using CATalyst BCS even though your PKC may not enable BCS.

To output to CARTView:

1. At Manage Jobs, open the Translate dialog box by pressing **Ctrl + t** or clicking the Translate & Edit icon.
2. In the upper right hand corner of the dialog box, in the Output To field, click the down arrow (▼) and select CARTView (local display).  

If you always want CATalyst to remember to output to CARTView, be sure there is a check in the box following the option.
3. Type a file name, select additional options and/or dictionaries if needed and click **OK** to begin realtime.
4. The CARTView window displays. If desired, click and drag it to another monitor or screen.
5. To [customize the CARTView window](#), right click and select the appropriate options.
6. When finished, press **Ctrl + \** (Stop Translation) and the CARTView window closes.

## Customizing the CARTView window

The [CARTView window](#) displays text with no toolbars or menus. You can customize the font style and size, the transparency of the background, the color of the text, background and outlining of text characters (if desired) and the alignment of text and line spacing. You can save the CARTView window customization to the [Alternate User Settings](#). You can save as many settings files as you want.

A Case CATalyst CARTView Settings Icon () is available in the Windows System Tray. When selected, the icon displays the CARTView screen settings listed below. The system tray icon makes it very easy to control the CARTView settings when you do not have instant access to the CARTView window. For example, let's say you are in the back of a large convention room with CARTView displaying on a large screen in the front of the room when you realize you need to change the color or the size of the text to make it more readable. By clicking the Case CATalyst CARTView Settings icon you'll instantly have access to the CARTView settings.

To customize the CARTView screen, right click on the CARTView window and do any of the following:

### Font

Text Size

To increase the size of the text, move the slider to the right. You can also click the slider and use the Down arrow or Right arrow to increase the font size.

To decrease the size of the text, move the slider to the left. You can also click the slider and use the Up arrow or Left arrow to decrease the font size.

### Choose Font

In the Font dialog box, select the Font type, Font style and/or Size and press Enter. If you need the euro symbol (€) be sure to select a font that supports the euro symbol.

Outline Width

You can outline each character of the text and adjust the thickness of the outline.

To increase the thickness of the character outline, move the slider to the right. You can also click the slider and use the Down arrow or Right arrow to increase the outline thickness.

To decrease or remove the character outline, move the slider to the left. You can also click the slider and use the Up arrow or Left arrow to decrease the outline thickness.

### Transparency

Background

To increase the background transparency of the CARTView window, move the slider to the right. You can also click the slider and use the Down arrow or Right arrow to increase the transparency.

To decrease the background transparency of the CARTView window, move the slider to the left. You can also click the slider and use the Up arrow or Left arrow to decrease the transparency.

Text

To increase the transparency of the text, move the slider to the right. You can also click the slider and use the Down arrow or Right arrow to increase the text transparency.

To decrease the transparency of the text, move the slider to the left. You can also click the slider and use the Up arrow or Left arrow to decrease the text transparency.

### Text Alignment

Left

Aligns the text to the left margin.

Center

Aligns the text in the middle based on the right and left margins.

Right

Aligns the text to the right margin.

### Color

Text

Select a color for the text. You can create your own color by selecting Define Custom Color. A color selection dialog box displays. To create your own color, consult your Windows documentation for more information.

### Background

Select a color for the background. You can create your own color by selecting Define Custom Color. A color selection dialog box displays. To create your own color, consult your Windows documentation for more information.

### Text Outline

Select a color for the text outline, if desired. You can create your own color by selecting Define Custom Color. A color selection dialog box displays. To create your own color, consult your Windows documentation for more information.

If you select to outline the characters, you can adjust the outline width by right clicking, selecting Font and then Outline Widths.

## Margins and Spacing

### Left/Right Margins

To increase the left margin and decrease the right margin, move the slider to the right. You can also click the slider and use the Down arrow or Right arrow to increase the left margin and decrease the right margin.

To decrease the left margin and increase the right margin, move the slider to the left. You can also click the slider and use the Up arrow or Left arrow to decrease the left margin and increase the right margin.

### Bottom Margin

To increase the Bottom margin, move the slider to the right. You can also click the slider and use the Down arrow or Right arrow to increase the Bottom margin.

To decrease the Bottom margin, move the slider to the left. You can also click the slider and use the Up arrow or Left arrow to decrease the Bottom margin.

To display the most text in the CARTView window, the Bottom margin slider should be all the way to the left.

### Top Margin

To increase the Top margin, move the slider to the right. You can also click the slider and use the Down arrow or Right arrow to increase the Top margin.

To decrease the Top margin, move the slider to the left. You can also click the slider and use the Up arrow or Left arrow to decrease the Top margin.

To display the most text in the CARTView window, the Top margin slider should be all the way to the left.

### Line Spacing

To increase the spacing between the lines, move the slider to the right. You can also click the slider and use the Down arrow or right arrow to increase the spacing between the lines.

To decrease the spacing between the lines, move the slider to the left. You can also click the slider and use the Up arrow or left arrow to decrease the spacing between the lines.

## Snap Size

The Snap Size feature allows you to quickly size and/or position the CARTView window and also undo the selection quickly. For example, If you want the CARTView window to expand to the width of

your screen, you would select Width. Or if you want the CARTView screen to be at the bottom of your screen but still show the Windows Taskbar, you would select Bottom Workspace. Selecting a snap size does not lock the CARTView position or size, you can still move the window, and size the window by selecting the top, bottom, side or corner of the window.

#### Unsnap

Reverts the window size and position to the default settings.

#### Width

Expands the CARTView window horizontally to the size of the current screen. The height of the window does not change.

#### Height

Expands the CARTView window vertically to the size of the current screen. The width of the window does not change.

#### Workspace

Expands the CARTView window to the entire size of the screen except for the Windows Taskbar. The Windows Taskbar will still be visible.

#### Full Screen

Expands the CARTView window to the entire size of the screen. The Windows Taskbar will be covered.

#### Bottom Workspace

Expands the width of the CARTView window to the size of the screen and moves the window to the bottom of the screen just above the Windows Taskbar. The height of the window does not automatically change but can manually be sized.

#### Bottom Full Screen

Expands the width of the CARTView window to the size of the screen and moves the window to the bottom of the screen covering the Windows Taskbar. The height of the window does not automatically change but can manually be sized.

## Using Alternate User Settings with CARTView

Once you have customized your [CARTView window](#), you can save the customization to a Alternate User Settings file by selecting File, Save Alternate User Settings. When you want to use that Alternate User Settings file, you select the settings file in the Translate dialog box. You can also name and save Translation settings file and when you are ready to translate, you can easily load dictionaries, translation options and the Alternate User Settings files. For example, half the time you report depositions for the same court reporting firm so you have a specific layout, translation options and EZ Speaker dictionary you use. In the Translate dialog box you select the layout, translation options and EZ Speaker dictionary you use and save those settings to the Depo Translation Settings file. A quarter of the time you write CART for a physics student at the local college. In the Translate dialog box you select CARTView as the output, select the special Physics dictionary you have created and select the Alternate User Settings file that has been set up with the size of the text and color combination that works for him and you save that Translation Settings file. Lastly, a quarter of the time you provide CART for your church. In the Translate dialog box you select CARTView as the output, select the Special dictionary you have created, and Alternate User Settings file that you set up for the church and you save that Translation Settings file. The next time you write realtime, you can quickly load the appropriate [Translation Settings](#) file which has all the correct settings, dictionaries, etc., for the current job and reduces your setup time.

1. Once you have customized your CARTView window in realtime, select File, Alternate User Settings and name the file.
2. The next time you are writing realtime to CARTView, click Translate, click Options and then click the down arrow (▼) in the User Alternate User Settings For Edit field.
3. Highlight the Alternate User Settings file you want to use.
4. Selection additional options if necessary, and to return to the Translate dialog, click **OK**.
5. Confirm the Output To field displays CARTView and select any dictionaries needed to help Translate, name the file and click **OK** to begin realtime. The CARTView window displays the settings based on the Alternate User Settings file selected.  
Once realtime has started, loading a Alternate User Settings file from the File menu will not change the CARTView settings. The Alternate User Settings file must be selected in the Translate Input tab.

### Dragging CARTView window to another screen

The [CARTView](#) window can be displayed on the Case CATalyst screen or can be viewed on another monitor or display by dragging it to the other display. The first thing you need to do is to establish a connection between another monitor or device to your computer and there are a couple different ways to accomplish that.

#### Connect another monitor to your computer:

If you have an external monitor with a video cable, you would simply connect the video cable to your laptop, right click the Desktop, select Screen Resolution, and then at "Multiple Displays" select "Extend desktop to this display."

If you are using a tablet as a second screen and do not want a cable connection, you would need a piece of software that connects the computer to the tablet via WiFi. For example, you can use an iPad® as an extra monitor. You could set up a local WiFi network via a hardware router, then use an app to create additional real estate, such as iDisplay and an associated iDisplay PC application on your laptop. Once app is running and the two pieces of equipment are talking to each other, make sure you have the Extend desktop to this display selected in your Windows screen resolution settings.

Next, you simply click the window and drag it over to the second display. If you're not sure which way to drag it, take a look at the Screen Resolution dialog. You'll see one screen labeled 1, another screen labeled 2. Click Identify and you'll see which one is which. You may want to make sure that the screens are in logical order. In other words, if you laptop screen is labeled #1 and your second monitor is labeled #2 and displays on the right of your screen, make sure the second display is to your right and the sides of the screens are touching in the "Change the appearance of your displays" dialog box.

A Case CATalyst CARTView Settings Icon () is available in the Windows System Tray. When selected, the icon displays the CARTView screen settings such as font, transparency, color, etc. The system tray icon makes it very easy to control the CARTView settings when you do not have instant access to the CARTView window. For example, let's say you are in the back of a large convention room with CARTView displaying on a large screen in the front of the room when you realize you need to change the color or the size of the text to make it more readable. By clicking the Case CATalyst CARTView Settings icon you'll instantly have access to the CARTView settings. No need to go to the front of the room to make adjustments.

(IMPORTANT NOTE: Stenograph does not recommend or endorse any one particular method or application for adding an additional screen.)

## Using Split Screen in Realtime

Split Screen is a feature in Translate & Edit and Edit that allows you to split the Edit screen, showing two displays of the same file. You may want to use this feature so you can retain your editing place in one screen and watch your realtime scrolling in the other screen. Simply click in the screen in which you want the focus. When using Split Screen while writing realtime, the bottom window remains stationary and the top window scrolls, following realtime. You can use the scroll bar to move through the file in either display.

If you want to view one screen and easily move the cursor between your last editing location and watching your realtime text, you can use the [Follow Realtime](#) command.

### Split the Edit Screen

1. Using the mouse, move the pointer to the upper right hand side of the Edit screen, positioning it on the vertical bar just above the scroll bar. When the pointer is in the correct position, it displays as a line with arrows on each end as shown below:

2. Holding the left mouse button, move the mouse down, moving the vertical bar to create a split screen. Place the vertical bar in the desired position and release the mouse button.
3. To return the display to a single window, move the vertical bar to the top of the Edit screen.

## AudioSync Microphone Set Up and Test

Before using AudioSync, set up and test your microphone to ensure clear recording and playback sound. Your Case CATalyst e-Key license must include the AudioSync option in order to use AudioSync.

**IMPORTANT:** When synchronizing with a videographer, adjust the clock time on your computer, if necessary, **before** starting the realtime file. Do NOT change the clock time on your computer at any time during a realtime session or have any operating system setting that automatically updates your clock. Changing the clock time once realtime begins affects the playback of the audio recording.

### Set Up the Microphone

1. Plug the microphone into the correct port. Computers generally have different ports for sound input and output. Some notebook computers have a combined sound input and output port. You may need an adapter to connect a microphone to a combined port. Some microphones connect via a USB port, instead of the 3.5mm jack. Refer to the documentation for your microphone for additional connection information.

You can identify the most common ports by the following symbols:

Headphones

Line in (Sound coming in from an external hardware device other than a microphone.)

2. If your microphone is battery-powered, you may need to turn it on.

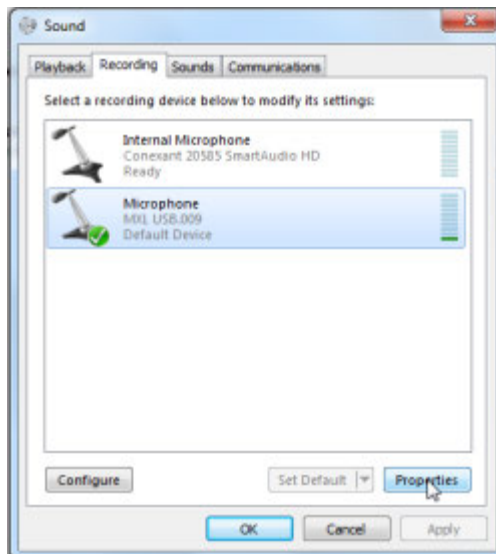

## Adjust Recording and Playback Volume

Different types of sounds can play at different volume levels on your computer. Sounds attached to events such as starting or closing Windows, the playback of an audio CD, and the sounds recorded by a microphone may all play back at different volume levels. The volume levels depend on your sound card sound level settings.

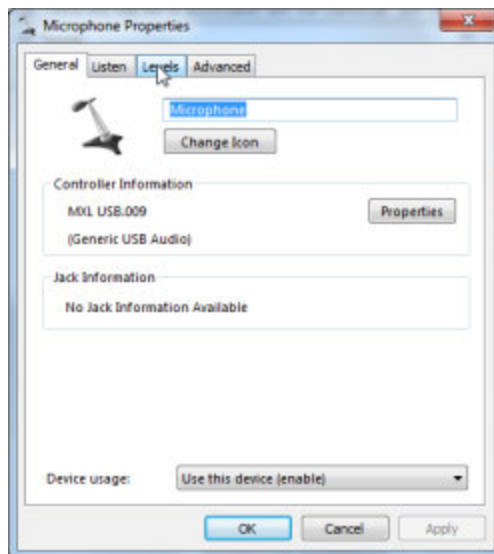

**Important:** Microsoft ended Windows Vista support as of April 2017. Case CATalyst is no longer supported when running Windows Vista.

### Windows 8 and Windows 7

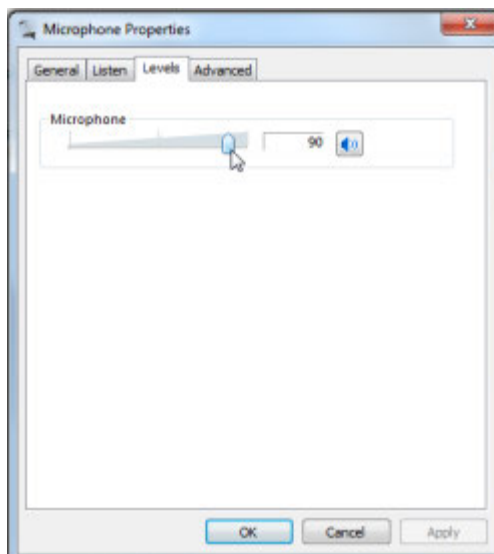

1. Right click the volume control  icon on the Windows taskbar and select **Recording Devices**. The Sound dialog box displays
2. On the **Recording** tab, click the microphone you are using for room sound and then click **Properties**. Only one microphone may displays.

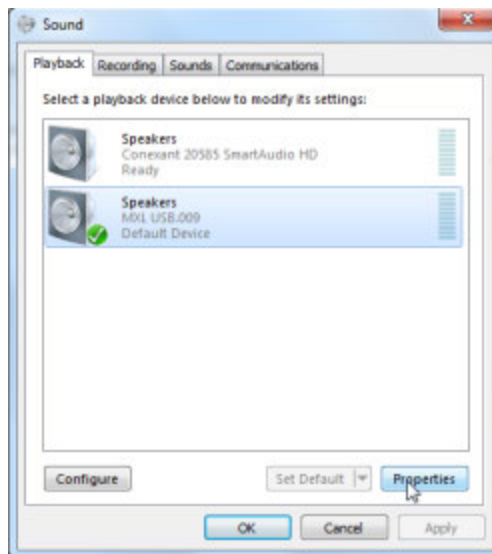

3. The Microphone Properties dialog box displays. Click the **Levels** tab.

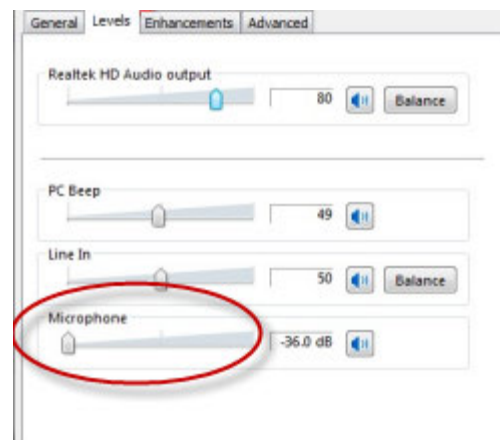

4. On the Levels tab, use the mouse to drag the Microphone level to approximately **90** percent.

5. Click **OK** to save the change. The Sound dialog box displays.
6. Click the **Playback** tab.
7. On the Playback tab, click the speakers you are using for playback and then click **Properties**.

8. The Speaker Properties dialog box displays. Click **Levels**.
9. On the Levels tab, use the mouse to drag the Speaker output level to approximately **80** percent. If a microphone volume control also displays on the tab, ensure that it is first set completely to the left before adjusting the volume output level for the speakers. This ensures the speaker setting is configured correctly.

10. Click **OK** to save the change. The Sound dialog box displays.
11. In the Sound dialog box, click **OK**.
12. Test the recording and playback levels.

## Test the Recording and Playback Levels

### Windows 8 and Windows 7

1. From the Windows Start Menu select **All Programs/Accessories/Sound Recorder**. The Sound Recorder dialog box displays.
2. Click **Start Recording**. Say a few words to test the microphone, standing at different distances and then click **Stop Recording**. The Save As dialog box displays.
3. Name the test audio file and save it to a convenient location, such as the Desktop.
4. Close the Sound Recorder.
5. Using Windows Explorer, navigate to the test audio file.
6. Double click the file to playback the recording. The file plays in the default selected media player.

**Important:** Microsoft is ending Windows Vista support as of April 2017. At that time, Case CATalyst will no longer be supported when running Windows Vista.

## Globals Exchange realtime and writer

When writing realtime via a USB or WiFi connection using Case CATalyst V13 or higher and the Luminex or Diamante V2.0 or higher, J-Defines made on the Luminex or Diamante, including used briefs, are automatically sent to the global table of the Case CATalyst realtime file. Any dictionary definitions made in the Case CATalyst realtime file, including D-Defines, J-Defines, K-Defines and Other Defines, are automatically sent to the Luminex or Diamante where they become J-defines on the steno machine. The exchanged definitions apply from the point of creation forward to all new realtime steno written.

If you Undo a global, Undo Last Global or delete a global in Case CATalyst, it does not remove the definition from the dictionary in the Luminex memory or Diamante memory or from the Luminex or Diamante job dictionary file. Refer to the Luminex or Diamante User Guide for information on removing J-Defines from the Luminex or Diamante.

## Realtime Commands Dictionary - System Files Case

A Realtime Commands Dictionary is a default file in your System Files case and also in the Default Files\System Files folder located in the CAT4 directory (or wherever CATalyst is installed) .

The Realtime Commands Dictionary contains dictionary entries for translation commands, number conversion and trigger commands and more. You can modify any or all of the entries to match your steno theory and then select this dictionary to help translate your realtime file or copy/paste the entries into your Personal dictionary or another dictionary you may use when writing realtime.

Please note: The Realtime Commands Dictionary is updated when new commands become available. When updating to the latest version of Case CATalyst, if there is a new Realtime Commands Dictionary it does not overwrite your existing Realtime Commands Dictionary. If you have modified your Realtime Commands Dictionary, you most likely will want to manually insert new entries that become available. If you haven't modified your Realtime Commands Dictionary, you copy the latest Realtime Commands Dictionary from C:\CAT4\DefaultUserFiles\System Files to your user's System Files case.

STENO	TEXT DEFINITION	DESCRIPTION
*	{Delete}	Deletes the previous steno outline.
#*	{Delete}	Deletes the previous steno outline.

O*RD	{Number Conversion}[*Ordinal]	Converts the previous number or set of numbers to ordinal numbers. This option also converts a word number such as "one" to 1st. This option does not convert an ordinal word number such as "first" to 1st.
A*T	<Delete Space>@<Delete Space><Force Next Lower>	Inserts @ and deletes any space before or after the @ symbol and forces the following text to be lower case regardless of the capitalization.
A*E	{Prefix Number}[']	Inserts an apostrophe immediately in front of the previous number or set of numbers. Works with numbers followed by an "s," for example, 70s.
EF/EF	{Text E-Define}	Invokes the Power Text Define dialog box allowing you to create e-defines from your writing machine.
RO* EP L	{Number Conversion}[*RomanUpper]	Converts the previous number or set of numbers to upper case Roman Numerals.
H*T	{Stitch On}[web]http://<Delete Space>	Translates as http:// and lower cases all text without spaces between words that follows.
H* TS	{Stitch On}[web]https://<Delete Space>	Translates as https:// and lower cases all text without spaces between words that follows.
H*PB	{Prefix Number}[-]	Inserts a hyphen (negative) immediately in front of the previous number or set of numbers.
TPH*EG	{Prefix Number}[-]	Inserts a hyphen (negative) immediately in front of the previous number or set of numbers.
W*T	{Stitch On}[web]www.<Delete Space>	Translates as www. and lower cases all text without spaces between words that follow.
W*RDZ	{Number Conversion}[*Words]	Converts the previous digit or set of digits to word numbers.
W*EB	{Stitch On}[web]	Lower cases all text without spaces between words that follow.
P*T	{Prefix Number}[.]	Inserts a period immediately in front of the previous number or set of numbers.
PO*UPBD	{Prefix Number}[#]	Inserts a pound sign (#) immediately in front of the previous number or set of numbers.
TK-Z	{Prefix Number}[\$]	Inserts a dollar sign (\$) immediately in front of the previous number or set of numbers.
S-Z	{Prefix Number}[<Delete Space>.]	Inserts <Delete Space>. in front of the previous number. For example, \$14 30 becomes \$14.30

PAUS/PAUS	{Pause Audio}	Pauses the recording of AudioSync.
SAOUP/SAOUP	{Resume Audio}	Resumes/starts the recording of AudioSync.
PHR*US	{Prefix Number}[+]	Inserts a plus sign (+) immediately in front of the previous number or set of numbers.
PW*EPB/PW*EPB	{Toggle Bench Mode}	Toggles Bench Mode on/off. When Bench Mode is on, translating text is not visible on any receiving system (computers receiving realtime output via CaseViewNet or other similar realtime receive/litigation support software). The reporter can toggle the display of text in Case CATalyst by clicking View, Show, Bench Text.
KAP/#4	{Cap Previous 4 Words}	Caps the previous four words.
KAP/#3	{Cap Previous 3 Words}	Caps the previous three words.
KAP/#2	{Cap Previous 2 Words}	Caps the previous two words.
KAP/#1	{Cap Previous 1 Words}	Caps the previous word.
STR*	{Cap Previous 2 Words}Street	The word Street translates and caps one previous word before Street.
STRAO*ET	{Cap Previous 3 Words}Street	The word Street translates and caps two previous words before Street.
KA*P/OPB	<All Caps On>	All text is capitalized following this command.
KA*P/OF	<All Caps Off>	All text following this command will translate as it is defined in the dictionary.
TEL/PREP	{Number Conversion}[X (XXn) NNN-NNNN]	Converts a minimum of previously written nine numbers up to thirteen numbers to a U.S. phone number format with parenthesis. See <a href="#">Common Number Formats</a> for more information.
TEL/TPOEPB	telephone{Number Trigger}[X (XXn) NNN-NNNN]	Inserts the word 'telephone' into the transcript and converts a minimum of nine numbers up to thirteen numbers following the word telephone to a U.S. phone number format with parenthesis. See <a href="#">Common Number Formats</a> for more information.
TEL/TKARB	{Number Conversion}[n-NNN-NNNN]	Converts a minimum of previously written nine number up to thirteen numbers to a U.S. phone number format. See <a href="#">Common Number Formats</a> for more information.

TPOEPB	phone{Number Trigger}[X (XXn) NNN-NNN]	Inserts the word 'phone' into the transcript and converts a minimum of nine numbers up to thirteen numbers following the word phone to a phone number format. See <a href="#">Common Number Formats</a> for more information.
T*PL	{Number Conversion}[*Time00]	Converts previous three- or four-digit number to HH:MM format; changes one through twelve to digits and MM becomes 00.
TAOEUPL/TAOEUPL	{Number Conversion}[*Time]	Converts previous three- or four-digit number to HH:MM format; changes one through twelve to digits.
TAOEUPL/#2	{Number Conversion}[NN:nn:Nn]	Time with two-digit hour and option for seconds. See <a href="#">Common Number Formats</a> for more information.
TAOEUPL/#1	{Number Conversion}[nN:nn:Nn]	Time with one-digit hour and option for seconds. See <a href="#">Common Number Formats</a> for more information.
TRABG/TRABG	{Toggle Follow Realtime}	Toggles between the cursor following realtime or staying in the last edit position.
TPRAO*EL	{Toggle Follow Realtime}	Toggles between the cursor following realtime or staying in the last edit position.
TPOPB/TPOPB	{Toggle Phonetic Mode}	Toggles between turning Phonetic translation on and off.
TPO*PBT/PWEUG	<Font Size 18>	Causes text written after this command to display and print in a larger font size. (Font size changes only display with Page View; not Normal View.)
TPO*PBT/TPHORPL	<Font Size 12>	Causes text written after this command to display and print in a standard font size. (Font size changes only display with Page View; not Normal View.)
TPO*PBT/SPHAUL	<Font Size 9>	Causes text written after this command to display and print in a smaller font size. (Font size changes only display with Page View; not Normal View.)
SKWROP	{Set Job End Time Field}	Fills in the Job End Time field value with the current time.
SKWRART	{Set Job Start Time Field}	Fills in the Job Start Time field value with the current time.
TKAEUT/#1	{Number Conversion}[nN/Nx/nn]	Date with one-digit month, one- or two-digit day and two digit year, separated by slashes. See <a href="#">Common Number Formats</a> for more information.

TKAEUT/#2	{Number Conversion}[NN/nn/Nn]	Date with two-digit month, one- or two-digit day and two digit year, separated by slashes. See <a href="#">Common Number Formats</a> for more information.
TPAEUT/#1	{Number Conversion}[nN/Nx/NNNN]	Similar to TKAEUT/#1 entry only requires a four-digit year.
TPAEUT/#2	{Number Conversion}[NN/nn/NNNN]	Similar to TKAEUT/#2 entry only requires a four-digit year.
PHAO*EL	{Number Conversion}[*Month/Year]	Convert 3 to 6 numbers into a month/year date format.
TPHUPL/H-PB	{Number Conversion}[nn-nn-nN-nN]	Converts previous numbers with hyphens. See <a href="#">Common Number Formats</a> for more information.
TPHUPL/PAOER	{Number Conversion} [nnnnnnnnX.NN]	Converts previous numbers with period. See <a href="#">Common Number Formats</a> for more information.
TPHUPL/PAO*ER	{Number Conversion} [n,nnn,nnn,nnX.NN]	Converts previous numbers with period and commas. See <a href="#">Common Number Formats</a> for more information.
TPHUPL/PREPB	{Number Conversion}[(XXXXXXXXXXN)]	Converts numbers surrounded by parenthesis. See <a href="#">Common Number Formats</a> for more information.
TPHUPB/TPHUPL	{Number Conversion} [nnn,nnn,nnn,nnN]	Converts previous numbers with commas. See <a href="#">Common Number Formats</a> for more information.
TPHUPB/TKARB	{Number Conversion}[nnnnnnnnX-NN]	Converts previous numbers with dash. See <a href="#">Common Number Formats</a> for more information.
TPHUPB/SHRARB	{Number Conversion} [NNNNNNNNX/NN]	Converts previous numbers with slash. See <a href="#">Common Number Formats</a> for more information.
TKHR-RS	{Number Conversion} [\$nnn,nnn,nnn,nnN]	Converts previous numbers to dollars. See <a href="#">Common Number Formats</a> for more information.
TKHR-RSZ	{Number Conversion} [\$nnn,nnn,nnn,nnX.0N]	Converts previous numbers to dollars and cents. See <a href="#">Common Number Formats</a> for more information.
S-S	social security{Number Trigger}[NNN-NN-NNNN]	Inserts the words "social security" and converts the next nine numbers to a U.S. social security number format.
S*S	{Number Conversion}[NNN-NN-NNNN]	Converts previously written nine numbers to a U.S. social security number format. See <a href="#">Common Number Formats</a> for more information.
TPHEURB/AUF	{InitialCap Off}	Turns off the InitialCap On command.

TPHEURB/OF	{InitialCap Off}	Turns off the InitialCap On command.
TPHEURB/OPB	{InitialCap On}	Turns on the Initial Cap On command. All words following the {InitialCap On} command will be initial capped except words that are listed in <a href="#">Advance Edit's Words to suppress capping when found in the middle of phrase</a> option.
TPHREUBG/TPHREU BG	{Toggle Auto Conflict Resolution}	Toggles the <a href="#">Auto Conflict Resolution</a> command on and off.
TKEF/TKEF	{Define}	Invokes the <a href="#">Power Define</a> dialog box.
SKAPB/SKAPB	{Scan Define}	Scans back to the last untranslate and opens the Power Define dialog box.  <a href="#">Advanced Translate Options</a> includes the ability to have the Scan Define command also stop on drag/drop and/or suffix drag translations.
SPEF/SPEF	{EZ Speaker Define}	Opens the Create EZ Speaker Entry dialog box.
SKA*EUP	{Cancel Active Dialogs}	Closes most active dialog boxes (without taking action) including message boxes, except Associate Audio File, Set Page Number, Make Exhibit Index Entries, Power Define, Scan Define, Text Define and Create EZ Speaker Entries from the steno machine. <i>If the Power Define or Text Define dialog box is in Suspend mode, you can write the steno for the Cancel Active Dialog command to close it.</i>
ST*FP/-FPLT	{Stitch On}[.]	Stitches finger spelled letters or words with periods.
ST*FP/H-PB	{Stitch On}[-]	Stitches finger spelled letters or words with hyphens.
ST*FP/OF	{Stitch Off}	Turns off any Stitch command.
ST*FP/AUF	{Stitch Off}	Turns off any Stitch command.
1*#	{Resolve Conflict, Choice 1}	Searches back to the last conflict in the file and selects the first choice of the conflict.
2*#	{Resolve Conflict, Choice 2}	Searches back to the last conflict in the file and selects the second choice of the conflict.
3*#	{Resolve Conflict, Choice 3}	Searches back to the last conflict in the file and selects the third choice (if available) in the conflict. <a href="#">{Resolve Conflict, Choice}</a> commands are available for 1 - 9 conflict choices.

STAO*EUPL	{Start Timer}[1]	Causes Timer1 to begin. If Show <a href="#">Timers</a> is selected, the timer is displayed (reporter's Case CATalyst screen only).
1-R#	{Replace With LS1}	Replaces the untranslate and additional steno (if appropriate) with the first Live Suggestion text.
2-R#	{Replace With LS2}	Replaces the untranslate and additional steno (if appropriate) with the second Live Suggestion text.
3-R#	{Replace With LS3}	Replaces the untranslate and additional steno (if appropriate) with the third Live Suggestion text.
1-D#	{Define With LS1}	Defines the untranslate and additional steno (if appropriate) with the first Live Suggestion text.
2-D#	{Define With LS2}	Defines the untranslate and additional steno (if appropriate) with the second Live Suggestion text.
3-D#	{Define With LS3}	Defines the untranslate and additional steno (if appropriate) with the third Live Suggestion text.
TPHORBBS	{Ignore Steno for LS}	Ignores the last untranslate so Live Suggestion will not provide suggestions on the ignored steno.
TKAURG	.org{Stitch Off}	Adds .org to the end of the previous word and turns off the Stitch command.
TKAUT	.net{Stitch Off}	Adds .net to the end of the previous word and turns off the Stitch command.
TKAUF	.gov{Stitch Off}	Adds .gov to the end of the previous word and turns off the Stitch command.
TKAUD	.edu{Stitch Off}	Adds .edu to the end of the previous word and turns off the Stitch command.
TKAUPL	.com{Stitch Off}	Adds .com to the end of the previous word and turns off the Stitch command.
TKO*T	.<Delete Space><Force Next Lower>	Adds a period to the end of the previous word, removes the space from whatever is written after this steno stroke and forces the text to be all lower case.
SWREUP/KOED	ZIP Code{Number Trigger}[NNNNn-nnnn]	Inserts the words ZIP Code and formats a five digit number and/or nine digit number following the words ZIP Code.
SWREUP/SWREUP	{Number Conversion}[NNNNn-nnnn]	Converts previously written five and/or nine digit numbers to a U.S. ZIP Code format.

## Quick Tran

Quick Tran allows you to start realtime translation bypassing any dialog box entries. For example, let's say you are an official court reporter and you want to break each calendar call into its own file. You can use Quick Tran to start a realtime session (first file for the day) and/or if you have already started realtime and want to start a new file quickly. Case CATalyst automatically uses the last realtime settings, including selected dictionaries and assumes *Writer* is selected in the Steno Source field of the Translate dialog box. By default, Case CATalyst assigns the file name using the two digit year, month and day followed by the hour, minute and seconds. For example: 080816\_140905 was created August 13, 2016 at 2:09:05 p.m. To customize the Quick Tran file naming convention, create a new naming formula in the Advanced Translate option, [Quick Tran filename format](#).

If you are writing realtime with a Diamante or élan Mira A3 WiFi connection and using the Quick Tran feature, you can have CATalyst automatically connect to the last WiFi writer by selecting the Auto Connect Last WiFi writer in the Translate, [Realtime settings](#).

If you select Quick Tran while in an active realtime file, Case CATalyst disconnects from the current realtime file and starts a new realtime file. **It is necessary to end the file on the writer to prevent the steno strokes from the current realtime file from being added to the new realtime file.** A new realtime file (tab) is started and the original realtime file remains open, allowing you to edit and save it. To change the default Quick Tran file name, use the [Rename](#) feature in Manage Jobs.

Access Quick Tran:

- at Manage Jobs, press **Alt + f, q (File/Quick Tran)** to start your first realtime file of the day. The first file and all subsequent files will use the last used translation settings (including selected dictionaries) and will name the file according to the Advanced Translate *Quick Tran filename format* option.
- while writing realtime, press **Alt + f, q (File/Quick Tran)** to start a new realtime file. The new file opens in a new tab with the default naming convention or if you modified the naming option, however you have modified the naming convention.
- in Edit, use a [keyboard command](#) assigned to Quick Tran or [macro](#) that invokes the Quick Tran command.

[Keyboard Map](#) Function: Quick Tran

## RealTeam - Simultaneous Editing

RealTeam™ is Stenograph's simultaneous editing feature. RealTeam allows realtime editing (sharing of text, globals and audio) with one or more scopists/proofreaders while the reporter is writing realtime. All the RealTeam participants have access to the text and audio. All globals can be shared with each connected RealTeam user's Global Table. RealTeam is not limited to just a realtime setting. It can also be used while just editing. For example, let's say that realtime is over and the reporter goes home for the day. The scopist can continue working on the transcript and even invite the proofreader to make a final pass at editing. Together, they can review the audio to create a perfect Transcript!

Each RealTeam participant [logs in](#) with an e-mail address and password which identifies themselves and allows access to a secure RealTeam connection.

### RealTeam Overview:

For example, let's say a reporter is hired to do a daily copy and wants to have a scopist edit the file during the proceedings. The reporter starts a realtime file (is automatically logged into RealTeam) and invites the scopist to join the realtime file. The scopist logs in to RealTeam and is notified of the invitation from the reporter. The scopist accepts the invitation and the realtime file opens on the scopist's system. The scopist begins editing and has access to the audio and can define, replace, delete, include, build an index, modify the layout, etc. Any changes made by the reporter or scopist are reflected on both systems. By default, all D, J, K and E defines are shared with all connected users' Global Tables. However, the reporter has an option to not receive dictionary defines made by the invited participants and can change this option per connection. If a Personal Global is used by any of the connected users, the Personal Global goes into the Global Table also. The Reporter's Area can be displayed so the scopist can see where the reporter can still make changes from the writer such as invoking realtime commands, number conversions, etc., but the Reporter's Area does not prohibit the scopist/proofreader from editing in the shaded area. When the scopist/reporter highlights text in the shared file, the highlight may display in a selected color on the scopist's/reporter's system. The reporter's/scopist's cursor displays with a name on the other system to indicate their cursor location. In other words, the reporter's cursor location displays on the scopist's system and the scopist's cursor displays on the reporter's system.

Each of the connected users has a copy of the RealTeam file on their own system. As long as the reporter remains connected, if any one of the other connected users close their file, the other connected users can continue to edit the file but changes will not be synched with the closed file. If a [participant](#) (one who was invited) closes their file, the [host](#) (one who sent the invitation) receives a message, in the lower right-corner of their screen, that states that the name of the participant has closed their file. It displays for approximately 15 seconds and then the message closes. If the host closes their file, a message displays on all of the connected participant screens stating that the name of the host has closed their file. The message displays until the participant either clicks the X in the upper right-hand corner of the message box or closes the file.

When you connect to a RealTeam session, (whether realtime or edit) the connected user's system retains the file structure and naming conventions from the host (user initiating the RealTeam session). For example, let's say Bill is going to take several depositions concerning an industrial accident. Bill creates a case named IA Depositions and starts his realtime job in the case and names the job: IA Depositions\_JSMITH\_12\_10\_18. He then invites Pam to the RealTeam session. Once Pam accepts the invitation, a case named IA Depositions is created on her system and a file named IA Depositions\_JSMITH\_12\_10\_18 is created within the case.

The view of things such as page/normal view, colors and options for the way dialog panes display are all based on the individual user settings. The host and participant's users' Usersettings information is not shared between systems. Format symbols, such as hidden text and oops, are shared within the transcript. Therefore, they will show up in everyone's Hidden Text and/or Hotspots panes. If you apply a different layout or modify paragraph settings, that affects the file on all connected users' systems.

You can easily set up a [RealTeam realtime test](#) and/or a [RealTeam non-Realtime](#) test in 5 easy steps.

### What you need:

- Case CATalyst V20.
- RealTeam or Cloud Backup login.
- Contact information for your scopist, proofreader or whomever you will be inviting to share your realtime.
- Internet connection with or without a local network.
- Edge for Case CATalyst Support Plan.

### Where to start:

- a. Create a RealTeam login or use an existing Cloud Backup login. See [RealTeam Login](#) for detailed information.
- b. Decide who your contacts will be, gather their contact information such as e-mail address and phone number (optional) and create your contacts. See [RealTeam Invite](#) (Contacts) for detailed information.
- c. Set up a time to test the connection, if possible, and familiarize yourself with RealTeam.

### RealTeam Things to Know:

- The RealTeam Host (the person doing the inviting) must be in the RealTeam file for the feature to share editing changes. Once the host closes the file, RealTeam session ends. In other words, if the reporter did the inviting and is done for the day or closes out at lunch, and there are two or more other participants working on the file in RealTeam, all sharing ends when the reporter closes the file. The participants will receive a message, "Host Name has closed their RealTeam file. Future changes will not be synched." Once the participants get that message, any editing they do will only be changed in their copy of the file.
- The RealTeam toolbar () with just the RealTeam Status icon is automatically added to Manage Jobs. You can click vertical dot section () while holding down your left mouse button and drag the toolbar to your desired location. The RealTeam toolbar with both the RealTeam Status icon and RealTeam Invite icon () is automatically added to Translate & Edit. A realtime or edit file must be open in order to invite a participant to a RealTeam session.
- To invite someone to a RealTeam session, the host (person inviting a contact(s) to join the RealTeam session) needs to select the RealTeam Invite option from the Translate dialog box, the File menu in Edit or by clicking the RealTeam Invite icon () on the RealTeam toolbar while in edit. When you select RealTeam Invite, you are automatically logged in to RealTeam.
- The participant/participants (person/people that will be receiving the invite for a RealTeam session) need to log in to RealTeam by selecting RealTeam Ready from the File menu from anywhere in CATalyst or click the RealTeam Status icon () on the RealTeam toolbar. If the RealTeam Status

icon is blue () , you are already logged into RealTeam. The Auto Login to RealTeam at CATalyst Startup option is available in the RealTeam Ready dialog box.

- If you have been invited to share a file and you close the file while RealTeam is still active or you disconnect, you will receive the invite again. You have the option to decline the second invitation if you are done editing.
- If you are currently active in a RealTeam session and you select to close the file, you are not logged out of RealTeam. If you are listed in other RealTeam user contact lists, your status will display Available. If you wish to "log out" of RealTeam, you can either select File, RealTeam Ready and click the Logout button or click the RealTeam Status icon () and click the **Logout** button. In addition, when you close Case CATalyst, you are automatically logged out of RealTeam.
- It is possible to have another system with the same PKC make changes to the RealTeam file without simultaneous usage information being reported. For example, an official reporter sets up a RealTeam session with the courtroom computer and the office computer. During a break, the reporter goes to the office and edits, which updates the courtroom computer. **As long as no changes are made to the transcript using the courtroom computer at the same time the reporter is making changes on the office computer, simultaneous usage will not be reported .**
- Format symbols, such as Oops, or Hidden Text comments, are shared within the transcript. Therefore, they will show up in everyone's Hidden Text and/or Hotspots panes.
- The view of things such as page/normal view, colors and options for the way panes display are all based on the individual user settings. The connected users' Usersettings information is not shared between systems.
- If you are editing right up against the realtime text, the audio playback may stop because there isn't audio available yet. Simply select Play Audio again in a few seconds and there should be more audio available.
- The Track Changes feature is not supported with RealTeam.

## Set up a RealTeam Realtime Test - 5 easy steps

### Set up a RealTeam Realtime Test - 5 easy steps

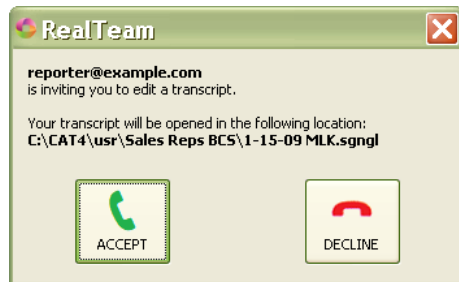

Stenograph encourages you to set up a RealTeam realtime test prior to trying it in a real situation. The following information focuses on starting a RealTeam session while writing realtime.

Coordinate with your scopist or another reporter to set up a RealTeam session.

1. Start a realtime file. (Select Translate, type a file name, **select the [RealTeam Invite check box](#)** and click **OK**.) Selecting the RealTeam Invite automatically logs you in and displays the RealTeam Invite dialog box.
2. In the RealTeam Invite dialog box, click the check box in the Invite column for the contact you want to invite and click the Invite button (**Alt + i**). You can also highlight a contact and press **Spacebar** to invite. See [RealTeam Invite \(Contacts\)](#) for more actions you can take in the dialog box. You can invite a contact even if he or she has an Offline status. When he or she has an Available status (RealTeam Ready), he or she will receive the invite.
3. Start writing realtime. If the Connected Users pane is not displayed, click **View, Panes, Connected Users (Alt + v, e, u)**. You can see the status of your contacts in the Connected Users pane.
4. Advise your scopist/proofreader to login by clicking the **RealTeam Status** icon () or select File, RealTeam Ready and click **Finish**. Once they are logged in, your invitation will be sent to them. Once the invitation is received by the scopist/proofreader, he or she should click **Accept**.

The RealTeam invitation dialog box produces a "ring" like a telephone and the CATalyst icon flashes () on the Windows Taskbar. The RealTeam invite notification screen displays the e-mail address

of the person who sent the invitation and displays the RealTeam file and destination location. The file will be created in the current user with the same file name and in the case (if any) specified by the reporter.

5. Once the participant selects to Accept the invitation, the scopist/proofreader receives the file. Continue to write realtime, test the audio if you selected to record audio, edit, etc. You may see the scopist/reporter cursor, marks, changes as he/she edits. When finished, save and close the file.

**NOTE:** During a RealTeam session, if your cursor or mouse pointer is in the same place as a remote cursor, the remote system's cursor may hide temporarily. If a remote cursor(s) is positioned above the top viewable line on the screen, the remote cursor(s) name will display in the upper left-hand corner of the screen. If the remote cursor(s) is positioned below the last viewable line on the screen, the remote cursor(s) name will display at the lower left-hand corner.

**In the future, these are your steps for a RealTeam realtime session. Start realtime translate with the RealTeam invite box checked. Invite one or more people. That's it!**

## Set up a RealTeam Non-Realtime Test

### Set up a RealTeam Non-Realtime Test

RealTeam can be used in a non-realtime situation. You can invite a scopist to share the file, or the scopist may invite you to share the file.

1. Open a file. The RealTeam Invite feature is only available when you are in a file (edit or realtime).
2. Select File, RealTeam Invite and select the contact(s) you want to invite and click Invite (**Alt + i**). Selecting the RealTeam Invite automatically logs you in and displays the RealTeam Invite dialog box. You can invite a contact even if he or she has an Offline status. When he or she has an Available status (RealTeam Ready), he or she will receive the invite.
3. Advise your scopist/reporter/proofreader to select File, RealTeam Ready and click **Finish**. Also, once the invitation is received, the other person should click **Accept**. The RealTeam invitation dialog box produces a "ring" like a telephone and the CATalyst icon flashes on the Windows Taskbar.
4. The scopist/proofreader receives the file. You and your scopist/proofreader should try editing commands, listening to the audio if the file has audio, etc. When finished, save and close the file.

**NOTE:** During a RealTeam session, the contact's name displays to indicate the contact's cursor location in the file. The person's name who invited the contact displays on the contact's screen to indicate the location of his/her cursor. If a contact's cursor is covering text that you'd like to view, simply move your cursor or mouse pointer near or over the contact's cursor and it will temporarily shrink/hide. When you move your cursor or mouse pointer away, their cursor will display again.

**In the future, these are your steps for a RealTeam non-realtime session. Open a file, invite one or more people. That's it!**

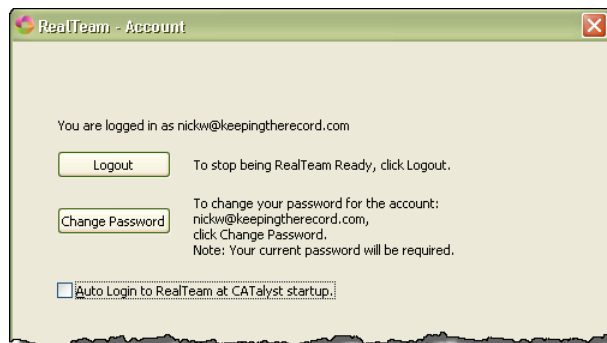

## Login into RealTeam

Each RealTeam participant needs a RealTeam login. However, if you would like, you can use the same login as your Cloud Backup account. Once you have your login information completed, the Auto Login to RealTeam at CATalyst startup option allows you to select it once and every time you start Case CATalyst, you will automatically be RealTeam Ready.

**To use an existing login or create a new RealTeam login:**

1. Anywhere in CATalyst, do **one** of the following:

- On the [RealTeam toolbar](#) in Manage Jobs, click the RealTeam Status (  ) icon. The icon turns blue when you are RealTeam Ready.
- select **File** and then **RealTeam Ready**.

If you have an existing Cloud Backup account, it will suggest that login information. Proceed to **Step 2**.

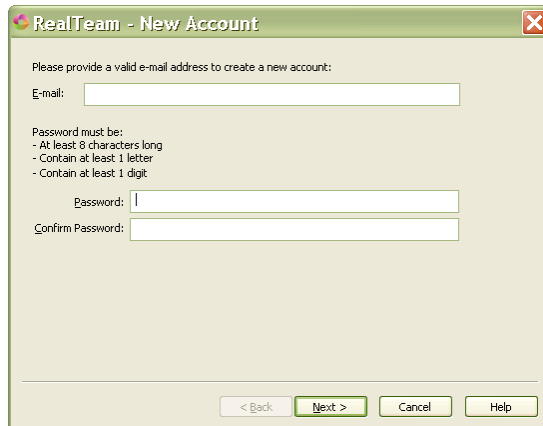

If no login exists, the E-mail and Password fields will be blank. Proceed to **Step 2**.

2. Do **one** of the following.

- To log in using the suggested login information, click the **Login** button. **Go to Step 7**.
- To log in using a different account than the suggested information, type your e-mail address and password for the account you want and click Login. **Go to Step 7**.
- To create a new account, click the **Create New Account Now** button. **Go to Step 3**.

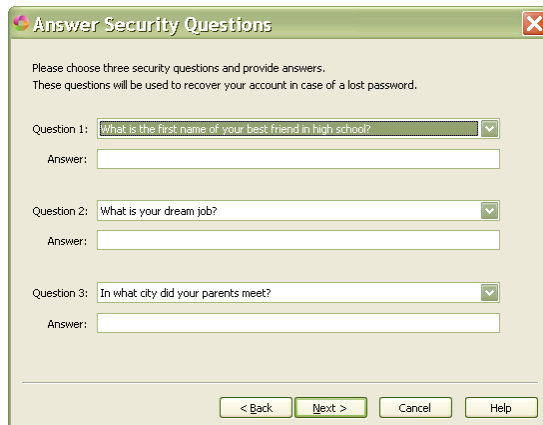

3. In the Create New Account Now dialog box, do the following:

The dialog box is titled "RealTeam - New Account". It contains the following elements:

- A message: "Please provide a valid e-mail address to create a new account:"
- An "E-mail:" text input field.
- A "Password must be:" section with three bullet points:
  - At least 8 characters long
  - Contain at least 1 letter
  - Contain at least 1 digit
- A "Password:" text input field.
- A "Confirm Password:" text input field.
- At the bottom, four buttons: "< Back", "Next >", "Cancel", and "Help".

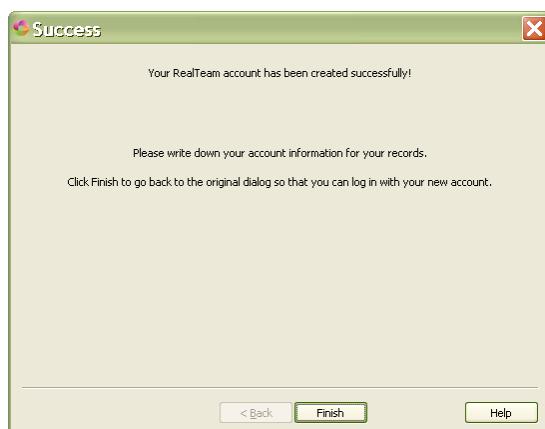

- In the **E-mail** field, type a valid e-mail address. Press **Tab** to move to the Password field. (Although you are entering a valid e-mail address, you will not receive e-mails from RealTeam. The e-mail address is used strictly as a login name.)
  - In the Password: field, type a password that contains at least 1 letter, 1 digit and is at least 8 characters long.
  - In the Confirm Password: field, type the same password you typed in the Password field. If the passwords match, the Answer Security Questions dialog box displays. If the passwords do not match, *The passwords don't match* dialog box displays. You will need to retype the passwords.
  - Press **Enter** or click Next >.
4. The Answer Security Questions dialog box displays. Select a question and type an answer for each of the three questions. In the event that you forget your password, you maybe prompted for the answers to the three questions you selected.

The dialog box is titled "Answer Security Questions". It contains the following elements:

- A message: "Please choose three security questions and provide answers. These questions will be used to recover your account in case of a lost password."
- Three question-answer pairs:
  - Question 1: "What is the first name of your best friend in high school?" (dropdown menu) with an "Answer:" text input field.
  - Question 2: "What is your dream job?" (dropdown menu) with an "Answer:" text input field.
  - Question 3: "In what city did your parents meet?" (dropdown menu) with an "Answer:" text input field.
- At the bottom, four buttons: "< Back", "Next >", "Cancel", and "Help".

- To continue, press **Enter** or click Next >.
- The Success dialog box displays. Be sure to write down your login information and store it in a safe location. Click **Finish** to return to the RealTeam Login dialog box and login.

7. Do **one** of the following:

- To automatically be logged in to RealTeam and be RealTeam Ready when you start Case CATalyst, press **Alt + a** (Auto Login to RealTeam at CATalyst Startup) and then press **Enter** or click Finish.
- To log in to RealTeam, press **Enter** or click Finish.

The [RealTeam Status icon](#) turns blue () when you are RealTeam Ready.

## RealTeam Host and Participant

The **RealTeam Host** is the one that invites one or more people to the RealTeam session. The RealTeam session can be a realtime file or editing a transcript.

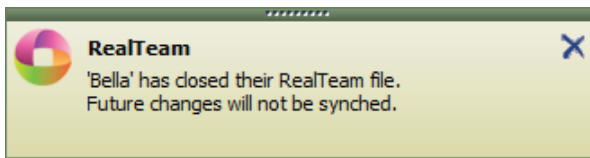

### Realtime:

1. Open CATalyst and start a realtime file. Type a file name, select output options, record audio, create EZ Speakers, select dictionaries, etc., if appropriate. To start realtime, click the **RealTeam Invite** option and then press **Enter**. You are automatically logged into RealTeam.
2. In the RealTeam Invite dialog box, select the contacts you wish to invite and press **Enter** or click **invite**.
3. Continue writing realtime as usual.

### Edit:

1. Open CATalyst and open the file you want for the RealTeam session.
2. Click the RealTeam Invite icon () to open the RealTeam Invite dialog box, select the contacts you wish to invite and press **Enter** or click **Invite**.
3. Edit your file as usual.

Note: If a participant closes the file while the host continues to edit, the following message displays on the host's screen in the lower right-hand corner:

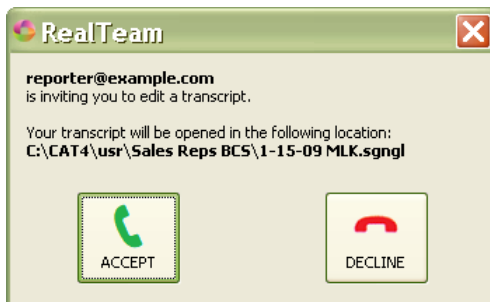

The message displays approximately 15 seconds and then closes.

The **RealTeam Participant** is one who is invited to the RealTeam session. The RealTeam session can be a realtime file or editing a transcript.

Realtime or Edit:

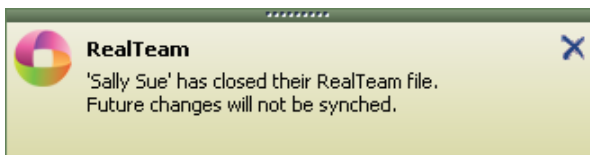

1. To log in to RealTeam, click the RealTeam Status icon (  ) on the toolbar. Once you are logged in, the icon turns blue (  ).
2. The RealTeam invitation dialog box produces a "ring" like a telephone and the CATalyst icon flashes (  ) on the Windows Taskbar. When you receive the RealTeam invitation, click the **Accept** button.

Clicking the  in the upper right-hand corner of the Invite (Answer/Decline) dialog box, will hide the invite dialog box momentarily and then you will be invited again. The Invited dialog box is modeless which means it can stay on the screen while you perform other actions such as finishing up a job or changing users.

3. Start editing as usual.

Note: If the host closes the file while other participants continue to stay in the file, a similar message displays on the connected participant's screen in the lower right-hand corner:

The message displays on each connected participant's screen until they click the X in the upper right-hand corner or close the file.

## RealTeam - Transfer to User

The Transfer to User option allows the current host to make any of the currently connected participants (clients) the new host for the current RealTeam session. Once the initial host transfers to the new host, the initial host will disconnect from the RealTeam session. The new host and all other participants will still be connected and able to continue the RealTeam session without interruption. The ability for a host to transfer the RealTeam session to a new host lets the reporter leave the RealTeam session when their writing is done without interrupting the RealTeam connection of all other RealTeam participants. This is great for teams when the reporter is done writing for the day and the scopists want to continue their RealTeam editing. They no longer need to invite each other to a new RealTeam session. Instead, the reporter can simply transfer the hosting of the RealTeam session to one of the team members and be on their way!

When the current host is ready to transfer the RealTeam hosting to one of the connected participants they will do the following:

1. Open the *Connected Users* Pane by selecting **View, Panes, Connected Users** (*Alt+v,e,u*).
2. In the RealTeam Connected Users section of the Connected Users pane, right click on the name of the participant who will become the new host and select **Transfer to User**.

During the transfer process, the message "Transfer is in progress. Please wait." will appear on the participants screens. When the transfer is complete, the new host will receive the message "Transfer is complete. You are the new host."

There are a couple of items you may want to make note of about the Transfer to User feature:

- The new host does not inherit the "Add To My Dict." settings from the previous host. If the participant who will be taking over as host wants to obtain defines made by the participants (e.g. to make it easier to provide comprehensive dictionaries to the original host), the new host should open the RealTeam Invite dialog box and make sure that the "Add To My Dict" setting for each user is set as preferred for each RealTeam participant.
- It is possible for the new host and participants invited by a new host to receive a new file with an "\_1" appended to the original file name of the current transcript. RealTeam does this to prevent loss of editing changes in situations where it is possible for editing changes made offline to conflict with editing changes made during a RealTeam session. For example, let's say the original host for a RealTeam session transferred the RealTeam session to a new host. The original host then made editing changes to the transcript while not connected to the RealTeam session. If the new host decided to invite the original host back into the RealTeam session for the transcript, the original host would receive a new file with an \_1 appended to the file name of the transcript. In this way, Case CATalyst prevents the editing changes made by the RealTeam participants from being lost when the original host reconnects to the RealTeam session.

## RealTeam Invite - Translate dialog box

A RealTeam Invite option has been added to the Translate dialog box. When the RealTeam Invite (**Alt + i**) option is selected and you start realtime, you are automatically logged in to your RealTeam login and the [RealTeam Invite dialog](#) box displays your contacts so you can quickly see who is available and select your scopist or proofreader and then write realtime as you normally do.

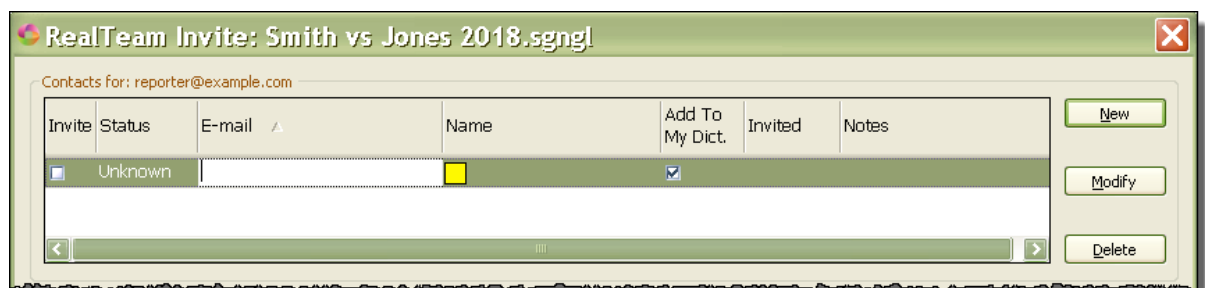

If you forgot to select the option when starting realtime, you can always select the File (**Alt + f**) and then select RealTeam Invite to access your contacts and select them.

## RealTeam Contacts - Invite dialog box

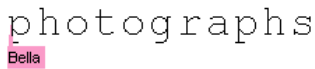

### RealTeam Invite (Contacts) dialog box

The RealTeam Invite dialog box contains your contacts' connection information (CATalyst V20 users that you will be inviting) for RealTeam. Although you can add a contact at any time, it might be easier to add some contacts before starting RealTeam. The RealTeam Invite dialog box contains fields for an e-mail address, name, cursor/highlight color, option to have defines he/she makes should be added to your appropriate dictionary and a note area. The minimum information you need for a contact is an e-mail address although additional information may be useful. For example, if you only want your scopist's dictionary definitions added to your Global Table and not to your appropriate dictionary, you might want to deselect the Add to My Dict. option or you might use the Note field for the contact's phone number or alternate e-mail address. In addition to your contact information, the RealTeam Invite dialog box also allows you to invite contacts and see their current status. This information is also available in the [Connected Users pane](#).

1. The **RealTeam Invite feature is available when a file is open or when starting realtime**, do **one** of the following:
  - Open an existing file and click the RealTeam Invite icon (  ) or select **File** and then **RealTeam invite**.
  - Select Translate, name a file, select the **RealTeam Invite** option and start a realtime file.
2. The Invite dialog box displays.

3. To add a contact, do the following:

- a. In the E-mail field, **type a valid e-mail address** for the contact and press **Tab** to move to the Name field.
  - b. **Type the contact's name.** If desired, click the down arrow (▼) to select the cursor/highlighting color for the contact on your system. The name in the Name field displays in the shared file (realtime or edit) to indicate the contact's cursor location during RealTeam. For example, let's say Bill starts his realtime file and invites his contact, Bella, to scope for him. Bella's name displays on Bill's realtime screen to indicate where her cursor is located. Bill's name displays on Bella's realtime screen to display where his cursor is located. If there is no name in the Name field for the contact, then the name/characters up until the @ in the E-mail field will be used as the name for the cursor location. The following is an example of the cursor name:  

  - c. The **Add To My Dict.** column is selected for each contact by default. When selected, dictionary defines that the connected participant make are added the host's global table and appropriate dictionary along with the global table and dictionary on their own system. For example, let's say that the witness' name is Daniel and the testimony is going fast and instead of writing TKAPB/KWREL, the reporter writes TKAPB/SWR-L. The scopist quickly J-defines the outlines as Daniel and the j-define goes to the reporter's Global Table and Job dictionary in addition to the scopist's Global Table and job dictionary. If you want the connected participant's defines to only go to the host's Global Table, deselect the option. The status of this option is remembered per participant unless you open the RealTeam Invite dialog box and change it..
  - d. If you desire, you can press **Tab** twice to move the cursor to the **Notes** field in the event you want to add the contact's phone number or any additional information that would be helpful.
  - e. To add another contact, click **New** or press **Alt + n**. Press **Tab** to move to the Name field. Create as many contacts as you want.
4. Do one of the following:
- To invite a contact, place a check mark in the Invite column for the contact or contacts you want to invite and click **Invite (Alt + i)**.
  - To save and close your contacts, click **Close (Alt + c)**. For more extensive information about the RealTeam Invite dialog box, see the [RealTeam Invite \(Contacts\)](#) topic.

### Column Information for the Invite dialog box

**Invite:** click the check box associated with the contact you want to invite to the RealTeam session. You can also use the up/down arrow keys to highlight the contact and then press the **Spacebar** to Invite.

**Status:** displays the contact's current status.

- Offline - contact is not RealTeam Ready/not logged in to RealTeam. You can still invite a contact with an Offline status and once they log in to RealTeam, they will receive the invite.
- Available - the contact is online and logged into RealTeam waiting to be invited. Availability status is per document/transcript. Click the Status column  to sort your contacts based on their current status, available contacts listed first.
- Connected - the contact is logged in and connected to the current RealTeam session. If you want to rescind your "invite" to the contact or disconnect them from the RealTeam session, click the check box in the Invite column of an invited user, the following message displays:

If you select Yes, the contact is disconnected from your RealTeam session.

- Declined - the contact received your invitation but selected Decline instead of Accept. If you want to try and invite the contact again, simply click the check box in the Invite column again.
- Unknown - RealTeam cannot determine the status of the contact.

**E-mail:** displays the e-mail address for the contact. The email address should be the same one used to log in to RealTeam. This information displays in the Connected Users pane. (Although you are entering a valid e-mail address, you will not receive e-mails from RealTeam. The e-mail address is used strictly as a login name.)

**Name:** displays the name of the contact and the color of the cursor/highlighting for the contact on your system. The contact's information displays in the Connected Users pane when connected. If the name field is empty in RealTeam Invite dialog, the cursor displays their email address field up until the @ symbol.

**Add to My Dict.:** is selected by default and means that any dictionary definitions the contact makes during a RealTeam session will automatically be sent to the Global Table and to respective dictionary on the "host's" system. If you do not want the contact's dictionary defines to be place in your dictionaries, deselect this option. All defines, including Personal Globals are shared and sent to the Global Table of all connected users.

**Invited:** displays Invited when the contact has been invited. Even if the contact declines the invitation, the status will remain Invited.

**Notes:** type any additional information you might want available for the contact such as an alternate phone number or e-mail address.

### Modify Contacts

To open the Invite dialog box and modify the information for a contact(s), open a file in edit and click the

RealTeam Invite icon () or select File and then RealTeam Invite. The RealTeam Invite menu item is only available in the Edit function (you can also access the invite dialog after you select the RealTeam check box when starting translate). The Invite dialog box displays.

1. To modify a contact's information, use the mouse or up/down arrow to highlight the existing contact and then click **Modify** or press **Alt + m**.
2. Use **Tab** to move from column to column to modify/add information.
3. Repeat **Step 1** to modify another contact's information or click **Close** (Alt + c) to save and close the Invite dialog box.

### Delete Contacts

To open the Invite dialog box and delete a contact or contacts, open a file in edit and select File and then RealTeam Invite. The RealTeam Invite menu item is only available in the Translate & Edit function (you can also access the RealTeam Invite dialog after you select the RealTeam check box when starting translate). The RealTeam Invite dialog box displays.

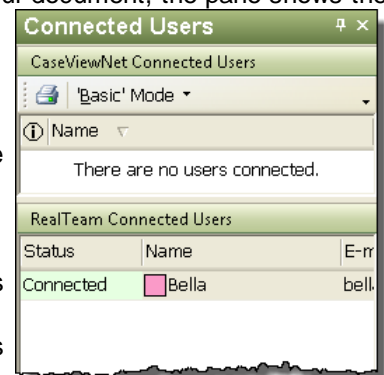

1. To delete a contact, use the mouse or up/down arrow to highlight the existing contact and then click **Delete** or press **Alt + d**.
2. At the "Are you sure..." message select **Yes** to delete the contact from the Invite dialog box.
3. Repeat **Step 1** to delete additional contacts from the RealTeam Invite dialog box or click **Close** to save and close the RealTeam Invite dialog box.

### Login Settings

If you are in the RealTeam Invite dialog box and need to log in to RealTeam with different credentials (since CATalyst automatically logs in when you select RealTeam Invite), you can select the **Login Settings** button. Once the RealTeam - Account dialog box displays, click the **Logout** button, then log in with the appropriate account e-mail and password and click **Finish**.

## RealTeam Connected Users Pane

The Connected Users pane is available by selecting the View menu, Panes and then Connected Users (**Alt + v, e, u**). The Connected Users pane has two sections - the RealTeam section is on the bottom part of the pane. If you are the host that invited other users to share your document, the pane shows the contact information for all the users that have been invited. For example, let's say you are the reporter writing realtime and you invited your scopist and a proofreader. Your Connected Users pane will show both contacts along with their status. Let's say the scopist accepted your invitation, so the scopist's status shows Connected. Let's say the proofreader is going to wait 30 minutes before connecting so the proofreaders status is Offline. Once the proofreader logs in and accepts your invite, the status displays Connected. If you are the scopist and/or proofreader in this example, you will only see the status for the person that invited you. In other words, the scopist will not see the status of the proofreader and the proofreader will not see the status of the scopist.

### The Connected Users Pane Expanded:

RealTeam Connected Users				
Status	Name	E-mail	Notes	Conn Type
Connected	Bella	BellaMainPetersen@g...	No Mondays	Direct
Offline	Sammy	sammy@au.com		Unknown

A Right click menu is available in the Connected Users pane with the following actions:

- Disconnect - disconnects the selected contact from RealTeam.
- Reconnect - attempts to establish a new connection with the contact - an invite is sent out.
- Modify - allows you to modify the contact's name and cursor/highlight color.

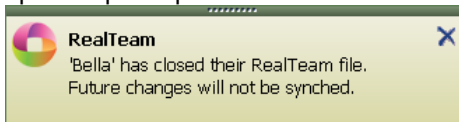

Status: displays the status of the contact.

- Connected - the connection has been established. The "host" (who invited the participants) can right click a contact's Status field and select Disconnect User, Reconnect User or Modify. The "host" (who invited participants) see all the connected participants and a participant will only see the "host" in their Connected User Pane.

- Declined - the contact declined the invitation for the current document. Perhaps this was by mistake. If so, the "host" (who invited the participant) can right click the contact's Status field and select Reconnect.
- Available - the contact is online and logged into RealTeam waiting to be invited. Availability status is per document/transcript.
- Failed - indicates that something went wrong with the connection. RealTeam will continue to attempt to connect. If it doesn't reconnect on its own, manually select to reconnect or contact support for assistance if the failed status continues to display.

Name: displays the contact's name. The name field displays the contact's name in the Connected Users

Pane, as the remote cursor name (  ). This name is also used in the informational message that pops up if the participant/host closes out of a file while the host/participant is still connected.

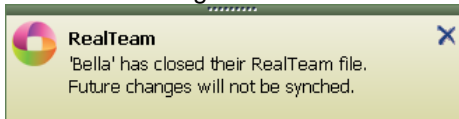

- If you right click the contact's Name field, you can modify the Name and/or change the cursor/highlight color associated with the contact. The color indicates the color of the cursor and highlights. Use the drop-down arrow to select your preferred color for each contact. Changing the cursor/highlight color only affects the display on your computer.

E-mail: displays the contact's e-mail address. This can only be modified in the RealTeam Invite dialog box.

Notes: displays any notes that were added to the contact's information in the RealTeam Invite dialog box. This can only be modified in the RealTeam Invite dialog box.

Conn Type -- displays the type of connection which is either Direct or Relay. This information may be helpful to support when troubleshooting. still connected users, the message displays the name that they have in a message if one of the connected users close their file while there are still connected users.

- If you right click the contact's Name field, you can modify the Name and/or change the cursor/highlight color associated with the contact. The color indicates the color of the cursor and highlights. Use the drop-down arrow to select your preferred color for each contact. Changing the cursor/highlight color only affects the display on your computer.

E-mail: displays the contact's e-mail address. This can only be modified in the RealTeam Invite dialog box.

Notes: displays any notes that were added to the contact's information in the RealTeam Invite dialog box. This can only be modified in the RealTeam Invite dialog box.

Conn Type -- displays the type of connection which is either Direct or Relay. This information may be helpful to support when troubleshooting.

## RealTeam Globals

All globals made by the connected users are shared with the host and all other participants and are available in the global table on their respective systems. When a participant makes a D, J, K or E define, the global is placed in each connected user's global table and the dictionary defines (D, J, K) go in the respective dictionary of the participant that made the define. Using the default settings, the dictionary defines made by the participants will also be added to the host's dictionaries.

For example, Mary Jane is doing a realtime job and invites Maddie and Sam to scope the job. Both Maddie and Sam are familiar with the job and both are making J-defines. Maddie's J-defines are going to the global table and job dictionary on her computer and going to Mary Jane and Sam's global table on their computers and to Mary Jane's job dictionary. Sam has worked with Mary Jane for years and is making some D-defines that are going to his global table and Personal Dictionary and going to Mary Jane and Maddie's global table on their computers and to Mary Jane's Personal Dictionary.

**By default, all dictionary defines made by invited participants go to the "host's" respective dictionaries unless the host deselects the Add to My Dict. option for the contact in the [RealTeam Invite](#) dialog box.** For example, using the example above, let's say that Mary Jane deselected the Add to My Dict. option for Maddie because although she is familiar with the case, she has not worked with Maddie very often. So, in this scenario, Maddie's J-defines go to Maddie's global table and Job dictionary and her J-defines go only to Mary Jane and Sam's global tables.

If the Add to My Dict. option is selected for the contact, then the contact's D-defines go to the host's Personal Dictionary (or Update Area depending on the "Host's" Dictionary Options), K-defines (Case) go to the host's Case dictionary and J-defines go to the host's Job dictionary. E- defines go to each connected users Global Table.

If participants make dictionary entries that go to the host's dictionary, there is a quick and easy way to find all entries made during RealTeam sessions. In any dictionary, you can Filter or Search by the Entry Type: From RealTeam to see what defines were added to the respective dictionary during the RealTeam session. You can quickly review the steno and text and decide if you want to keep the entries in your dictionary.

### To Filter or Search for "From RealTeam" entries in a dictionary:

1. Open the dictionary where you want to filter or search (or use Search File Contents to search multiple dictionaries).
2. Do **one** of the following:
  - Select Filter to show all the entries created by connected users during a RealTeam session. The Filter command displays only the entries that meet the filter criteria.
  - Select Search to find the entries created by connected users during RealTeam sessions. The Search command moves to one entry at a time that meets the filter criteria.
3. In the Filter or Search dialog box, press **Alt + e** (or click the Entry Type option) to select the Entry Type option and then click the list field down arrow () to display the list of entry types and select **From RealTeam**.
4. Select any other appropriate options, if any and then press **Enter** to Filter or Search your dictionary for "From RealTeam" entries.
  - If you selected to Filter the dictionary, the dictionary displays only the From RealTeam entries. To display all the dictionary entries again, press **Alt + v, u** (Unfilter) or click the Unfilter icon ().
  - If you selected to Search the dictionary, you can press **F3** to move to the next entry or **Shift F3** to move to the previous entry.

5. To close the dictionary, press **Alt + f, c** (File, Close) if there are any unsaved changes you will be prompted to save the changes.

## RealTeam's Toolbar

A RealTeam toolbar with the RealTeam Status icon () is available at Manage Jobs toolbars and a RealTeam toolbar with the RealTeam Status icon and RealTeam Invite icon () is in Translate and Edit. The RealTeam toolbar displays both icons in Translate and Edit because a file must be open in order for you to send a RealTeam Invite. The icons function is to visually show the status of the RealTeam session in any function of CATalyst and to show your own RealTeam connection status (RealTeam Ready or not). The toolbar contains two icons - the first icon () is the RealTeam Status icon and second icon () is the RealTeam Invite icon. You can move the RealTeam toolbar by clicking the vertical dot section () of the toolbar while holding the left mouse button down and drag the toolbar to your desired location.

### RealTeam toolbar:

- The RealTeam Status icon displays different colors based on your status when you are or are not logged in to RealTeam or based on the RealTeam session connection status when in a RealTeam session. If you are going to be a participant in a RealTeam session and are waiting for invitation, click the RealTeam Status icon to access the RealTeam Ready dialog. When logged in, the icon will be blue () - Tooltip: RealTeam Ready!. If not logged in, the icon will be gray () - Tooltip: RealTeam is offline.
- The second icon is a shortcut to the RealTeam Invite dialog and you must be in a Transcript (realtime or edit) for it to be active. When active, () click the RealTeam invite icon to display your contacts and invite RealTeam participants.  
When a file is open, the icon is active () Tooltip: Invite other RealTeam members to join this transcript. When the icon is gray () you need to start translation or open a transcript/file.

### While in a RealTeam session:

- The RealTeam Status icon will show green () when you have at least two people successfully connected to the session (such as a reporter and scopist).
- The RealTeam Status icon will show yellow when a RealTeam participant is connecting.
- If the RealTeam Status icon is flashing red, it means there is a change in the connection and previously invited participants are not currently connected. A tooltip may tell you more information. Click the RealTeam Status icon to open or go to the Connected Users pane to get further details.

## RealTeam Log Out

There may be times where you have logged into RealTeam at the start of the day and now you no longer want to be RealTeam Ready but you are going to continue to work on your computer. You can log out of

RealTeam by clicking the RealTeam Status icon () on the RealTeam toolbar or by selecting File and then RealTeam Ready. The RealTeam - Account dialog box displays. Click the **Logout** button and then click **Cancel** to no longer be RealTeam Ready. Your status will be listed as "Offline" in any RealTeam Invite dialog box that contains your contact information.

## Edit

Edit is a function in Case CATalyst that allows you to make changes to the translated or typed text.

### Open an Existing Text File

- Press **Alt + f, o, t** (**File/Open/Text File**). Select a text file from the Open Existing dialog box and press **Enter** (**Open**).
- In Manage Jobs, double click on a text subfile or a job containing a text subfile.

### Create a New Text File

1. Do **one** of the following:
  - Press **Alt + f, n, t** (**File/New/Text**).
  - On the Function Bar, click the Edit  icon.
  - Press **Alt + u, e** (**Function/Edit**).
2. The Create New Document dialog box displays. Type a name in the *File name* field. If a text file with the selected file name is currently open in Edit, the file displays.
3. Select a Layout from the Layout Name field.
4. Press **Enter** (**Open**). Edit automatically opens with the new file.

## File - New - Text

The File, New, Text feature allows you to open a blank file in which you can type text, paste text, create an include file, parenthetical, index template, etc. When you select File, New, Text, the Create New Document dialog box displays with the Files of type field set to Transcript files (\*.sgnpl).

To create a new text file:

1. Press **Alt + f, n, t** (File, New, Text).
2. In the Create New Document dialog box, in the File name field, type the new file name.  
If you want to create the file in an existing case, double click the Case name.  
If you want to create a new case, click the New Case icon, type the name of the case and press **Enter**. To create the file in the new case, double click the case name.
3. In the Layout Name field, click the down arrow to display the list of available transcript layouts.  
Select the layout you want to apply to the new file.  
Once the blank file is open, the applied layout does not display until you type or paste text.
4. To create the file, press **Alt + o** (Open).
5. Begin typing or paste text.  
Once you begin typing or paste text the selected layout displays.

## Set Active Window

Set Active Window is a command that displays a dialog box listing the available Edit dialog panes from which you can select one to set the cursor focus. Each dialog pane in the list has an associated number. The list always displays in the same order with the same associated number. This assures the dialog panes retain the same number so you can include this command in a macro.

To use the Set Active Window command in Edit you must first open the desired keyboard map and [assign](#) a key to the command. You can [record](#) a macro using this command to set the focus to a window and then invoke a subsequent command.

### Use Set Active Window in Edit

1. Press the assigned key combination to invoke the Set Active Window command. The Set Active Window dialog box displays.
2. Select the number associated with the window on which you want to set the cursor focus. You can select to set the cursor focus on any available dialog pane in the list. If the dialog pane is closed, selecting the number opens the dialog pane and sets the cursor focus.

## Edit's Stationary Status Bar

Edit's stationary Status Bar is the bottom frame of the Case CATalyst software. Whether realtining or editing, the stationary Status Bar displays important information including page numbers, sections (if applicable), layout used and more. Below is an example of the stationary Status Bar.

Page 13    Sec 1    13/13    (13/584)    At 5.8 "    Ln 14    Deposition format: CAP | NUM | SCRL | OVR |    Kbd Map: Sydney's keyboard

### The following information displays on the stationary Status Bar:

- Page displays the current page number.
- Sec displays the current section number. A section is created when you reset a page number.
- x/x displays the current page number *versus* the total number of pages in the current section.
- (x/x) displays the current page number *versus* the total number of pages in the file.
- At x.x" displays the current horizontal location of the cursor in inches from the left margin.
- Ln x displays the current line number location of the cursor.
- The current layout name displays. If the layout has been modified in Edit, an asterisk (\*) displays for the layout name.
- The CAP display is black (active) if the Caps Lock key is on. If the Caps Lock key is not on, Caps appears grayed out.
- The NUM display is black (active) if the Num Lock key is on.
- The SCRL display is black (active) if the Scroll Lock (ScrLk) key is on. This key has no effect on CATalyst's scrolling or arrowing features.
- The OVR display is black (active) if the Insert key has been toggled and anything you type is going to overwrite the existing text. If you toggle the Insert key again, you will be in Insert mode and anything you type will be inserted into the body of the text.
- Kbd Map: displays the current keyboard map being used.

## Editing Basics

Editing Basics walk you through simple editing commands that allow you to make changes to the transcript, including text correction, conflicts resolution, definition of untranslates and paragraph formatting.

### Basic Cursor Movement Commands

You can perform basic cursor movements in Edit with keyboard commands, allowing you to keep your hands on the keyboard. You can also use keyboard shortcut keys to invoke menu features.

A [Keyboard Map](#) determines the action of the keys on the keyboard. Case CATalyst comes with a default keyboard map which you can change, allowing you to use keyboard commands from another Keyboard Map. Basic cursor keyboard commands for the default Keyboard Map include:

Key Assignment Name	Default Key Assignment	Description
Move Down	Down arrow	the down arrow key moves the cursor down one line at a time.
Move Down Word Begin		move the cursor down a line and at the beginning of a word.
Move Up	Up arrow	the up arrow key moves the cursor up one line at a time.
Move Word Right	Right arrow	the right arrow key moves the cursor one word to the right.
Move Word Left	Left arrow	the left arrow key moves the cursor one word to the left.
Move Right	Ctrl + Right arrow	moves the cursor one character to the right.
Move Left	Ctrl + Left arrow	moves the cursor one character to the left.
Move Screen Bottom	Ctrl + Down arrow	moves the cursor to the last line of text displaying on the screen
Move Screen Top	Ctrl + Up arrow	moves the cursor to the first line of text displaying on the screen
Move Line Begin	Home	moves the cursor to the beginning of the line.
Move Line End	End	moves the cursor after the last character in the line.
	End, End	moves the cursor after the last space at the end of the line.
Move Document Top	Ctrl + Home	moves the cursor to the beginning of the file.
Move Document Bottom	Ctrl + End	moves the cursor to the end of the file.
Move Screen Page Up	PgUp	moves the cursor back one screen at a time. In Page view, headers/footers are considered text and are counted when moving a screen at a time.
Move Screen Page Down	PgDn	moves the cursor forward one screen at a time. In Page view, headers/footers are considered text and are counted when moving a screen at a time.

Move Page Up	Ctrl + PgUp	moves the cursor to the first transcript line of the current page. If there are 25 transcript lines on a page, the cursor moves to line one.
Move Page Down	Ctrl + PgDn	moves the cursor to the last transcript line of the current page. If there are 25 transcript lines on a page, the cursor moves to line 25.
Scan Forward	F8	moves the cursor forward to the next scan item depending on your Scan For selection in Edit.
Scan Backward	Shift + F8	moves the cursor backward to the next scan item depending on your Scan For selection in Edit.

## Cursor Positioning in Edit

The cursor displays in Edit as a vertical blinking line in the text area of the editor and in the text field of a dialog box. Position the cursor to take an action on a:

### Single character or word

Place the cursor just before the character or on the word.

### Block of text or steno

Use a Mark command to extend the cursor until all the text or steno is highlighted.

### Space between words or symbols

Do **any** of the following:

- Position the cursor to the right of the space if you want to insert text.
- Position the cursor to the left of the space to add text to the previous word
- Position the cursor to the left of the space and press Delete to remove the space.
- Position the cursor to the right of the space and press Backspace to remove the space.

## Scan To and Define Untranslates

Untranslates are steno outlines that have not yet been defined in your dictionary. Use the Scan key to quickly move to the next untranslate. Scan can also move you to the next conflict, scan stop, or more depending on your [Scan For Options](#) settings.

Use [global definitions](#) to define untranslates, mistranslates, or partial translates you want to globally resolve. A global definition applies from the point of the cursor forward through the rest of the file. All global definitions go to the Global Table. Except for E-Defines, Case CATalyst also adds global definitions to the specified dictionary.

### Define an Untranslate

1. Press **F8** to scan to the next untranslate. The cursor positions immediately before the untranslated steno outline.
2. Do **one** of the following:

#### Define a single steno outline

There is no need to mark a single steno stroke. Continue with the next step.

### Define multiple steno outlines

Use any of the mark commands to highlight the steno strokes you want to define.

### Define partial translates

Use any of the Mark commands to highlight the steno outlines and translated text that follows the steno which you want to define.

To define steno outlines and translated text that precedes the steno, use any mark command that moves the cursor left, to highlight the text and steno strokes. For example, Shift + ← highlights text to the left of the cursor position.

3. Create a dictionary definition. Do **one** of the following:

#### D-Define

Press **Ctrl + d**. Use the [D-Define command](#) for common steno-based words or phrases that you want to add to your Personal Dictionary. A steno-based word or phrase has associated steno.

#### K-Define

Press **Ctrl + k**. Use the [K-Define command](#) for steno-based words or phrases that pertain specifically to this job or are not common steno-based words you want to add to your Personal Dictionary. The job must be in a case for the K-Define to be active.

#### J-Define

Press **Ctrl + j**. Use the [J-Define command](#) for steno-based words or phrases that pertain specifically to this job or are not common steno-based words you want to add to your Personal Dictionary.

#### Other Dictionary

Press **Ctrl + Shift + o**. Use the Other Define command for steno-based words or phrases you want to place in an alternative dictionary.

#### E-Define

Press **Ctrl + e**. Use the [E-Define command](#) for misspelled words or phrases that you want to globally correct or global but not add to any dictionary.

4. When the Global Define dialog box displays, type the text for the definition in the New Text field. You can insert format symbols into the definition by pressing **Alt + f (FS)** and selecting from the list or using [shortcut keys](#).
5. When finished defining press **Enter (OK)** to apply the definition.

## Scan To and Resolve Conflicts

Conflicts are multiple words that display together when the steno outline has more than one definition. For example: ^do you know ^down. In Edit, you can resolve a conflict for a single occurrence or globally resolve it so that it applies throughout the file. Use the Scan key to quickly move to the next conflict. Scan can also move you to the next untranslate, scan stop, or more depending on your [Scan For Options](#) settings.

Translate options such as [Auto Conflict](#) or [EZ Choice](#) can resolve conflicts automatically during translation. For example, when Auto Conflict is active, it resolves conflicts during translation by automatically selecting the first choice of the conflict. When EZ Choice is active, Case CATalyst resolves conflicts during translation based on previous conflict selections that occur in similar context.

## Resolve a Conflict

1. Press **F8** to scan to the next conflict. Case CATalyst positions the cursor immediately before the first caret (^) of the conflict.
2. Do **one** of the following:

#### Resolve for a single occurrence

Press the number associated with the conflict choice. For example, the conflict is ^do you know ^down. Press **1** to select the first conflict choice "do you know". Press **2** to select the second conflict choice, "down". To continue to scan, press **F8**.

#### Resolve globally

- a. Do one of the following:

##### E-Define

Press **Ctrl + e**. Use the [E-Define command](#) for misspelled words or phrases that you want to globally correct or global but not add to any dictionary.

##### D-Define

Press **Ctrl + d**. Use the [D-Define command](#) for common steno-based words or phrases that you want to add to your Personal Dictionary. A steno-based word or phrase has associated steno.

##### K-Define

Press **Ctrl + k**. Use the [K-Define command](#) for steno-based words or phrases that pertain specifically to this job or are not common steno-based words you want to add to your Personal Dictionary.

##### J-Define

Press **Ctrl + j**. Use the [J-Define command](#) for steno-based words or phrases that pertain specifically to this job, case, or are not common steno-based words you want to add to your Personal Dictionary.

- b. When the Global Define dialog box displays, type the text for the definition in the New Text field. Insert format symbols into the definition by pressing **Alt + f (FS)** and selecting from the list or using [shortcut keys](#).
- c. When finished defining, press **Enter (OK)** to apply the definition.

## Marking Text in Edit

A Mark command highlights steno and text for the purpose of performing another command. There are several Mark commands. The most common action to perform after Marking steno or text is to define or delete it. You can also use the Mark command to highlight steno or text for searching. When text is marked, the associated steno displays on the left side of the Status Bar.

Use the Mark command when you want to select more than one steno outline or word. It is not necessary to use the Mark command when defining or replacing a single steno outline or word. For example, to define the steno /SWORPB, position the cursor immediately before /SWORPB and press a define command.

You can use any of the following commands to Mark text. To unmark text, press **Alt + s, k (Special Edit/Unmark)** or click the mouse once anywhere on the screen.

- Shift + any basic cursor movement
- Ctrl + [

- Click and hold left mouse button + move mouse
- Click + hold Shift + click end of text
- Select Special Edit/Mark Start and Mark End

### Shift + any basic cursor movement key

Highlight steno outlines and words using Shift and any [basic cursor movement](#), such as →, Ctrl + , or Ctrl + Page Down. Depending on the cursor movement selected, this Mark command can highlight a single steno outline or word, line, or page.

For example, the Mark command, Shift + → highlights one steno outline or word at a time. To use this Mark command:

1. Position the cursor on or immediately before the steno or text.
2. Press **Shift** + → to mark the first steno outline or word. Continue to hold **Shift** and press → to highlight all the steno or text you want to mark. If you mark too much:
  - To unmark one steno outline or word at a time, press **Shift** + ← .
  - To unmark all the text, press the → arrow key without holding Shift; press **Alt** + **s, k** (**Special Edit/Unmark**); or click anywhere on the screen.
3. Perform the command for the highlighted steno and text.

### Ctrl + [

Highlight one steno outline or word at a time. To use this Mark command:

1. Position the cursor on or immediately before the steno or text.
2. Press **Ctrl** + [ to mark the first steno outline or word. Continue to hold **Ctrl** and press [ to highlight all the steno and text you want to mark.

If you mark too much:

  - To unmark one steno outline or word at a time, press **Ctrl** + ] .
  - To unmark all the text, press an arrow key; press **Alt** + **s, k** (**Special Edit/Unmark**); or click anywhere on the screen.
3. Perform the command for the highlighted steno and text.

### Click and hold left mouse button + move mouse

Highlight all the steno and text from where you first click and hold the left mouse button to where you move the mouse and release the button. To use this Mark command:

1. Position the cursor on or immediately before the steno or text and **press** and **hold the left mouse button**.
2. Move the cursor to the place where you want to quit marking and release the left mouse button.

If you mark too much:

  - To unmark one steno outline or word at a time, press **Ctrl** + ] or **Shift** + ← .
  - To unmark all the text, press an arrow key; press **Alt** + **s, k** (**Special Edit/Unmark**); or click anywhere on the screen.

## Click + hold Shift + click end of text

Highlight consecutive lines of steno and text. Position the cursor at the beginning of the text you want to mark. Hold **Shift**. Locate and click the last line or word of text to mark.

If you mark too much:

- To unmark one steno outline or word at a time, press **Ctrl + ]** or **Shift + ←**.
- To unmark all the text, press an arrow key; press **Alt + s, k** (**Special Edit/Unmark**); or click anywhere on the screen.

## Select Special Edit/Mark Start and Mark End

The [Mark Start/End commands](#) located on the Special Edit menu, perform differently than other Mark commands. You can use the Search feature in conjunction with these commands to highlight large blocks of steno and text. When using the Mark Start command with certain Edit commands, such as Copy, Cut or Delete, Case CATalyst assumes the Mark End at the end of the marking.

To use this Mark command:

1. Position the cursor on or immediately before the steno or text and select **Special Edit/Mark Start**.
2. Move your cursor to highlight the desired steno and text or use the Search feature to locate the end of the text you want to highlight.
3. Perform any other necessary Edit command. To unmark the highlighted text and not perform another Edit command, press **Alt + s, k** (**Special Edit/Unmark**) or click anywhere on the screen.

## Inserting Text

The cursor displays in Edit as a vertical blinking line in the text area of the editor and in the text field of a dialog box. When in Insert mode (default mode), you can type directly on the screen to insert text, format symbols, and punctuation.

When typing, the cursor pushes the text to the right as you type if you are in Insert (OVR is grayed out on Status Bar) mode. When you are in Overstrike (OVR) mode, the text you type overwrites the existing text. The default cursor mode in Edit is Insert (INS). To change the Insert/Overstrike mode, press the **Insert** key.

If you never use Overstrike mode or tend to press the Insert key by mistake, you can set the Insert key to do nothing in your [Keyboard Map](#).

To manually insert a conflict, you must use **Ctrl + i** (**Edit/Insert/Conflict**) to type the text in the Insert Conflict/Text dialog box in order for Case CATalyst to recognize the caret (^) as a conflict.

## Replace Text

You can replace existing text for a single occurrence with the [Replace command](#). If [Intuitive Replace](#) is active, Case CATalyst remembers all the replacements and suggests a word in the New Text field. Type new text or toggle through the 10 most recent replacements and select one.

### Example

To use the Replace command:

1. Position the cursor immediately before the word you want to replace. To replace more than one word, first Mark the text.

2. Press **Ctrl +r (Global/Replace)** The Global-Replace dialog box displays with the Global Type field set to Replace.
3. In the New Text field, type the new text or press **Ctrl + r** to toggle through the last ten replacements when using Intuitive Replace feature and select one to use.
4. Press **Enter (OK)**.

## Deleting Text

You can delete text in Edit in the following ways:

- Position your cursor immediately after the character or word you want to delete. Press **Backspace** to delete one character at a time.
- Position your cursor immediately before the word you want to delete. Press **Ctrl + Delete** to delete the word. You can continue to delete successive words.
- Mark text and then press **Delete**. Case CATalyst deletes only the highlighted text. If you mark a single word, Case CATalyst deletes only the word and does not include any adjoining spaces.

## Creating Global Definitions

A global definition allows you to define steno, words and phrases while editing (realtime or after the fact) once and apply the definition forward through to the end of the job or to the entire file. You [create](#) a global definition when you define steno outlines, including untranslates, mistranslates, or partial translates, as a D-Define, K-Define, J-Define, or an E-Define. You can also [apply a global only to the current section](#) in the file or [selectively](#).

Case CATalyst places D-Defines into your Personal Dictionary or the [Update Area](#), if selected for use, K-Defines into the Case dictionary, J-Defines into the Job dictionary, and E-Defines into the Global Table. In addition to placing the D-Defines, K-Defines, and J-Defines into a dictionary, Case CATalyst also places the definitions into the Global Table.

### Example

1. Position the cursor immediately before the steno outline. If the steno outline is more than one stroke, use a Mark (Shift + right arrow) command to highlight the strokes.
2. Press **Ctrl + d (Global/D-Define)** to place the definition into your Personal Dictionary. The Global D-Define dialog box displays.
3. With your cursor in the New Text field, type the text for the steno.
4. When finished defining press **Enter (OK)** to apply the definition.

There are [additional options in the Global dialog box](#) such as capitalization options, spacing options, stitch options and more.

## Creating Paragraph Format Definitions

There are several formatting definitions, with Question, Answer, Colloquy, New Line Paragraph and Centering among the most common. When creating a formatting definition, you include a specific format symbol in the definition to set the format for the paragraph. For example, you use the format symbol <Answer> to create an Answer definition. Paragraph values, such as margins, indents, and line spacing are set in [Layout](#).

Refer to the specific [format symbol](#) for detailed steps to create a formatting definition.

### Example

1. Position the cursor immediately before the steno outline. If the steno outline is more than one stroke, use a Mark command to highlight the strokes.
2. Press **Ctrl + d (Global/D-Define)** to place the definition into your Personal Dictionary. If you do not want the definition in your Personal Dictionary, use the appropriate command to place the entry in the correct dictionary. The Global D-Define dialog box displays.
3. With your cursor in the *New Text* field, do **one** of the following:
  - Use the shortcut key by pressing **F4 and then appropriate paragraph command**. For example, press F4 q for a <Question> paragraph style.
  - Press **Alt + f (FS)** to display the format symbol list. To insert a paragraph format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol you want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. For example, select Question for a <Question> paragraph style.
4. The format symbol displays in the *New Text* field. How the selected paragraph displays on the screen is determined by the paragraph style parameters set in the applied Layout. For example, if you inserted a <Question> paragraph style, the current layout determines whether a period follows the Q and the spaces before text begins along with the margins.
5. When finished defining press **Enter (OK)** to apply the definition.

## Creating Punctuation Definitions

Common formatting definitions include: period, question mark, comma, dash, colon, and apostrophe. To create the definition for punctuation:

1. Position the cursor immediately before the steno outline you want to define. If the steno is more than one stroke, use a Mark command to highlight the steno strokes.
2. Press **Ctrl + d. (Global/D-Define)**. The Global D-Define dialog box displays.
3. In the New Text field, type **any** of the following punctuation definitions. Case CATalyst automatically inserts one space following the punctuation. When you want to add or remove spaces following the punctuation, you must add the appropriate format symbol to the definition.

### Period/Point

- To create two spaces after a period during translation, type:

**. and then press the Spacebar once**

- To create a space before the period but no space after the period or to create a decimal point between two numbers when you are using the Automatic Number Conversion feature, define the stroke as the word "**point**" (no quotes). During translation, when the word "point" is written immediately before numbers, such as "point zero 8, Case CATalyst converts it to ".08". When a number followed by the word "point" followed by another number is written, such as "5 point 2", Case CATalyst converts it to 5.2.

No entry is required in the NumberConversion.ini table to use "point". When Automatic Number Conversion is active, Case CATalyst converts appropriately.

- To create a space before the period but no space after the period during translation, for numbers such as .08 or .385 when you are not using the Automatic Number Conversion feature, type:

**<Sticky Space>.<Delete Space> or <Delete Space>space.<Delete Space>**

- To create no space before the period and no space after the period during translation for numbers such as 1.25 or 7.5, when you are not using the Automatic Number Conversion feature, type:

**<Delete Space>.<Delete Space>**

#### **Question Mark**

To create two spaces after a question mark during translation, type:

**?** and then press the **Spacebar** once.

#### **Comma**

To create one space after a comma, type:

**,**

#### **Dash or Reporter's Dash**

To create a dash (--) and keep the dash on with the previous word, type:

**<Sticky Space>--**

#### **Colon**

To create two spaces after a colon during translation, type:

**:** and then press the **Spacebar** once

#### **Possessive and Non-possessive Apostrophe**

To have the Case CATalyst Smart Punctuation feature determine whether the apostrophe is possessive or non-possessive during translation, type:

**'**

#### **@ definition**

To create a dictionary for the @ symbol where you do not want a space before or after the symbol, type:

**<Delete Space>@<Delete Space>**

To create a dictionary definition for the @ symbol where you want a space before it and a space following it, type:

**<Sticky Space>@**

(The @ at the beginning of a definition is used to indicate auto include dictionary definition so when creating a dictionary definition for the @ symbol alone, a format symbol must proceed the @. Using a Sticky Space format symbol will retain a blank space before the @ symbol.)

4. When finished defining press **Enter (OK)** to apply the definition.

## **File Management Tools**

Several file management tools are available to assist in managing your transcript files, allowing you to append multiple files, break a single file into multiple files, merge files together and include files (parentheticals, title pages, certificate pages, exhibit blurbs, etc.) into a job. File management tools also include saving and loading alternate user settings for translation, reviewing the history for a job and changing writers during a realtime session.

## Save As

Save As (**Alt + f, e**) displays the Save As dialog box, which allows you to save the current file to another name, case, user folder, or drive. The original file is closed in it's original state or last saved version and a copy of the file with the new file name is created and opened. **You are now working in the new (Save As named) file.** You can automatically have Case CATalyst display the Save As dialog box with the last folder location in which you saved a file or the folder location of the current file by setting the [Advanced Edit Option](#), *Remember last folder used for Save As*.

### To use Save As:

1. Open the original file. If you make any changes in this file without saving and then do a Save As, the original file is closed and the changes in the file are saved to the Save As copy.
2. Press **Alt + f, a (File/Save As)**. In the Save Copy as dialog box, use the following fields and options as necessary:

### Save in

Defaults to the current user. Use the drop down button to save a file in another location.

### Go To Last Folder Visited

Return to the previous folder viewed.

### Up One Level

Move one folder level up in the file structure.

### File Window

Available files for the current user.

### Create New Folder

Create a new folder in the File Window. The folder icon along with a default name displays in the File Window. Type a new name in the highlighted area, then press **Enter**.

### View Menu

Display the files in the selected view: Thumbnails, Tiles, Icons, List, or Details.

### File name

Select an existing file name or type a new file name in the field. If you type the same name as an existing file, the following message displays when you select Save: "*filename.xxxx* already exists. Do you want to replace it?" If you select Yes, the existing file is overwritten by the current file. If you select No, the Save As dialog box displays and you can type a different name.

When typing a new file name, you can use upper and lower case letters, numbers and spaces. The following symbols are also valid characters to include in a file name: ' ~ ! @ # \$ % ^ & ( ) - \_ { }

Some characters are reserved by the operating system and used to perform system functions. They cannot be used in a file name. These characters include: " / \ [ ] : ; , | = < > ? \*

If you type the same name as an open file in another application, the following message displays: "This file is already is use. Select a new name or close the file in use by another application." Select **OK** and type a different file name or close the job or application and type the file name again.

### Save as type

The type of file that displays in the File Window which also indicates the type of file you are saving. To change the display of the file type, click the down arrow and select **All Files (\*.\*)**. The default file type is .sgcap.

### Save Selection

When you have selected text, this field displays allowing you to save the selection to a file. For example, you may want to save a portion of text from the current captioning session to create a script file for future use.

### Load to Story Queue

Check this box to load the saved file into the Story Queue and assign a Story Slug line using the current name of the saved file followed by the current date and time.

### Save

Save the captioning file.

### Cancel

Close the Save As dialog box without saving the file.

## Save and Load Alternate User Settings

Save and Load Alternate User Settings are Edit commands that enable you to save multiple user setting files and easily switch between them within the same user name. For example, you may want to have different user settings files based on the type of job, deposition versus court, transcript, [CART](#) using CARTView output or realtime versus editing.

Features saved to a user setting file include:

- Page display, Normal or Page view.  
Case CATalyst does not retain Full Screen. You can create a macro or AccelerWriter to switch the display to Full Screen when starting a job.
- Zoom settings.
- Color selections.
- Position and display status of the Vertical Notes and Reveal Codes dialog panes when the panes were docked or set to AutoHide. They are not remembered if panes were floating.
- Cursor context and size.
- Display font when in Normal view.
- CARTView window - font style, font size, background color and transparency, window position and line spacing.

The Save and Load Alternate User Settings features are accessible from Manage Jobs allowing you to save the current user settings after exiting Edit and load a user settings file before opening Edit. You can also select the Translate option, [Use Alternate User Settings for Edit](#), prior to translation and have Case CATalyst automatically load the saved settings when Edit opens. When you choose to save the translate settings, the file currently selected in the Use Alternate User Settings in Edit field is part of the [Saved Translation Settings](#) file.

When sending to CARTView and selecting an Alternate User Settings file, the Alternate User Settings file needs to be selected on the Input tab of the Translate dialog box in order to be applied to the CARTView window. Once realtime has started, loading a Alternate User Settings file from the File menu will not change the CARTView settings. If you want to change the CARTView display during realtime, [right click the CARTView window](#) or click the CARTView Settings Icon in the Windows System Tray.

Alternate User Settings files are stored in the Alternate User Settings case located within the Systems Files case.

## Save Alternate User Settings

1. In Edit, set the feature options you want to save to the user settings file.
2. Select **File/Save Alternate User Settings**. The Save As dialog box displays.
3. Do one of the following:
  - In the File name field, type a name for the user settings file and press **Enter (Save)**.
  - Select an existing file. The name displays in the File name field. Press **Enter (Save)**. Case CATalyst prompts you to replace the existing file. Press **Enter (Yes)** to overwrite the existing file.

## Load Alternate User Settings

1. Select **File/Load Alternate User Settings**. The Open dialog box displays.
2. Highlight the user settings file you to load and press **Enter (Open)**.

When sending to CARTView and selecting an Alternate User Settings file, the Alternate User Settings file needs to be selected on the Input tab of the Translate dialog box in order to be applied to the CARTView window. Once realtime has started, loading a Alternate User Settings file from the File menu will not change the CARTView settings. If you want to change the CARTView display during realtime, [right click the CARTView window](#) or click the CARTView Settings Icon in the Windows System Tray.

## Append

Append is an Edit feature that attaches a copy of a selected job file to the end of the current job. The original text selected to append remains unchanged. When the text you are appending has steno associated with the text, the steno also copies into the current session. You can append text from a file in your user name, another user name, or a case.

When appending a file that contains audio into a file that contains audio, the portion of file you are appending does not remain linked to its original audio. Case CATalyst displays a warning message allowing to continue or cancel appending the file.

## Append a Job in Edit

1. With your cursor in any position, press **Alt + f, d (File/Append)**. The Append dialog box displays.
2. Make entries in the fields as necessary:

### Look in

Choose the user name from which you want to select the file to append. The default is the current user. To locate a file in a location other than the CAT4 user level, use **Browse**.

### File Window

Available files for the current user. Highlight the file you want to copy to the end of the current Edit file. The selected file name displays in the File name field below. To select a file within a case, double-click the case to open it.

### **File name**

Type the name of the file to append. If you highlight a file to append, the file name displays here.

### **Files of type**

Displays the type of file to append. The default type is a Case CATalyst text (.sgnfl) file.

### **Browse**

Search for a different folder.

### **Bring Fields**

If there are field values in the file you are appending, decide whether you want to bring those fields values into the current file. If you bring the field values and they conflict with existing field values in the current file you will be prompted to select the field value you want. CATalyst remembers the last state of the Bring Fields option the next time you use the Include, Append or Merge command.

### **Bring Layout**

Check this box to bring in the associated layout for the file you are appending.

### **Keep Inc File Page Number**

The Keep Inc File Page Numbers (**Alt + e**) option (when the Bring Layout option is selected) allows you to append the selected file to the end of the current transcript and retain the page numbering on the appended file.

### **Keep Orig File Page Numbers**

This option is not available when appending.

3. Press **Enter (Open)** to Append the selected file.

## **Break**

Break is an Edit feature that allows you to split a text file into two or more portions and save the additional portion to a new or an existing file.

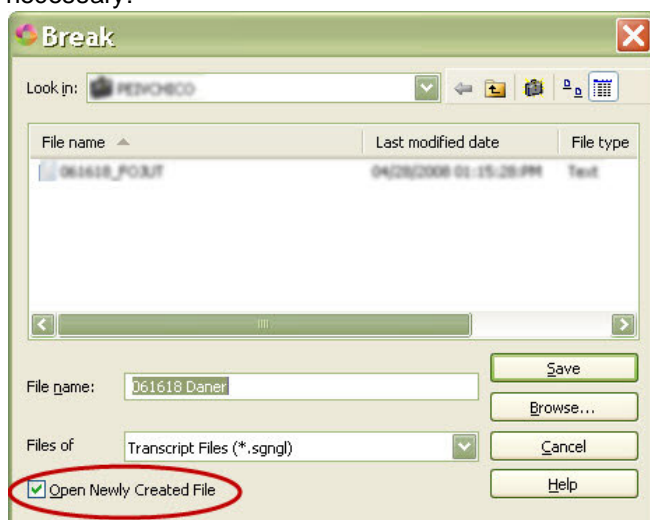

When you break a text file:

- a copy of the vertical notes and a copy of the Job Wordlist for that portion of the original file is placed into the new or existing file. If you choose to Undo a Break, Case CATalyst restores the text and steno to the original file. The text and steno broken from the original file remains intact in the new or existing file.
- and save the broken text to an existing file, a confirmation message displays with a Yes/No option to continue. When you select Yes, a New Page format symbol inserts at the end of the existing file and appends the broken text beginning on the new page. Case CATalyst includes the layout information with the broken text.
- with an associated audio file, the audio file is copied to the new or existing file. Case CATalyst creates a link in the new or existing file that allows the audio to play from the point at which the file was split.
- that contains fields, field values are copied from the original transcript to the new or existing file.

- with an image in the broken text, the broken text retains the image.

## Break an Edit File

1. Open the job you want to split.
2. Do **one** of the following:
  - Position the cursor where you want to break the job. Everything after the cursor is moved to the new or selected existing job.
  - Use a Mark command to highlight the specific text you want to break. Only the text that is highlighted is moved.
3. Press **Ctrl + b (File/Break)** to break the job. The Break dialog box displays. Make entries as necessary:

### Look in

Defaults to the current user. Use the drop down button to display the current folder level.

### File Window

Available files for the current user. To append the broken text to an existing file, highlight the file. The selected file name displays in the File name field below. To select a file within a case, double-click the case to open it.

### File name

Type a new file name or select an existing file name. When you select an existing file name, the following message displays: *This will append the text to the end of the selected file. Do you wish to continue?* Press **Enter (OK)**.

### Files of type

The type of file that displays in the File Window. The default type is a Case CATalyst text (.sgnl) file.

### Browse

Locate a different folder.

### Open Newly Created File

Select this option to automatically open the newly created file with the new name. When the option is selected, the newly created file is saved under the new name and the file opens in a new Edit tab. This option's status is remembered.

4. Press **Enter (Save)**. The text following the cursor or the marked text is removed from the current job and placed in the new job or at the end of the existing selected job. Case CATalyst automatically saves the new or existing file and then closes it.
5. Continue to work in the current job. If you want to confirm the moved text, press **Ctrl + o** to display the Open Existing Document dialog box and select the file to which you moved the text.

## History For

When you exit an Edit file without saving the changes, the History For dialog box displays providing editing statistics about the file and prompting you to save the job. It also enables you to identify the completion status for the job. You can view all the statistics for the job by selecting to view the Job History for the file from Manage Jobs.

### History Dialog Box Data

#### Edited By

The user name where the file is located.

#### Session Date

The date of the editing session.

#### Duration

The length of the editing session.

#### Job State

Identify the completion status of the job by selecting one of the following options:

- In Progress
- Final Edit
- Proofread

Your selection displays in: Manage Jobs under the Job State column when in Detailed List View; and in Job History on the [Edit tab](#).

#### Save changes to filename.sgngl

##### Yes

Save changes to the job.

##### No

Close the job without saving the changes. By default, you will be prompted with a "Are you sure..." dialog box.

## Merge

Merge is an Edit command that merges the text of a selected job into the end of the current job. The selected file that you merge becomes a part of the current job and the text subfile of the selected file is deleted. You can restore the original file from the Windows recycle bin. If you want to combine two or more files without deleting the original text subfile, use the [Append](#) command.

When merging a file that contains audio into a file that contains audio, the portion of file you are merging does not remain linked to its original audio. Case CATalyst displays a warning message allowing to continue or cancel the merge.

### Merge a Job

1. With your cursor in any position, press **Ctrl + m (File/Merge)**. By default, Case CATalyst displays a warning message that the entire contents of the selected file you want to merge into the current file will be deleted. You are prompted to continue or, if you do not want to delete the selected file to merge, prompted to cancel and use the Append feature. You can by-pass the warning by checking the option, *I understand the consequence of my action. Please stop asking.* or deselecting the warning in Edit Options, [Warnings](#). Select **Yes** to display the Merge dialog box.
2. Make entries as necessary:

#### Look in

Choose the user name from which you want to select the merge file. The default is the current user.

#### File Window

Available files for the current user. Highlight the file you want to merge. The selected file name displays in the File name field below. To select a file within a case, double-click the case to open it.

#### File name

Type the name of a file to merge. If you highlight a file to merge, that file name displays here.

#### Files of type

The file type displayed in the File Window. The default subfile type is a Case CATalyst text (.sgnfl).

#### Browse

Locate a file in a folder other than the CAT4 user level.

#### Bring Fields

If there are field values in the file you are appending, decide whether you want to bring those fields values into the current file. If you bring the field values and they conflict with existing field values in the current file you will be prompted to select the field value you want. CATalyst remembers the last state of the Bring Fields option the next time you use the Include, Append or Merge command.

#### Bring Layout

Check this box to bring in the associated layout for the file you are merging.

#### Keep Inc File Page Number

The Keep Inc File Page Numbers (**Alt + e**) option (when the Bring Layout option is selected) allows you to merge the selected file at the current cursor position and retain the page numbering on the selected file.

#### Keep Orig File Page Numbers

The Keep Orig File Page Numbers is not available when merging files.

3. Press **Enter (Open)** to Merge the selected file.

## Multi-File Append...

The Multi-File Append feature is available on Edit's File menu and allows you to quickly combine multiple [Work Units](#) or other transcripts. For example, let's say you are writing realtime and you are also creating Work Units so your scopist can begin editing the file as soon as possible. Once the scopist is done editing the Work Units, the Multi-File Append feature can be used to combine the Work Units into one file. Another example for using Multi-File Append would be for reporters that [take turns writing](#) realtime to the same file and when finished need to combined each reporters edited transcripts into one transcript.

Work Units are sequentially numbered as each Work Unit is created, i.e. filename\_1, filename\_2, etc. The Multi-File Append feature uses this naming convention to identify a Work Unit versus a named transcript. If the feature recognizes the files as Work Units, the remaining Work Units that have not been appended to the current file are displayed in the dialog box. Work Units are appended in sequential order based on the naming convention. If no Work Units are identified, all available files in the current location are displayed in the dialog box. You can select the files you want to append and reorder them in the order that you want them appended. This feature is an append feature so the original files, whether Work Units or other transcripts, remain intact.

To use the Multi-File Append feature:

1. Open the transcript to which you want to append other files.
2. From the file menu, press **Alt + f, f** (Multi-File Append). The Multi-File Append dialog box displays.
3. Do **one** of the following:

- a) If CATalyst identifies transcripts with the default Work Unit naming convention (same filename\_#) or transcripts followed by the default Work Unit naming convention with additional characters (work units that may include the scopist's initials, i.e. filename\_#SMP or filename\_#\_SMP), CATalyst displays the transcripts that have not been appended in sequential order. CATalyst automatically looks in the same location as the current transcript and the Work Unit option is selected. If the correct files are displayed, **go to Step 4**.

- b) If CATalyst does not find files consistent with Work Unit naming conventions, all files in the current location display and the All Files radio button is selected. Using Windows selection conventions, select the files you want to append and click **OK**. The Confirm File Order dialog box displays. The files will be appended in the order they are listed in the dialog box. Do **one** of the following:
  - i. To change the order, highlight a filename and click the up or down arrows (   ) in the upper right-hand corner of the dialog box to move the file in the correct order. either click OK to append the files in the order that they appear or change the order of the files by highlighting a file and then clicking the up or down arrow in the

upper right hand corner to put it in the proper order for appending and **go to Step 4.**

- ii. If the files are in the proper order in which you want them appended, **go to Step 4.**
  - iii. To select additional files, press **Alt + b** (Back) to return to the Multi-File Append dialog box. **Repeat Step 3b.**
  - c) To change the path (location) of files, click **Browse...**, navigate to the folder that contains the files you want to append. Review the above two options and then **go to Step 4.**
  - d) To keep the current page numbers of the Work Units or selected files to append, press **Alt + k** to select the Keep Work Unit/Appended Files Page Numbering option.
4. To append the selected files click **OK**. Work Units are appended in the order of their job name (i.e. filename\_4 and then filename\_5, filename\_6, etc.). Selected files are appended in the order they displayed in the Confirm File Order dialog box.

## Stop Translation

Stop Translation ends the [realtime](#) session. This stops writing text to the file via the writing machine. The transcript remains open in Edit. When you use the Stop Translation command, it is recommended that you wait a few seconds before closing the transcript so all steno from the steno machine is sent to the realtime file. If you end realtime by turning off your steno machine, it is recommended you use the same procedure. Wait a few seconds before closing the transcript to insure all the steno from the steno machine has been sent to the realtime file.

## Include

Include is an Edit (F9) command that allows you to copy the entire text of another file into the current job. For example, you can include a title page or certificate page into the current job. The original file selected to include remains unchanged. The included file copies into the current job immediately before the cursor position.

When the file you are including has steno associated with the text, the steno also copies into the current job. When the file you are including contains [fields](#), you can select the Bring Fields option to retain the field values. If the destination file contains a value for the same field as the file being included, and that value conflicts, Case CATalyst prompts you to choose which of the two values you want for the entire job. You cannot have two values for one field in a job.

You can include a job from your user name, another user name, or a case. If you Include a specific file regularly, you can create an [Auto Include](#) definition to have Case CATalyst include the file automatically during translation.

You can also attach the page layout for the Include file. For example, the index page you are including uses Roman numerals as the numbering format and has smaller margins than the transcript page layout. When you include the index page, you can attach the page layout so the Include file retains the formatting.

### Include a File in Edit

1. Position the cursor to the right of where you want to include the file and press **F9**. The Include File dialog box displays.
2. Make entries in the fields as necessary:
3. **Look In**

Choose the user name from which you want to select the include file. The default is the current user. To locate a file in a location other than the CAT4 user level, use **Browse**.

### **File Window**

Displays a list of the files from which to choose. Highlight the file you want to Include. If the file is in a case, double-click the case to open it.

### **File name**

The name of the selected file to Include.

### **Files of type**

Displays the type of file to Include. The default type is a Case CATalyst text (.sgnfl) file.

### **Browse**

Locate a different folder.

### **Bring Fields**

If there are field values in the file you are including, decide whether you want to bring those fields values into the current file. If you bring the field values and they conflict with existing field values in the current file you will be prompted to select the field value you want. CATalyst remembers the last state of the Bring Fields option the next time you use the Include, Append or Merge command.

### **Bring Layout**

Check this box to bring in the associated layout for the file you are including. By default, Case CATalyst remembers the Bring Layout setting. For example, if Case CATalyst remembers that you always bring the layout when you include your Title page but you do not select the Bring Layout option when you include your CERT page. You must include each file once for Case CATalyst to remember the Bring Layout setting.

### **Keep Inc File Page Number**

The Keep Inc File Page Numbers (**Alt + e**) option (when the Bring Layout option is selected) allows you to bring in the selected include file and retain the page numbering on the include file.

### **Keep Orig File Page Numbers**

The Keep Orig File Page Numbers (**Alt + k**) options (when the Bring Layout option is selected) allows you to retain the page numbering in the original file.

For example, let's say that you need the first page of the transcript to be Page 1 regardless of the number of standard pages (title, appearance, stipulation, etc.) that appear before the first page of testimony. You start your realtime file with testimony and the transcript begins with Page 1. When appropriate, you move your cursor to the beginning of the file and include the title page. In the Include dialog box, you select the Bring Layout option along with the Keep Inc File Page Numbers option and the Keep Orig File Page Numbers option. The title page include file is inserted into the transcript and retains its current page numbering and the transcript page (the original file) retains its Page 1 numbering. All subsequent pages are numbered consecutively. This option is only available when the Bring Layout option is selected. If you have the Remember Bring Layout option set to Yes (default setting) in the Include options dialog box, CATalyst remembers the state of Bring Layout option and the state of the Keep Inc File Page Numbers and Keep Orig File Page Numbers options.

### **Options**

Select Options (**Alt + p**) to modify the available [include settings](#).

4. Press **Enter (Open)**.

## Creating an Include File

In Case CATalyst, standard pages and parenthetical are referred to as include files or "includes." Include files contain pages or sections of text that you use time after time in your jobs, such as title pages, certificate pages, an indication of taking a recess, or going off the record. The exact wording and format of any include file varies between courts, agencies, and reporters. As a result, each reporter generally creates his or her own unique set of include files.

[Tables](#) allow you to align text in columns without affecting other text on the same horizontal line. For example, you might use a table for the text at the beginning of a title or cover page to create the "birdcage". The advantage in using a table for this text is that you can type text and have it wrap automatically in the column margins without affecting the horizontal or vertical placement of text which appears on the same horizontal line to the right of the text you are typing.

## Title Page

In the following title page caption example, one table cell contains text for the caption lines; a second table cell contains the parenthesis ( ), vertical bar ( | ), or colon ( : ) symbols for the birdcage; and a third table cell contains the case number and other information that should appear to the right of the birdcage.

### Example

PlaintiffName,	)	Case No. #
Plaintiff,	)	
- v -	)	Type of Proceeding
DefendantName,	)	
Defendant.	)	

The closed parenthesis always lines up on the title page regardless of the size of the Plaintiff or Defendant name typed into the first column. The parenthesis symbol in the second cell remains in place and the Plaintiff name wraps to the next line within the designated cell, if necessary. The table grid lines do not print.

To create a title page using the caption in the previous example:

1. Press **Alt + f, n, t (File/New/Text File)**. The Create New Document dialog box displays.
2. In the File name field, type a name for your title page, select the layout and press **Alt + o (Open)**. Case CATalyst opens an empty text file in Edit. **Once you start typing, the selected page layout will be applied.**
3. Position your cursor where you want to insert the table.  
  
If you want to single space the text, you can turn on single spacing before inserting the table or use a single spaced paragraph style within the table. To turn single spacing On before the table, press **F4S (Edit/Insert/Insert Format Symbol/Single Space On)**.
4. Press **Alt + e, i, t (Edit/Insert/Table)**. The Insert Table dialog box displays.
5. Make the following entries. When you are aligning text in columns, as shown in the example, only one row is necessary. You do not need to create a separate row for each line of text.

### Number of columns

Type **3** to create three columns in the table. If you want to create a birdcage with fewer or additional columns, type the appropriate number.

#### Number of rows

Type **1** to create one row in the table. If you want to create a birdcage with fewer or additional rows, type the appropriate number.

6. Press **Enter (OK)**. Case CATalyst inserts the table.
  7. If necessary, modify the cell widths to accommodate the amount of spaced required for the text:
    - a. Switch to Page view, press **Alt + v, p (View/Page)**.
    - b. Place your cursor in the column you want to modify.
    - c. Using the mouse, move the left and right column margin guides (  ) to the desired position.
    - d. Press **Ctrl + s (Save)**.
    - e. If desired, switch back to Normal view, press **Alt + v, n (View/Normal)**.
  8. Type the necessary text.
  9. To adjust the text alignment within the cells, apply appropriate paragraph styles. Press **Shift + F4** to display the Format Symbol Dialog Box. Double click the appropriate format symbol to apply the desired paragraph style. For example, if you want the text in the column to align to the left, use the New-Line Paragraph Style. If you want the text centered, use the Centered Paragraph Style. If you want text alignment to be aligned to the right, such as the page numbers on an index page, apply a User-Defined Paragraph Style in which text alignment is set at Right. To apply a user defined paragraph style, press **F4**, type **e**, then the number of the User Defined Paragraph Style you want to apply.
-  The left, center and right alignment toolbar icons in Edit available through the Customize Toolbar feature (View/Show/Customize Toolbar), Format group, do NOT apply to text in table cells.
10. Turn single spacing Off, if you turned it On before inserting the table. Press **Ctrl + End** to move your cursor to the end of the file. Press **F4s (Edit/Insert/Insert Format Symbol/Single Space Off)**.
  11. Press **Ctrl + s (File/Save)** to save the file.

## Parenthetical

In the following parenthetical example, a conflict (^ Plaintiff's ^ Defendant's) is a part of the parenthetical to allow you to scan and select the correct word by pressing 1 or 2 instead of typing the text each time.

The # symbol is placeholder text surrounded by <Scanstop Begin> and <Scanstop End>format symbols. The Scanstop allows you to scan to the placeholder text and replace it with the necessary information. You can use any word or phrase as placeholder text to indicate the job specific information necessary in that position.

### Example

(Whereupon, ^ Plaintiff's ^ Defendant's Exhibit #  
was marked for identification.)

## Create Example Parenthetical

1. Press **Alt + f, n, t (File/New/Text File)**. The Create New Document dialog box displays.

2. In the File name field, type a name for this parenthetical file and press **Alt + o (Open)**. Case CATalyst opens an empty text file in Edit. Only one parenthetical is placed in a file.
3. Apply the Parenthetical paragraph type. Press **Shift + F4 (Format Symbol Dialog Box)**. Double click the Parenthetical format symbol.
4. Type the text: **(Whereupon,** and then press the Spacebar once.
5. Insert the conflict:
  - a. Press **Ctrl + i (Edit/Insert/Conflict/Text)**. The Insert Conflict/Text dialog box displays.
  - b. Type: **^ Spacebar Plaintiff's Spacebar ^ Spacebar Defendant's**
  - c. Press **Enter (OK)**. Case CATalyst inserts the conflict text into the file.

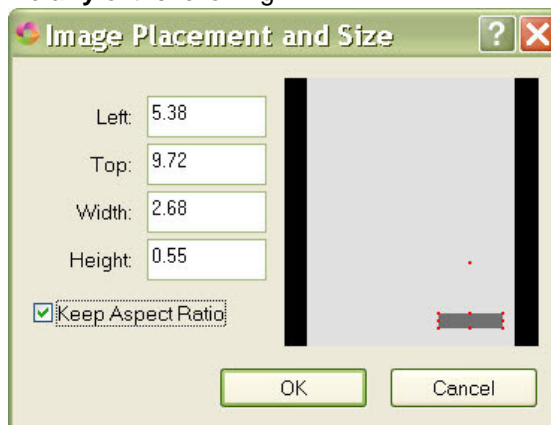

You must use the Case CATalyst Insert Conflict/Text feature to insert a conflict. If you type a conflict into the file, you cannot Scan to the conflict.

6. Type: **Exhibit #**
7. Mark the placeholder text, # , and then press **F4 O (Edit/Insert/ Insert Format Symbol/ScanStop Begin)** to surround the placeholder text with <Scanstop Begin> and <Scanstop End> format symbols. Case CATalyst automatically places a Scanstop End format symbol at the end of the text when you mark the text. Use [Reveal Codes](#) to view the format symbols as necessary.
8. Type the remaining text.
9. Press **Ctrl + s (File/Save)** to save the file.

## Certificate page with signature

If you want to add an electronic signature to your certificate page or other transcript documents, you first need to sign your name, scan your signature and save it as a bmp or jpg file type. An electronic signature is a representation of your signature and is not the same as a [digital signature](#).

1. Open the include file in which you want to insert your signature, for example your include file named cert. Make sure your Edit view is set to Page view (**Alt + v, p**).
2. To modify the layout, press **Alt + o, l (Format, Modify Layout)** and go to the Header/Footer tab.
3. Select a header/footer number not in use – such as header 7.
4. Click the **Image...** button. In the Open File dialog box, navigate to the location of your scanned signature and double click it.
5. The Image Placement and Size dialog box displays. Do **any** of the following:
  - a) Click the image in the right pane and move it to the location and/or adjust the size.
  - b) Use the fields on the left to adjust the placement and size of the image.
  - c) Click OK to save the changes.
6. In the Layout pane, click **Apply** and select **Only This Page**.
7. Confirm the location and size of the signature and go back to the Layout pane to make any adjustments until you have your signature image as you want it.

8. Close the Layout pane.
9. When including this page (whether manually or auto include), you will need to bring the Page Layout with the file. When you bring a page layout with a file, the file automatically starts on a new page. If you have a New Page format symbol at the beginning of this file, remove it.
10. Save and close the include file.
  - If you auto include the certificate page, open the dictionary that contains the auto include entry and add [Y] following the definition, i.e. @cert[Y] or @Includes\cert[Y]. The @Includes\cert[Y] indicates that the cert include file is in a Case named Includes.
  - If you manually include the certificate page, you can change your Include Options *Remember Bring Page Layout setting* option. The next time you include your cert or certificate page, select the *Bring Page Layout* option. CATalyst will remember the Bring Page Layout setting whenever the certificate page is included until you change the option.

### Quick Tran

Quick Tran allows you to start realtime translation bypassing any dialog box entries. For example, let's say you are an official court reporter and you want to break each calendar call into its own file. You can use Quick Tran to start a realtime session (first file for the day) and/or if you have already started realtime and want to start a new file quickly. Case CATalyst automatically uses the last realtime settings, including selected dictionaries and assumes *Writer* is selected in the Steno Source field of the Translate dialog box. By default, Case CATalyst assigns the file name using the two digit year, month and day followed by the hour, minute and seconds. For example: 080816\_140905 was created August 13, 2016 at 2:09:05 p.m. To customize the Quick Tran file naming convention, create a new naming formula in the Advanced Translate option, [Quick Tran filename format](#).

If you are writing realtime with a Diamante or élan Mira A3 WiFi connection and using the Quick Tran feature, you can have CATalyst automatically connect to the last WiFi writer by selecting the Auto Connect Last WiFi writer in the Translate, [Realtime settings](#).

If you select Quick Tran while in an active realtime file, Case CATalyst disconnects from the current realtime file and starts a new realtime file. **It is necessary to end the file on the writer to prevent the steno strokes from the current realtime file from being added to the new realtime file.** A new realtime file (tab) is started and the original realtime file remains open, allowing you to edit and save it. To change the default Quick Tran file name, use the [Rename](#) feature in Manage Jobs.

Access Quick Tran:

- at Manage Jobs, press **Alt + f, q (File/Quick Tran)** to start your first realtime file of the day. The first file and all subsequent files will use the last used translation settings (including selected dictionaries) and will name the file according to the Advanced Translate *Quick Tran filename format* option.
- while writing realtime, press **Alt + f, q (File/Quick Tran)** to start a new realtime file. The new file opens in a new tab with the default naming convention or if you modified the naming option, however you have modified the naming convention.
- in Edit, use a [keyboard command](#) assigned to Quick Tran or [macro](#) that invokes the Quick Tran command.

[Keyboard Map](#) Function: Quick Tran

## Create Work Unit

The Create Work Unit feature creates a work unit on demand while writing realtime instead of waiting for the work unit settings [timed increment](#). For example, let's say you have your Translate Realtime Create Work Units set to every 50 minutes. As you are writing, you decide you want your scopist to see that text as soon as possible. You can press Alt + f, k (File, Create Work Unit) or write a steno outline to invoke macro to create a work unit immediately rather than waiting for the 50 minutes. When the Create Work Unit command is invoked, the work unit is created with the next consecutive number at the point the command is invoked and the work unit timer is reset. When a work unit is created based on the time increment setting, CATalyst attempts to end the work unit at the end of the current paragraph. When a work unit is created by invoking the Create Work Unit feature, the work unit is ended exactly where the command is written.

If you have started realtime and forgot to select the Create Work Units option, you can press Alt + f, k (File, Create Work Unit) or write a steno outline to invoke macro to create a work unit which displays the [Start Work Unit](#) dialog box and allows you to start work units after realtime has started. When the Create Work Unit command is invoked, the work unit is created with the next consecutive number at the point the command is invoked and the work unit timer is reset.

This option is grayed out if you are not in a current realtime session.

1. Start a realtime file.
2. Select File, Create Work Unit (**Alt + f, k**).  
You can record a macro to create a work unit and assign it to a steno outline in your dictionary to invoke the Create Work Unit from your steno machine. A macro that is invoked by a dictionary definition is called an [AccelerWriter](#).
  - a) If the Create Work Units option was selected before starting realtime, a new work unit is created.
  - b) If the Create Work Units option was not selected before starting realtime, the Start Work Units dialog box displays. Do any of the following:
    - Change the time interval for work units.
    - Change the *Save to a different folder* option.
    - Change the Save location.
    - Deselect the With Audio option if you do not want to create an audio file with the work units. If the With Audio option is grayed out, audio is not currently being recorded in the realtime file and the option cannot be changed.
3. To save the changes and start creating work units, invoke the Create Work Unit command again. Whatever changes you made are saved and become the default setting for the Create Work Unit feature. That includes having the Create Work Units option selected.

Keyboard Map Function: Create Work Unit

## Change Writer Turn

Several international and a few domestic court reporting proceedings require that multiple court reporters take turns writing to the same realtime file. In many cases, the realtime is being sent to realtime receive systems at the same time. In these situations, the reporters need to change the steno machines and have their dictionary being used without a break in the realtime feed. The Change Writer Turn feature allows you to change writing machines and dictionaries without interruption to the realtime job. For example, Reporter 1 writes realtime for 30 minutes and then Reporter 2 writes realtime for the next 30 minutes. The Change Writer Turn feature allows the reporters to physically remove one steno machine connection from the computer and connect another steno machine and load the appropriate reporter's dictionary and other necessary files.

When there is a change in reporters, steno outlines written on the newly connected steno machine may not be sent to the realtime file until the user's files were selected and the dialog box was closed. This works very well for the majority of reporters who take turns writing to one file, but some prefer to have CATalyst send all steno on the new writer after the Change Writer Turn. The Change Writer Turn - [Translate Pending Change Writer Strokes](#) option is available in your UserSettings file that allows all steno written on the newly connected writer to dump into the file once you change writer turns. For example, Reporter 1 is writing realtime and at the time the reporters are going to switch, Reporter 2 starts writing as Reporter 1 stops and selects Change Writer Turn which loads Reporter 2's dictionary and settings files. When the dialog box closes, all the steno strokes Reporter 2 wrote are translated using Reporter 2's dictionary and sent to the realtime file.

To make the Change Writer Turn situation successful, it is important that you follow the preparation instructions and practice the procedure so you feel comfortable with the process.

## Copy Personal and Job Dictionaries

Each reporter must make a copy of their Personal dictionary and appropriate job dictionaries for use in the realtime job.

1. From Manage Jobs, double click the **System Files** case and highlight your **Personal Dictionary**.
2. Press **Ctrl + c (Tools/Copy)**. The Copy dialog box displays.
3. Ensure the *Keep Case Structure* option is not selected.
4. In the *Job Name* field, type a name for your Personal Dictionary and press **Enter**. Use a name that allows you to easily identify it when switching dictionaries during the realtime job. For example, rename it by typing your initials before the name, such as *KRB Personal Dictionary*.
5. Follow the previous steps to copy and rename any job dictionaries you want to use for the realtime job. When renaming a dictionary, you may want to use your initials before the name to easily identify it. For example, *KRB Power Define*.
6. Backup the renamed Personal dictionary along with any job dictionaries to removable media, such as a thumb drive, unless you are using the same computer for the realtime job.

## Preparation for Using Change Writer Turn

It is necessary to create a new user on the computer to use for the realtime job; have each reporter copy their Personal dictionary and appropriate job dictionaries to the new user; and set individual Translate options prior to the realtime session.

### Create a New User on the Realtime Computer

1. Start Case CATalyst on the realtime computer.

2. At the sign on screen, press **Alt + f, n, u** (**File, New, User**). If Auto Logon is active, move up one level to create the new user.
3. Type a new user name and press **Enter**.
4. Sign on to that user name.
5. Create a Personal Dictionary. Press **Alt + f, n, d, p** (**File, New, Dictionary, Personal**).
6. Insert one entry into the newly created Personal Dictionary.
7. Press **Ctrl + s** (**File\Save**) to save the dictionary and then press **Ctrl + F4** (**File\Close**) to close the dictionary.

### Restore Dictionaries to the New User on the Realtime Computer

1. Insert the thumb drive or removable media that contains your renamed Personal dictionary and appropriate job dictionaries into the realtime computer.
2. From Manage Jobs on the realtime computer, press **Ctrl + r** (**Tools\Restore**). The Open dialog box displays.
3. Navigate to the location of the removable media and select the compressed dictionary files to restore. You can select multiple files.
4. Press **Enter** (**Open**). The Restore dialog box displays.
5. Select your renamed Personal dictionary and appropriate renamed job dictionaries and press **Enter** (**OK**).

### Set Translate options

Each reporter must select their renamed Personal and job dictionaries and their steno machine and then save the selection to a Translate Options Settings file on the computer used for the realtime job.

1. From Manage Jobs, press **Alt + t, u, t** (**Function/Translate**). The Translate dialog box displays.
2. Click **Options**. The Case CATalyst Translate Options dialog box displays.
3. On the Realtime tab, select the type of steno machine you are using from the *Realtime Writer* list. Select any other Realtime options as necessary.
4. On the Input tab, select any [Translate](#) and [Advanced Translate](#) options that all the reporters have agreed to use for this realtime job.
5. Click **OK** in the Case CATalyst Translate Options dialog box.
6. In the Translate dialog box, choose your renamed Personal and job dictionaries and click *Dictionary Priorities* to set the priority use for translation. When finished setting dictionary priorities, click **OK**.
7. Click **Save Settings** to save and name your Translation settings. The Saved Translation Settings dialog box displays.
8. Type a name in the *File name* field and click **Save**. This Translation settings file is the file you load which identifies your steno machine connection and dictionaries. Stenograph recommends that you apply the same naming conventions used for your renamed Personal and job dictionaries.

### Test your connections and procedures.

1. Connect the steno machine for the first reporter to the realtime computer.
2. On the realtime computer, sign in to the newly created user.

3. From Manage Jobs, press **Alt + t, u, t (Function/Translate)**. The Translate dialog box displays.
4. Click **Load Settings**. The Saved Translation Settings dialog box displays. Select the settings file for the first reporter and press **Enter (Open)**.
5. Make a selection in the *Output To* field; type a name the *File* field; and press **Enter (OK)** to start translation.
6. Write some text.
7. Practice switching reporters. Press **Alt + f, w (File, Change Writer Turn)**. It is necessary to invoke the Change Writer Turn command before disconnecting the current steno machine.
8. Click **Load Settings**. The Saved Translation Settings dialog box displays. Select the settings file for the next reporter and press **Enter (Open)**.
9. Disconnect the current steno machine and connect the steno machine for the next reporter.

**IMPORTANT:** Do NOT end the file on the first steno machine until the next steno machine is successfully connected and you have selected the Settings file for the next reporter. If you end the file on the current steno machine before connecting a new steno machine, the following message displays when you press Enter:

*You need to invoke the Change Writer Turn command before disconnecting the current writer.*
10. Continue writing the realtime job. The realtime data is sent to the realtime file and realtime receive systems without interruption.
11. When finished writing the realtime job, end the file on the steno machine.

## Change Writer Turn option

The Change Writer Turn feature is used when more than one reporter is used for the realtime proceedings without an interruption in the proceedings. For example, Reporter 1 writes realtime for 30 minutes and then Reporter 2 writes realtime for the next 30 minutes. The Change Writer Turn feature allows the reporters to physically remove one steno machine from the computer and connect another steno machine and load the appropriate reporter's dictionary and other files.

A UserSettings option has been added that allows all steno written on the newly connected writer to dump into the file once you change writer turns. For example, Reporter 1 is writing realtime and at the time the reporters are going to switch, Reporter 2 starts writing as Reporter 1 stops and selects Change Writer Turn which loads Reporter 2's dictionary and settings files. When the dialog box closes, all the steno strokes Reporter 2 wrote are translated using Reporter 2's dictionary and sent to the realtime file.

### To use the Change Writer Turn - Translate Pending Change Writer Strokes setting:

1. Be sure you are in your User name.
2. From Manage Jobs, open the **System Files** case.
3. Double click the **UserSettings** file. The Settings Manager dialog box displays.
4. Click in the dialog box and press **Ctrl + f**. The Find dialog box displays.
5. Type: translate-pending and press **Enter**.

- Click the **Edit** button on the right side and change the 0 to a 1.

- Click **OK** and then click **Save**.

## Edit Commands

Edit Command features provide the ability to manage movement from within the transcript, such as jumping to a designated page and searching for text. You can also copy, cut and paste text, insert items like format symbols, fields and speakers, look for a definition and conduct an Internet search. The Send to Cat Scratch feature allows you to send items such as text, dictionary definitions and briefs directly to the [Cat Scratch](#) dialog pane.

### Copy and Cut Text in Edit

You can copy or cut (remove) text from a transcript or file and paste it to another file, if appropriate. Copied and cut text is sent to the CATalyst [Clipboard](#). For example, you might want to copy text from one file to paste to another file to create an excerpt or copy certain verbiage to paste to another file. You might cut text from one file to another to separate multiple files in one transcript. When copying and cutting text in Edit, by default, the underlying steno and timestamps of the text, if appropriate, is copied with the text. When you paste the text, the underlying steno and timestamps associated with that text is also pasted. If you print your transcript with timestamps, the timestamps may be out of sequence with the destination file's timestamps. You can change an option in [Advanced Edit Options](#) to not include the underlying steno or to have Case CATalyst automatically prompt you with a Yes/No option to include the underlying steno.

Fields contained in copied or cut text that is pasted into a new or existing file are either copied with field attributes (continue to function as placeholders) or as plain text (the value of the field is pasted but not longer functions as a field). You can select how copied fields are pasted in the [Fields Options](#) dialog box, *Retain Fields when pasting* option.

### Copy or Cut Text

- Use a Mark command to highlight the text you want to copy/cut.
- Do one of the following:
  - Press **Ctrl + c** to copy the text.
  - Press **Ctrl + x** to cut the text.
- Do **any** of the following:

#### [Paste](#) the copied or cut text within this job

Position the cursor to the right of where you want to insert the copied text and press **Ctrl + v**. Case CATalyst pastes the text immediately before the cursor.

#### **Paste** the copied or cut text into an existing job

If the job is open in Edit, press **Alt + w** and then the associated file number to switch to that job. Position the cursor to the right of where you want to insert the copied text and press **Ctrl + v**.

If you need to open the job, press **Ctrl + o (File/Open/Text File)**, select the job from the Open Existing Document dialog box, and press **Enter (Open)**. Position the cursor to the right of where you want to insert the copied text and press **Ctrl + v**.

#### **Paste the copied or cut text into a new job**

Press **Alt + f, n, t (File/New/Text)**, type the name of the job in the File name field and select a Page Layout. Press **Enter (Open)**. Position the cursor to the right of where you want to insert the cut text and press **Ctrl + v**.

## **Go To**

Go To is an Edit command that allows you to move quickly to a specific page or line number in the current job. This feature may be useful if you reviewed a hard copy of your transcript and now you want to make the changes to your electronic transcript. If you simply indicate the page number, CATalyst moves the cursor to the first line of the desired page. If your transcript contains sections, you need to include the section number also. If your transcript does have sections and you simply type the page number, CATalyst moves to the page indicated in the current section, if available.

### **Go To Page or Line Number**

1. From the current job, press **Ctrl + g (Edit/Go To)**. The Go To dialog box displays.
2. Type a number in **one** of the following fields and then press **Enter (OK)**.
  - **Section Number**
  - **Page Number**
  - **Line Number**

[Keyboard Map](#) Function: Go To Page/Line

## **Go To Index Entry**

Go To Index Entry is an Edit command that allows you to locate an indexed item in the transcript. For example, let's say you build an index using the [Build Index](#) feature. You are reviewing the index and want to check the transcript concerning the indexed item. You can use the Go To Index Entry command to instantly move your cursor to the index location. After building an index, position your cursor on an indexed item and press **Alt + e, x (Edit/Go To Index Entry)**. The cursor moves to the indexed location in the transcript.

## **Move to Next Red Squiggle**

Transcript Spell Check options has a *Display Red Squiggle Under Misspelled Words* option, that when selected will display a red squiggly line under words that Spell Check does not find in the selected Spell Check wordlists. You might want to turn this option on to see words that Spell Check doesn't recognize. The red squiggle under words is only visible on the realtime/edit screen and does not print. The Move to Next Red Squiggle command allows you to move the cursor forward in the transcript to the next word (based on cursor position) that has a red squiggle underneath. This command is available on the Edit menu and is available for assignment in a Keyboard Map.

*Keyboard Map Function:* Move to the next red squiggle  
Move to the previous red squiggle

## Move to Previous Red Squiggle

Transcript Spell Check options has a *Display Red Squiggle Under Misspelled Words* option, that when selected will display a red squiggly line under words that Spell Check does not find in the selected Spell Check wordlists. You might want to turn this option on to see words that Spell Check doesn't recognize. The red squiggle under words is only visible on the realtime/edit screen and does not print. The Move to Previous Red Squiggle command allows you to instantly move the cursor backward in the transcript to the previous word (based on cursor position) that has a red squiggle underneath. This command is available on the Edit menu and available for assignment in a Keyboard Map.

*Keyboard Map Function:* Move to the previous red squiggle  
Move to the next red squiggle

## Definition Search

The Definition Search feature connects you to the specified Internet search site when you have an active Internet connection. For example, let's say you are doing a landscaping transcript and you come across the word "vernalization" and you want to check the definition. You can position your cursor immediately before the word and use the Definition Search command to open your specified site with the word "vernalization" in the search field and the definition displayed. You need to be connected to the Internet. To set your default *Definition Search* site, go to the [Advanced Edit Options](#).

### Search for a Definition

1. Position your cursor is immediately before a word or highlighted phrase.
2. Do one of the following:
  - Press **Alt + e, f** (**Edit/Definition Search**).
  - From the [Word Definition](#) dialog box, click the **Definition Search** (  ) icon.
3. Case CATalyst automatically connects to the user specified site and displays the search results.

[Keyboard Map](#) Function: Definition Search

## Internet Search

The Internet Search feature allows you to do an Internet search from Edit when you have an active Internet connection. For example, let's say you have come across a word in the transcript that you are not very familiar with and you want to learn more. You position your cursor immediately before the word and select Internet Search. CATalyst connects to your specified search engine, puts the cursor in the text field and the search results are displayed.

When searching the Internet on text that contains punctuation, Case CATalyst replaces the punctuation with a space. For example, [www.stenograph.com](http://www.stenograph.com) becomes, www stenograph com. 1.3 cubic feet becomes 1 3 feet. The default search engine is Google. You can change the search engine in [Advanced Edit Options](#).

When the [Surround each phrase with quotes](#) Advanced Edit option is active, Case CATalyst surrounds the searched word or a phrase with quotes in the search engine. The words are considered grouped together, narrowing the search. Without the quotes the scope of the search is broader and may identify sites that use only one of the words. By default, the *Surround each phrase with quotes* option is set to Yes.

1. Position your cursor is immediately before a word or highlighted phrase.
2. Press **Alt + e, n (Edit/Internet Search)**.
3. Case CATalyst automatically connects to the user specified site and displays the search results.

[Keyboard Map](#) Function: Internet Search

## Paste Text in Edit

Copied or cut text goes to the CATalyst [Clipboard](#) and is available to be pasted in any job or in a compatible text file/program outside of Case CATalyst. You use the Paste command to place the [copied/cut](#) text from the clipboard. Do any of the following:

### Paste the cut text within this job

Position the cursor to the right of where you want to insert the cut text and press **Ctrl + v**. Case CATalyst pastes the text immediately before the cursor.

### Paste the cut text into an existing job

If the job is open in Edit, press **Alt + w** and then the associated file number to switch to that job. Position the cursor to the right of where you want to insert the cut text and press **Ctrl + v**.

If you need to open the job, press **Ctrl + o (File/Open/Text File)**, select the job from the Open Existing Document dialog box, and press **Enter (Open)**. Position the cursor to the right of where you want to insert the cut text and press **Ctrl + v**.

### Paste the cut text into a new job

Press **Alt + f, n, t (File/New/Text)**, type the name of the job in the File name field and select a Page Layout. Press **Enter (Open)**. Position the cursor to the right of where you want to insert the cut text and press **Ctrl + v**.

Whether the underlying steno and timestamps, if appropriate, are pasted with the copied text depends on the Retain Steno option in your [Advanced Edit Options](#) setting.

Whether copied fields are pasted as functional fields or plain text depends on the Retain Fields option in your [Field Options](#) setting.

## Search

The Search command in Edit allows you to locate text, steno or timestamps in your transcript. A text search can locate whole, partial or multiple words depending on your selection. The Search also looks for the specified text within fields, hidden text and any header/footer text changed with format symbols in Edit. If Search finds text in hidden text or header/footer text, Reveal Codes displays with the header/footer or hidden text line highlighted.

A steno search can locate full or partial steno strokes depending on your selection. When searching for timestamps, Case CATalyst displays the Vertical Notes window if it is not already open. If Case CATalyst does not locate the exact timestamp, the next timestamp that occurs within one minute of the timestamp searched for is highlighted.

You can search forward or backward in the file for any search criteria. Once a searched entry displays, you can repeat the Search for the same search criteria. Press F3 to search for the next occurrence or Shift + F3 to search backward for a previous occurrence.

## Search in Edit

1. Press **Ctrl + f (Edit/Search)**. The Search dialog box displays.
2. Make necessary entries:

### Search For

Select the Search Type and then type the text, steno or timestamp for the search.

### Search Type

Select one:

#### Text

Search by text. Type the text for the search in the *Search For* field. Include format symbols or [extended characters](#) as necessary.

#### Steno

Search by steno. Type the steno for the search in the *Search For* field. You can type either a forward slash (/) or press the Spacebar to separate steno outlines. For example, to search for a two stroke word, such as "guideline", you could type TKPWAOEUD -- then type / or press the Spacebar to finish with the second stroke, HRAOEUPB. When typing steno that starts with a final stroke, place a – (hyphen) before the first letter.

For more information about typing steno outlines in the Steno field, see the [Steno Shortcut Table](#).

#### Timestamp

Search by timestamp. By default the *Search For* field displays the current time in hour/minutes/seconds, based on your computer's time. Type a different timestamp if necessary or highlight the hour, minute or seconds and use the up and down arrows to adjust the time.

If Case CATalyst does not locate the exact timestamp, the next timestamp that occurs within one minute of the timestamp searched for is highlighted.

### Wildcard Text

Search for specific text with unknown characters. Type the text for the search in the *Search For* field. Use the following:

- Use a ? (question mark) in a word or phrase for a single unknown character.
- Use an \* (asterisk) in a word or phrase for an unknown number of characters following the asterisk.

### Regular Expression

Search based on a specific text string. A list of default expressions displays in the dialog box. Double click an expression to insert it into the *Search For* field. Refer to the Regular Expression Default List for details on each regular expression default formula.

To create a shortcut for an expression in the list, right click the name and select **Modify Shortcut**. Type alpha or numeric characters in the field and press **Enter (OK)**. You may want to use the shortcut key to create a [macro](#) which you can use in a regular expression. To record a macro for a regular expression, press Alt + t, m, r (Tools/Macro/Record) to display the RecordMacro Toolbar. Begin recording the macro; invoke the Search command and select Regular Expression. The cursor defaults to the Search For field. Press Tab to move to the Regular Expression list. Type the shortcut key and press Enter to put the formula in the Search For field..

### Regular Expression Default List

- **Acronyms** – searches for any occurrence that begins a word with a character followed by a period. There must be at least “character period character period” in order for it to be considered a match.
- **Alnum** – searches for any capital or lower case alpha/numeric character individually or part of a group.
- **Alpha** – searches for any capital or lower case alpha character individually or part of a group.
- **Digit** – searches for any numeric character individually or part of a group.
- **Contractions** – searches for any word that begins with one or more alpha characters which are followed by an apostrophe and one or more characters follow the apostrophe and end the word.
- **Dates** – searches for all occurrences of dates with the exceptions when a month is listed by itself or a digit displays before the month, such as 1 January.
- **E-mail address** – searches for any alpha character including a hyphen or period, followed by @ with any alpha character following including a hyphen or period.
- **Mixed Alpha and Digits** – searches for occurrences at the beginning of a word any alpha characters followed by numeric characters or occurrences that begin with any number character followed by alpha characters.
- **One Alnum** – searches for any alpha/numeric character.
- **One Alpha** – searches for any alpha character. This will treat each alpha character in a word as a single search item.
- **One Digit** – searches for any single numeric character. This will treat each numeric character as a single search item.

- **Phone Number** – searches for the number 1 followed by either a period or hyphen, but the search will continue even if this condition does not exist. The search will continue and look for a three digit number followed by a period or hyphen but will continue even if this condition does not exist. A match is only found when a three digit number followed by period or hyphen followed by a 4 digit number is found.
- **Repeated Words** –searches for occurrences of a word that begins and ends with alpha characters and the same word immediately follows.
- **SSN** – searches for occurrences of 3 digits followed by a hyphen, followed by 2 digits followed by a hyphen followed by 4 digits.
- **Stitched** – searches for occurrences that begins a word with a single alpha character followed by one or more hyphens.
- **Time** – searches for occurrences of time with the exception of “o’clock” time.

Optionally you can create your own regular expression formula to save for later use. Refer to the list of regular expression characters when creating your own formulas. To save your customized formula, click the **Save As** button. The Saved Named Regular Expression As dialog box displays. Type a name for the expression and press **Enter (OK)**. The name is added to the list in the dialog box.

### Regular Expression Characters for Customized Formulas

- **\d** = any one digit
- **\w** = any one alpha character
- **|** = OR (please note | is the pipe symbol)
- **[ ]** = any one character in a set
- **[^]** = any one character not in a set
- **( )** = treat group as a single item
- **\>** = at the end of a word
- **\<** = start at the beginning of a word
- **\*** = zero or more of the previous item (can be used as a\*b)
- **?** = zero or one of the previous item (can be used as a?b)
- **+** = one or more of the previous item (can be used as a+b)
- **.** = any single character
- **{n}** = specific number of occurrence (Replace n with an actual number)
- **,** = use inside squiggle brackets to specify “or more” for example {2,} indicates two or more.
- **\.** = use to make ‘period’ a character to which to be searched
- **-** = use to express “through” as in an “A through Z” or “1 thorough 9” search.
- **\n** = n can be digits 1 through 9. This finds the previous matched expression n times.

### FS

Search for a format symbol or add a format symbol to the search. Select **FS** and double-click a symbol from the list to select it.

You can also use shortcut keys to insert a format symbol. Place the cursor in the New Text field, press **F4** and then press the appropriate letter or symbol.

Check the Go to Reveal Codes after FS Search option to open the Reveal Codes window when searching for a format symbol without any text.

This option is only available when searching for text or format symbols.

### **Case Sensitive**

Check this box to search for text in the *Search For* field exactly as it is typed in upper and lower case. For example, if you only want to find occurrences of "Mark" when it is capitalized, you would type "Mark" in the Search For field and select the Case Sensitive option.

If you do not select Case Sensitive, the search finds the word both as it stands alone and as part of another word. For example, if you search for "Mark" and do not check this box, Case CATalyst finds all occurrences of word "mark" and "Mark".

This option is only available when searching for text or format symbols.

### **Whole Word**

Search only for the whole words that match the text typed in the *Search For* field. For example, if you only want to find occurrences of able when it is the word "able" and not part of a word like "table", you would type "able" in the Search For field and select the Whole Word option.

If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. For example, searching for "able" results in Search stopping on "able", "table", "unsinkable", "controllable", etc. This is often called a wildcard search.

This option is only available when searching for text or format symbols.

### **Go to Reveal Codes after FS Search**

Check this box to have Case CATalyst open the Reveal Codes window when searching for a format symbol. Case CATalyst highlights the searched text in the Reveal Codes window. If the searched text is not found, the Reveal Codes window does not open.

For example, you may want use this option when searching for a format symbol to delete. Case CATalyst opens Reveal Codes, locates the format symbol and highlights the format symbol in the Reveal Codes window.

You may want to turn this option Off when creating a macro that includes searching for a format symbol.

### **Search Direction**

Select one:

#### **Forward**

Search forward, from the cursor position to the end of the job. If you do not begin the search at the beginning of the job, Case CATalyst prompts you to continue the search from the beginning of the file.

#### **Backward**

Search backward, from the cursor position to the beginning of the job. If you do not begin the search at the beginning of the job, Case CATalyst prompts you to continue the search from the end of the file.

#### **List Results**

Search the entire transcript and automatically display the Search information in the [Search Results](#) pane with the text content, page, line and section reference for each occurrence. This option is available when searching for Text, Wildcard and Regular Expression searches. If this option is selected when performing a Wildcard or Regular Expression search, searched text or regular expression matches will be underlined in the Search Results pane. If you are searching for Q, A or Colloquy format symbols, the first letter following the format symbol will be underlined in the Search Results pane.

### Deselect All

Reset the options in the Search dialog box to their default values. You may want to use this feature when recording a macro to achieve consistent results when replaying the macro.

3. Press **Enter (OK)** to start the Search.
4. To repeat the same search, press **F3 (Edit/Repeat Search Forward)** or **Shift + F3 (Edit/Repeat Search Backward)**.

## Search and Replace

Search and Replace allows you to locate and replace a word or words in Edit without making an [E-Define](#) global. You can search and replace forward or backward for a whole word, part of a word, or multiple words.

Inserting {Prefix} and {Suffix} format symbols during Search and Replace does not produce results as designed. Insert these format symbols directly into a dictionary definition.

## Search and Replace Text

1. Press **Alt + e, e (Edit/Search and Replace)**. The Search and Replace dialog box displays.
2. Make necessary entries:

### Search For

Type the text for the search. Include any format symbols or [extended characters](#) as necessary. Press **F9** to add extended characters.

### Replace With

Type the replacement text, including format symbols or [extended characters](#) as appropriate. Press **F9** to add extended characters.

Leave this field blank to search for the text in the *Search For* field and delete it from the transcript.

### FS

Select **FS** to add [format symbols](#) to your search. Double click the format symbol from the list to select it. You can also type the format symbol shortcut key. Place the cursor in the *Search For* field, press **F4** and then press the appropriate letter or symbol.

This option does not apply to when using Search and Replace in the Edit [Number Conversion](#) feature.

### Case Sensitive

Check this box to search for the text in the Search For field exactly as it is typed in upper and lower case. For example, if you only want to find occurrences of "Mark" when it is capitalized, you would type "Mark" in the Search For field and select the Case Sensitive option.

If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field. For example, if you search for "Mark" and do not check this box, Case CATalyst finds all occurrences of word "mark" and "Mark".

### **Whole Word**

Check this box to search only for the whole words that match the text typed in the Search For field. For example, if you only want to find occurrences of able when it is the word "able" and not part of a word like "table, you would type "able" in the Search For field and select the Whole Word option.

If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. For example, searching for "of" would result in Search stopping on "of", "officer", "coffee", "soft", etc. This is often called a wildcard search.

### **Go to Reveal Codes after FS Search**

Check this box to have Case CATalyst open the Reveal Codes window when searching for a format symbol. Case CATalyst highlights the searched text in the Reveal Codes window. If the searched text is not found, the Reveal Codes window does not open.

For example, you may want use this option when searching for a format symbol to replace. Case CATalyst opens Reveal Codes, locates the format symbol and highlights the format symbol in the Reveal Codes window.

You may want to turn this option Off when creating a macro that includes searching for a format symbol.

### **Search Direction**

Select **one** of the following:

#### **Forward**

Search forward, from the cursor position to the end of the job.

#### **Backward**

Search backward, from the cursor position to the beginning of the job.

### **Deselect All**

Reset the options in the Search and Replace dialog box to their default values. You may want to use this feature when recording a macro to achieve consistent results when replaying the macro.

3. Select one of the following to begin the search:

#### **Selective**

Choose when to replace occurrences of the original text with the replacement text. The Confirm dialog box displays allowing you to choose to replace for this occurrence, all occurrences, or skip replacement for this occurrence and move to the next.

#### **Replace All**

Replace all occurrences of the original text with the replacement text. When finished, Case CATalyst displays the number of replacements made.

*Keyboard Map Function: Search and Replace*

## Send To Cat Scratch

The [Cat Scratch pane](#) is a virtual scratch pad. Many reporters make notes of attorney names or specific terms on the notice sheet or a piece of paper. Instead of using a piece of paper that can get lost or destroyed, use the Cat Scratch pane to organize all the information. The information in the Cat Scratch pane stays with the file and/or case depending on your settings. The Send To Cat Scratch Pane features allow you to send transcript text, dictionary definitions, [Brief It entries](#), AccelerWriter definitions, [Power Defines](#) and [Global definitions](#) directly to the [Cat Scratch](#) dialog pane. Depending on the scope selected in [Advanced Edit Options](#), the Cat Scratch information is available in the job, case or user Cat Scratch pane.

There are many ways you can send information to the Cat Scratch pane. You can assign a keyboard combination to one or all of the keyboard functions listed below to your keyboard map. You can select the *Send Used Briefs to Cat Scratch* option in the [Brief It Options](#) and automatically send suggested briefs to the Cat Scratch pane. If you send just text to the Cat Scratch pane, the text is placed in the Text section of the Cat Scratch pane. If you send Steno and Text, the entry is sent to the Steno/Text section of the Cat Scratch pane. You can create a keyboard command, Send Steno & Text to Cat Scratch Pane, that sends highlighted text with the underlying steno in the transcript to the Steno/Text section of the Cat Scratch pane. You can highlight a brief in the Brief It pane and send it to the Steno/Text section of the Cat Scratch pane. While [creating a global](#), you can select the Add 2 Cat Scratch option and send the definition to the Cat Scratch Pane. While you are [Power defining](#), you can write the steno outline defined in your Power Define dictionary as [CAT SCRATCH], to send the text and definition to the Cat Scratch pane.

[Keyboard Map](#) Function: [Send To Cat Scratch](#)

[Send Steno & Text to Cat Scratch Pane](#)

[Send Last Brief to Cat Scratch](#)

## Send Text to Cat Scratch

The Send to Cat Scratch command is an edit command that allows you to highlight text and send it to the Text section of the Cat Scratch pane. The [Cat Scratch pane](#) is a virtual scratch pad. Many reporters make notes of attorney names or specific terms on the notice sheet or a piece of paper. Instead of using a piece of paper that can get lost or destroyed, use the Cat Scratch pane to organize all the information. The information in the Cat Scratch pane stays with the file and/or case depending on your settings.

For example, let's say that you want to remember to research specific terminology that was used in the proceedings. You can simply highlight the terminology and use the Send to Cat Scratch command to put it on your virtual scratch pad that you can open at anytime.

**To send text to the Cat Scratch pane:**

1. In the body of the transcript, highlight the text you want to send to the Cat Scratch pane.
2. Do one of the following:
  - a) If you have assigned a key combination to the [Send to Cat Scratch](#) command in the current keyboard map, press the assigned key.
  - b) Right click and select Send to Job/Case Cat Scratch.
  - c) Press **Alt + e, o** (Edit, Send to Cat Scratch).The selected text is sent to the text section in the Cat Scratch pane.
3. If the Cat Scratch pane is not currently displaying, press **Alt + v, e, c** (View, Panes, Cat Scratch).

[Keyboard Map](#) Function: Send To Cat Scratch

[Send Steno & Text to Cat Scratch Pane](#)

[Send Selected Brief to Cat Scratch](#)

[Send Last Brief to Cat Scratch](#)

## Send Steno & Text to Cat Scratch Pane

The Send Steno and Text to Cat Scratch Pane is an edit command that allows you highlight text and send the text, along with the underlying steno to the Text/Steno section of the Cat Scratch pane. The [Cat Scratch pane](#) is a virtual scratch pad. Many reporters make notes of attorney names or specific terms on the notice sheet or a piece of paper. Instead of using a piece of paper that can get lost or destroyed, use the Cat Scratch pane to organize all the information. The information in the Cat Scratch pane stays with the file and/or case depending on your settings.

If you want to just send the text and not the underlying steno, use the [Send to Cat Scratch command](#).

### To send text to the Cat Scratch pane:

1. Highlight the text you want to send to the Cat Scratch pane.
2. Do one of the following:
  - a) If you have assigned a key combination to the [Send Steno & Text to Cat Scratch](#) command in the current keyboard map, press the assigned key.
  - b) Press **Alt + e** and select the Send Steno and Text to Cat Scratch Pane menu item. The selected text along with the underlying steno is sent to the steno and text section in the Cat Scratch pane.  
If the beginning of the selected text does not have underlying steno, the *Beginning of selection must include steno* message displays. Click **OK**.
3. If the Cat Scratch pane is not currently displaying, press **Alt + v, e, c** (View, Panes, Cat Scratch).

[Keyboard Map](#) Function: Send To Cat Scratch

[Send Steno & Text to Cat Scratch Pane](#)

## Send Selected Brief to Cat Scratch

Send Selected Brief to Cat Scratch is a command available in the Brief It pane. [Brief It](#) is a translation feature that suggests conflict free brief forms for words and phrases that you write during a realtime job. When you write three or more steno strokes, Case CATalyst generates a brief form or reminds you of an existing brief form in one of your dictionaries and displays it in the Brief It dialog pane. You can write the suggested/reminder brief to reduce writing multiple stroke outlines.

The [Cat Scratch pane](#) is a virtual scratch pad. Many reporters make notes of attorney names or specific terms on the notice sheet or a piece of paper. Instead of using a piece of paper that can get lost or destroyed, use the Cat Scratch pane to organize all the information. The information in the Cat Scratch pane stays with the file and/or case depending on your settings.

You can select the *Send Used Briefs to Cat Scratch* option in the [Realtime Aid Options](#) and automatically send suggested briefs to the Cat Scratch pane. While [creating a global](#), you can select the Add 2 Cat Scratch option and send the text definition and steno to the Cat Scratch Pane. While you are [Power defining](#), you can write the steno outline defined in your Power Define dictionary as [CAT SCRATCH], to send the steno and text definition to the Cat Scratch pane.

The Brief It option, [Show Phonetic Steno](#), determines whether the steno displays in steno characters or the “phonetic” sound of the combined letters. For example, let’s say you have the Show Phonetic Steno option selected and you write the phrase “large imbalances”, Brief It displays the suggestion as “LARJ” instead of “HRARPBLG.” And in the Steno field of the Text/Steno section, you would see "LARJ". And when you send that brief to the Cat Scratch pane, the steno display as "LARJ" in the Text/Steno section.

### To send a selected brief to the Cat Scratch pane:

1. In the Brief It pane, highlight any brief.
2. Do one of the following:
  - a) If you have assigned a key combination to the [Send Selected Brief to Cat Scratch](#) command in the current keyboard map, press the assigned key.
  - b) Right click and select Send to Job/Case Cat Scratch.

The selected brief information is sent to the steno and text section in the Cat Scratch pane.

3. If the Cat Scratch pane is not currently displaying, press **Alt + v, e, c** (View, Panes, Cat Scratch).

## Send Last Brief to Cat Scratch

Send Last Brief to Cat Scratch is a command available in the Brief It pane. [Brief It](#) is a translation feature that suggests conflict free brief forms for words and phrases that you write during a realtime job. When you write three or more steno strokes, Case CATalyst generates a brief form or reminds you of an existing brief form in one of your dictionaries and displays it in the Brief It dialog pane. You can write the suggested/reminder brief to reduce writing multiple stroke outlines.

The [Cat Scratch pane](#) is a virtual scratch pad. Many reporters make notes of attorney names or specific terms on the notice sheet or a piece of paper. Instead of using a piece of paper that can get lost or destroyed, use the Cat Scratch pane to organize all the information. The information in the Cat Scratch pane stays with the file and/or case depending on your settings.

You can select the *Send Used Briefs to Cat Scratch* option in the [Realtime Aid Options](#) and automatically send suggested briefs to the Cat Scratch pane. While [creating a global](#), you can select the Add 2 Cat Scratch option and send the definition to the Cat Scratch Pane. While you are [Power defining](#), you can write the steno outline defined in your Power Define dictionary as [CAT SCRATCH], to send the text and definition to the Cat Scratch pane.

The Brief It option, [Show Phonetic Steno](#), determines whether the steno displays in steno characters or the “phonetic” sound of the combined letters. For example, let’s say you have the Show Phonetic Steno option selected and you write the phrase “large imbalances”, Brief It displays the suggestion as “LARJ” instead of “HRARPBLG.” And in the Steno field of the Text/Steno section, you would see “LARJ”. And when you send that brief to the Cat Scratch pane, the steno display as “LARJ” in the Text/Steno section.

### To send a selected brief to the Cat Scratch pane:

1. In the Brief It pane, highlight any brief.
2. Do any of the following:
  - a) If you have assigned a key combination to the [Send Last Brief to Cat Scratch](#) command in the current keyboard map, press the assigned key.
  - b) Right click and select Send to Job/Case Cat Scratch.
3. The last brief in the Brief It is sent to the steno and text section in the Cat Scratch pane.
4. If the Cat Scratch pane is not currently displaying, press **Alt + v, e, c** (View, Panes, Cat Scratch).

[Keyboard Map](#) Function: [Send To Cat Scratch](#)

[Send Steno & Text to Cat Scratch Pane](#)

[Send Selected Brief to Cat Scratch](#)

Send Last Brief to Cat Scratch

## Insert

The Edit, Insert feature provides the ability to insert:

- [Conflict Text](#)
- A [Dash](#)

- [Fields](#)
- [Format Symbols](#)
- [Hidden Text and Comments](#)
- [Images](#)
- [Extended Characters](#)
- [Exhibit Index Entries](#)
- [Speakers](#)

## Insert Conflict/Text

Insert Conflict/Text is an Edit command that displays the Insert Conflict/Text dialog box allowing you to insert a conflict into the file. Case CATalyst uses a caret (^) to identify a conflict. To insert a conflict in Edit, you must use the Insert Conflict/Text feature to have Case CATalyst recognize the caret (^) as a conflict. Case CATalyst does not recognize a caret (^) as a conflict when it is typed directly on the screen. When defining steno to be a conflict, use a define command.

For example, you are creating an Include file and you want to create an entry such as, ^ Plaintiff ^ Defendant on your title page so you can [scan](#) to the entry while editing. You press Ctrl + i to display the Insert Conflict/Text dialog box and then type the conflict into the Text field. A ^ (caret) should precede each conflict choice and a space should follow each caret. If a space is not typed after each caret, Case CATalyst inserts the spaces along with a <Conflict End> format symbol at the end of the conflict.

You can type directly on the screen to insert text, format symbols, and punctuation.

**^ Spacebar Plaintiff Spacebar ^ Spacebar Defendant**

## Insert Conflict Text

1. Position the cursor to the left of where you want to insert the text and press **Ctrl + i** (**Edit/Insert/Conflict**).
2. In the Text field, create the conflict. Type a caret (^) followed by a space and then the word or words; then type a space, caret, space, followed by the second word. Continue with this format until you have entered all your conflict choices. Do not put a space after the last word. For example, to create a conflict between "there", "their", and "they're", type:

**^ Spacebar there Spacebar ^ Spacebar their Spacebar ^ Spacebar they're**

It displays in Edit as ^ there ^ their ^ they're.

You can include a format symbol, field, extended characters and additional text in the command:

-  To include a format symbol, select **FS** and choose one from the list or use a format symbol shortcut key.
-  To insert a field or make it part of the entry, select [Insert Field](#) and choose from the list.
-  To insert an [extended character](#), press **F9**.
-  To include additional text following the conflict that is not part of the conflict, use the [Conflict End](#) format symbol after the last word in the conflict.
-  To insert previously typed inserted text, use Intuitive Replace by pressing Ctrl + r in the Insert Conflict dialog box. Case CATalyst cycles through the last ten typed items. Depending on your setting, Intuitive Replace cycles through the last items inserted for job, for the case or by the user.

3. Press **Enter (OK)**.

## Insert Dash

Insert Dash is an Edit command that inserts two hyphens after the cursor position. To use the Insert Dash command, position your cursor to the left of where you want to insert the dash and press **Ctrl + /**. For example, if you want to insert a dash between the words "he she", position your cursor anywhere between the two words and press **Ctrl + /**. The result is he -- she.

## Insert Field

Insert Field displays the Insert Field dialog box where you can create new [fields](#), remove fields, fill in fields, create field list groups, clear field list groups and insert fields into the job while Editing.

In Edit, you can access Insert Field from the Edit menu and from select dialog boxes, such as the Global Define or Insert dialog box. In Manage Dictionary, the Insert Field feature is available from the Insert Entry and Modify Entry dialog boxes. To insert a field:

- in Edit. Press **Alt + e, i, f (Edit/Insert/Field)** to display the Insert Field dialog box.
- in Edit and Manage Dictionary from select Case CATalyst dialog boxes. Click the **Insert Field** button to display the Insert Field dialog box.

### Insert a Field

The Insert Field dialog box displays with two columns. Field Names displays the list of available field in the left columns. The right column, Field Value, displays the definition for the field, if a definition has been created.

Use the following features as necessary. When you invoke Insert Field from within a dialog box, such as the Global Define dialog box, not all features are available.

#### Field Name

The list of available fields. Highlight the field to insert and click **OK**.

#### Field Value

Displays the definition for the field, if a definition has been created.

#### Close dialog after inserting field

Check this option to automatically close the Insert Field dialog box after inserting a field.

Uncheck this option to have the dialog box remain open after inserting a field. This allows you to move the cursor focus between the Insert Field dialog box and the text file while maintaining fields. You must manually close the Insert Field dialog box.

#### Clear Field List Group

Depopulate filled in Field List Group values from the transcript by positioning your cursor in one of the field values for the Field List Group and select **Clear Field List Group**. You may want to use this option if all the field values for a particular Field List Group is incorrect. The Clear Field List Group only removes field values from the current transcript.

For example, while editing a job, you selected the Kurkowski and Kohlmeyer firm on your appearance page. During your proofreading, you realize you selected the wrong firm. You position your cursor in the Attorney 1 field name and select Clear Field List Position. Case CATalyst removes all the field values for Kurkowski and Kohlmeyer from the transcript.

#### Options

Display the [Field Options](#) dialog box where you can determine how Case CATalyst handles certain parameters when working with fields

#### New Field

Create a new user defined field such as Plaintiff, Defendant or County. Case CATalyst inserts a new field using the default name FIELD followed by the next consecutive number, such as FIELD1, FIELD2, etc. In the highlighted area, type a name for the field such as County or Judge. After typing the name, press **Enter** or click anywhere in the dialog box. You can create as many user defined fields as necessary. User defined fields can have a User, Case or Job scope.

### Fill In Field

Enter the value for the current field. For example, you created a new field for County. Highlight County and select Fill In Field. The [Fill In Field](#) dialog box displays where you can type the value and set the scope. A field value cannot exceed 200 characters.

### Add Next Field List Group

Case CATalyst includes five [field list groups](#) which include fields for Attorney, Firm, Address, etc. These fields correspond with the fields in the Fill-In-Field List file. Use this option to create the next consecutive field list group. For example, you are working on a big case which requires nine appearances. A field list group includes ATTORNEY, FIRM, ADDRESS, etc. Case CATalyst assigns the next consecutive group number to the new field list group.

### Insert

Insert the selected field into the text file at the cursor location. The fields displays in the user selected [color](#).

You can select multiple fields to insert by holding Ctrl and clicking the desired fields. To select consecutive fields, hold Shift while you click the first field and then the last field.

### Close

Save changes and close the Insert Field dialog box.

### Delete Field

Remove a user defined field from the list. Highlight the field you want to delete and then select **Delete Field**. The field is only removed from the list. If the field you delete already exists in a document, it remains in the document.

To delete multiple fields, hold Ctrl and click the desired fields. To select consecutive fields, hold Shift while you click the first field and then the last field. A confirmation message displays. Select **Yes** to continue the deletion.

## About Fields

Fields are placeholders for information that change in the job, such as page numbers, appearance data, witness names, plaintiff & defendant names, dates and times. You can use fields in include files, definitions, and headers and footers. They can also be used in place of text surrounded by Scanstops or single-choice conflicts, such as ^WITNAME, where you usually replace or E-define the text. Generally, once you fill in a field, it changes throughout the transcript.

There are three different field types in Case CATalyst, [predefined](#) fields, [user defined](#) fields and [field list groups](#). Predefined fields are available fields that are automatically filled in, such as page numbers and creation date. User defined fields are fields created by the user such as Witness and Plaintiff. Field List Groups are specifically designed for quickly and easily filling in appearance information and work in conjunction with the [Fill In Field List](#).

Fields are inserted into a transcript file, text file or definition using the [Insert Field](#) feature. Fields display in a user selected [color](#) on the Edit screen. In Edit, you can access Insert Field from the Edit menu and

from select dialog boxes, such as the Global Define or Insert dialog box. In Manage Dictionary, the Insert Field feature is available from the Insert Entry and Modify Entry dialog boxes.

You can fill in fields while editing and from the Fill-In-Field List file. When editing, the Scan and [Fill In Fields](#) feature is used to define information for user defined fields and field list groups. Predefined fields are automatically filled in by Case CATalyst. The Fill-In-Field List works in conjunction with Field List Group fields and stores client information such as addresses and attorney names. You can view, add, delete and modify field list group entries in the Fill-In-Field List.

When [including](#) a file that contains fields that have values, such as Appearances or title page information, the field values are retained. If the destination file contains a value for the same field as the file being included, and the value of the fields conflicts, Case CATalyst prompts you to select which of the two values you want for the entire job. You cannot have two values for one field in a job.

When you break a file that contains fields, field values are not retained in the text portion broken to the new or existing file. The fields values reset to empty. If the field values exist in another job, you can use the [Use Other Fields Values](#) command to fill in the fields.

When building an index, Case CATalyst indexes the text entered for the field value, not the field placeholder.

The Case CATalyst default setting for fields that are copied or cut is to paste the field or field value into a new or existing file as plain text. The field values display as plain text. They no longer function as placeholders for information that you can change using field features. You can change the default setting in [Field Options](#) so that fields contained in cut or copied text paste with the field value intact and functioning like a field.

## Field Types

### Predefined Fields

Case CATalyst contains predefined (automatic) fields. They include:

- **Current Date and Current Time**

Use these fields in dictionary definitions or text files when you want the **date or time to change each time** the file is opened or edited. Case CATalyst makes the change based on the computer's current date and time.

- **Current Year**

This field reflects current year based on your computer date and dynamically changes when the year changes on your computer. Use this field in include files where the current year is necessary.

- **First/Last Indexed Word on Page**

Use these fields in a concordance index to [add](#) the first and last indexed word to the header or footer.

- **First Page and Last Page**

Use these fields where you want the actual page number of the first page and last page of the transcript. This number changes when the pages in the file change. You may, for example, use these fields in a certificate page include file. When the include file is brought into the transcript, the fields automatically adjust the page number based on the current transcript.

- **First Page in Section/Last Page in Section**

Use these fields where you want the actual first page number of the current section and last page number of the current section. This number changes when the pages in the file change. For example, you have multiple proceedings in one transcript which require multiple sections in the file. If you need a certificate page which contains the page number for each proceeding, use these fields.

- **Job End Time**

Displays the time when the [Set Job End Time Field](#) translate command was inserted into the transcript.

- **Job Start Time**

Displays the time when the [Set Job Start Time Field](#) translate command was inserted into the transcript.

- **Page Number – x, x, x...**

These fields change when the page numbers in the transcript change. Page number fields are generally used in layouts to number the transcript pages.

- **Seal Date and Seal Date with Day (These fields require manual insertion into a file and cannot be used in an include file.)**

Use these field formats to reflect the current date the field was inserted into the transcript using an ordinal day followed by the month and year, 9th of February, 2009; or the day followed by the word "day" followed by the month and year, 9th day of February, 2009.

The date in these fields does not change when you open and close the file. Insert the fields into the transcript at the time of the required date. For example, record a macro that includes your certificate include file, scans to the location of where the seal date should be placed and then inserts the appropriate Seal Date field.

- **Seal Date when Included (Static date set when included) and Seal Date with Day when Included (Static date set when included)**

These two Seal Date fields are different than the above Seal Date fields. The Seal Dates when included can be put into include files, and they remain as a field until they are included into a transcript. Once included into the transcript, the current date is filled in and becomes static text and is no longer a field.

For example, let's say you are creating a new Certificate page and have inserted the [!Seal Date with Day when Included] field. When you have completed the certificate page include file, you save and close the file. On your next job, you have finalized the transcript and include your new Certificate page on October 18th, 2018. The [!Seal Date with Day when Included] field changes to static text, *the 18th day of October, 2018*. No matter how many times you open and close that transcript, that date will not change.

If, in the above example, you inserted the Seal Date when Included field instead of Seal Date with Day when Included field, the date format would be *the 18th of October, 2018*.

- **Static Date and Static Time**

Use these field formats in dictionary definitions when you want to timestamp the file and have the date or time remain the same. For example, let's say that you need to add a parenthetical at the end of the proceedings that displays the time. You create a dictionary entry that inserts the following in the transcript: <Parenthetical>(Whereupon the deposition concluded at [!Static Time - 12 Hour]). The [!Static Time - 12 Hour] field uses the time from your computer to fill in the field value. These fields can also be used in dictionary definitions that include the static time field for witness stepped down and recess taken types of entries. The date and time do not change when you open and close the file. You can also manually insert the fields into a file. Also see the Job Start Time and Job End Time fields (listed above) that work with the [Set Job Start Time Field](#) and [Set Job End Start Field](#) translate commands if you need to note the start and end time of the proceedings. These fields and translate commands can be used to automatically fill in the cover or title page information.

Static date and time uses the following rules:

- When writing realtime, the date and time is taken from the computer.
- When translating a steno file with timestamps, the date and time is taken from the steno file.
- When translating a steno file without timestamps, the date and time shows all zeros.
- The time is separated with a colon. You change the separator to a period in [Field Options](#).
- Do not use static date and time fields in include files.
- Static Time - H:M:S displays the time in hours, minutes and seconds based on a 12-hour clock.
- Static Time - 12 Hour displays the time in hours and minutes based on a 12-hour clock.
- Static Time - 24 Hour displays the time in hours and minutes based on a 24-hour clock (often referred to as military time).

- **Total Pages In Document**

Display the total number of pages in the job. For example, you might want your page number to reflect the current page number of the total number of pages in the file, such as 2 of 78.

- **Total Pages In Section**

Display the total number of pages in a section. For example, you might want your page number to reflect the total pages in the concordance index section.

pre-defined calculation fields, Transcript Start, Transcript End and Transcript Total. Transcript Start and Transcript End are designed to work in conjunction with Transcript Total for the purpose of calculating transcript totals. Transcript Total is also designed for use independently of the other pre-defined calculation fields.

- **Transcript Start**

Identify the first transcript page for billing purposes. This field inserts into the transcript as Hidden Text to prevent the field value from displaying in the transcript. When inserted into a job report template, the field inserts into the transcript as regular text to display the information. This field works in conjunction with the Transcript Total field.

- **Transcript End**

Identify the last transcript page for billing purposes. This field inserts into the transcript as Hidden Text to prevent the field value from displaying in the transcript. When inserted into a job report template, the field inserts into the transcript as regular text to display the information. This field works in conjunction with the Transcript Total field.

- **Transcript Total**

Calculate the total number of pages based on the Transcript Start and Transcript End fields. This field inserts displaying the field value information. If you do not use the Transcript Start and End fields, the total page count begins on the page with the first occurrence of underlying steno and ends on the page with the last occurrence of underlying steno.

## User Defined Fields

User defined fields allow you to create customized fields for information such as county, judge, witness names or any field you need in your job. You identify the specific name to represent the field in the current job. Additionally, you can set the [scope](#) for the definition to determine the availability of the field values for other jobs. For example, you create a COUNTY field and want that field to display all the available county names in every job. You set the scope to *User*. In another example, you create a WITNESS field and want that field to display only the available witness names in the current job. You set the scope for the WITNESS field to *Job*.

There are five date fields that you can insert into an Include file or the transcript to show the date the job was created. Case CATalyst automatically bases the field value on the creation date in the Job History. For example, you can use the Creation Date field on your title page Include file. When you insert the Creation Date field into the title page, it displays the *date the Title page Include file was created*. When you include the title page into the job, the Creation Date dynamically adjusts to display the creation date for the current transcript. If the date is incorrect, you can change the field value in the [Insert Field](#) dialog box.

The five Creation Date fields include:

### Creation Date

The date display in all numeric format: 04/12/2012.

### Creation Date in Words

The date displays in word and numeric format: April 12, 2012.

### Creation Date Ordinal

The date displays in words and numeric ordinal format: 12th of April, 2012.

### Creation Date Ordinal with Day

The date displays in words along with the word 'day' and numeric ordinal format: 12th day of April, 2012.

### Creation Day of the Week

The day of the week displays: Tuesday.

If you are currently using the Creation Date field in a job and switch to the International date format (DD/MM/YY), it is necessary to delete the text of the Creation date field in that job, save and close the file, and reopen the job. For example, the Creation date field is in an include file with a "date" value. In order for the International date format take effect, open the include file. Open the Insert Field dialog box, Edit/Insert/Field and delete the value in the Creation Date field. Save and close the include file. When you reopen the file, the international date format takes effect. If the Creation Date field is not in use, no action is required when you switch to International format.

## Field List Groups

A field list group is a series of related fields usually associated with appearances, such as speaker, attorney, firm name, and address. For example, the Insert Field dialog box displays the fields: SPEAKER1, FIRM1, ATTORNEY1, ADDRESS-A1, ADDRESS-B1, CITY1, STATE1, ZIP1. These fields work in conjunction with the [Fill-In-Field List](#) file. When you make an entry for a field list group during Edit, Case CATalyst stores the information in the Fill-In-Field List file. The information is available for all jobs. The Fill-In-Field List is located in the System Files case.

You can create additional attorney fields for a field list group to accommodate multiple attorneys from the same firm. For example, you are using Field List Group 3. You have FIRM3, ATTORNEY3, ADDRESS-A3, etc. You [create](#) a new field named ATTORNEY3A. The ATTORNEY3A field is now associated with the FIRM3 List Group. You can also create other additional fields such as E-MAIL3A, PHONE NUMBER3A, etc. There are five preset field list groups and you can create additional groups.

## How to Use Fields in a Transcript

Fields can be inserted into include files, definitions and headers and footers. The following examples show how to use the three [field types](#) in Case CATalyst: predefined fields, user defined fields and field list groups.

### Include Files

On your appearances page, you can use a field list group for the appearance information. Insert all the appropriate fields and then format the information as necessary.

#### *Field List Group Example*

APPEARANCES

FOR PLAINTIFF:	[!FIRM1]
	BY: [!ATTORNEY1]
	[!ADDRESS-A1]
	[!ADDRESS-B1]
	[!CITY1], [!STATE1]
	[!ZIP1]

#### *User Defined Field Example*

Create a field for the witness name, such as [!WITNAME]. On a title page, cert page, or sworn statement, you might insert the [!WITNAME] name field.

## Definitions

Fields can be used in definitions to automatically bring in information for a predefined field or to insert a user defined field for which you later enter the information.

#### *Predefined Field Example*

At the end of the proceedings note the time the proceedings concluded. In any dictionary, you define the steno outline, EPBD/EPBD or KHRAOUD/KHRAOUD (or whatever steno you want to use)as:

<Parenthetical>(Whereupon, the proceedings concluded at [!Static Time – 12 hour]) (You can use whatever wording is appropriate for your work.)

The pre-defined [!Static Time - 12 hour] field automatically fills in the time from your computer when the stroke is written. If you are not writing realtime but you are using a steno machine that records timestamps, you can read in the steno file from your writing machine and when you translate the steno file, CATalyst will use the timestamp from the steno file.

## Headers/Footers in Layouts

Predefined, user defined and Field List Group fields can be used in a header or footer.

### *Header Example*

You want a header identifying the witness and current speaker at the beginning of every page. You insert fields into the header, such as:

DIRECT EXAMINATION OF [!WITNAME] BY [!SPEAKER1]

## Add Attorney Fields to Field List Group

Field List Group fields are related fields designed for Appearance pages. There are five preset field list groups. Default fields for a field list group include, SPEAKER, FIRM, ATTORNEY, ADDRESS-A, ADDRESS-B, CITY, STATE, ZIP. The same number follows each of the fields in the field group. For example, SPEAKER1, FIRM1, ATTORNEY1, ADDRESS-A1, ADDRESS-B1, CITY1, STATE1, ZIP1. The next group will be SPEAKER2, FIRM2, ATTORNEY2, ADDRESS-A2, ADDRESS-B2, CITY2, STATE2, ZIP2, etc. The number indicates that the fields are all part of the field group. You can create as many field list groups you want and you can create additional fields for the field group.

You can create additional attorney fields to associate with a Field List Group for use when there are multiple attorneys present from the same firm. For example, let's say you are using Field List Group 1. You have FIRM1, ATTORNEY1, ADDRESS1-A, etc. You create a new field named ATTORNEY1A. The ATTORNEY1A field is associated with the FIRM1 List Group. The transcript you are working on has two attorneys representing the plaintiff. You scan and fill in the fields for FIRM1, selecting the Jones, Jones & Jones firm that has one location and six attorneys. Case CATalyst fills in the FIRM1 field along with the ADDRESS, CITY, STATE and ZIP fields and then displays the list of attorneys for the ATTORNEY1 field. You select the first attorney. Case CATalyst scans to the ATTORNEY1A field and displays the same list of attorneys from which to select. You can also create additional fields for E-MAIL1A, PHONE NUMBER1A, etc., to associate with the additional attorney field. All the additional fields you create are available in the [Fill-In-Field List](#).

## Create an Additional ATTORNEY Field

1. In Edit, press **Alt + e, i, f, (Edit, Insert, Field)**. The Insert Field dialog box displays.
2. Select **New Field**.
3. Type **ATTORNEY** followed by the number of the list group and then an alphabetic letter or word and press **Enter**. For example, ATTORNEY1A or ATTORNEY1\_SECONDCHAIR. You can create multiple attorney fields for each firm. For example, ATTORNEY1B.
4. When finished, click **Close**.
5. To use the newly created field, insert the field in the appropriate location in your include file that contains appearance information or in the transcript while editing. When you Scan and Fill in Fields, Case CATalyst recognizes the additional field associated with Field List Group.

## Timer and Timer Group Fields

A Timer field, when inserted into the transcript, displays the total time for the specific [Timer](#). A Timer tracks the amount of time for a speaker or specific event in a job. For example, some jurisdictions or specific types of proceedings place time limits on the testimony of an expert witness. The responsibility of tracking the time often falls to the court reporter. A dictionary definition with the [Start Timer](#) translate command is necessary for each individual speaker for whom you want to track time.

A TimerGroup field, when inserted into the transcript, displays the total time for a specific [Timer Group](#). A Timer Group contains multiple Timers listed under one group name for the purpose of tracking their cumulative time.

You can insert Timer and TimerGroup fields directly into the transcript or as part of an include file. It is necessary to create a Timer field for each Timer used in the job. For example, you have MR. JONES assigned to the {Start Timer}[1] translate command and MR. SMITH assigned to the {Start Timer}[2] translate command and both speakers questioned the witness during the proceedings. On your certificate page, you want to include the total time that MR. JONES questioned the witness and the total time MR. SMITH questioned the witness. You create a [TIMER1] field and a [TIMER2] field. On your Cert page, you insert the [TIMER1] field to display the total time that MR. JONES questioned the witness and insert the [TIMER2] field to display the total time MR. SMITH questioned the witness.

If you assign multiple Timers to a Timer Group, you can create a TimerGroup field for each Timer Group if you want to keep track of the group time. For example, there is an additional speaker, MR. DOE. He and MR. SMITH are both defense attorneys. You created a Timer Group for the two attorneys. You can create a [!TIMER GROUP1] field and insert it into the Cert page for the cumulative time of both SMITH and DOE.

## Create Timer and TimerGroup Fields

1. Open the Insert Field dialog box. Press **Alt + e, i, f (Edit/Insert/Field)**. The Insert Field dialog box displays.
2. Depending on the type of Timer field you want to insert, highlight the **Timer** or **TimerGroup** field and press **Alt + f (Fill in Field)**.
3. In the Select Timer or TimerGroup dialog box, type or use the spin control to select the speaker Timer or Timer group number.
4. Press **Enter**. The new Timer or TimerGroup field displays in the Insert Field dialog box. For example, you created a Timer field for Speaker 2. The *TIMER2* field displays.
5. Create additional Timer and TimerGroup fields as necessary.
6. When finished, press **Alt + c (Close)** to close the Insert dialog box.

**NOTE:** If you use the New Field button to create a Timer field instead of the instructions above, make sure you type TIMER immediately followed by the timer number. For example, TIMER102 is correct but TIMER 102 will not work properly.

## Insert a Timer or TimerGroup Field

1. In the transcript or Include file, position your cursor at the insert point for the Timer or TimerGroup field.
2. Press **Alt + e, i, f (Edit, Insert, Field)**. The Insert Field dialog box displays.

3. Locate and highlight the specific Timer or TimerGroup field to insert and press **Alt + i (Insert)**.
4. Insert additional Timer or TimerGroup fields as necessary.
5. When finished, press **Alt + c (Close)** to close the insert dialog box.

**NOTE:** If you use the New Field button to create a TimerGroup field instead of the instructions above, make sure you type TIMERGROUP immediately followed by the timer group number. For example, TIMERGROUP2 is correct but TIMERGROUP 2 will not work properly.

## Insert Format Symbols

Insert Format Symbols is an Edit command that displays the Insert Format dialog box from which you can select [format symbols](#) for insertion into the transcript text. You can add other format symbols to the default list in the Case CATalyst Insert Format Symbol dialog box by modifying your [Format Symbols Options table](#).

### Display the Insert Format Symbol Dialog Box

- In Edit, press **Shift + F4**.
- From the menu select **Edit/Insert/Insert Format Symbols**.
- Click  on the Edit toolbar.

## Insert Hidden Text/Comment

Use the Insert Hidden Text/Comment feature in Edit when you want to include a note that is not visible on the transcript in Edit and does not display on the printed transcript. For example, a reporter working with a scopist may want to include notes to one another. Case CATalyst displays a push pin on the Edit screen to indicate hidden text. Double click the push pin to display the hidden text.

You can add format symbols to the hidden text, such as bold and italics, or include the hidden text on an Index page. For example, you may want to use hidden text to add a description you need when marking an exhibit. By surrounding the hidden text with Indexing format symbols, you can have Case CATalyst display the description on the Index page. In the actual transcript, the exhibit description does not display.

When inserting format symbols, you can highlight the text and select a format symbol to have Case CATalyst automatically insert the format symbol at the beginning of the highlighted text. When adding a paired format symbol, such as Bold On/Off or Index On/Off, highlight the text and then select the format symbol that turns the formatting on. Case CATalyst automatically surrounds the text with the appropriate On and Off symbols.

The Hidden Text dialog box accepts up to 1792 characters. When you insert more than one hidden text entry on a line, an arrow displays in the lower right corner of the Hidden text dialog box. Click the arrow to expand the dialog box to display all the hidden text entries. A number displays above each entry. Case CATalyst numbers the entries in the order you create them.

### Insert Hidden Text in Edit

1. Press **Alt + e, i, h (Edit/Insert/Hidden Text/Comment)**. The Hidden Text dialog box displays.
2. Type the text you want to insert. Use the following options as necessary:

**FS**

Display the list of available format symbols. Double click the format symbol you want to use in the definition. You can insert a format symbol at any point in the text entry. To have the format symbol list always display, check the box, Always Show Format Symbols.

You can also use shortcut keys to insert a format symbol. Press **F4** and then press the appropriate letter or symbol.

### Insert Field

Display the [Insert Field](#) dialog box from which you can select a field to insert into the hidden text.

When you insert hidden text that contains a Field, the field value displays in Reveal Codes but not in the Hidden Text dialog box. For example, in the transcript you fill in your user defined [!COUNTY] field as COOK. When you insert the [!COUNTY] field into the Hidden Text dialog box, the field value does not display. When you close the Hidden Text dialog box, the filled in field value displays in Reveal Codes.

### Extended Characters

Press **F9** to display the Insert Character dialog box where you can select an [extended character](#) to insert into the hidden text.

3. Press **Enter (OK)** to insert the hidden text. If the Transcript Spell Check option, [Spell Check While Defining](#), is active, Case CATalyst spell checks the text.

To view additional hidden text entries for the line, press **Ctrl + Down Arrow** (↓). To shrink the dialog box, press **Ctrl + Up Arrow** (↑).

4. To search for hidden text entries:
  - Use the Special Search commands, [Search](#) Next/Previous Hidden Text.
  - Set your [Scan For](#) options to scan for hidden text using Reveal Codes, **Ctrl + Shift + r** (**View/Review Codes**) to view the hidden text.
  - Use the [Hidden Text](#) feature to display all the Hidden Text in a dialog pane.

[Keyboard Map](#) Function: Insert Hidden Text

## Insert Image

Insert Image is an Edit feature that allows you to insert a graphic image into your job file. Place your cursor anywhere on the line when inserting the image. Case CATalyst places the image on a new line below the insertion point. Text displays below the image, but does not wrap around the image. You can use Image Properties or the mouse to reposition the image on the line or to modify the size.

### Insert a Image

1. In Edit, press **Alt + e, i, i** (**Edit/Insert/Image**). The Open File dialog box displays.
2. Make necessary entries:

#### Look in

The current folder. If necessary, select another location.

#### File name

The selected file to open. Click a file to select it or type the file name.

### Files of type

The type of image files that displays in the window. You can insert almost any type of graphic. Display all image types or filter the display by selecting a specific file type from the list, such as .bmp or .jpg (JPEG). A PDF file is not a graphic file and cannot be opened or inserted as an image.

### Enable Preview

Display the image in the dialog box to preview it before insertion.

### File Info

Display the File Information dialog box showing additional information such as image format size, and resolution.

3. Press **Enter (Open)** to insert the image.
4. Use [Image Properties](#) to modify the position and size of the image as necessary.

[Keyboard Map](#) Function: Insert Image

## Insert Extended Characters

Insert Extended Characters is an Edit command that allows you to insert Upper ANSI characters into the file. The current font selection in the transcript determines the extended characters available for selection. You can change the font, however changing the font may result in a difference in the availability of characters.

### Insert an Extended Character into the Text

1. Press **Alt + e, i, x (Edit/Insert/Extended Characters)**. The Insert Character dialog box displays. To change the font, press **Alt + t**. The Font dialog box displays where you can modify the font characteristics.
2. Double click a character to insert. Case CATalyst inserts the character at the cursor location.

### Insert an Extended Character into a Dialog Box

1. With the cursor in the Text or New Text field, press **F9**. The Insert Character dialog box displays. To change the font, press **Alt + t**. The Font dialog box displays where you can modify the font characteristics.
2. Double click a character to insert. Case CATalyst inserts the character at the cursor location in the Text or New Text field.

## Make Exhibit Index Entries

Make Exhibit Index Entries is an Edit feature that allows you to insert index format symbols and exhibit descriptions for individual, multiple or a range of exhibits marked at one time. For example, you mark exhibits 1 through 20 for identification. You are using index category B for your exhibits. Your index page is designed with the exhibit number in the first column, exhibit description in the second column, the page reference where the exhibit is marked in the third column and page references where the exhibit is admitted in the fourth column. Using the Make Exhibit Index Entries feature, you can identify all the exhibit numbers to be indexed, have Case CATalyst insert the appropriate indexing format symbols and add any necessary description text to each Exhibit numbers. When you use the Build Index feature, Case CATalyst copies the exhibit information to the appropriate columns on the index page.

Exhibit information is created as individual Hidden Text. If you exit the Make Exhibit Index Entries feature before entering all the desired information for the exhibits, Case CATalyst automatically saves the completed exhibit entries and prompts you to either insert the remaining exhibit numbers or exit without inserting the entries. If you select to insert the remaining exhibit numbers, you can later open [Hidden Text](#) dialog pane and complete the description information.

You can also select Help, Self-Study Guides and then Automatic Index Self-Study Guide for step-by-step instructions to create an index template and using Case CATalyst's Build Index feature.

[Keyboard Map](#) Function: Make Exhibit Index Entries

## Identify, Format and Describe Exhibit Index Entries

1. In Edit, position the cursor where you want to insert the exhibit information.
2. Press **Alt + e, i, m (Edit/Insert/Make Exhibit Index Entries)**. The Make Exhibit Index Entries dialog box displays.
3. Make necessary entries:

### Exhibit range

Type the exhibit entries as follows:

- Individual — Type the exhibit number.
- Multiple — Type the exhibit numbers, separated by a comma. For example: 1, 6, 8
- Range — Type the beginning exhibit number followed by a hyphen followed by the ending exhibit number. For example: 1-20. You can combine alpha and numeric numbers such as A-F, 1A-1F or "A-1"-“A-6.”

When entering a range that includes a number, hyphen and letter, such as "A-1" it is necessary to put quotes around the beginning and ending range number. You can use either single or double quotes, but they must match. For example, type "A-1"-“A-6” or ‘A-1’-‘A-6’ for the range.

If you enter a range of A1, C1, F1, exhibit entries A1, C1 and F1 are created. You can also enter individual entries with no particular order, such as A1, B7, 286, F17. If Case CATalyst cannot determine the range criteria, a message displays.

### Index Category (A-Z, 1-9)

Type the letter or number for the index [category](#) which you are using for exhibits. For example, you might use category A for witnesses and category B for exhibits. If you are using an index template, make sure you use the same exhibit letter or number category that is on the index template.

### **Use Indexing Format Symbols**

Select one of the following:

#### **Index Heading Only**

Insert Index Heading format symbols around the exhibit number and text, if included.

#### **Index Heading and Index**

Insert Index Heading format symbols around the exhibit number and Index format symbols around the description.

#### **Index Only**

Insert Index format symbols around the description.

### **Use Index Cell**

Index Cell format symbols are used when you want more than one reference number for one indexed item. For example, you have an Exhibit number and need to provide reference (page) numbers as to when it was marked and when it was admitted. Use a different index cell number for marked exhibits and admitted exhibits.

Depending on your selection in the Use Indexing Format Symbols section, only certain options are available. Select one of the available options:

#### **For Index Heading, use Index Cell(s)**

Select this option if you are using Index Cell format symbols along with Index Heading format symbols. Type an Index Cell number in the field. Your index template, should use the same cell number you enter here.

If you are identifying more than one action, such as exhibit marked and exhibit admitted at the same time, type the appropriate cell number in each cell number field.

#### **For Index, use Index Cell(s)**

Select this option if you are using the Index Cell format symbols along with Index format symbols. Type an Index Cell format symbol in the field. Your index template, should use the same cell number you enter here.

If you are identifying more than one action, such as exhibit marked and exhibit admitted at the same time, type the appropriate cell number in each cell number field.

#### **Not using cells**

Select this option if you are not using Index Cell format symbols.

### **Sample Text**

Displays an example of text with format symbols based on your selections.

### **I want to customize Index Heading text**

This option is available when you select to use Index Heading only or Index Heading and Index format symbols. Check this option to add an additional identifier text to the exhibit number.

### I want to add description text

This option is available when you select to use Index only or Index Heading and Index format symbols. Check this option to add a description to the exhibit. The Exhibit Detail dialog box displays when you press Enter (OK).

3. Press **Enter (OK)**. One of the following occurs:

- If you did not select to customize Index Heading text or add description text, Case CATalyst closes the Make Exhibit Index Entries dialog box and inserts a Text icon to indicate information exists for building an exhibit index. You can click on the icon to display the information.
- If you selected to customize Index Heading text or to add description text to the exhibit the Exhibit Detail dialog box displays when you press Enter (OK). Do the following:
  - a. Make entries in the fields for the first exhibit. To add the exhibit numbers without a description, leave the field blank.

#### Index Heading Text

This field is available when you select to use Index Heading only or Index Heading and Index format symbols and select to customize the Index Heading Text. Type the text you want to add and insert additional [format symbols](#) and [fields](#) as necessary. Case CATalyst automatically adds the Index Heading format symbols.

#### Index Text

This field is available when you select to use Index only or Index Heading and Index format symbols and select to add description text. Type the text you want to add and insert additional [format symbols](#) and [fields](#) as necessary. Case CATalyst automatically adds the Index format symbols.

Select *Repeat Description* to type a description and automatically apply it as the description for all remaining entries. Click Done when finished. If you press Enter instead of clicking Done, the next exhibit number displays and the *Repeat Description* option is deselected.

- b. Press **Enter (Next)** to display the Enter Detail screen for the next consecutive numbered exhibit. Continue entering information for each exhibit until finished. Use the Back button to return to a previous entered exhibit. If you select Done before moving through all the exhibit entry screens, Case CATalyst prompts you to enter the remaining exhibits without descriptions. Select Yes to enter both the exhibits with completed descriptions and those without descriptions. You can add the descriptions later. Select No to enter only entries with completed descriptions. Only exhibits with completed descriptions are added to the transcript.
- c. When you finish entering exhibit information for the last exhibit, click Done. Case CATalyst closes the Make Exhibit Index Entries dialog box and inserts a Text icon to indicate information exists for building an exhibit index. You can click on the icon to display the information.

## Insert Speaker

Insert Speaker allows you to insert a speaker name from the Speaker List without opening the Speaker List dialog pane. CATalyst VP inserts the speaker name into the job as Colloquy unless the speaker name is inserted directly before or after a Question when it displays as a By Line. To customize the By Line format, use the [By Line Options](#).

## Insert a Speaker

1. Press **Alt + e, i, s (Edit/Insert/Speaker)**. The Select EZ Speaker dialog box displays.
2. In the *Enter Value* field, type the token number associated with the speaker name you want to insert and press **Enter (OK)**.
3. The speaker name displays in the associated color in Colloquy format.

## Insert Speaker from Speaker List

To insert a speaker name from the Speaker List during Edit:

1. Open the Speaker List. Press **Alt + v, e, k** (**View/Panes/Speaker List**).
2. Double click the entry or highlight the entry and click the **Insert** button.

## Tables

Tables allow you to align text in columns without moving other text placed on the same horizontal line. Using the Insert Table command, you can quickly [create](#) tables with any number of columns and rows. After creating the table, you can [modify](#) the table size, number of columns and rows, cell size and cell properties. You can also [copy](#) and paste a table along with its contents. Table grid lines display in Edit in both Normal and Page view for visual assistance in adjusting the cells, margins, and text placement. Grid lines do not print. Stenograph recommends working in Page view when creating and modifying tables.

Using tables on include pages which require column formatting, such as captions on title pages, is helpful in aligning text. For example, you may want to use a table to create the birdcage setup on a title page so that the birdcage, the closed parenthesis or colons, always lines up regardless of the amount of information for the caption. The following table is one row and three columns. One table cell contains the Plaintiff and Defendant names. Another cell to the right contains the closed parenthesis or colons. The last cell contains the case or docket number.

PlaintiffName,	)	Case No. #
Plaintiff,	)	
- v -	)	Type of Proceeding
DefendantName,	)	
Defendant.	)	

When you type in the Plaintiff name, the parenthesis in the next cell remains in place and the Plaintiff name wraps to the next line within the designated cell, if necessary. For more information about using tables on Include pages, see [Creating an Include File](#).

The [Build Index](#) command uses tables for indexed information. When you use the Build Index command without an index template, Case CATalyst automatically places the indexed information in a table. When using an [index template](#), you must place indexing format symbols into table cells to format the indexed information.

Keyboard Map Functions:

- All Cap Cell
- Copy Current Table
- Copy Table Rows

- Cut Table Rows
- Delete Table
- Delete Table Columns
- Delete Table Rows
- Init Cap Cell
- Insert Table Columns
- Insert Table Dialog
- Insert Table Rows
- Join Tables
- Paste Table Rows
- Split Table
- Swap Table Rows
- Table Cell Properties
- Table Column Properties
- Table Row Properties

## Insert Table...

Create tables in a job with any number of columns and rows. Once the table is created, you can add and delete columns and rows, modify cell size and modify cell properties. Table grid lines display in both Normal and Page View for visual assistance in adjusting the cells, margins, and text placement. Table grid lines do not print.

You can insert multiple tables into one file. Place at least one paragraph style between tables.

## Insert a Table into a Job

1. In Edit, switch to Page View, press **Alt + v, p (View/Page)**.
2. Position your cursor where you want to insert the table. To add a table at the end of a job, press **Ctrl + End** to move your cursor to the end of the file.
3. Press **Alt + e, i, t (Edit/Insert/Table)**. The Insert Table dialog box displays.
4. Make entries in the fields:

### Number of columns

Enter the number of columns you want in your table.

### Number of rows

Enter the number of rows you want in your table.

Most tables only require one row with multiple columns. You do not need to create a row for every line of text in the table.

5. Press **Enter (OK)**. Case CATalyst displays the table.
6. If necessary, [modify](#) the column width in Page view.
  - a. Place your cursor in the column you want to modify.

- b. Move the left and right column margin guides (  ) to the desired position. If the ruler elements are not visible, confirm you are in Page view, press **Alt + v, p (View/Page)**.
- c. Press **Ctrl + s (Save)**.
- d. If desired, switch back to Normal view, press **Alt + v, n (View/Normal)**.

[Keyboard Map](#) Functions: Insert Table Dialog

## Insert Rows and Columns

Add rows and columns to existing tables. If you want to remove an inserted column or row use the [Delete](#) Column and Delete Row features. Stenograph recommends using Page view when working with tables.

### Insert Rows

Add rows above or below the current row in which your cursor is located.

1. Switch to Page view, press **Alt + v, p (View/Page)**.
2. Place your cursor in the desired row.
3. Press **Alt + e, b, r (Edit/Table/Insert Rows)**. The Insert Row dialog box displays.
4. Select the number of rows you want to add and whether to add them before or after the current row.
5. Press **Enter (OK)**.

### Insert Columns

Add columns to the left or right of the current column in which your cursor is located.

1. Switch to Page view, press **Alt + v, p (View/Page)**.
2. Place your cursor in the desired column.
3. Press **Alt + e, b, c (Edit/Table/Insert Columns)**. The Insert Column dialog box displays.
4. Select the number of columns you want to add and whether to add them before or after the current column.
5. Press **Enter (OK)**.
6. If necessary, modify the column width:
  - a. Place your cursor in the column you want to change.
  - b. Move the left and right column margin guides (  ) to the desired position. If the ruler elements are not visible, confirm you are in Page view, press **Alt + v, p (View/Page)**.

[Keyboard Map](#) Functions: Insert Table Columns

Insert Table Rows

Insert Table Dialog

## Split Table

Split one table into two separate tables using the Split Table feature. The table splits horizontally. You can only use Split Table on tables that contain more than one row. You cannot split a table from the first row. For example, you use the Build Index command and a row of indexed information splits between two pages. Use the Split Table feature to avoid splitting the row between two pages.

## Split Table

1. Switch to Page view, press **Alt + v, p (View/Page)**.
2. Place your cursor on the row where you want to split the table. This becomes the first row of the new table. Press **Alt + e, b, s (Edit/Table/Split Table)**.
3. Press **Ctrl + s (File/Save)**.

[Keyboard Map](#) Functions: Split Table  
Swap Table Rows

## Join Tables

The Join Tables feature allows you to put two [tables](#) together as long as there is no text between the two tables. This feature can be used when creating index templates or while editing a transcript. For example, let's say you want to create a table in your index template for previously marked exhibits. You want the first row to have two columns and the second row have three columns for the exhibit number, description and page number. You can create the first table with one row and two columns and then create the second table that has one row and three columns. You then position your cursor in the first table and use the Join Table command to make it one table.

DEPOSITION EXHIBITS  
(PREVIOUSLY MARKED)

DEPOSITION EXHIBIT	PAGE
EXHIBIT	

### To join tables:

1. Create the two tables. Remember, you need a paragraph style between the two tables but no text.
2. Position your cursor in the first of the two tables you want to join.
3. Select Edit, Tables, Join Tables or press **Alt + e, b, j**. A Join Table keyboard map function is also available or you can record a macro to join the tables along with other commands.

### Possible messages:

- If you attempt to join two tables and there is text between the two tables, the following message displays:  
*Unable to join the tables because of text between the tables.*

- If you position your cursor in the last table in the index template and select join tables, the following message displays:  
*Unable to join the tables.*
- If you are in the last table which is at the end of the file and try to join tables it displays a message:  
*Can't join tables.*

[Keyboard Map](#) Function:      Join Tables  
Split Tables  
Swap Table Rows

## Table Properties

Using the Table Properties feature, you can prevent a table row from spanning across pages. The default setting allows the text of a row or cell that does not fit on the current page to continue on the following page. Alternatively, you can force the row and cell text onto the next page to eliminate the row or cell text from displaying on two pages. You can set the Table Properties manually for each table or you can put the command in an Index Template. If you select to force row and cell text to the following page and you want to add a line of text at the top of the following page, such as *Index Cont*, use the [Split Table](#) feature before adding the text to the following page.

Table Properties also allows you to control the printing of table borders or "grid lines" for individual tables. By default the grid lines of a table do not print. When you select to print borders, only the table in which your cursor is located is affected by the option. For example, you can select to print borders on your Title page table (birdcage) but it does not affect the borders of an index table.

[Keyboard Map](#) Functions:      Table Properties  
Table Row Properties  
Table Cell Properties

## Set Table Properties

1. Place your cursor inside the table in which you want to set the Table Properties. If you are setting the table properties in an Index Template, open the appropriate Index Template.
2. Press **Alt + e, b, a (Edit/Table/Table Properties)**. The Table Properties dialog box displays.
3. Set options:
4. **Allow table rows to span pages.**  
Do one of the following:
  - Check the box, **Allow table rows to span pages** to allow row and cell text to display on two pages.

- Uncheck the box to force row and cell text that does not fit on the current page to the following page.

### Print Table Borders

Do one of the following:

- Check this box to print table borders for the table in which the cursor is positioned.
- Uncheck this box to hide table borders for the table in which your cursor is positioned

5. Press **Enter (OK)**.

## Copy, Cut and Paste Table Rows

The Copy, Cut and Paste Table Row commands allow you to copy or move table rows to a new position within the same table. When you use these commands in a table that contains index items, Case CATalyst retains the dynamic reference information associated with the indexed items. Table rows can only be copied, cut and pasted to the same table. You can record macros to paste the table rows with the Before and After locations.

To quickly change the position of one row in a table with the following row using the [Swap Table Rows](#) feature. If you are copying the entire table, use the [Copy A Table](#) command.

## Move Table Rows

1. Position the cursor in the row to copy or cut. To copy or cut multiple rows, mark the rows.
2. Do one of the following:

### Copy the Rows

Leave the rows in the current position and make a copy of them to insert into in another location in the table. Select **Edit/Table/Copy (Rows(s))**.

### Cut the Rows

Remove the row from the current position and move them to another location in the table. Select **Edit/Table/Cut Row(s)**.

3. Position the cursor in the location where you want to paste the copied or cut information.
4. Select **Edit, Table, Paste Row(s)**. The Paste Table Row dialog box displays.

If the Paste option not available, either you did not copy or cut the rows or your cursor is positioned in a table other than the one from which the rows were copied or cut. Copy and cut rows can only be pasted within the same table.

5. Select one of the following within the table from which you cut or copied the rows:

### Before

Place the copied or cut table rows before the row in which the cursor is located.

### After

Place the copied or cut table rows after the row in which the cursor is located.

6. Press **Enter** to paste the rows.

[Keyboard Map](#) Functions:

- Copy Table Rows
- Cut Table Rows
- Paste Table Rows
- Copy Current Table

## Copy a Table

You can copy and paste existing tables and their contents. The copied table is available on the Clipboard and can be copied to multiple jobs. For example, you use a table to format your caption information, the birdcage. You use the same caption information with the same format on your certificate page. You can copy the entire table.

To copy or move table rows to a new position within the same table, use the [Copy, Cut and Paste Table Row](#) commands. To quickly change the position of one row in a table with the following row using the [Swap Table Rows](#) feature. If you are copying the entire table, use the [Copy A Table](#) command.

## Copy an Existing Table

1. Position the cursor in the table you want to copy.
2. From the Edit menu, select **Table/Copy Table**.
3. Position the cursor at the location in the transcript where you want to insert a copy of the table.
4. Press **Ctrl + v (Edit/Paste)**. Case CATalyst inserts the table at the position of the cursor.

[Keyboard Map](#) Functions:

- Copy Current Table
- Copy Table Rows
- Split Table
- Swap Table Rows

## Table Cell, Column and Row Properties

Table cell, row and column properties determine the left margin for the text within a cell. Cell, row and table properties also allow you to add a character separator to the end of the first or last line of text within a cell and set whether the characters and reference number are aligned with the first line or last line of indexed text. For example, you may want to use a period separator within a cell on an Index Template to have leader dots appear before a right justified page number:

1	Photograph of house.....	14
---	--------------------------	----

## Set Table Cell Properties

1. Switch to Page view, press **Alt + v, p (View/Page)**.
2. Locate the table you want to modify and place your cursor in the desired cell, row, or column.

3. Modify properties for a cell, column or row by pressing one of the following:
  - **Alt + e, b, p (Edit/Table/Cell Properties)**  
Changes made for a cell affect only the individual cell selected.
  - **Alt + e, b, u (Edit/Table/Column Properties)**  
Changes made for a column affect all the cells in the column.
  - **Alt + e, b, o (Edit/Table/Row Properties)**  
Changes made for a row affect all the cells in the row.
4. The properties dialog box for the selected cell, row or column properties displays. Make entries:

**Align Top**

Position the leader character on the same line as the first line of text.

**Align Bottom**

Position the leader character on the same line as the last line of text.

**Extend First Line of cells with character**

Add a leader character to the end of the first or last line of text within the cell. Type the character you want to use in the field to the right.

**Interior Margin**

Type a number to determine the amount of space between the left edge of the cell and the text within the cell. A setting of "0" (zero) places the text against the cell edge. Increase the number to increase the distance. The default is .13.

This customized setting is remembered for subsequent tables created when you use the Insert Table feature from the Edit menu. When using the Insert Table icon to insert a table, the default setting of .13 is applied.

5. If necessary, modify the column width in Page view:
  - a. Place your cursor in the column you want to change.
  - b. Move the left and right column margin guides (  ) to the desired position. If the ruler elements are not visible, confirm you are in Page view, press **Alt + v, p (View/Page)**.
6. Press **Ctrl + s (File/Save)**.

[Keyboard Map](#) Functions:

- Table Cell Properties
- Table Column Properties
- Table Properties
- Table Row Properties

**Delete Tables, Columns and Rows**

Using the Delete features from the Table menu, you can delete an entire table or specific columns and rows. You can Undo the delete if needed.

1. Switch to Page view, press **Alt + v, p (View/Page)**.
2. Do any of the following:

**Delete Table**

Place your cursor anywhere within the table and press **Alt + e, b, d (Edit/Table/Delete Table)**.

**Delete Column**

Place your cursor in the column you want to delete and press **Alt + e, b, L (Edit/Table/Delete Column)**.

**Delete Row**

Place your cursor in the row you want to delete and press **Alt + e, b, w (Edit/Table/Delete Row)**.

3. Press **Ctrl + s (File/Save)**.

[Keyboard Map](#) Functions:

- Delete Table
- Delete Table Column
- Delete Table Rows
- Swap Table Rows
- Split Table

## Swap Table Rows

Change the position of one row in a table with the following row using the Swap Table Rows feature. You can only swap one row at a time. This feature may be useful when you want to change a row in a transcript index that is already built or when creating a multiple row index template table.

To copy or move table rows to a new position within the same table, use the [Copy, Cut and Paste Table Row](#) commands.

## Swap Table Rows

1. Switch to Page view, press **Alt + v, p (View/Page)**.
2. Place your cursor in the first cell of the row you want to move.
3. Press **Alt + b, b (Edit/Table/Swap Table Rows)**. Case CATalyst swaps the selected row with the row immediately below.
4. Press **Ctrl + s (File/Save)**.

[Keyboard Map](#) Functions:

- Swap Table Rows
- Copy Table Rows
- Split Table

## Modify Table Column Width

1. In Edit, open the file that contains the table you want to modify.
2. Switch to Page view, press **Alt + v, p (View/Page)**.
3. Place your cursor in the column you want to modify.
4. Move the left and right column margin guides (  ) to the desired position. If the ruler elements are not visible, confirm you are in Page view, press **Alt + v, p (View/Page)**.
5. Press **Ctrl + s (Save)**.
6. If desired, switch back to Normal view, press **Alt + v, n (View/Normal)**.

[Keyboard Map](#) Functions:

- Table Cell Properties
- Table Column Properties
- Table Properties
- Swap Table Rows
- Join Tables

## Special Edit Commands

Special Edit Commands include several features that enhance your transcript editing, including but not limited to managing fields, conducting special searches and scans and changing number, punctuation and word formats.

### Bookmark Cursor Location

Bookmark Cursor Location is an Edit feature that allows you to electronically mark (bookmark) a location in the file for quick reference. When you bookmark the location of your cursor, you can move anywhere in the file and easily return the cursor to the bookmarked location. Case CATalyst remembers the exact position of the cursor on the line.

You may want to use this feature to copy information from a previous location in the file to the current cursor location. For example, you need to copy the text of a question to read back. Use Bookmark Cursor Location to identify the current location of the cursor. Move to the text you want to copy. Copy the text and use Go to Cursor Location to return to your current position in the job.

You can only bookmark one location at a time. If you bookmark more than one location, Case CATalyst only remembers the most recent bookmark. If no location is marked and you select Go to Cursor Location, Case CATalyst moves the cursor to the beginning of the file.

A Bookmark Swap command is also available from the Special Edit menu. The Bookmark Swap command has two potential purposes. One purpose provides the ability to bookmark the current location and return to a previous bookmark in the file and the other usage would be if you built your index page and then realized you needed to add an examination or exhibit reference that would need to be bookmarked in the PDF. For more details, see the [Bookmark Swap](#) command.

[Keyboard Map](#) Function: Bookmark Current Cursor Location

Bookmark Swap

## Bookmark and Return to a Location

1. Move to the location in the file you want to bookmark.
2. Press **Alt + s, a** (**Special Edit/Bookmark Cursor Location**).
3. When you are ready to return to the bookmarked location, press **Alt + s, g** (**Special Edit/Go to Bookmarked Cursor**).

## Go to Cursor (Bookmark) Location

The Go to Cursor Location command moves the cursor to the last bookmarked (electronic mark) in the file. The Bookmark Cursor Location you to electronically mark (bookmark) a location in the file for quick reference. When you bookmark the location of your cursor, you can move anywhere in the file and easily return the cursor to the bookmarked location by using the Go to Cursor Location command. Case CATalyst remembers the exact position of the cursor on the line.

A Bookmark Swap command is also available from the Special Edit menu. The Bookmark Swap command has two potential purposes. One purpose provides the ability to bookmark the current location and return to a previous bookmark in the file and the other usage would be if you built your index page and then realized you needed to add an examination or exhibit reference that would need to be bookmarked in the PDF. For more details, see the [Bookmark Swap](#) command.

## Bookmark and Return to a Location

1. Move to the location in the file you want to bookmark.
2. Press **Alt + s, a** (**Special Edit/Bookmark Cursor Location**).
3. When you are ready to return to the bookmarked location, press **Alt + s, g** (**Special Edit/Go to Bookmarked Cursor**).

## Bookmark Swap

A Bookmark Swap command is now available from the Special Edit menu and as an assignable function in the keyboard map. As you know, only one bookmark can exist at one time in a transcript. Once you insert a bookmark using the [Bookmark Cursor Location](#) command and then use the Bookmark Cursor Location command again, the first bookmark is removed and only the last bookmark location exists. If you bookmarked a location and then later wanted to return to that same location but also bookmark your current location so you can return to it, you could use the Bookmark Swap command.

The Bookmark Swap command serves dual purposes:

### Purpose 1

Allows you to bookmark the current location and return to a previous bookmark: Let's say you are editing a file and see reference to the name of a medical procedure. You remember researching the medical procedure earlier in the job, but didn't global the change. You aren't sure you have the right name or spelling. You decide to bookmark your current location (page 54 line 7) and find the earlier discussion of this procedure. Once you find the previous location (page 21 line 17), you would like to bookmark this location so you can go back to it again, but you also want to return to where you were to fix things and continue editing (page 54 line 7). You use the Swap Bookmark which does the following - it bookmarks the new location (page 21 line 17) and takes you back to where you were (page 54 line 7). The original bookmark is removed and CATalyst puts you back in your editing position. In other words, you "swap" the earlier bookmark with the current location and automatically return to the original bookmark location. You can use the Swap Bookmark feature to go back and forth a few times if necessary.

### Purpose 2

PDF Bookmarks (created by using the [PDF Bookmark Text On/Off](#) format symbols) only work when there is a CATalyst created index page using an [Index Template](#) and the [Build Index](#) feature. Have you ever experienced several missing page numbers on your index page because you added information to the transcript after building the index page? And this "added information" needs to be added to your index page. You can do this by placing a bookmark in CATalyst and then manually inserting an Index Page format symbol in your index. The index page will show the page number of the current bookmark location. Once it is inserted, that page number will be remembered even if you make a new bookmark in the file. That's all you need to do. You can use the new Bookmark Swap feature to ensure the PDF includes a bookmark to that exhibit reference and easily go back and forth between the index and the location of your bookmark.

For example, let's say you remembered that you manually inserted an exhibit blurb into the transcript while you were finalizing the transcript, so that exhibit was never added to your index page when you built the index. You manually edit your transcript to include this information in the index, but you don't have the CATalyst created index page number in the index. If you just type the correct page number on the index page, the new bookmark in PDF feature will not recognize the page number. You need that CATalyst created index page number for bookmarking in the PDF. As mentioned above, starting with this build, CATalyst will use a file's bookmarked position to help you manually create an Index Page inside a CATalyst created index.

**To manually make an index page reference inside your index using the example above, do the following:**

1. On your index page (that you have already built), position your cursor in the table where you need to add the information. If needed, add a table row.
2. In the table row, type the information that was added to the transcript. For example, you left out exhibit 34 which was a copy of a land agreement. In the appropriate table row and cell, you would type "34" and then surround the number with the appropriate <PDF Bookmark Text #> On and Off

format symbol. In appropriate table cell you would type Land Agreement and then surround the text with the appropriate <PDF Bookmark Text #> On and Off format symbol.

3. Position your cursor in the exhibit page number cell and use the Bookmark Cursor Location (**Special Edit, Bookmark Cursor Location**) command.
4. Then search for the transcript page that contains the exhibit information.
5. Once you have located the exhibit, use the Bookmark Swap (**Special Edit, Bookmark Swap**) command to return to the location in the index.
6. Finally, with your cursor in the page number cell of your index, insert the <Index Page> format symbol. When the transcript is printed to PDF and you have used the appropriate PDF Bookmark Text On/Off number format symbols, the exhibit will be properly bookmarked in the PDF.

The above method can be used for a missed examination, exhibit or whatever you have added to the transcript that needs to also be included in the index.

[Keyboard Map](#) Function: Bookmark Swap

Bookmark Current Cursor Location

Go To Bookmarked Cursor

## Fill In Field

The Fill In Field feature allows you to define a [field](#) for the current job and add the information to a Select List. From the Fill In Field dialog box, while editing a job or using the Insert Field feature, you can choose entries from the Select List to define [user defined fields](#) and [field list group](#) items. When filling in a User Defined field, you can also set the scope or the range for the field.

In addition to text values, the F(x)> option allows you to create [calculation formulas](#) within fields. For example, you want to create a simple formula that calculates the billable number of transcript pages multiplied by the page rate, plus an appearance fee. Case CATalyst contains three [pre-defined](#) calculation fields designed to calculate the total number of transcript pages.

Case CATalyst stores user defined field values in the current job and, depending on the scope chosen, stores the field information for other jobs. Field values cannot exceed 1024 typed characters. You can select User, Case or Job for the scope. Scope refers to how filled in field information is stored. When User is selected for the scope, the filled in text is available for all jobs in the current user. For example, you create a COUNTY field. Set the scope to User so all the county names display when filling in the field. When Job is the scope, the filled in text displays only for the current job. For example, you create a PLAINTIFF field. Set the scope to Job so only the current job values for the plaintiff field display. The default scope is Case. Filled in text with the scope of Case is available in the list for all jobs in a case. If you select Case as the scope and the job is not in a case, the filled in text is available for all jobs.

When defining fields in a field list group, you can set your [Transcript Spell Check options](#) to have Case CATalyst spell check the entry and then place the information into the [Fill-In-Field List](#) file, located in the System Files case. Entries in the Fill-In-Field List are available for all jobs.

Access the Fill In Fields dialog box:

- In Edit from the Insert dialog box. Press **Alt + e, i, f (Edit/Insert/Field)**. Choose a field and select **Fill In Field**.
- In Edit with the Scan and Fill In Field feature. Press **Alt + s, l (Special Edit/Scan and Fill In Fields)** to scan to the first empty field. Once you fill in the field, Case CATalyst automatically scans to the next empty field.
- In Edit scan (F8) to the field. In the Fill in Field dialog box, select or type the text and press **F8** to continue scanning. You must set your Scan For Options to stop on **Fields (empty)** and **Fill In Fields**.
- From a dialog box with an Insert Field button, select the Insert Field button to display the Insert Field dialog box. Choose a field to fill in and select **Fill In Field**.
- In the job, place your cursor just before or highlight the field and press **Alt + s, n (Special Edit/Fill In Field)**.
- In the job, double click the field.
- From the Translate dialog box, select a file to translate and select **Define Fields**. Choose a field and select **Fill In Field**.
- In Edit with the [Use Other Field Values](#) feature to select values from other jobs. Press **Alt + s, h (Special Edit, Use Other Field Values)**.

## Filling In Fields

To fill in a field:

1. Open the Fill In Field dialog box.
2. Use the following fields as necessary. Use [Field Options](#) to set the default cursor position for either *Field Value* or *Select List* field.

### Field Name

The name of the highlighted field.

### Field Value

Type the text that replaces the field. Add format symbols and [extended characters](#) as necessary. A field value cannot exceed 200 characters.

### Select List

Entries display in this field when you define user defined fields and field list groups. Depending on the scope for a user defined field, the entry is available for all the jobs in the current user, only for the jobs in the case, or only in the current job. Field list group entries are available for all jobs.

When the [Sort attorney names using Attorney Sort column](#) option is active, Case CATalyst displays, (Attorney Sort Active), next to Select List. When you fill in an ATTORNEY field group entry, the cursor focus defaults to the Select List. Type the first few letters of the attorney's last name to move your cursor to the closest matching entry. The attorneys display last name first in the list but are inserted into the transcript first name, last name. If you are not using this option, attorney names display in the transcript as they display in the Fill In Field List.

### Replace Field With Text (User Defined Fields Only)

Check this box to insert the field value as text and only replace the current field value. The field is no longer an active field. This does not fill in the text for all matching fields in the document. Case CATalyst remembers your option selection for this same field until you change it.

For example, you create a [!WITNESS] field and use it in your sworn statement. Your job today has multiple witnesses. You scan to the first [!WITNESS] field, type the name JOHN P. DOE and select the *Replace Field with Text* option. JOHN P. DOE replaces the field in this occurrence but the remaining [!WITNESS] fields remain empty. When you come to the next [!WITNESS] field, you type the appropriate name.

In another example, you have a [!Month] field on your title and certificate pages. You create a list of fields values with all the months of the year. While editing your September 30th transcript, you select "September," the month the proceedings took place, for the field value on the title page using the *Replace Field with Text* option. Case CATalyst inserts September as text in that location. On the certificate page, you select "October," the month you finish the transcript, for the field value using the *Replace Field with Text* option.

## FS

Display the [format symbol](#) list and double click a format symbol to add to the field value. To add [extended characters](#), position the cursor in the *Field Value* field and press **F9**.

## Insert Field

Display the [Insert Field](#) dialog box and select a field to add to the field value.

## F(x)>

Display the Formula menu. The Formula menu allows you to [create calculation formulas](#) in fields.

## Set Scope (User Defined Fields Only)

The Scope for *field name* dialog box displays where you can set the scope of the selected entry. This option is only available filling in a user defined field. Choose one:

### User

Make the field values available in all jobs. For example, you create a COUNTY field. You likely want to set the scope for User.

### Case

When using a Case to organize related jobs, you can make the field values available for all jobs in the specific case. For example, you are using a Case and created a user defined field for PLAINTIFF or DEFENDANT. You set the scope to Case. If you select Case as the scope and the job is not in a case, the entry is available for all jobs.

### Jobs

Make the field value available only in current job. For example, you create a WITNESS field. You would likely set the scope to Jobs.

## Add (User Defined Fields Only)

Add the user defined entry to the Select List. The entry displays as a choice when you choose to fill in the specified user defined field. You may want to use the Add command when you want to add several values for the currently selected field. For example, you created a COUNTY field value and you want to add as many county names you can think of at this time. Type the County name and then click Add.

**Delete Item (User Defined Fields Only)**

Remove a user defined entry from the Select List. Removing an entry from the Select List does not affect the transcript.

**Show All**

Show All allows you to show all the names for a particular Field List Group field. For example, you selected to fill in the value for an Attorney field. Show All displays all attorney names for all the firms in the Fill-In-Field List, select Show All.

Show All uses existing entries in the Fill-In-Fields list. This option is only available for a field list group entry.

**New List Entry**

Display the Fill in Fields dialog box where you can fill in any of the values for a field list group. Add format symbols, as necessary by selecting **FS**. You may use the [Import vCard](#) button to create the new Fill-In-Field list entry if you have a vCard available for the attorney. When finished making entries, you can apply the modified fields to the current field group by selecting the *Apply this entry to the current Field Group* (**Alt + g**) option. Whether or not you select the *Apply this entry to the current Field Group* option, the field values are added to the Fill-In-Field List **Enter** (**OK**). Entries made to the fields in this dialog box are also entered into the [Fill-In-Field List](#).

This option is only available for a field list group entry.

**Clear Group**

Depopulate filled in Field List Group values from the transcript. Position your cursor in one of the field values for the Field List Group and select **Clear Field List Group** to clear all the field values for the group. The Clear Field List Group only removes field values from the transcript. It does not remove information from the Fill-In-Field List.

For example, while editing a job, you selected the Kurkowski and Kohlmeyer firm on your appearance page. During your proofreading, you realize you selected the wrong firm. You position your cursor in the Attorney1 field name and select Clear Field List Position. Case CATalyst removes all the field values for Kurkowski and Kohlmeyer from the transcript.

3. Press **Enter** (**OK**) to add the entry to the Select List and close the dialog box.

**Creating Calculation Formulas**

The F(x)> option, available from the Fill In Field dialog box, allows you to create calculation formulas in fields. For example, you want to create a simple formula that calculates the billable number of transcript pages multiplied by the page rate, plus an appearance fee. Case CATalyst contains three [pre-defined](#) calculation fields designed to add page count totals.

It is necessary to create new fields that contain the formulas. For example, you may want to create Page Rate, ASCII Rate and Appearance Fee fields. Several mathematical attributes are available from the F(x) menu that allow you to make a variety of simple to complex formulas. All formulas must begin with an = (equal sign). The equal sign is built into each of the attributes and displays in the *Field Value* field when you select an item. Do not remove the equal sign.

Several mathematical attributes are available from the F(x) menu that allow you to make a variety of simple to complex formulas. A short list of commonly used attributes and suggested applications are provided. Review the common attributes and the examples for steps on creating a simple formula. **Stenograph strongly recommends you consult Excel or an Excel formula resource for assistance building the formulas if you require assistance.**

## Pre-defined Calculation Fields

Three pre-defined calculation fields, Transcript Start, Transcript End and Transcript Total. Transcript Start and Transcript End are designed to work in conjunction with Transcript Total for the purpose of calculating transcript totals. Transcript Total is also designed for use independently of the other pre-defined calculation fields. If you do not use the Transcript Start and End fields, the total page count begins on the page with the first occurrence of underlying steno and ends on the page with the last occurrence of underlying steno.

### Transcript Start

Insert this field into the transcript on the page you want to identify as the first transcript page for billing purposes. This field inserts into the transcript as Hidden Text to prevent the field value from displaying in the transcript. When inserted into a job report template, the field inserts into the transcript as regular text to display the information.

This field works in conjunction with the Transcript Total field.

### Transcript End

Insert this field into the transcript on the page you want to identify as the last transcript page for billing purposes.

This field inserts into the transcript as Hidden Text to prevent the field value from displaying in the transcript. When inserted into a job report template, the field inserts into the transcript as regular text to display the information.

This field works in conjunction with the Transcript Total field.

### Transcript Total

Insert this field anywhere in a document to calculate the total number of pages based on the Transcript Start and Transcript End fields. This field inserts displaying the field value information. If you do not use the Transcript Start and End fields, the total page count begins on the page with the first occurrence of underlying steno and ends on the page with the last occurrence of underlying steno.

## Creating New Calculation Fields

It is necessary to create new fields that contain the formulas. For example, you may want to create a field for Page Rate field that has several values because you charge a different rate for realtime, daily copy and expedited transcripts.

All formulas must begin with an = (equal sign). The equal sign is built into each of the attributes and displays in the *Field Value* field when you select an item. Do not remove the equal sign.

You may want to make the Transcript Start and Transcript End fields part of an Include file instead of manually inserting them into the transcript each time. By default, if you do not use the Transcript Start and End fields, the total page count begins on the page with the first occurrence of underlying steno and ends on the page with the last occurrence of underlying steno. If the Transcript Start or Transcript End field is part of a dictionary definition, such as a parenthetical, the field does not insert into the transcript as hidden text and the field value displays as text in the transcript.

If you create a calculation field that ends with \_Start, \_End or \_Total, the fields work similarly to the [pre-defined](#) calculation formulas, Transcript\_Start, Transcript\_End and Transcript\_Total. The user defined fields can be used to calculate the total number of pages for a part of the transcript. For example, you need to calculate a page count for specific pages in addition to the transcript pages, such as the number of confidential pages in a transcript. Create additional fields to calculate the information.

Several mathematical attributes are available from the F(x) menu that allow you to make a variety of simple to complex formulas. A short list of commonly used attributes and suggested applications follows. Review the common attributes and the examples for steps on creating a simple formula. **Stenograph strongly recommends you consult Excel or an Excel formula resource for assistance building the formulas if you require assistance.**

### Commonly Used Attributes

- **Addition** - Use the Addition attribute in a formula that adds the cost of the transcript plus an appearance fee.
- **Subtraction** - Use the Subtraction attribute to subtract a credit from the current balance due.
- **Multiplication** - Use the Multiplication attribute to multiply the number of pages by the page rate to calculate the cost of the transcript.
- **CURRENCY (number, decimals)** - Use the CURRENCY attribute to place a dollar sign in front of a number. By default, CURRENCY displays two decimal places. For example, \$100.00.
- **Math Functions - SUM** - Add two or more numbers. Separate the numbers you want to add with a comma. Eliminates the use of the plus sign (+) between numbers. This attribute can be useful in a complex formula.
- **Math Functions - PRODUCT** - Multiply numbers. Separate the numbers you want to multiply with a comma. Eliminates the use of the asterisk (\*) between numbers. This attribute can be useful in a complex formula.

### Example 1 - Total Due for Job Report

You want to calculate the total number of transcript pages on your job report and to multiply the number of pages by your page rate to display the total amount due.

#### Step 1 - Create Calculation Fields

1. Open your [Job Report](#) Template.
2. Type the appropriate information for the billing and insert *Transcript Total* field.  
i.e. Transcript Pages: [!TRANSCRIPT TOTAL]
3. Open the Insert Field dialog box. Press **Alt + e, i, f (Edit/Insert/Field)**.

4. Select **New Field**. In the highlighted area, replace the default name with the field name, **Page Rate** and press **Enter**. You can use any name for the field. Page Rate is an example.
5. Highlight the new field and select **Fill in Field**. Click **Set Scope**, select **User** and press **Enter**.
6. Position the cursor in the *Field Value* field and select **F(x)>**.
7. From the menu, select **CURRENCY**. The formula, `=CURRENCY()` displays the *Field Value* field with the cursor inside the parentheses.
8. Type your page rate and press **Enter**. For example, your page rate might be, 3.50.
9. Click **OK**. The formula, `=CURRENCY(3.50)`, displays as the field value for *Page Rate*. You can have more than one value for the field if necessary.
10. Select **New Field**. In the highlighted area, replace the default name with the field name, **Total Due** and press **Enter**. You can use any name for the field. Total Due is an example.
11. Highlight the new field and select **Fill in Field**. Click **Set Scope**, select **User** and press **Enter**.
12. Position the cursor in the *Field Value* field and select **F(x)>**.
13. From the menu, select **CURRENCY**. The formula, `=CURRENCY()` displays the *Field Value* field with the cursor inside the parentheses.
14. Click **Field** and insert the **TRANSCRIPT TOTAL** field.
15. Type an asterisk (\*) for multiplication and then click **Field**.
16. Insert the **PAGE RATE** field. The following formula displays in the *Field Value* field:  
`=CURRENCY([TRANSCRIPT TOTAL] * [PAGE RATE])`
17. Click **OK**.
18. Click Close to close the Insert Field dialog box.
19. Modify your job report to include the text for Page Rate Total Due information and insert the appropriate fields. For example, your billing information may display as:  
 Transcript Pages: [!TRANSCRIPT TOTAL]  
 Page Rate: [!PAGE RATE]  
 Total Due: [!TOTAL DUE]
20. Save and close your Job Report.

## Step 2 - Create Job Report

1. Open the edited transcript for which you want to calculate the amount due.
2. Press **Alt + t, j (Tools, Create Job Report)**.
3. Select the job report modified with the newly created total calculation fields.
4. The *Total Due* field fills in based on the total number of pages in the transcript multiplied by the page rate you indicated when creating the Page Rate field. If multiple values exist, select a Page Rate. For example:

Transcript Pages: 205

Realtime Page Rate: \$3.50

TOTAL DUE: \$717.50

You may want to place the total due information in a table to justify the text in the columns.

### ***Example 2 - Transcript Page Numbers for Cert Page***

You want to place the first transcript page number and the last transcript page number on your certificate page. The title page, errata sheet and the certificate page are not included in the count. By default, if you do not use the Transcript Start and End fields, the total page count begins on the page with the first occurrence of underlying steno and ends on the page with the last occurrence of underlying steno.

#### **Step 1**

Insert the pre-defined Transcript Start and Transcript End fields in the transcript on the appropriate pages to indicate where the page count should begin and end. If there is steno in your title or cert pages because you use auto includes, do one of the following:

- Insert the pre-defined **Transcript Start** field into your Sworn or your Stipulations Include files to indicate where the transcript starts. The field inserts as hidden text and does not display when you print.
- Insert pre-defined **Transcript End** field into your Deposition Concluded Include file to indicate where the transcript ends. The field inserts as hidden text and does not display when you print.

You may want to make the Transcript Start and Transcript End fields part of an Include file instead of manually inserting them into the transcript each time. If the Transcript Start or Transcript End field is part of a dictionary definition, such as a parenthetical, the field does not insert into the transcript as hidden text and the field value displays as text in the transcript.

#### **Step 2**

1. On the Certificate page, create two fields that will be filled in with the start and ending page numbers. For example, Transcript Start Page and Transcript End Page. This is necessary because pre-defined Transcript Start and Transcript End fields insert as hidden text unless you are in a job report template.
2. Open the Insert Field dialog box. Press **Alt + e, i, f (Edit/Insert/Field)**.
3. Select **New Field**. In the highlighted area, replace the default name with the field name, **Transcript Start Page** or whatever field you created and press **Enter**.
4. Highlight the new field and select **Fill in Field**. Click **Set Scope**, select **User** and press **Enter**.
5. Position the cursor in the *Field Value* field, click **Field** and insert the **TRANSCRIPT START** field.
6. Click **OK**.

7. Select **New Field**. In the highlighted area, replace the default name with the field name, **Transcript End Page** or whatever field you created and press **Enter**.
8. Highlight the new field and select **Fill in Field**. Click **Set Scope**, select **User** and press **Enter**.
9. Position the cursor in the *Field Value* field, click **Field** and insert the **TRANSCRIPT PAGE** field.
10. Click **OK**.

### Step 3

1. Open your Certificate Include file and insert the newly created fields. The values for the Certificate page display but when the file is included, the values adjust to the actual transcript page number.
2. When you are finished, click **Close**.

## Fix Numbers

Case CATalyst has two Edit features that allow you to quickly change the format of numbers while editing a job: [Automatic Number Conversion](#) and [Number Conversion](#). Automatic Number Conversion converts numbers and words using specific formatting rules in the NumberConversion.ini file. Number Conversion converts numbers written as digits (1234), text (one thousand two hundred thirty-four), or a combination of digits and text (12 hundred) into selected text or numeric formats.

## Automatic Number Conversion

Automatic Number Conversion is an Edit feature that converts numbers and words using specific formatting rules in the [NumberConversion.ini](#) file. The formatting rules are based on word and number combinations. The Automatic Number Conversion is also available in the [Global dialog box](#) when right clicking in the Text field or pressing **Shift + F10**.

You can also select the [Automatic Number Conversion](#) translate option to automatically convert numbers and words using the NumberConversion.ini file during translation. Since Automatic Number Conversion uses number formats in the NumberConversion.ini, Automatic Number Conversion does not use Number Conversion or Number Trigger dictionary entries. The NumberConversion.ini file is located in the System Files case.

## Apply Automatic Number Conversion

1. Position the cursor immediately before or within the number and words you want to change.
2. Press **Alt + s, u, v** (**Special Edit/Fix Numbers/Automatic Number Conversion**).  
If you are in the Global dialog box, press **Ctrl + Shift + u** or right click and select Auto Number Conv.

## Number Conversion

Number Conversion is an Edit feature that converts numbers written as digits (1234), text (one thousand two hundred thirty-four), or a combination of digits and text (12 hundred) into selected text or numeric formats. Some formats must have a specific number of digits in order for that number conversion to display in the Number Conversion dialog box. For example, there must be nine numbers to convert to a Social Security number.

Case CATalyst comes with a default list of number conversion formats such as ordinal, Roman numerals and time. You can [customize](#) the list by modifying entries in the Number Conversion section of the UserSettings file. For example, let's say you need a special number format for your jurisdiction. You need to convert 11 numbers as follows: XX-XXX-X-XXX-XX. You can edit an existing Edit number conversion format to have the number format you need.

You can also [create](#) dictionary entries containing number conversion formats to convert numbers while writing realtime or translating a file.

In the [Advanced Translate Options](#) dialog box, there is a *Force lowercase ordinal suffixes* option. If you are using the All Cap On format symbol to capitalize transcript text and you want ordinal suffixes (st, nd, rd, th) to be lower case, set this option to Yes. This option affects {Number Conversion}[\*Ordinal], {Number Trigger}[\*Ordinal] commands and selecting an ordinal conversion from Edit's Number Conversion dialog box.

## Convert a number in Edit

1. Select the digits or text for conversion. Do **one** of the following:
  - If the numbers are digits and contiguous (1234), place the cursor immediately before the number and press **Ctrl + u** (**Special Edit/Fix Numbers/Number Conversion**).
  - If the numbers are digits, separated by a space (1234 67), to include all the numbers in the conversion, use a Mark command to highlight all the numbers and press **Ctrl + u** (**Special Edit/Fix Numbers/Number Conversion**).
  - If the number appears as text or is part digits and text, use a Mark command to highlight all the text or digits and text and press **Ctrl + u** (**Special Edit/Fix Numbers/Number Conversion**).
2. The Number Conversion dialog box displays. Highlight a number format. The actual number you are formatting displays in the Formatted Text field.
3. Do one of the following:

### Search and Replace

The Number Conversion dialog box closes and the [Search and Replace](#) dialog box displays allowing you to search the job for the highlighted number and replace it with the selected number format. When the Search and Replace is finished, the Search and Replace dialog box closes.

### E-Define

E-Define the highlight number using the selected number format. Case CATalyst applies the E-Define and closes the Number Conversion dialog box.

### Enter

Press **Enter** to apply the formatting only to this occurrence.

## Customize Edit's Number Conversion

The [Number Conversion](#) feature in Edit uses a default list of number formats to convert numbers written as digits (1234), text (one thousand two hundred thirty-four), or a combination of digits and text (12 hundred) into selected text or numeric formats. for example, let's say you have a special number format based on your type of work or work area that is not available in the default list. You can customize the list to meet your needs by modifying the existing entries.

An entry in the number conversion list consists of two lines: Format and FormatDesc. Located in the UserSettings file, the number conversion list displays all Format lines together and all FormatDesc lines together. The Format line includes a numeric identifier, such as "Format1," along with the actual number conversion format, such as "NNN NN NNNN." The FormatDesc line includes a numeric identifier, such as "FormatDesc1," followed by a user defined description. For example, the default entry for a social security number is:

Format1 NNN-NN-NNNN

FormatDesc1 Social security number

The number included with the words, Format and FormatDesc, is unique for each entry. The Format and FormatDesc numbers must match, such as Format1 and FormatDesc1, Format2 and FormatDesc2, etc.

### Modify the Number Conversion List

The conversion format for the Number Conversion feature uses the same [formats](#) and [guidelines](#) as Number Conversion and Number Trigger dictionary definitions. This includes the use of N, n, X, x, 0, \_, and \. The Number Conversion dialog box in Edit displays number conversion commands in alphabetical order.

To modify a Number Conversion format:

1. Be sure you are in your User name.
2. From Manage Jobs, open the **System Files** case.
3. Double click the **UserSettings.sgxml** file. The Settings Manager dialog box displays.
4. Click in the dialog box and press **Ctrl + f**. The Find dialog box displays.
5. Type **Format-1** and press **Enter** to move to the *Number-Conversion* section.
6. In the *Format* list, highlight a Format to modify and click **Edit**.
7. Type your changes using the number conversion [formats](#) and [guidelines](#) and click **OK**.
8. In the *FormatDesc* list, locate the description that contains the same number as the modified *Format* line and click **Edit**. For example, if you modified the Format12 line, locate FormatDesc12.
9. Type a new description and click **OK**.
10. Press **Alt + s (Save)** to save the settings and close the dialog box.
11. Test the new number conversion format.

### Fix Punctuation

Case CATalyst contains several features that assist you in applying punctuation to transcript. They include:

- [Cycle Possession](#)
- [Interrupted Q/A/C](#)
- [Smart Punctuation](#)
- [Smart Remove Punctuation](#)
- [Stitch](#)
- [Surround Text with Punctuation](#)
- [Surround with Dashes](#)

- [Toggle Punctuation](#)
- [Cycle Possession](#)

## Cycle Possession

Cycle Possession is an Edit command that allows you to cycle through a choice of possessive apostrophes. When you place your cursor on a word ending with an "s" and select Cycle Possession, you can cycle through a choice of plural possessive apostrophe, no apostrophe and single possessive apostrophe and then back to plural possessive. For example, the word "friends" displays in the transcript. Using Cycle Possession, the cycle choices would be friends', friends and friend's. Invoking the command on a singular word makes the word plural and then cycles through the possessives. For example, "dog" becomes dogs', dogs, dog's.

In rare circumstances, Cycle Possession may not produce a desired result. For example, using Cycle Possession with the word bus, you get " bus' " and then you get "bu" because "bu" is in one of the Case CATalyst wordlists. In this situation, you can add "bu" as an exclude to your Personal wordlist and Cycle Possession no longer offers the word. In another example, using Cycle Possession with the word "knife" results in "knives." Knives is considered a correct spelling but you want the word "knives." Add the word "knives" as an exclude to your Personal wordlist and Cycle Possession offers "knives."

You may want to create a keyboard map assignment for this command for more efficient use.

## Use the Cycle Possession Command

1. Place the cursor immediately before or on the word.
2. Press **Ctrl + ' (Special Edit/Fix Punctuation/Cycle Possession)** until you have selected the possessive option you want to use.

[Keyboard Map](#) Function: Cycle Possession

## Interrupted Q/A/C

Interrupted Q/A/C (**Ctrl + q**) is an Edit command that inserts reporter's dashes (--) at the end of a Question or Answer and in front of the next Question or Answer and at the beginning and end of matching Colloquy Speaker Names. The Interrupted Q/A/C command, when used for a Question, Answer or Colloquy, also lower case the first word of the second Question, Answer or Colloquy. The reporter's dash has a space before and after the hyphens. Refer to the following example for Question, Answer or Colloquy.

### Example

Position the cursor anywhere on the first Question and press **Ctrl + q** (Special Edit, Fix Punctuation, Interrupted Q/A/C) to produce the following results:

Q. How did you - -

A. I didn't.

Q. -- know he wasn't going to be home that day.

Dashes are inserted before the Answer format symbol (F4 a) and after the next Question format symbol (F4 q). An Uncap Next format symbol (F4 F5) is inserted before the first word following the second set of reporter's dashes.

### **Example**

Position the cursor anywhere on the first Colloquy and press **Ctrl + q** (Special Edit, Fix Punctuation, Interrupted Q/A/C) to produce the following results.

MR. SMITH: Objection to form --  
MR. JONES: The witness can answer.  
MR. SMITH: -- and foundation

### **Insert an Interrupted Q/A/C**

Position the cursor anywhere in a Question, Answer or Colloquy and press **Ctrl + q** (Special Edit, Fix Punctuation, Interrupted Q/A/C).

### **Smart Punctuation**

Smart Punctuation is an Edit feature designed to help reduce steps when typing and removing certain punctuation. When you press the selected keyboard command, Case CATalyst inserts the punctuation, preset spacing, and when appropriate, capitalizes the next word. Case CATalyst inserts only the amount of spaces needed for the selected punctuation. For example, the default Smart Punctuation setting for a period inserts two spaces after the period. You place your cursor at the end of a word or the beginning of the next word (one space already exists between the two words) and press period. Since one space already exists, Case CATalyst inserts the period immediately following the word (before the cursor if you cursor was immediately following a word or at the end of the previous word if your cursor was on the beginning of the next word), inserts one additional space to meet the default setting of two spaces and capitalizes the next word. When you remove punctuation, Case CATalyst removes the punctuation, spacing and when appropriate, uncaps the next word.

Smart punctuation also replaces existing punctuation. For example, if you have the text "He was there. I know he was there." If you position your cursor either immediately after the period or immediately before "I" and you press a comma, Case CATalyst will remove the period, replace it with the comma and remove the extra space that was following the period. In this example, it does nothing to the "I" because it is capitalized and should not be lower cased. "He was there, I know he was there."

Case CATalyst applies Smart Punctuation when you use the [Toggle Punctuation](#) feature or type punctuation, provided a space occurs before or after the point of insertion. Smart Punctuation does not apply during translation where punctuation is determined by the dictionary definition or when you type text and include punctuation, such as [www.stenograph.com](#).

Smart Punctuation spacing is determined by the Spaces After settings in the UserSettings file. You can modify the spacing associated with each Smart Punctuation command.

In the [Advanced Edit](#) option, the Use Enhanced Smart Punctuation option is available. When set to Yes, you are able to remove existing punctuation by typing the same Smart punctuation while continuing to be able to add or modify punctuation by typing the desired punctuation. Regardless of your cursor position, the action will take place at the end of a word and never in the middle. This option may work best for those users that have transitioned from a previous CAT system that allowed you type the same punctuation to insert or remove it. The default setting is set to No. For more information, see the Advanced Edit options.

The Case CATalyst Default keyboard map contains default key assignments for the Smart Punctuation commands. You can [change](#) these key assignments. The commands and default settings include:

## Smart Punctuation Commands and Default Key Assignments

### Colon

Attaches a colon (:) to the end of the previous word, adds two spaces, and caps the next word.

Default Key Assignment: Shift + :

### Comma

Attaches a comma (,) to the end of the previous word and adds a space.

Default Key Assignment: ,

### Exclamation

Attaches an exclamation mark (!) to the end of the previous word, adds two spaces, and caps the next word.

Default Key Assignment: Shift + 1

### Period

Attaches a period (.) to the end of the previous word, adds two spaces, and caps the next word.

Default Key Assignment: .

### Question

Attaches a question mark (?) to the end of the previous word, adds two spaces, and caps the next word.

Default Key Assignment: Shift + /

### Remove Punctuation

Removes the punctuation at the end of the previous word, removes a space, and uncaps the next word. This feature works for colon, period, exclamation mark, question mark, and semi-colon.

Default Key Assignment: None.

### Surround with Dashes

[Surround with Dashes](#) automatically inserts dashes (–) with spaces before and after each dash around the current word or marked words.

Default Key Assignment: Ctrl + =

### Semi-colon

Attaches a semi-colon (;) to the end of the previous word and adds a space.

Default Key Assignment: ;

## Customize Smart Punctuation Spacing

The Case CATalyst [Smart Punctuation](#) feature automatically inserts spacing after punctuation and before and after dashes when you type the punctuation, provided a space occurs before or after the point of insertion. Smart Punctuation also applies when you use the [Toggle Punctuation](#) feature.

You can customize the automatic spacing by changing the setting for the selected Spaces After option. For example, to have Case CATalyst insert one space after a period when you press the period key during edit, change the default setting for the Spaces After Period option from two spaces to one.

To customize the Smart Punctuation spacing:

1. Be sure you are in your User name.
2. From Manage Jobs, open the **System Files** case.
3. Double click the **UserSettings.sgxml** file. The Settings Manager dialog box displays.
4. Click in the dialog box and press **Ctrl + f**. The Find dialog box displays.
5. Type **Spaces** and press **Enter** to move to the *Spaces-After* section.
6. Click the **Edit** icon on the desired option.
7. Type the desired number of spaces, **0 - 5**, in the field and click **OK**. To restore the default setting, click **Default**. table below to review the available settings, their defaults and a brief description of their function.
8. Press **Alt + s** (**Save**) to save the setting and close the dialog box.
9. Press **Ctrl + s** (**File/Save**).
10. Press **Alt + f, x** (**File/Exit**).

### Smart Punctuation Default Settings

Spaces After Option	Default	Function
Reporters Dash	2	Sets the number of dashes (--) that are inserted when using the Reporter's Dash or Toggle Punctuation command. This setting does <u>not</u> affect the Interrupted Q/A/C command.
Spaces After Colon	2	Sets the number of spaces that follow the punctuation when a colon (:) is typed.
Spaces After Comma	1	Sets the number of spaces that follow the punctuation when a comma (,) is typed.
Spaces After Dash	1	Sets the number of spaces that follow the punctuation when inserting a dash using the Reporter's Dash or Toggle Punctuation command. This setting does <u>not</u> affect the Interrupted Q/A/C command.
Spaces After Exclamation	2	Sets the number of spaces that follow the punctuation when an exclamation mark (!) is typed.
Spaces After Period	2	Sets the number of spaces that follow the punctuation when a period (.) is typed.

Spaces After Question	2	Sets the number of spaces that follow the punctuation when a question mark(?) is typed.
Spaces After Semicolon	1	Sets the number of spaces that follow the punctuation when a semicolon (;) is typed.
Spaces Before Dash	1	Sets the number of spaces that precede the punctuation when inserting a dash using the Reporter's Dash or Toggle Punctuation command. This setting does <u>not</u> affect the Interrupted Q/A/C command.

## Smart Remove Punctuation

Smart Remove Punctuation is an Edit feature that removes unnecessary punctuation and extra spaces. For example, you have the following in your job: "Don't go down that road. Today." If your cursor is immediately before the T in "Today", when you invoke the Smart Remove Punctuation command, Case CATalyst removes the period and the extra space.

Smart Remove Punctuation is a keyboard command feature. You must select a keyboard combination to use the feature, adding it to the desired [keyboard map](#). You can quickly add the command to the active keyboard map during Edit.

### Add Smart Remove Punctuation to the Active Edit Keyboard Map

1. From Edit, double click the keyboard name in the Status bar at the bottom of the screen.
2. Press **Ctrl + i (Edit/Insert)**. The Assign Key to Function dialog box displays.
3. Click any function in the Functions list and press **Ctrl + f**. The Find dialog box displays.
4. Type **Smart Remove Punctuation**, select a direction and press **Enter (OK)**. Case CATalyst highlights the feature.
5. In the Key field, select a key for assignment from the drop down list and then click the radio button next to **one** of the following: **Key Only**, **Ctrl + Key**, **Shift + Key**, **Ctrl + Shift + Key**. When a function is currently assigned to the selected key combination, it displays in the Currently Assigned to field. If no function is assigned, the field is blank.

When selecting a single key for assignment, consider instead, assigning Shift plus the key to prevent the possibility of invoking the capped version of the keyboard command when the Caps Lock is on.

6. Press **Enter (Assign)**. The entry displays in the Keyboard Map list.

If you select a key combination currently assigned to another function, the following message displays: "The Key: *nameofkey* is already assigned to the Function: *nameoffunction*. Do you want to replace it?" Choose **Yes** to replace the existing assignment with the new function. Choose **No** to retain the existing assignment.

7. Press **Esc (Close)** to exit the Assign Key to Function dialog box.
8. Press **Ctrl + s (File/Save)** to save the change to the keyboard map.
9. Press **Ctrl + F4**, to close the keyboard map. Case CATalyst returns you to Edit.

## Stitch

Stitch is an Edit command that cycles through options to define the character or separator between letters of a word or between words. The default characters and cycle order is hyphen, space and period. You can customize the character selection and the cycle order and select how the space is handled for the Stitch command in [Advanced Edit Options](#). The default setup does the following:

- Inserts a hyphen, space, or period between the letters of one word.
- Insert a hyphen, space or period between two or more words.
- Inserts hyphens, spaces or periods between the letters of two or more words.

[Keyboard Map](#) Function: Stitch

## Use Stitch in Edit

1. Do **one** of the following:
  - Place the cursor in front of or on the word you want to Stitch.
  - Mark the words you want to Stitch.
2. Press **Ctrl + - (hyphen)** (**Special Edit/Fix Punctuation/Stitch**) to cycle through the selection.

## Customize Stitch Characters

Customize the character selection for the Stitch command. To modify the list:

1. From Manage Jobs, press **Alt + t, o, e, a** (**Tools/Options/Edit/Advanced Edit**). The Advanced Edit Options dialog box displays.
2. Click **Stitch characters in cycle order** option and type the desired characters in the desired cycle order.
3. To change how spaces are handled, click the **Stitch Spaces** and select the appropriate option. The Stitch Spaces option allows you to select how a "space" is handled if a "space" is part of your Stitch characters in cycle order options. The available options apply to the "space" in your cycle order of the stitch command. Three options on handling a space are available.
4. To include a Delete Space format symbol at the end of the stitch cycle, click the **Include Delete Space**.

If this option is set to Yes, then the very last cycle of the Stitch command will insert a <Delete Space> format symbol between the characters/words. For example, during the testimony the witness refers to WITC and it translates as W I T C. During editing you highlight W I T C and if a <Delete Space> was at the end of the stitch cycle, then the result would be WITC and Reveal Codes would show W<Delete Space>I<Delete Space>T<Delete Space>C.

The default setting for this option is No.

5. Press **Enter (OK)** close the Advanced Edit Options dialog box and save the changes.

## Surround Text with Punctuation

Surrounding text with punctuation is an Edit feature designed to help reduce steps when typing and adding certain punctuation. When you highlight text and then press the designated keyboard command, Case CATalyst inserts the punctuation before and after the highlighted text. You can surround a word or phrase with single quotes, double quotes, commas and parentheses. For single quotes, double quotes and parentheses, Case CATalyst inserts the punctuation immediately in front of the highlighted text and immediately following the highlighted text. When inserting commas, Case CATalyst inserts a comma following the word preceding the highlighted text and following the last word of the highlight text.

You can also highlight the same text that includes the surrounding punctuation, press the matching opening punctuation and the surrounding punctuation is removed. Using the example, "so he said" which is surrounded by quotes, you can highlight "so he said" and press the keys assigned to " (quote) and the quotes are removed resulting in *so he said*.

If there is multiple surrounding punctuation around the highlighted text, for example, ("so he said"), in order to remove only the surrounding quotes, you would need to highlight just the text surrounded by the quotes or the quotes and the text and then press the keys assigned to " (quote). Using the same example, if you wanted to remove both sets of opening and closing punctuation, you could highlight all the punctuation and text and press the keys assigned to ( (open parenthesis) to remove the parentheses and then the keys assigned to " (quote) to remove the quotes.

## Surround Text with Selected Punctuation

1. Highlight the desired word or phrase.
2. Press one of the following default keyboard commands:

'	Single Quote
"	Double Quote
( or )	Left or Right Parenthesis
,	Comma

## Surrounding Punctuation that can be Toggled

'	Single Quote
"	Double Quote
(	Left or Right Parenthesis

## Surround with Dashes

Surround with Dashes (Ctrl + =) is an Edit command that allows you to insert reporter's dashes (--) before and after highlighted text. Case CATalyst automatically inserts a space before and after the dashes.

You can [change](#) the number of dashes that Case CATalyst inserts in the Surround with Dashes by changing the setting in the UserSettings.sgxml file.

## Surround Words with Dashes

### One Word

Place your cursor to the left of the word and press **Ctrl + =** (**Special Edit/Fix Punctuation/Surround with Dashes**).

### Multiple Words

Use a Mark command to highlight the word or phrase around which you want to insert the reporter's dashes and press **Ctrl + =** (**Special Edit/Fix Punctuation/Surround with Dashes**).

## Toggle Punctuation

Toggle Punctuation is an Edit command that allows you to cycle through several common punctuation symbols on the same line and/or paragraph without moving the cursor to the actual punctuation. Using three different keyboard commands, you can change punctuation on the same line as the cursor and at the end of the current paragraph.

[Smart Punctuation](#) applies when you use the Toggle Punctuation command. Case CATalyst automatically inserts the punctuation, adjusts the spacing and when appropriate, initial caps or changes to lower case the first letter of the next word. You can change the number of spaces Case CATalyst automatically inserts after the punctuation by [changing the settings](#) in the UserSettings.sgxml file.

Toggle Punctuation includes:

- Period (.)
- Question Mark (?)
- Comma (,)
- Reporter's Dashes (--)
- No Punctuation (removes punctuation)
- Colon (:)
- Semicolon (;)
- Exclamation Point (!)

When you select *No Punctuation*, you can still cycle to one of the other options, in the same punctuation location, as long as you do not move the cursor. Once you move the cursor, you cannot go back and use the Punctuation command.

## Toggle Punctuation Commands

### Ctrl + , (comma)

Hold **Ctrl** and press **,** (**comma**) to change the first punctuation occurrence following the cursor, which occurs on the same line as the cursor. Keyboard map function assignment is Toggle All Punctuation.

### Ctrl + . (period)

Hold **Ctrl** and press **.** (**period**) to change the last ending punctuation on the same line as the cursor. This command toggles period, question mark, exclamation mark, dashes, and no punctuation. Keyboard map function assignment is Toggle Sentence Ending Punctuation.

### Ctrl + Shift + . (period)

Hold **Ctrl** and **Shift** and press **.** (**period**) to change the ending punctuation of the paragraph in which the cursor is located. This command toggles period, question mark, exclamation mark, dashes, and no punctuation. Keyboard map function assignment is Toggle Paragraph Ending Punctuation.

## Cycle Quote and Parenthesis

There are a few punctuation marks that can either be an "open" or "closed" punctuation mark such as a single quote, quote or parenthesis. You can cycle those three punctuation marks between applying the punctuation to the current word, the previous punctuation or before the previous punctuation. For example, let's say you have the following Answer and you are going to insert a quote. As you move your cursor word by word through the first sentence, your cursor ends up before the first word in the second sentence. You can press the quote several times to position the quote in different locations.

A. He said, "It was all Bella's fault. He thought Bella went too far this time.

- If you position your cursor immediately before He and type a quote, the result is: ...fault. "He...
- If you then type the quote again, the result is the quote is placed immediately after the previous period: ...fault." He
- If you then type the quote again, the result is the quote is placed inside the period: ...fault". He

To take advantage of this feature, in your Keyboard Map assign the punctuation mark to the following functions:

'	single quote	Smart Single Quote
"	quote	Smart Quote
(	open parenthesis	Smart Parenthesis

### Things to know:

- If you reassigned the punctuation marks to be "smart" and you want to put quotes or parenthesis around an individual letter or word, you can highlight the letter or word and type the punctuation mark.
- Be sure to assign the three punctuation marks to the "Smart" equivalent in your Keyboard Map.

## Fix Words

Case CATalyst contains several features that assist you in editing words in the transcript. They include:

- [Cap/Uncap](#)
- [Word Swap](#)
- [Restore Steno](#)
- [QuickFix Prefix](#)
- [QuickFix Suffix](#)
- [Redact](#)
- [Split Compound Word](#)
- [Cycle Contraction](#)
- [Cycle Homophones](#)

## Cap/Uncap

Cap/Uncap is an Edit command that cycles through three options to capitalize and lower case letters, words or phrases. You can also use this command in the text field of D define, J-define, E-define, Insert and Replace dialog boxes. The three options include:

- Capitalize the first letter in a word or all words in a phrase
- Capitalize all the letters in a word or phrase
- Uncap the letters in a word or phrase

When capping stitched words, the command affects each letter. For example *W o r d s*, *W O R D S*, and *w o r d s*. This command does not uncap a letter if an embedded command controls the capitalization of that letter.

Case CATalyst comes with a default list of articles and conjunctions to leave lower case. The Cap/Uncap command does not initial cap these specified articles or conjunctions if they appear between a series of words such as United States of America or State of the Union. It does continue to initial cap the word if it appears at beginning of a phrase such as The Main Store. The [Advanced Edit Option, Words to suppress capping when found in middle of phrase](#), allows you to add or remove words in the list.

## Using Cap/Uncap Command

1. Place the cursor immediately before the word, on the word, or mark the block of steno or text you want to cap or uncap.
2. Press **Ctrl +F5 (Special Edit, Fix Words, Cap/Uncap)** until you have selected the cap option you want to use.

## All Cap

All Cap allows you to capitalize all the letters of the selected word or words. The [Advanced Edit option, Words to suppress capping when found in middle of phrase](#) setting has no effect on the All Cap command. This command is also available in a keyboard map function as Allcap selected text.

To cycle through capping options, use the [Cap/Uncap](#) command.

## Uncap

Uncap allows you lower case all the letters of the selected word or words. If a word that starts a sentence is part of the selected text, the Uncap command will not uncap the word that starts a sentence. To remove the capitalization of the first word that starts a sentence, you would need to use the [Uncap Next](#) format symbol. This command is also available in a keyboard map function as Uncap selected text.

To cycle through capping options, use the [Cap/Uncap](#) command.

## Initial Cap

Initial Cap allows you to capitalize the first letter of each selected word. The [Advanced Edit option, Words to suppress capping when found in middle of phrase](#) setting applies when using the Initial Cap command. In other words, if the *Words to suppress capping when found in middle of phrase* setting is set to Yes and "or" is one of the words that should be suppressed, highlighting and initial capping the phrase, "cats or dogs" will result in "Cats or Dogs."

To cycle through capping options, use the [Cap/Uncap](#) command.

## Word Swap

Word Swap (Ctrl + w) is an Edit command that reverses the position of two words. For example, in the sentence, "She would doing start the dishes." the word "doing" and "start" are reversed. Using Word Swap, you can switch the position of the words so that the sentence reads, "She would start doing the dishes."

If the words have associated steno, the steno outlines are not swapped. You cannot use the Word Swap command on untranslated steno.

## Using Word Swap

Place the cursor before or on the first of the two words you want to swap and press **Ctrl + w** (**Special Edit/Fix Words/Word Swap**).

## Restore Steno

Restore Steno is an Edit command that converts the selected text back to steno for possible redefining. To restore the steno outline for text:

1. Do **one** of the following:
  - Place the cursor in front of or on the word for the steno you want to restore.
  - Mark the words for the steno you want to restore.
2. Press **Ctrl + F2** (**Special Edit/Fix Words/Restore Steno**).

## QuickFix Prefix

QuickFix Prefix attaches a prefix to a word using the [EZ Link](#) rules of spelling. QuickFix Prefix also uses the [Prefixsuffixrules.ini](#) file when the Prefixsuffixrules.ini file is located in your System Files case. Case CATalyst attaches the prefix you select from the list of prefixes and attempts to correctly spell the combined word, first checking the Spell Check wordlist for a match. If no match exists then Case CATalyst attaches the combined root word and prefix without any spelling changes.

The QuickFix Prefix table contains entries that determine the prefix list in the QuickFix Prefix dialog box. You can [change](#) the default entries in the list.

## Attach a Prefix

1. Place your cursor immediately before, after or on the word to which you want to add a prefix.
2. Press **Alt + s, w, x** (**Special Edit/Fix Words/QuickFix Prefix**). The QuickFix dialog box displays.
3. Review the fields and options:

### Results

The root word selected to QuickFix. Once a prefix is selected, the result of the root word combined with the prefix displays.

### Window

The list of prefixes with a letter assignment for each prefix. To switch the list to suffixes, click the radio button next to **Suffix**.

### Options

Display the Prefixes dialog box. The entries in this table display in the selection list for QuickFix Prefix. Make changes as necessary and then press **Enter (OK)**.

4. Make your prefix selection from the list by pressing the associated letter or highlighting the entry and pressing **Enter (OK)**.

## QuickFix Suffix

QuickFix Suffix attaches a suffix to a word using the [EZ Link](#) rules of spelling. QuickFix Suffix also uses the [Prefixsuffixrules.ini](#) file when the Prefixsuffixrules.ini file is located in your System Files case. Case CATalyst attaches a suffix you select from the list of suffixes and attempts to correctly spell the combined word, first checking the Spell Check wordlist for a match. If no match exists then Case CATalyst attaches the combined root word and suffix without any spelling changes.

The QuickFix Suffix table contains entries that determine the suffix list in the QuickFix Suffix dialog box. You can [change](#) the default entries in the list.

## Attach a Suffix

- a. Place your cursor immediately before, after or on the word to which you want to add a suffix.
- b. Press **Alt + s, w, q (Special Edit/Fix Words/QuickFix Suffix)**. The QuickFix dialog box displays. Or assign a key combination to QuickFix Suffix in a keyboard map and press that key combination.
- c. Review the fields and options:

### Results

The root word selected for QuickFix. Once a suffix is selected, the result of the root word combined with the suffix displays.

### Window

The list of suffixes with a letter assignment for each suffix. To switch the list to prefixes, click the radio button next to **Prefix**.

### Options

Display the Suffixes dialog box. The entries in this table display in the selection list for QuickFix Suffix. Make changes as necessary and then press **Enter (OK)**.

- d. Do any of the following:
  - a. To add a suffix from the list, press the associated letter or highlight the entry and press **Enter (OK)**.
  - b. To remove an existing suffix from the word, press **Alt + r**. Repeat if necessary. To then add a suffix from the list, press the associated letter or highlight the entry and press **Enter (OK)**.

## Redact

Some jurisdictions require court reporters to edit sensitive information before releasing the transcript to the public. Sensitive information may include social security numbers, the full name of a juvenile, date of birth, etc. Using the Redact feature in Edit, you can "block out" this text in a transcript. The integrity of the transcript remains in place and the sensitive information is not readable in the printed or exported document.

The Redact feature surrounds text with Redaction format symbols. The text is hidden when printing to hard copy or PDF and when exporting to ASCII, HTML, RTF/CRE, CaseViewNet, PTX, PTF and TextMap. The hidden portion replaces the original text and takes up the same amount of space as the original text. Line spacing and line breaks are unaffected. You can change the appearance of redacted text to lines (///), Xs, black rectangle or white space in [Advanced Edit Options](#).

**Redacted text appears as follows in the following delivery methods:**

Redaction Setting	Print Hard Copy or PDF	Export to RTF/CRE	Export to ASCII	Export to HTML	Export to PTX or PTF	Export to TextMap	Export to CaseViewNet
Black Rectangle	(████)	( )	( )	( )	( )	( )	( )
Lines	(/////)	(/////)	( )	( )	( )	( )	(   )
White Space	( )	( )	( )	( )	( )	( )	( )
Xs	(XXXX)	(XXXX)	(XXXX)	(XXXX)	(XXXX)	(XXXX)	(XXXX)

[Compress Print](#), by default, shows redacted text as white space throughout the transcript with the exception of the initial and final pages. To have Compress Print use an alternative redacted text appearance throughout the transcript, choose the setting in Advanced Edit Options, *Redacted text displays as* option and in Compress Print, select the [Document](#) option and select the *Use the transcript's layout settings instead of these settings* option.

Assigning [keyboard commands](#) to Redaction Selection and Insert Redaction On and Insert Redaction Off format symbols allow you select and turn Redaction on and off from the keyboard.

**Example**

You have the following Social Security number in the transcript: 123-12-1234.

You surround 123-12 with Redaction On//Off format symbols. The text prints as:

123-████

## Using Redact

1. Place the cursor immediately before the word or mark the block of text you want to redact.
2. Do one of the following:
  - Press **Alt + s, w, d** (**Special Edit/FixWords/Redact**).
  - Press **Shift + F4** to display the Format Symbol list. Select **Redaction On**. Press **Enter**. The Redaction Off format symbol is automatically inserted at the end of the marked text.

## Remove Suffix

The Remove Suffix command is available from the Special Edit, Fix Words submenu. The Remove Suffix uses the entries in the [PrefixSuffixRules.ini](#) file to determine the shortest suffix to remove first. For example, the word *wanderings* is in the transcript. You position your cursor before *wanderings* and select Remove Suffix and the suffix "s" is removed to show the word *wandering*. If you use the Remove Suffix command again, the suffix "ing" is removed to show the word *wander*. If you used the Remove Suffix command again, the suffix "er" is removed to show the word *wand*. The PrefixSuffixRules.ini file contains prefix and suffix entries along with the rules as to how to attach the prefix or suffix. The Remove Suffix command uses these entries and rules to determine the suffix and how to remove it. In the example above, there is an entry for suffix 's' in the PrefixSuffixRules file and that is the shortest suffix to remove. Once that suffix is removed, there is an entry in the PrefixSuffixRules file for suffix 'ing', so that is the next suffix to remove. Finally, there is an entry for suffix 'er' so when the command is used again, the suffix 'er' is removed from the word 'wander' to form 'wand.'

The Remove Suffix command also spell checks the word to make sure it is a valid word once the suffix is removed. Let's say you have the word *coming* in the transcript and you use the Remove Suffix command. Depending on your PrefixSuffixRules entries, the result might be *com*. Spell Check recognizes 'com' as a word. You could open your [Personal Wordlist](#) and insert *com* and select the Exclude feature and the next time you remove the suffix from the word 'coming', it will result in 'come.'

### To remove a suffix

1. Position your cursor immediately before the word with the suffix. You can also highlight the word but it is not necessary.
2. Press **Alt + s, w, r** (Special Edit, Fix Words, Remove Suffix).  
If necessary to remove more than one suffix, repeat the command again.

*Keyboard Map Function: Remove Suffix*

## Split Compound Word

The Split Compound Word feature cycles through a list of suggested ways to split a compound word, according to the action selected in the Compound Words wordlist or another wordlist. When the compound word is not in a wordlist, Split Compound Word suggests a split word according to Spell Check. For example, if you position your cursor before "greenhouse" and use the Split Compound Word command, the result is "green house."

When the compound word has multiple split suggestions, repeat the Split Compound Word command to cycle through the split word choices. You can use the Spelling Lookup, with the Suggest Split Words option active, to view multiple ways to split the word. It is not necessary for the Suggest Split Words option to be active to use Split Compound Word.

Use the Set Compound Word Priority to change the priority order when multiple suggestions are offered or the Exclude Compound Word Pair to prevent a split word from displaying as a suggestion. The entries for these commands are stored in the Compound Words Wordlist.

To split a compound word:

1. Position the cursor before the word to split.
2. Press **Alt + s, w, s** (**Special Edit/Fix Word/Split Compound Word**). If the word has multiple split options, you can invoke the Split Compound Word command again to cycle to the next suggestion.

[Keyboard Map](#) Function: Split Compound Word

## Compound Words Wordlist

The Compound Words wordlist is used exclusively with the Split Compound Word command. Entries are added to the wordlist when using the Exclude Compound Word Pair or Set Compound Word Priority features. You also can [manually](#) manage entries in the wordlist. The wordlist is stored in the System Files case.

To access the Compound Words Wordlist, Press **Alt + f, o, w, w** (**File, Open, Wordlist, Compound Words**).

## Exclude Compound Word Pair

The Exclude Compound Word Pair command (**Alt + s, w, l**) allows you to exclude a word pair suggestion when using the Split Compound Word feature. For example, you position the cursor immediately before the word “notice” and invoke the Split Compound Word command. The first split suggestion is “no tice” and the next suggestion is “not ice.” You do not want “no tice” to ever be a suggestion. With the “no tice” suggestion displayed, you invoke the Exclude Compound Word Pair command. Case CATalyst places the suggestion, “no tice” in the Compound Words Wordlist with Action set to “Exclude” and does not display it again as a compound word split suggestion for “notice.” You can access the Compound Words Wordlist to manually manage the entries.

Repeat the Split Compound Word command to cycle through multiple split word suggestions. The Set Compound Word Priority feature allows you to change the priority order in which the suggestions are offered. You may want to use this feature to always suggest your most commonly used choice.

## Set Compound Word Priority

The Set Compound Word Priority feature (**Alt + s, w, p**) allows you to set a suggested word as your first choice when multiple Split Compound Word suggestions are available. You may want to use this feature to always display your most commonly used choice first. For example, you position the cursor immediately before the word “notice” and invoke the Split Compound Word command. The first split suggestion is “no tice” and the next suggestion is “not ice.” You want “not ice” to be the first suggestion. With the “not ice” suggestion displayed, you invoke the Set Compound Word Priority command. Case CATalyst places the suggestion, “not ice” in the Compound Words Wordlist with the Action set to “Suggest” and displays it as the first suggestion for “notice.” You can access the Compound Words Wordlist to manually manage the entries.

Repeat the Split Compound Word command to cycle through multiple split word suggestions for a compound word. The Exclude Compound Word Pair feature allows you to exclude a word pair from suggestion.

## Exclude Compound Word pair

The Exclude Compound Word Pair command (**Alt + s, w, l**) allows you to exclude a word pair suggestion when using the [Split Compound Word](#) feature. For example, you position the cursor immediately before the word “notice” and invoke the Split Compound Word command. The first split suggestion is “no tice” and the next suggestion is “not ice.” You do not want “no tice” to ever be a suggestion. With the “no tice” suggestion displayed, you invoke the Exclude Compound Word Pair command. Case CATalyst places the suggestion, “no tice” in the Compound Words Wordlist with Action set to “Exclude” and does not display it again as a compound word split suggestion for “notice.” You can access the Compound Words Wordlist to manually manage the entries.

Repeat the Split Compound Word command to cycle through multiple split word suggestions. The Set Compound Word Priority feature allows you to change the priority order in which the suggestions are offered. You may want to use this feature to always suggest your most commonly used choice.

*Keyboard Map Function: Split Compound Word - Exclude*

## Set Compound Word priority

The Set Compound Word Priority feature (**Alt + s, w, p**) allows you to set a suggested word as your first choice when multiple [Split Compound Word](#) suggestions are available. You may want to use this feature to always display your most commonly used choice first. For example, you position the cursor immediately before the word “notice” and invoke the Split Compound Word command. The first split suggestion is “no tice” and the next suggestion is “not ice.” You want “not ice” to be the first suggestion. With the “not ice” suggestion displayed, you invoke the Set Compound Word Priority command. Case CATalyst places the suggestion, “not ice” in the Compound Words Wordlist with the Action set to “Suggest” and displays it as the first suggestion for “notice.” You can access the Compound Words Wordlist to manually manage the entries.

Repeat the Split Compound Word command to cycle through multiple split word suggestions for a compound word. The [Exclude Compound Word pair](#) feature allows you to exclude a word pair from suggestion.

*Keyboard Map Function: Split Compound Word - Set Preferred*

## Cycle Contraction

The Cycle Contraction command allows you to change contractions to whole words or whole words to contractions. For example, you have “She’ll” in the transcript. Using Cycle Contraction, you cycle through “She will,” “She shall,” and back to “She’ll.”

The Cycle Contraction command is only available when the cursor is positioned on a contraction or words that can be converted to a contraction. Words available for Cycle Contraction are determined by the [Contraction Rules](#).

## Use Cycle Contraction

1. Position the cursor before the word or words for which you want to cycle through contractions.
2. Press **Alt + s, w, y (Special Edit/Fix Words/Cycle Contraction)**.

[Keyboard Map](#) Function: Cycle Contraction

## Cycle Homophones

Cycle Homophones cycles through a list of homophones for a particular word or phrase. Homophones are two or more words that are pronounced the same but differ in spelling or meaning or both. For example, "there", "their" and "they're". While editing you could use the replace feature to type the correct word or you could use the Cycle Homophones feature to cycle to the correct word.

Some reporters and/or editors may put common complicated mistranslates in the Homophones file as a quick and easy way to cycle between the words. For example, let's say the reporter occasionally misstrokes the word "commission" when wanting "communications". The reporter or editor might put the word "commission" in the Homophones file with the word "communication" as a homophone and then put the word "communication" in the Homophone file with the word "commission" as a homophone. This allows the editor to quickly switch to the correct word. In addition, the user may also put these two words in the [Mistran Minder](#) list. When editing is complete, they use the Mistran Minder feature that displays words in the Mistran Minder list that are also in the transcript along with context, if available. If one of the common mistranslates is in the Mistran Minder results and in their Homophones list, the user can quickly change to the correct word without typing anything.

Some reporters and/or editors might also use the Cycle Homophone feature to switch between acronyms and full names. For example, the user might add Federal Bureau of Investigation as a full description to the FBI entry. The user wants to change Federal Bureau of Investigation to FBI and simply highlights "Federal Bureau of Investigation" and uses the Cycle Homophone feature to change it to "FBI". This allows the user to quickly cycle between homophones, common complicated mistranslates, acronyms or more to save time and reduce typing.

The Cycle Homophones feature is available when the cursor is positioned on a word, acronym or highlighted phrase that is listed in the Homophones file. Homophones are case sensitive and the Cycle Homophones command works in the following ways:

- If the transcript contains an upper case version of a word but your Homophone list only contains a lower case version of the word (to start a list), the Cycle Homophones command will cycle the word and cycle back to the original case of the word. For example, if THERE is the word being cycled, Cycle Homophones will cycle through THEIR, THEY'RE and then back to THERE.
- If you have both an upper and lower case version of a word (to start a list) in the Homophone list, the Cycle Homophones command will cycle based on the right case of the word. For example, if "All-In-One" is the phrase being cycled and your Homophones list contains All-In-One and all-in-one in the list, the Cycle Homophones will cycle through all-in-one and All-In-One.
- The Cycle Homophones command cycles the case shown in the Homophone list for all other scenarios.

The list of homophones used by the Cycle Homophones feature is a text file accessible for modification. The default Homophones.txt file located in the System Files case. In addition homophones, you may want to add acronyms and their names to the list, such as FBI and Federal Bureau of Investigation, which allows you to toggle between the two. Since many users use the Homophones feature as an editing aid beyond just homophones, the Homophones menu item is available on the View menu for easy [modifying of the Homophones](#) file. and added View/Edit Homophones to the Keyboard Map function list. Both commands will open the Homophones Editor dialog box where you can easily add new homophones and/or edit/delete existing homophones.

When you start Case CATalyst, the homophone file for the selected user is loaded and is used throughout the current Case CATalyst job. Modifications made to the homophone file while editing are immediately available in Edit.

### Using Cycle Homophones

1. Position the cursor before the word or highlight a phrase for which you want to cycle through homophones.
2. Press **Alt + s, w, h (Special Edit/Fix Words/Cycle Homophones)**. If nothing happens, it means there isn't an entry in the Homophones list that matches the text. To add and/or edit the Homophones file, do one of the following:
  - a. Press **Alt + v, h (View, Homophones)**.
  - b. Press **Alt + t, p (Tools, View/Edit Homophones)**.
3. Repeat as necessary to cycle through the available homophones and/or edit homophones.

[Keyboard Map](#) Function: Cycle Homophones

View/Edit Homophones

### Modifying the Homophone list

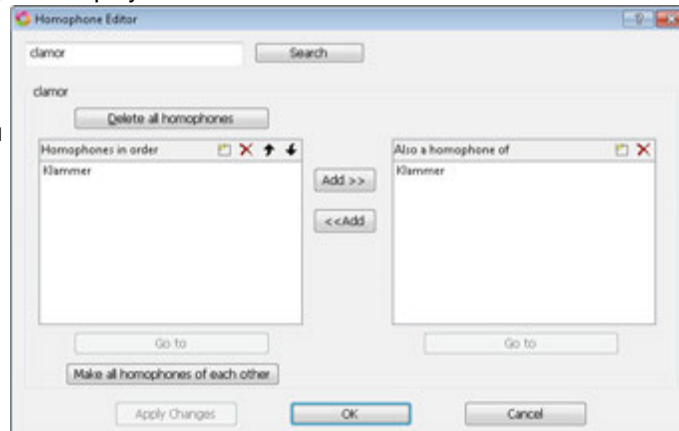

The Homophones file is located in the System Files case and is an ASCII file that can be edited in a text editor such as Notepad. Many users use the Cycle Homophones feature as an editing aid beyond just homophones. You can easily edit the Homophones list by selecting Homophones from the View menu, selecting View/Edit Homophones from the Tools menu and/or assign a key combination to the View/Edit Homophones Keyboard Map function in your Keyboard Map. All of the commands will open the Homophones Editor dialog box where you can easily add new homophones and/or edit/delete existing homophones. For example, let's say during the deposition the witness says, "I am a clamor by trade, I dig and sell clams to the tourist." While editing, you realize that the correct word is "clammer" so you want to check and see if these two words are in the Homophones list. You position your cursor before the word "clamor" and the press **Alt + v, h (View, Homophones)**, press **Alt + t, p (Tools, View/Edit Homophones)** or the key combination you assigned to the View/Edit Homophones function in your

keyboard map. The Homophone Editor dialog box displays with the word "clamor" in the Search field.

The word "clamor" is in the homophone list and shows the word "Klammer" is a homophone of "clamor". It also shows that "clamor" is a homophone of "Klammer". You can easily delete the word "Klammer" if you no longer want it in your list and add the words "clammer" and "clamber" as homophones of the word "clamor". And you can easily make them all homophones of each other.

The Homophones feature handles individual words, phrases and acronyms.

Homophones Editor dialog box:

- Search field - you can search your homophones list for a specific word. If the word is found, it displays immediately below the Search field. The current homophones associated with the searched word, if found, display in the Homophones in order display box.
- Delete all homophones - allows you to delete all the homophones associated with the current word.
- Homophones in order display box - displays the current homophones associated with the current word in the order in which they will cycle:
  -  - to add a new homophone for the current word, click the New icon or press **Ctrl + i**. A blank box displays, type the word and press Enter.
  -  - to delete an existing homophone, highlight the word and click the Delete icon.
  -  - to move an existing homophone up in the order, highlight the word and click the Move Up icon until the word is in the position you want.
  -  - to move an existing homophone down in the current order, highlight the word and click the Move Down icon until the word is in the position you want.
- Add >> - to take a word that is a homophone of the current word and have the current word be a homophone of that word, click the Add >> button.
- Add << - to add a word in that is listed in the "also a homophone of" list and make it a homophone of the current word, click the << Add button.
- Also a homophone of display box displays other words in which the current word is a homophone:
  -  - to add the current word to another homophone, click the New icon. A blank box displays, type the word and press Enter.
  -  - to delete the current word from being a homophone of one of the words listed in the "Also a homophone of" list, highlight the word and click the Delete icon.
- Go to - to see a list of homophones for a word that is currently displayed in the list, highlight the word and click the Go to button.

- Make all homophones of each other - to make all the words in both lists to be homophones of each other, click the Make all homophones of each other button.
- Apply Changes - to save all changes you have made, click the Apply Changes button. You can press this button after making any changes to save the most recent change.
- If you made changes and didn't apply the changes, clicking OK saves the changes and closes the dialog box.
- If you made changes and didn't apply the changes, clicking Cancel gives you the option to close the dialog box without saving changes.

Open and modify the Homophones list in Notepad:

1. From anywhere in Case CATalyst, press **Alt + f, o, i, h** (**File/Open/List/Table/Homophones**). The Homophones.txt file opens in Notepad or WordPad.

Each list of homophone entries in the file is separated by a blank line. Each entry within the list must be on a separate line. The number of entries for the homophone determines the number of lists required to identify the cycle priority for each word. The order of the entries in a list determines the cycle results. For example, the words "there, their, and they're" create a list. Three separate lists, one for each word, determine the cycle priority for the first word.

there  
their  
they're

their  
there  
they're

they're  
their  
there

2. Do either of the following:

### **Add an List**

To add an entry, create a blank line by pressing **Enter**. Type the word. There is no limit to the number of entries. All entries in the homophone file are case sensitive.

You may want to consider using the homophones file for lists of acronyms and their names. For example, to toggle between FBI and Federal Bureau of Investigation, you have two lists:

FBI  
Federal Bureau of Investigation

Federal Bureau of Investigation

FBI

### Delete and Entry

To delete an entry, highlight the word and press **Delete**. If a blank line remains, delete the blank line.

3. Press **Ctrl + s (File/Save)**.
4. Press **Alt + f, x (File/Exit)**.

[Keyboard Map](#) Function: Cycle Homophones  
View/Edit Homophones

## Mark

Mark Start and Mark End are Edit commands used to highlight large blocks of steno outlines and text at one time. When using the Mark Start feature with certain Edit commands, such as Copy, Cut or Delete, Case CATalyst assumes the Mark End at the end of the marking.

You can also use the Mark Start feature from the Special Edit menu in conjunction with the Search or Go To commands. For example, you want to delete Bench text. At the start of Bench Mode text, you select Mark Start and then select [Search](#) to search for Bench Mode Off format symbol. Case CATalyst highlights all the text from the Mark Start to the cursor location. When Case CATalyst locates Bench Mode Off, press Delete to remove the highlighted text. There are [additional Mark commands](#) you can use to highlight multiple steno outlines and text. However, you can only use Mark Start and Mark End, selected from the Special Edit menu, in conjunction with the Search feature.

### Mark Steno and Text

1. Position the cursor on or immediately before the steno or text and press **Alt + m, m (Special Edit/Mark/Mark Start)**.
2. Move your cursor to highlight the desired steno and text or use the Search feature to locate the end of the text you want to highlight.
3. When finished highlighting, press **Alt + m, e (Special Edit/Mark/Mark End)** or perform the Cut, Copy or Delete command. If using the Mark Start command with certain features such as Cut, Copy or Delete, Case CATalyst assumes the Mark end at the end of marking.
4. Perform any other necessary Edit command. To unmark the highlighted text and not perform another Edit command, click anywhere on the screen.

### Unmark

Press, **Alt + m, k (Special Edit/Mark/Unmark)**. Alternatively, you can click anywhere on the screen to unmark the text.

## Resolve All Chosen Conflicts

Resolve All Chosen Conflicts is an Edit command that confirms all [EZ Choice](#) and Auto-Conflict resolved conflicts in the open Edit file. When you final resolve an EZ Choice or Auto-Conflict resolved conflict, Case CATalyst changes the text from the conflict color to text color. Case CATalyst also adds the EZ Choice confirmed selection to the usage count in the conflict database.

When exporting to RTF/CRE, unconfirmed EZ Choice and Auto-Conflict resolved conflicts export in the original conflict form, so a scopist, for example, can view the original conflict. Once you confirm EZ Choice and Auto-conflict resolved conflicts, Case CATalyst exports the selection as normal text.

You can also confirm each EZ Choice and Auto-conflict resolved conflict individually by scanning to it and pressing Enter or selecting another conflict choice.

## Confirm All EZ Choice and Auto-Conflict Resolve Conflicts

1. From the Special Edit menu, select **Resolve All Chosen Conflicts**. Depending on your [Warning](#) option selection, the following warning message may display: *Are you sure you want to final resolve all EZ Choice conflicts and Auto Chosen conflicts?* displays. Press **Enter (Yes)** to continue.

You can select to not display this message by checking the box; *I understand the consequences of my actions. Please stop asking.* You can reselect to display the warning at any time in Tools/Options/Warnings.

2. The Resolving Conflicts dialog box displays the progress of the final resolve (confirmation) process.

If you press Cancel during the confirmation process, a warning message displays: *Action Aborted: xxx conflicts were finalized. Use undo if you want to change them back.* Press **Enter (OK)** to close the dialog box.

## Scan

Scan is an Edit command that moves the cursor to the next untranslate, conflict, scan stop, or more depending on your [Scan For Options](#) settings. To scan, press **F8 (Special Edit/Scan)**. You can also set [Spell Check options](#) to Scan while Spell Check.

## Scan Backwards

Scan Backwards is an Edit command that moves the cursor backward to the previous untranslate, conflict, scan stop, or more depending on your [Scan For Options](#) settings. To scan backward, press **Shift + F8 (Special Edit/Scan Backwards)**.

## Scan and Fill In Fields

Scan and Fill In Fields is an Edit feature that moves the cursor to the next empty [field](#) in the transcript and opens the Fill in Field dialog box. Once you type a new definition or choose an entry for the empty field and select OK, Case CATalyst automatically scans to the next empty field.

The Fill In Field dialog box contains a Select List from which you can choose an entry for the empty field. The Select List displays entries that match the field. For example, if the cursor stops on [!FIRM1], all the entries for FIRM display. [!FIRM] is part of a field list group. Field list group entries are available for all jobs. User defined fields entries are available depending on the scope selected for the entry.

When filling in field list groups and you select a firm name from the Select List that has only one attorney and one location listed, then Scan and Fill In Fields replaces the appropriate empty group fields with the selected information. If you select a firm name that has more than one address or more than one attorney, Case CATalyst fills in the empty fields but stops on any field that needs more information. For example, your Appearance section includes two address lines for every firm group. When using the Scan and Fill In Fields command, you select a firm that only has one address line. Case CATalyst scans to the empty field and displays the Fill-in-Fields dialog box. You can select OK and Case CATalyst deletes the empty field from the group and removes the entire line if there is no other text on that same line.

## Using Scan and Fill In Fields

1. Press **Alt + s, I (Special Edit/Scan and Fill In Fields)**. Case CATalyst locates the next empty field and displays the [Fill In Fields](#) dialog box. The field name displays in the Field Name field.
2. In the Field Value field, type an entry or select an entry from the Select List for the field name. To delete an empty field and the entire line if no other text is on that line, press **Enter** without typing a value. When typing a field value, it cannot exceed 200 characters.
3. Press **Enter (OK)**. Case CATalyst inserts the entry and scans to the next empty field. A message displays when there are no more empty fields.

## Scan For

The Scan For feature allows you to quickly scan forward in the transcript for a single specific item. Available Scan For items display in a submenu when you select the Scan For feature.

To scan forward for a variety of items, use the [Scan](#) feature. Your [Scan For options](#) determine which items Case CATalyst locates when using Scan or Scan Backward.

## Using Scan For

Press **Alt + s, c (Special Edit/Scan For)** and select an item from the submenu. To continue to scan for the same item, press **Alt + s, c (Special Edit/Scan For)** and select the item again. You can also assign a key combination in a keyboard map to the specific Scan For item to quickly scan to it.

Bench - scans to the next [Bench Mode](#) On format symbol.

Conflicts - scans to the next unresolved [conflict](#).

Drag/Drop - scans to the next [Drag/Drop Analysis](#) translation and/or [TrueStroke Drag/Drop](#) translation.

Fields - scans to the next empty [field](#).

Hidden Text - scans to the [Hidden Text](#) indicator.

Index Placeholder - scans to the next [Index Placeholder](#) format symbol.

Indexed Items - scans to the next text surrounded by [index](#) format symbols.

Oops - scans to the next [Oops](#) format symbol.

Prefix/Suffix - scans to the next [Prefix](#) or [Suffix](#) format symbol.

Scan Stop - scans to the next [Scanstop Begin](#) format symbol.

Suffix Drag - scans to the next [Suffix Drag](#) format symbol.

Untranslates - scans to the next untranslated steno outline, no dictionary entry found for the steno outline.

Attachment Points - scans to the next [Attachment Point](#) format symbol.

Change - scans to the next [track changes](#) modification.

To search backward for a specific item, use Scan Backward For. Press **Alt + s, k (Special Edit/Scan Backward For)** and select an item from the submenu.

[Keyboard Map](#) Function: Available for each item on the Scan For submenu.

## Scan Backwards For

The Scan Backward For feature allows you to quickly scan backward in the transcript for a single specific item. Available Scan Backwards For items display in a submenu when you select the Scan Backward For feature.

To scan backward for multiple items at once, use the [Scan Backward](#) feature. Your [Scan For options](#) determine which items Case CATalyst locates when using Scan Backward.

## Using Scan Backwards For

Press **Alt + s, k (Special Edit/Scan Backward For)** and select an item from the submenu. To continue to scan backward for the same item, press **Alt + s, k (Special Edit/Scan Backward For)** and select the item again. Assign a key combination to the specific Scan Backward For item to quickly scan to it.

Bench - scans to the next [Bench Mode](#) On format symbol.

Conflicts - scans to the next unresolved [conflict](#).

Drag/Drop - scans to the next [Drag/Drop Analysis](#) translation and/or [TrueStroke Drag/Drop](#) translation.

Fields - scans to the next empty [field](#).

Hidden Text - scans to the [Hidden Text](#) indicator.

Index Placeholder - scans to the next [Index Placeholder](#) format symbol.

Indexed Items - scans to the next text surrounded by [index](#) format symbols.

Oops - scans to the next [Oops](#) format symbol.

Prefix/Suffix - scans to the next [Prefix](#) or [Suffix](#) format symbol.

Scan Stop - scans to the next [Scanstop Begin](#) format symbol.

Suffix Drag - scans to the next [Suffix Drag](#) format symbol.

Untranslates - scans to the next untranslated steno outline, no dictionary entry found for the steno outline.

Attachment Points -scans to the next [Attachment Point](#) format symbol.

Change - scans to the next [track changes](#) modification.

To search forward for a specific item, use Scan For. Press **Alt + s, c (Special Edit/Scan For)** and select an item from the submenu.

[Keyboard Map](#) Function: Available for each item on the Scan Backward For submenu.

## Set Job Start Time Field

The Set Job Start Time Field command can be inserted in a realtime file to timestamp exactly when the command was invoked and automatically fill in the value for the Job Start Time field with that time information. Many reporters put the time the proceedings started and ended on their title page, certificate page, job reporter, etc. Once the Start Job Time field is inserted on a title page, certificate page, job reporter, etc., when the include file is inserted into the transcript and the Set Job Start Time Field command was invoke in the time at the time the proceedings started,, the Job Start Time field will automatically be filled in based on the time the Set Job Start Time Field command was invoked. .

The Set Job Start Time Field and Set Job End Time Field commands can also be inserted via a dictionary definitions containing the Set Job Start Time Field translate command and a dictionary definition containing the Set Job End Time Field translate command.

The Set Job Start Time Field and Set Job End Time Field can also be inserted manually when the commands are assigned key combinations in a [keyboard map](#).

[Keyboard Map](#) Functions: Set Job Start Time Field  
Set Job End Time Field

## Set Job End Time Field

The Set Job End Time Field command can be inserted in a realtime file to timestamp exactly when the command was invoked and automatically fill in the value for the Job Start Time field with that time information. Many reporters put the time the proceedings started and ended on their title page, certificate page, job reporter, etc. Once the Start Job Time field is inserted on a title page, certificate page, job reporter, etc., when the include file is inserted into the transcript and the Set Job Start Time Field command was invoke in the time at the time the proceedings started,, the Job Start Time field will automatically be filled in based on the time the Set Job Start Time Field command was invoked. .

The Set Job Start Time Field and Set Job End Time Field commands can also be inserted via a dictionary definitions containing the Set Job Start Time Field translate command and a dictionary definition containing the Set Job End Time Field translate command.

The Set Job Start Time Field and Set Job End Time Field can also be inserted manually when the commands are assigned key combinations in a [keyboard map](#).

Keyboard Map Functions: Set Job End Time Field  
Set Job Start Time Field

## Special Search

Special Search commands allow you to quickly find specific items within the transcript. They include searching for the next or previous:

- [Question, Answer or Colloquy.](#)
- [Hidden text.](#)
- [Headers.](#)
- [Layout changes.](#)
- [Punctuation.](#)
- [Ending punctuation for a sentence.](#)
- [Paragraphs.](#)
- [Missing By Line.](#)
- [Search results.](#)

### Search Next/Previous Q/A/C

Search Next Q/A/C and Search Previous Q/A/C are Edit commands that move your cursor to the next Question, Answer or Colloquy format symbol in the file. Search Next Q/A/C may be useful if you are checking the ending punctuation of Questions, Answers, or Colloquy. Search Q/A/C may be helpful when reading back testimony.

- To move to the next Question, Answer, or Colloquy format symbol, press **Alt + s, p, q** (**Special Edit/Special Search/Next Q/A/C**).
- To move to the previous Question, Answer, or Colloquy format symbol, press **Alt + s, p, a** (**Special Edit/Special Search/Previous Q/A/C**).

### Search Next/Previous Hidden Text

Search Next Hidden Text and Search Previous Hidden Text are Edit features that search the job file for [hidden text](#) or comments.

- To search forward in the file for the next hidden text, press **Alt + s, p, h** (**Special Edit/Special Search/Search Next Hidden Text**).
- To search backward in the file for hidden text, press **Alt + s, p, v** (**Special Edit/Special Search/Search Previous Hidden Text**).

### Search Next/Previous Header

Search Next Header and Search Previous Header are Edit features that search the file for a header or footer text change.

- To search forward in the file for the next header/footer, press **Alt + s, p, x** (**Special Edit/Special Search/Search Next Header**).
- To search backward in the file for header/footer text, press **Alt + s, p, p** (**Special Edit/Special Search/Search Previous Header**).

## Search Next/Previous Layout Change

Search Next Layout Change and Search Previous Layout Change are Edit features that search forward in the file for a change in the job layout and then display the changed information. If you want to search for a header change, use [Search Next/Previous Header](#) .

## Search the File for Layout Changes

1. Do one of the following:
  - To search forward in the file, press **Alt + s, p, c** (**Special Edit/Special Search/Search Next Layout Change**).
  - To search backward in the file, press **Alt + s, p, y** (**Special Edit/Search Previous Layout Change**).
2. The Page Layout Change dialog box displays with two columns of layout information. The left column identifies the location of the previous layout change and displays data for that section of the file. The right column identifies the location of the current layout, where the cursor is located in the file, and displays data for that section of information. Layout changes display in red.  
  
To view Paragraph Style changes, highlight either of the Paragraph Style(s) headings and press Enter or double click a heading. Another Page Layout Change dialog box containing all the paragraph style data displays. When finished viewing, press **Enter (OK)** to close the dialog box contain paragraph style data.
3. When finished reviewing the changed information, press **Enter (OK)**. If Paragraph Style(s) is highlighted, you must click **OK** or deselect the heading before pressing Enter to close the Page Layout Change dialog box.

## Search Next/Previous Sentence Ending Punctuation

Search Next Sentence Ending Punctuation and Search Previous Sentence Ending Punctuation are Edit features that search the file for a period, question mark or dash.

- To search forward in the file for the next sentence ending punctuation, press **Alt + s, p, e** (**Special Edit/Special Search/Next Sentence Ending Punct**).
- To search backward in the file for the previous sentence ending punctuation, press **Alt + s, p, n** (**Special Edit/Special Search/Search Prev Sentence Ending Punct**).

## Search Next/Previous Punctuation

Search Next Punctuation and Search Previous Punctuation are Edit features that search the file for a period, question mark, comma, colon, semicolon, hyphen, single quotes, double quotes, open parenthesis, close parenthesis and apostrophe.

- To search forward in the file for the next punctuation, select **Special Edit/Special Search/Next Punct**).
- To search backward in the file for the previous punctuation, select **Special Edit/Special Search/Search Prev Punct**).

## Search Next/Previous Paragraph

Search Next Paragraph and Search Previous Paragraph are Edit features that search the file for the next paragraph style. Case CATalyst positions the cursor before the paragraph format symbol.

- To search forward in the file for the next paragraph, select **Special Edit/Special Search/Search Next Paragraph**).
- To search backward in the file for the previous paragraph, select **Special Edit/Special Search/Search Previous Paragraph**).

## Search Next Missing By Line

Search Next Missing By Line searches the transcript for occurrences of where a By Line paragraph with speaker name should occur and prompts you to insert the speaker By Line. You can specify the placement of the By Line and set search criteria in [By Line Options](#).

The Search Next Missing By Line gathers speaker information starting at the top of the transcript and searches forward. When it locates an occurrence of a missing By Line, the Fix Missing By Line dialog box displays highlighting a probable speaker name. You can choose to insert the suggested speaker name, select another speaker name from the list, type a new speaker name or ignore the occurrence. The speaker name inserts as a By Line using the By Line paragraph style from the file's current Layout. The field at the bottom of the dialog box, displays the format for the By Line. You can add format symbols and fields to the By Line.

The Search Next Missing By Line feature may not prompt for a missing By Line when one exists. This is often due to an incorrect use of format symbols to define the Colloquy and Parentheticals. For example, Case CATalyst recognizes Colloquy occurrences when the speaker is defined with the Colloquy format symbol. Case CATalyst may not recognize Colloquy if you use the format symbols: <New Line Paragraph><Tab><Tab> followed by the speaker name. The same situation can occur for Parentheticals. Case CATalyst recognizes a Parenthetical occurrence when a Parenthetical paragraph style is used but may not recognize a Parenthetical occurrence when a Colloquy format symbol is used. For more information, see [Paragraph Setup](#) and [Colloquy + Q= Auto By Line](#).

## Search for Missing By Lines

1. Press **Alt + s, p, b** (**Special Edit, Special Search, Search Next Missing By Lines**). When the feature locates an occurrence of a missing By Line, the Fix Missing By Line dialog box displays.
2. A list of speaker names identified in the transcript displays. The speaker name selected for insertion displays in the field below the list. Do any of the following:
  - Insert the highlighted speaker name. Click **Insert**.
  - Select another speaker name from the list and click **Insert**.
  - Modify the text in the field and click **Insert**. For example, you want to insert a speaker name that is not in the list or add a field to the speaker name. Use format symbols and fields as necessary. Select **FS** to choose a [format symbol](#) to add to the speaker name. Select [Insert Field](#) to add a field to the speaker name.
  - Ignore the occurrence and automatically continue the search. Click **Ignore**.
  - Navigate in the transcript without closing the Fix Missing By Line dialog box. Click anywhere in the transcript. The Insert button changes to Resume. To continue using the Search Next Missing By Line feature, click **Resume**.
3. The search continues identifying missing By Line until it reaches the end. You are not prompted start from the beginning.

[Keyboard Map](#) Function: Search Next Missing By Lines

## Search Next/Previous Search Result

When you invoke a [Search](#) in Edit with the *List Search Results* option selected, Case CATalyst searches the transcript and automatically displays the results of the Search in the Search Results dialog pane. The text content, page, line and section reference display for each occurrence of the searched item.

The Search Next Search Result and Search Previous Search Result features allow you to move your cursor from the current position in the transcript to the next occurrence of the [Search](#) criteria. You can also double click an entry to move to that location in the transcript.

- To move forward to the next occurrence, select **Special Edit/Special Search/Search Next Search Result**).
- To move forward to the previous occurrence, select **Special Edit/Special Search/Search Previous Search Result**).

## Use Other Field Values

Use Other Field Values is an Edit feature that allows you to bring field values from another job into the current job. Use Other Field Values brings in the values for user defined field entries and any assigned values for group field list entries.

When you assign a value to a field in the current job and then bring in a different value for the same field, Case CATalyst prompts you to select which of the two values you want for the entire job. You can choose to keep the currently assigned field value or overwrite it with the value you bring in from the other job. You cannot have two values for one field in a job.

## Use Field Values from Another Job

1. Do one of the following to display the Select Job for Other Field Values dialog box:
  - In Edit, press **Alt + s, h** (**Special Edit/Use Other Field Values**).
  - From the Translate dialog box, select **Define Fields/Use Other**.
2. Choose the job from which you want to bring the field values and press **Enter** (**Open**). The Select Fields dialog box displays with all fields highlighted.
3. Do any of the following:

### Select All Field Values

Press **Ctrl + a** (**Select All**). All the field values are highlighted for selection.

### Select a Consecutive Group of Field Values

Click to highlight the first field value of the group. Locate the last field value. Press and hold **Shift**, while you click the last field values. All the field values in-between are highlighted.

### Select Field Values

Press and hold **Ctrl** while you click the individual field values you want to add. The individual field values are highlighted.

4. Press **Enter** (**OK**) to add the selected field values to the job.

If a field value from the selected job conflicts with a field value in the current job, Case CATalyst displays a message asking if you want to change the field. You can choose to retain the field name in the current job or replace it with the field name from the other job.

## Track Changes

The Track Changes feature, when active, tracks non-global changes made to a transcript. The changed items can include deletions, insertions, replacements, including a file and adding spaces. Global definitions, undo last global, layout changes and filling in fields are not tracked, however, if you use the Undo Global Once command, the action is recorded as a Replace.

Changes are viewable within the body of the transcript in the [assigned](#) color for the current editor when the [Display Changes](#) feature is active. A summary of all the changes made while Track Changes was active is viewable in the [Track Changes pane](#). If your cursor is positioned on a change in the transcript, you can right click and select Change Info to open the Track Changes pane and see more information about the transcript change. The right click menu item, Change Info, is only available if your cursor is positioned on a change in the transcript and the Track Changes option is selected. Each change, except for deletions, display in the transcript and the Track Changes pane in the user assigned color for the current editor. All deletions display the assigned deletion color regardless of the editor.

The current user name identifies the current editor of the tracked changes unless a name is specified in Application/Computer option, [Editor ID](#). The *Editor ID* option allows you to specify an editor name, however, the editor name applies to all users on the system who select to use the Track Changes feature.

You can track changes made by multiple editors, such as between a reporter and scopist. For example, Track Changes is active when the reporter makes small changes to the transcript before sending the transcript to the scopist. The change is recorded in the pane using the editor name and user [assigned](#) color for Editor 1. The reporter sends the file to the scopist. The scopist becomes the second editor. Changes are recorded using their editor name in the assigned color for Editor 2. When the transcript is returned to the reporter, scopist changes are displayed in the Editor 2 color. It is important that the reporter and scopist determine and set the same Editor colors prior to editing the job.

Each user controls the active status of the Track Changes feature. By default, the Track Changes feature is not active. It is necessary to activate the Track Changes feature once for each new transcript in which you want to track changes. Once activated, it remains active for the transcript unless it is deselected.

## Activate Track Changes

From Edit, select **Special Edit/Track Changes**.

To see the changes in the body of the transcript, select **Normal** view (Alt + v, n) and select **Display Changes** (Alt + v, c)

## View Commands

View commands provide access to several Case CATalyst features that affect the screen display and ability to view certain transcript related information that includes, but is not limited to Briefs, Speakers, Reveal Codes, Global Table, a word definition, Layout details and CaseViewNet and CaseView passwords and when outputting to CaseViewNet via a network or Cloud, you can see who is connected, change a user's rights or block users from receiving your realtime feed. The Block feature is usually used in a courtroom situation where the Judge may have inadvertently connected to the wrong court reporter for the day.

## CaseView Options

The CaseView Options (**Alt + v, a**) menu allows access to the CaseView II and [CaseViewNet passwords](#), the [Connected Users](#) for CaseViewNet and iCVNet user connected via the cloud or network and the [CaseViewNet notifications](#) allow you receive alerts when connected via the cloud or network.

## CaseView Passwords

Display the CaseView Passwords dialog box. The CaseView Passwords dialog box allows you to verify passwords used by CaseView II clients and to view and modify the passwords used by CaseViewNet clients. You can size the dialog box to make all the column headings visible. In Edit, press **Alt + v, a, p** (**View/CaseView Options/CaseView Password**).

## CaseView II

Case CATalyst generates the CaseView II password and displays it when you begin the realtime session. You can view the password in Edit after realtime has begun by pressing **Alt + v, a, p** (**View/CaseView Options/CaseView Passwords**).

## CaseViewNet

CaseViewNet clients connect via wireless network and/or internet must have a password in order to receive the realtime feed. Passwords do not apply to CaseViewNet receive systems connected to the Case CATalyst realtime computer via serial cable. Make entries in the fields as necessary. When finished, select **OK**.

### Allow Save

Create a password configuration to allow the client to save the CaseViewNet file using the password indicated in the Password field. A check mark indicates the Allow Save feature is active.

### Connections

Select one of the following:

#### Single LAN User

The first local (connected via a local area network) CaseViewNet client to connect to your Case CATalyst server using the password in the Password field is the only one allowed to use the password. You may want to use this setting when sending realtime to your judge. CATalyst provides connectivity via a LAN (local area network) or a WAN (wide area network such as the Internet). If you give an internet CaseViewNet/iCVNet client a Single LAN User password, the client will not be able to connect as both CaseViewNet and iCVNet via an internet connection will consider the password invalid.

#### Multiple Users

Allow multiple CaseViewNet clients to connect to your Case CATalyst server using the same password in the Password field.

### Expiration

Set a password expiration date. Click in the field and select one of the following:

#### Today

The password expires at midnight tonight.

#### Never Expires

The password can be continually used without expiring.

#### Specific Date

Select a specific date on the calendar for the password expiration date. The password expires at midnight of the selected day. For example, if you are in a five-day trial, CaseViewNet clients can use the same password throughout the five days of trial.

### Password

Specify the password that allows clients to connect to your Case CATalyst server and receive the realtime feed through CaseViewNet. The CaseViewNet client is prompted for a password when connecting to the Case CATalyst server. The password you give the CaseViewNet client determines whether or not they can save the realtime file.

Use the current password, generate a new password in the I Want To field or type a new password. Passwords must be 4 -64 characters. You can create separate passwords for clients allowed only to view the realtime file and for clients allowed to view and save the realtime file.

Passwords do not apply to CaseViewNet receive systems connected to the Case CATalyst realtime computer via serial cable.

## I Want To

### Clone

Make a copy of the password and associated information. A new line displays at the bottom of the list. Use this feature to create separate "Save" passwords for each client.

### Delete

Deletes the current password and associated information. You can also highlight the password you want to delete and click the Delete Password button at the top of the dialog box.

### Set Expired

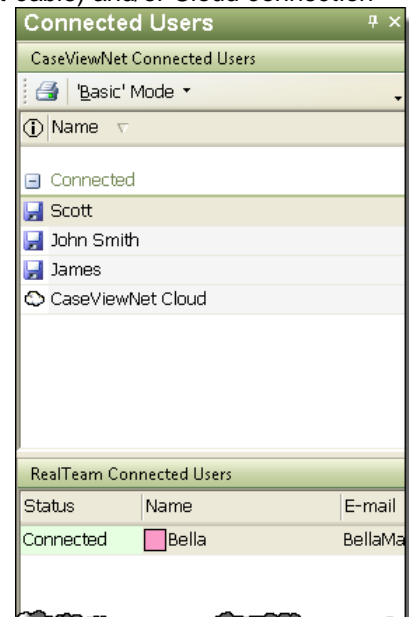

Set the password to inactive. The message "Expired" displays in the Expiration field. This prevents clients from accessing the network with the password. To reactivate the password, select an option in the Expiration field.

### Generate Password

Generate a new password. If a password already exists, Case CATalyst displays a confirmation message. Select **Yes** to change the password. You can also click the New Password button at the top of the dialog box. Case CATalyst generates a new password with default settings.

## Connected Users

The Connected Users dialog pane displays the connection status of [CaseViewNet/iCVNet users](#), if applicable, connected via a network connection (wireless or Ethernet cable) and/or Cloud connection" and also displays [RealTeam connected users](#), if applicable. The top part of the pane is reserved for CaseViewNet users and the bottom part of the pane is reserved for RealTeam users. You can click and drag the title bars within the pane to adjust the size of each section.

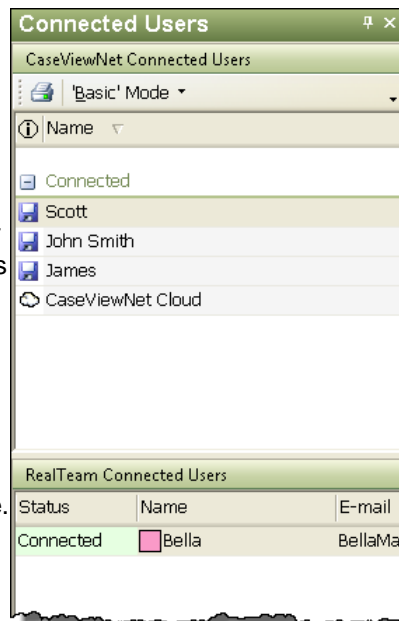

## CaseViewNet Connected Users Section

The CaseViewNet section of the Connected Users dialog pane displays the connection status of CaseViewNet/iCVNet users connected via a network connection (wireless or Ethernet cable) and/or Cloud connection.

If there is a Cloud connection, a 'cloud' icon will display. User connection status includes connected with save rights, connected without save rights, disconnected and blocked information.

Connection details for each CaseViewNet user is viewable in the CaseViewNet Connected User dialog pane for the current session. Basic and Advanced Modes display detailed connection information in a message bubble that is available by resting the cursor on a user name. In Advanced mode, the information for each user also displays in columns. You can select which columns display and modify the display order.

Right clicking on a user name in the CaseViewNet Connected User dialog pane allows you to manage user connections. You can change the selected user's save rights or disconnect and block the connection making your Case CATalyst server inaccessible to the selected user. You might block a user when working in a courthouse. When you block a user, you can send a message explaining the reason. For example, you were in a courtroom yesterday where the judge received your wireless feed for the proceedings. Today you are in a different courtroom and the judge from yesterday automatically connects to you by mistake. You can block that judge from connecting and send a message to explaining the reason for blocking.

A blocked CaseViewNet user will get a message stating the connection has been blocked and if the reporter wrote message as to why the user was blocked, that information will display. An iCVNet user will not get a blocked message but they will immediately be disconnected and will not be able to connect until the reporter unblocks the user.

To open the CaseViewNet Connected User dialog pane in the Case CATalyst realtime session, press **Alt + v, a, u** (**View/CaseView Options/CaseView Connected Users**).

## CaseViewNet User Information

### Connection Status

#### Connected

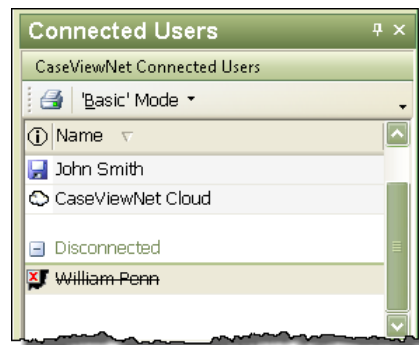

The user is connected to the current CaseViewNet session with save rights as indicated by a floppy disk icon (🖨️) or no save rights as indicated by a floppy disk icon with a red X (🖨️❌).

### Disconnected

The user was connected to the current session but is not connected at this time.

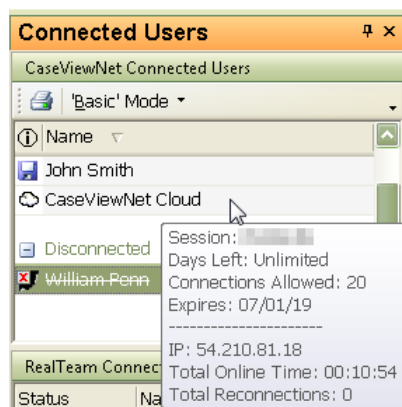

### Blocked

The user is blocked by the court reporter and cannot connect to the CaseViewNet session as indicated by a user icon being moved under the heading Disconnected and the icon marked with a red X.

## Connection Details

In Basic and Advanced mode, you can position the cursor on a CaseViewNet user name to display connection details. Details includes each user's name, affiliated organization, if any, current connection status, the IP connection address, total time online, the number of times an invalid password is used, the total times the user has reconnected to the session, and the CaseViewNet save rights. In Advanced Mode, you can select which connection details to view in columns, sort by a specific connection detail and create subgroups for connection detail. If you position and hover your cursor over the CaseViewNet Cloud line, you see the following information about the CaseViewNet Cloud session.

**Session:** The Session Code used. In this example, wa4m03 is the Session Code.

**Days Left:** The number of days left at the *start* of this CaseViewNet Cloud session. The number of days is selected at the time of the Session Code purchase.

**Connections Allowed:** The number of connections the current Session Code allows during the CaseViewNet Cloud session. The number of connections allowed is selected at the time of the Session Code purchase.

**IP:** The IP address of the Case CATalyst connection.

**Total Online Time:** The amount of time the CaseViewNet Cloud has been connected.

**Total Reconnections:** The number of times CaseViewNet Cloud disconnected and reconnected to the server.

If you position and hover your cursor over the connected client's name, you see the following information:

**Name:** The name the client used when logging into CaseViewNet or the name of the iPad when connecting via iCVNet.

**Organization:** The name of the organization the client used when logging into CaseViewNet. If the client is using iCVNet, nothing will display in this field.

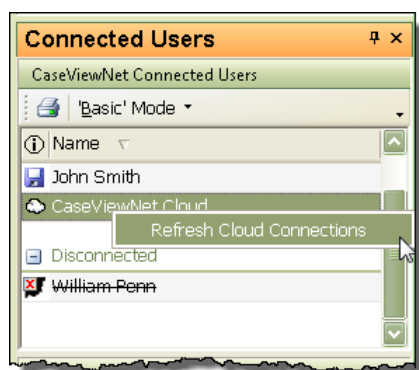

**Status:** The current status of the client.

**IP:** The client's IP address.

**Total Online Time:** The amount of time the client has been connected.

**Total Reconnections:** The number of times the client has disconnected and reconnected to the server.

If you want to refresh the display of the connected CaseViewNet Cloud clients, right click the CaseViewNet Cloud line and select Refresh Cloud Connections. Please be aware that all connections will be disconnected and then reconnected when using this feature.

### Print

Print the CaseViewNet Connected Users information based on the current display mode, Basic or Advanced. When you select to print to PDF, by default Case CATalyst uses the job file name followed by *\_CaseViewNetUsers.pdf* to name the file. For example, if the current realtime session is 032609SMP, the PDF name is *032619SMP\_CaseViewNetUsers.pdf*.

### Basic/Advanced Mode

The current display mode. To switch the mode, click the down arrow and select the mode from the drop down menu. A check mark in front of the name indicates the active mode. For example, print the detailed connection information in Advanced mode to reference how long clients were connected.

## CaseViewNet Dialog Pane Display Modes

The CaseViewNet Dialog pane displays connection information in either Basic or Advanced mode.

### Basic Mode

The CaseViewNet Connected User dialog pane, by default opens in Basic Mode with users grouped by connection status, Connected, Disconnected and Blocked. Click on the plus sign next to the status heading to expand or collapse the list of user names. You can sort by name within each group. Case CATalyst identifies the sort column with a triangle to the right of the column heading. Click the Name column heading until the triangle points up for ascending order or down for descending order.

Each user name displays with an icon, indicating their current save rights. These include:

- Save Rights - A diskette icon before the user's name indicates the CaseViewNet user has the ability to save CaseViewNet file.
- No Save Rights - A diskette with a red X icon before the user's name indicates the CaseViewNet cannot save the CaseViewNet file. The client can save a report that includes page and line number references for their marks, issue codes and their notes.
- Blocked - A red X on top of a silhouette icon before the user's name and the user name with a line through it indicates the CaseViewNet user is disconnected from the CaseViewNet session and is blocked from connecting.

### Advanced Mode

The Advanced Mode contains additional options that allow you to group users by various connection details. Use the following options as necessary:

### Filter

Filter allows you to display users by specific criteria contained in the entries. Type the criteria by which you want to filter. Filter hides the display of items not specified. It does not remove them. All entries display when you remove the typed entry. For example, to filter all users that have Save rights, type **save** in the Filter field. Switching to Basic Mode removes the text from the Filter field.

### Column List

Display the Column Chooser dialog box where you can click and drag a heading to the CaseViewNet Connected User dialog pane. Position the heading as a column to display the indicated information for each user or position the heading in the Advanced Grouping field to create a grouping.

### Advanced Grouping

Display the Advanced Grouping field where you can create groups and subgroups by which you can sort the users by various connection details. Click the Column List icon to display the Column Chooser dialog box and drag a heading from the list to the Advanced Grouping field located above the user list. For example, you can create a group by all users with save rights based on the current connection status.

To remove the groups and subgroups, click the column list names in the CaseViewNet Connected User dialog pane and drag them out of the dialog pane.

## Manage CaseViewNet User Connections

Position the cursor on a user name and right click. Select one of the following actions from the menu.

### Has Save Rights

Change the current save rights for the selected user. Right click the user name. A check mark displays next to the option, *Have Save Rights*, when the selected user currently has save rights. If the user does not have save rights, no check mark displays. Click **Have Save Rights** to permit or revoke the user's current rights status. CaseViewNet users will not be able to save the transcript except for marks and notes the user made. iCVNet users will not be able to e-mail the transcript.

A floppy disk icon () next to the user name indicates they have save rights. A floppy disk icon with a red X () indicates they do not have save rights.

### Block User

Block and disconnect the selected user. Right click the user name and select **Block User**. A check mark before the option indicates the user is blocked. When you block a user, the Block CaseViewNet User dialog box displays in Case CATalyst indicating you are blocking the user and provides the opportunity to include a message. If desired, type a message to the CaseViewNet user explaining the reason for blocking the connection. For example, "Please connect to the Linda Server, she is your court reporter today." When finished typing your message, click **Block & Logoff User** to active the block. When Case CATalyst blocks the user, a blocked connection message displays in CaseViewNet along with the reporter's message, if applicable.

To remove the block and allow connection for a selected user, right click the user name and click **Block User**. No check mark displays in front of the option when a user has an active CaseViewNet connection. When removing the block, it is necessary for the CaseViewNet user to reconnect in order to receive the realtime transcript. iCVNet users will not be able to connect or receive the realtime feed until they are unblocked. The iCVNet iPad will not indicate that it is blocked.

When using the Block feature with a version of CaseViewNet other than 2.1.1 or higher, the CaseViewNet user does not receive get the blocked message. The CaseViewNet user is disconnected and the Login dialog box displays. If the user attempts to reconnect, the Login dialog box displays.

[Keyboard Map](#) Function: View CaseViewNet UserList Pane

## CaseViewNet Notifications

Display a brief notification message in the lower right corner of your computer screen during realtime. Notification messages only apply to CaseViewNet and iCVNet clients connected via a network or Cloud connection.

### Notification Messages

There are three different types of notifications although blocking and unblocking a user will generate when a user connects and/or disconnects. A check mark in front of the option indicates it is active.

#### Notify when user connects

Toggle the display of the notification message, press **Alt + v, a, c** (**View/CaseView Options/Notify when user connects**).

#### Notify when user disconnects

Toggle the display of the notification message, press **Alt + v, a, d** (**View/CaseView Options/Notify when user disconnects**).

#### Notify when user's rights change

Toggle the display of the notification message, press **Alt + v, a, r** (**View/CaseView Options/Notify when user rights change**).

## Dictionary Info

Dictionary Info allows you to view dictionary entries during Edit. You can view an entry directly in the selected dictionary or by using the [Query Realtime Translations](#) feature. When you highlight a word in the History window and select a dictionary to view the entry, the selected dictionary opens the Manage Dictionary function and displays the dictionary entry that matches the highlighted word. If Case CATalyst cannot find the entry, the first dictionary entry displays.

When you choose to look at the definition for a particular outline using the Query Realtime Translation feature, the Lookup dialog box displays. The outline appears in the title bar and the definition is listed along with the dictionaries in which the definition is found.

### View a Dictionary Entry

1. Place your cursor immediately before the word or highlight the word you want to view.
2. Do **one** of the following:
  - To view the entry in your Personal Dictionary, press **Ctrl + Shift + i**.
  - To select the dictionary in which you want to view the entry:
    - a. Press **Alt + v, i (View/Dictionary Info)**.
    - b. From the Dictionary Info menu, select **one** of the following:

#### **Personal**

Display the Personal Dictionary for the current user.

#### **Case**

Display the Case dictionary associated with the open job. This option is only available when the job is in a case.

#### **Job**

Display the Job dictionary associated with the open job.

#### **Other**

This feature is currently not available.

## Query Realtime Translations

Query Realtime Translations displays the dictionary name and definition indicating the source of the translated text along with all possible entries of the steno outline found in the dictionaries used to translate. This allows you to instantly access the dictionary entry for modification or deletion. The dictionary automatically refreshes following any changes.

You can query words during realtime or after translation while editing. When you use Query Realtime Translations after translation, Case CATalyst uses the Job History file to determine which dictionaries were used for translation. If the Job History file is not available, no dictionaries are available for Query Realtime Translation when editing after translation.

If the message "No translation available for STENO" displays, it could be a result of attempting to query on a word that was typed in and has no underlying steno. It could also result from no translation history in the Job History.

The Lookup dialog box for Query Realtime Translations lists the entries from all the dictionaries in which there is a translation for the selected steno outline, for any entry that begins with the same first stroke as the selected steno outline and for individual definitions if it is a multi-stroke entry. The dictionary name in which the translation originates, the steno and the text definition of the dictionary display first in the list. For example, you query the word "endorsement" which is written as follows:

/EPB/TKORS/PHEPBT

The Lookup dialog box displays:

Number	Dictionary	Steno	Entry Text
1	Personal Dictionary	/EPB/TKORS/PHEPBT	endorsement
2	Personal Dictionary	/EPB/TKORS	endorse
3	Personal Dictionary	/EPB	even
4	Job Dictionary	/TKORS	Doris
5	Personal Dictionary	/PHEPBT	meant

## Query Translations

- Do one of the following:
  - Place your cursor immediately before the word or highlight the words in the transcript.
  - Highlight the steno in the Vertical Notes pane.
- Press **Ctrl + Shift + q (View/Dictionary Info/Query Realtime Translation)**. The Lookup dialog box displays with the steno outline for the selected words or steno in the Title Bar. The first entry in the list reflects the location of the translation.
- The following information displays for each entry:

### Number

The priority in which the dictionary is used in translation.

### Dictionary

The dictionaries that contain the entry. Dictionaries display in priority order.

### Steno

The steno outline for the selected word.

### Entry Text

The definition for the steno identified in the Title Bar.

- Do any of the following as necessary:

### Modify

Highlight an entry and select **Modify**. The Modify Dictionary Entry dialog box displays. [Make changes](#) to the entry as necessary and press **Enter (OK)**. Press **Enter (OK)** in the Lookup dialog box to accept the changes. The dictionaries in use for translation automatically refresh.

### Global

Highlight an entry and select **Global** to global the definition for the current realtime session. Case CATalyst applies the global and closes the Lookup dialog box.

### Delete

Highlight an entry and select **Delete** to remove the entry from the dictionary. A confirmation message displays by default. Check the option, *I understand the consequence of my actions. Please stop asking.* to bypass the confirmation message. Press **Enter (OK)** in the Lookup dialog box to accept the changes. The dictionaries in use for translation automatically refresh.

## Display

The Display menu allows you to access Case CATalyst features that affect the display of items in Edit. For example, this includes but is not limited to, setting colors for untranslates and conflicts, the cursor size, vertical notes and reveal codes font and cursor context. Select View and then Display.

## Colors

The Colors feature allows you to change the color for specific elements on the Edit screen, such as text, background, line numbers, untranslates, scan stops, timestamps, globalled text, work unit area, Hyperlink, etc.

1. In Edit, press **Alt + v, d, c (View/Display/Colors)**. The Colors dialog box displays.
2. Make necessary changes:

### Sample Text Window

Identify the various types of text in Edit for which you can set colors. Move your cursor to an area in the window. The Description field shows the type of text selected. For example, position your cursor on the Q. The Description field at the bottom of the screen identifies the text as a Question.

When you identify the type of text you want to change, you can click it to select it for modification. Case CATalyst displays the type in the drop down list to the right.

### Description

Describes the text on which the cursor is positioned in the sample window.

### Drop Down List

Select the type of text for which you want to change the color. A red box displays around the selected text type in the sample window.

### Color Field

The current color for the text type identified in the above field. Click the Color field to display the Color palette. Click the color you want to use and press **Enter (OK)**.

### More Colors

You can create your own color by selecting **Define Custom Color**. A color selection dialog box displays. To create your own color, consult your Windows documentation for more information.

## Page View

### Show Display Colors

Display the selected colors in Normal and Page view.

### Show Font Colors

Display the selected colors only in Normal view. Page view uses the font colors from the applied layout.

### Default

Reset colors for all the text types to the default settings that came with Case CATalyst.

3. Press **Enter (OK)** to accept the changes and close the Colors dialog box. Case CATalyst remembers the new settings for the current user until changed again.

## Display Font

Display Font is an Edit option that allows you to change the font and font characteristics used to view text on the screen. The selected display font is only visible in Normal view. Modifying the font using Display Font does not affect the printed transcript. To change the font on the printed transcript, use [Font](#) or the [Font format symbol](#).

### Change the Display Font

1. In Edit, press **Alt + v, d, d (View/Display/Display Font)**. The Display Font dialog box displays.
2. Check the box, **Use Display Font**.
3. Select **Font**. The Font dialog box displays. Make necessary changes:

#### Font

Select a font type.

#### Font Style

Select a font style:

- **Regular**—no style attributes
- **Italics**—apply italics to the selected font
- **Bold**—apply bold to the selected font
- **Bold Italic**—apply italics and bold to the selected font.

#### Effects

##### Strikeout

Check the box to have the selected text display with strikeout line.

##### Underline

Check the box to have the selected text display underlined.

#### Color

This feature does not apply to Display Font. To change editing and printing font colors use the [Colors](#) option (**View/Display/Colors**).

#### Sample

A sample of how text displays in the job with the selected font settings.

4. Press **Enter (OK)** to close the Font dialog box.
5. In the Display Font dialog box, press **Enter (OK)** to apply the changes. If necessary, verify you are in Normal view, press **Alt + v, n (View/Normal)**.

## Vertical Notes Font

Vertical Notes Font is an Edit option that allows you to change the font and font style in the vertical notes dialog pane. To adjust the character size, change the size of the Vertical Notes dialog pane. Case CATalyst remembers the selected font and font style until it is changed.

### Change the Vertical Notes Font

1. Place the cursor focus in the Vertical Notes dialog pane by clicking in the pane.
2. Press **Alt + v, d, v (View/Display/Vertical Notes Font)** or right click and select **Vertical Notes Font**. The Font dialog box displays. Make necessary changes:

#### Font

Select a font type.

#### Font Style

Select a font style:

- **Regular**—no style attributes
- **Italics**—apply italics to the selected font
- **Bold**—apply bold to the selected font
- **Bold Italic**—apply italics and bold to the selected font.

#### Sample

A sample of how text displays in the job with the selected font settings.

3. Press **Enter (OK)** to close the Font dialog box.
4. In the Display Font dialog box, press **Enter (OK)** to apply the changes.

## Reveal Codes Font

The [Reveal Codes](#) feature in Edit displays formatting information along with the transcript text inside a dialog pane. Adjusting the size of the Reveal Codes pane increases or decreases the number of text lines displayed but font attributes remain unchanged. The Reveal Codes Font feature allows you to change the font, font style and the font size in the pane. The default font is Arial, size 23. You can change the font color for format symbols only in the Reveal Codes pane by [modifying](#) a setting in your UserSettings file.

To select a modify the font:

1. In Edit, position the cursor in the Reveal Codes dialog pane.
2. Right click and select **Reveal Codes Font** or select **View/Display/Reveal Code Font**. If Reveal Codes Font is grayed out, the dialog pane does not have the cursor focus.
3. In the Font dialog box change a value in any of the following field.
  - Font
  - Font style
  - Size
4. Click **OK**. The text in the Reveal Codes pane reflects the change.

[Keyboard Map](#) Function: Reveal Codes

Set Focus to Edit

## Change Format Symbol Color in Reveal Codes

The default background color of the Reveal Codes window is gray when the cursor focus is in the body of the transcript. When the cursor focus is in the Reveal Codes window, the background color is the same as the transcript background. To change the color of the format symbols that display in the Reveal Codes dialog pane. Use any RGB color number. For example, to make the format symbols the same default color as globals use the RGB number, 13382655.

To change the font color of format symbols in Reveal Codes:

1. Be sure you are in your User name.
2. From Manage Jobs, open the **System Files** case.
3. Double click the **UserSettings.sgxml** file. The Settings Manager dialog box displays.
4. Click in the dialog box and press **Ctrl + f**. The Find dialog box displays.
5. Type **RevealCodesFSRGB** and press **Enter** to move to the *RevealCodesFSRGB* option.
6. Click the **Edit** icon.
7. Type the RGB number for the desired color in the field and click **OK**. You can use an RGB number already in use for another View-Settings option. To restore the default setting, click **Default**.
8. Press **Alt + s (Save)** to save the setting and close the dialog box.

## Set Cursor Size

Set Cursor Size is an Edit option that allows you to change the size of the cursor on the screen. You can set the cursor size for the Default and other keyboard maps.

## Change the Cursor Size

1. Press **Alt + v, d, z (View/Display/Set Cursor Size)**. The Cursor Size dialog box displays.
2. Make entries:

### Cursor Type

Select the keyboard map type for which you want to change the cursor size. Select one:

- Default Keyboard Map
- All Other Keyboard Maps

### Enter Value

Type a number **1 through 20**.

3. Press **Enter (OK)**.

## Set Cursor Context

Set Cursor Context is an Edit feature that allows you to select a resting cursor position for arrowing or scrolling through the file. The default percentage is 18. This is a percent of the screen with the bottom being 0 and the middle of the screen being 50, so that 50% is at the center of the screen. 50% is comparable to center line editing.

This setting does not affect cursor or mouse movement for editing.

## Set a Cursor Position

1. In Edit, press **Alt + v, d, e (View/Display/Set Cursor Context)**. The Set Cursor Context dialog box displays.
2. Type a number between **0 – 50** in the field. Case CATalyst retains the settings for the current user until changed.
3. Press **Enter (OK)**.

## Folio Count

Folio Count is an Edit feature that allows you to view the number of characters, words and folios in the current file. As necessary, you can [change](#) the number of words that comprise a folio.

To view the character, word and folio count press **Alt + v, u (View/Folio Count)**.

## Included and Excluded Items in the Character Count

### Included

- Q and A along with any punctuation associated. For example, **A.** counts as two characters.
- Text.
- Punctuation.
- Characters inside a field.
- EZ Choice and Second Choice selected conflicts count the number of characters for the selected conflict only.
- Stitched text counts each alpha and punctuation character. For example, **M-a-i-n** is 7 characters.
- Underlined words that use format symbols count only the number of characters in the word.
- An underlined character is counted as one character.

### Excluded

- Page numbers.
- Line numbers.
- Text in headers and footers.
- Timestamps.

## Global Table

The Global Table feature opens the [global table](#) where you can [manage the global](#) entries for a job.

Access the Global Table:

- in Edit. Press **Ctrl + y (Global/Global Table)**.
- in Manage Jobs. Press **Alt + f, o, i, t (File, Open, List/Table, Global Table)**. In the Open Existing Document dialog box, select a Global Table and press **Enter (Open)**.

Modifying a Global Table entry from Manage Jobs does not change globals already applied to the open job. To affect globals, it is necessary to modify the globals from within Edit. Additionally, it is only possible to Undo a global from within Edit.

## Show Active CartView

The [CARTView](#) window is extremely easy to use and is a viable solution for CART providers, for presentations, etc. When start a CART job, at the Translate dialog box select CARTView (local display) as your output option. You can then customize the font style, color, size and more. There are several position options also. You can show or hide the CARTView window via menu items or keyboard commands. Let's say you are using CARTView to provide realtime to a large business meeting. The meeting takes a 15 minute break and you like to hide the text display during the break. You can use the [Hide CARTView](#) command while on break and when the meeting starts again, you can use the *Show Active CARTView* command to provide realtime when the meeting resumes.

When outputting to CARTView, you can position the CARTView window along with [customizing](#) how the text looks by changing the font style, font size, color and more. You have the ability to show the CARTView window via the menu and keyboard combination or keyboard map assignment. You can hide the CARTView window for whatever reason and then when you are ready to display it again, simply select Show CARTView Window and you are off and running again. In addition, you can record macros to hide and show the CARTView window so the commands can be invoked from your writing machine.

### CARTView Keyboard Map Functions:

- Hide CARTView - hides all active CARTView windows
- Show CARTView window - displays all active CARTView windows  
This option will only show the CARTView window if CARTView (local display) was selected when starting translation.

### View menu (Alt + v) items:

- Hide Active CARTView (t) - hides the current active CARTView window
- Show Active CARTView (v) - displays the current active CARTView window  
This option will only show the CARTView window if CARTView (local display) was selected when starting translation.

### Right Click in CARTView window

- Hide Window

## Hide Active CARTView

The [CARTView](#) window is extremely easy to use and is a viable solution for CART providers, for presentations, etc. When start a CART job, at the Translate dialog box select CARTView (local display) as your output option. You can then customize the font style, color, size and more. There are several position options also. You can show or hide the CARTView window via menu items or keyboard commands. Let's say you are using CARTView to provide realtime to a large business meeting. The meeting takes a 15 minute break and you like to hide the text display during the break. You can use the *Hide CARTView* command while on break and when the meeting starts again, you can use the [Show Active CARTView](#) command to provide realtime when the meeting resumes.

When outputting to CARTView, you can position the CARTView window along with [customizing](#) how the text looks by changing the font style, font size, color and more. You now have the ability to hide and show the CARTView window via the menu, keyboard combination or right click (hide only). You can hide the CARTView window for whatever reason and then when you are ready to display it again, simply select Show CARTView Window and you are off and running again. In addition, you can record macros to hide and show the CARTView window so the commands can be invoked from your writing machine.

### CARTView Keyboard Map Functions:

- Hide CARTView - hides all active CARTView windows
- Show CARTView window - displays all active CARTView windows  
This option will only show the CARTView window if CARTView (local display) was selected when starting translation.

### View menu (Alt + v) items:

- Hide Active CARTView (t) - hides the current active CARTView window
- Show Active CARTView (v) - displays the current active CARTView window  
This option will only show the CARTView window if CARTView (local display) was selected when starting translation.

### Right Click in CARTView window

- Hide Window

## Layout Information

Layout Information is an Edit feature that displays the Page, Paragraph, and Headers & Footers layout information for the current job. You can [modify](#) the job layout information.

To display layout information, press **Alt + v, i (View/Layout Information)**.

## Panes

Select Case CATalyst features, such as [Search File Contents](#), [Search Due Jobs](#), [Job Details](#) or [Integrated Video Training](#) in Manage Jobs; and [Vertical Notes](#), [Reveal Codes](#), [Speaker List](#), [EZ Text](#), [Clipboard](#), [Hotspots](#), [Search Results](#), [Cat Scratch](#), [Brief It](#), [Hidden Text](#), [Track Changes](#) and [Connected Users](#) in Translate/Edit, are accessible from a small self contained resizable window called a [dialog pane](#). Dialog panes, when selected to show, display in a default fixed position on the Case CATalyst screen. You can easily reposition dialog panes to vertical, horizontal, floating or auto-hide (tabbed) locations on the Case CATalyst screen.

You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to

move) of the pane, your cursor will change to a horizontal double arrow (  ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen.

## Reveal Codes

Reveal Codes is an Edit feature that displays formatting information along with the transcript text inside a dialog pane. Use the Reveal Codes pane to identify and delete unwanted formatting information such as paragraph styles, format symbols or headers.

The background color of the Reveal Codes pane is gray when the cursor focus is in the body of the transcript. When the cursor focus is in the Reveal Codes window, the background color is the same as the transcript background. You may want to create a key combination for the [Set Focus to Edit](#) keyboard command to move the cursor focus between the Edit screen and the Reveal Codes pane.

When you adjust the size of the Reveal Codes pane, the text remains the current size and the pane increases or decreases the number of lines of text displayed. Using the Display, [Reveal Codes Font](#) feature, you can change the font, font style and font size. To change the color of the font, it is necessary to [modify](#) a setting in your UserSettings file.

You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to

move) of the pane, your cursor will change to a horizontal double arrow (  ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen.

Press **Ctrl + Shift, r** (**View/Panes/Reveal Codes**) to display the Reveal Codes dialog pane.

[Keyboard Map](#) Function: Reveal Codes

Set Focus to Edit

## Set Focus to Edit - Keyboard Command

Set Focus to Edit is a keyboard command that places the cursor focus back to the Edit screen when you are in the Reveal Codes or Vertical Notes dialog pane. You must select a keyboard combination to use the feature, adding it to the desired [keyboard map](#). You can quickly add the command to the active keyboard map during Edit.

To add Set Focus to Edit to the active keyboard map during Edit:

1. From Edit, double click the keyboard name in the Status bar at the bottom of the screen.
2. Press **Ctrl + i** (**Edit/Insert**). The Assign Key to Function dialog box displays.
3. Click any function in the Functions list and press **Ctrl + f**. The Find dialog box displays.

4. Type **Set Focus to Edit**, select a direction and press **Enter (OK)**. Case CATalyst highlights the feature.
5. In the Key field, select a key for assignment from the drop down list and then click the radio button next to **one** of the following: **Key Only**, **Ctrl + Key**, **Shift + Key**, **Ctrl + Shift + Key**. When a function is currently assigned to the selected key combination, it displays in the Currently Assigned to field. If no function is assigned, the field is blank.

When selecting a single key for assignment, consider assigning Shift plus the key to prevent the possibility of invoking the capped version of a keyboard command when the Caps Lock is on.

6. Press **Enter (Assign)**. The entry displays in the Keyboard Map list.

If you select a key combination currently assigned to another function, the following message displays: "The Key: *nameofkey* is already assigned to the Function: *nameoffunction*. Do you want to replace it?" Choose **Yes** to replace the existing assignment with the new function. Choose **No** to retain the existing assignment.

7. Press **Esc (Close)** to exit the Assign Key to Function dialog box.
8. Press **Ctrl + s (File/Save)** to save the change to the keyboard map.
9. Press **Ctrl + F4**, to close the keyboard map. Case CATalyst returns you to Edit.

## Vertical Notes

Vertical Notes is an Edit feature that displays the steno notes in paper tape format within the Vertical Notes dialog pane. The steno notes display in the Arial Monospaced font by default. You can change the font and font style using the [Vertical Notes Font](#) feature. By default, the Vertical Notes pane displays as a tab on the right side of the screen.

The vertical notes automatically scroll with the cursor movement on the screen and also allow for manual scrolling throughout the note file. You can edit the job, making dictionary definitions from vertical notes pane. Global definitions made from vertical notes apply throughout the job in the same manner as defining from the Edit screen. Use the [Set Focus to Edit](#) keyboard command to move the cursor focus from the Vertical Notes pane to the Edit screen.

You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to

move) of the pane, your cursor will change to a horizontal double arrow (  ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen.

Steno outlines in the vertical notes that display in light gray can indicate the steno outline:

- was deleted using asterisk delete from the writer.
- was deleted using the Delete key on the computer keyboard.
- was written while power defining. These are not the initial strokes to invoke Power Define.
- is a number converted by a Number Conversion or Number Trigger.
- was written for an AccelerWriter.

To toggle the Vertical Notes display open and closed, press **Ctrl + n (View/Panes/Vertical Notes)**. A check mark indicates that Vertical Notes is active.

## Defining from Vertical Notes

You can create dictionary definitions from the Vertical Notes pane. Defines made from the vertical notes are placed in the selected dictionary and are available for future translation. Global definitions made from vertical notes apply through the job in the same manner as defining from the Edit screen.

1. Highlight the desired steno strokes in the Vertical Notes pane.
2. Press one of the following and make necessary entries.
  - **Ctrl + d (D-Define)**. The Global – D-Define dialog box displays.
  - **Ctrl + k (K-Define)**. The Global – K-Define dialog box displays.
  - **Ctrl + j (J-Define)**. The Global – J-Define dialog box displays.
  - **Ctrl + Shift + o (O-Define)**. The Global – O-Define dialog box displays.
3. Make entries:

### Steno (Alt + s)

The steno for the text selected to global.

### Text (Alt + t)

Type the text for the definition, including necessary format symbols, fields or extended characters. Press **F9** to add [extended characters](#).

### FS (Alt + f)

Display the list of available [format symbols](#). Double click the format symbol to insert it at any point in the text portion of definition.

You can also use shortcut keys to insert a format symbol. Place the cursor in the New Text field, press **F4** and then press the appropriate letter or symbol.

### Insert Field (Alt + i)

Display the [Insert Field](#) dialog box to select a field for insertion into the text portion of the definition.

### Endings (Alt + n)

When you type a word in the *New Text* field, Case CATalyst analyzes the word to determine if a " G", " S" or " D" steno outline could be added to the word. If so, then Case CATalyst activates the Endings button. The Global Endings dialog box displays when the Endings button is selected. You can choose any of the suggested definitions to add to your dictionary. For example, you have REPT in the Steno field and type "represent" in the Text field. The following suggested entries display when you select Endings:

REPTD = represented

REPTS = represents

The word "representing" is not suggested because the final "g" comes before the final "t" in the original steno outline.

### Global Type (Alt + g)

The type of define originally selected displays. To select a different type of global define, choose from the drop down box.

### Pick Other Dictionary (Alt + p)

This field is available if you select Other Dictionary in the Global Type field. You can send the Brief It Suggestion to an alternative dictionary when making an O-Define. Select a current dictionary from the drop down list or use **Browse** to choose another dictionary. Depending on your [Global options](#) settings, Case CATalyst remembers your selection for the current session or for every job. This field displays when you select Other Dictionary in the Global Type field.

### Quick add to Personal Global Table (Alt + q)

Check this box to add the definition to the [Personal Global Table](#).

This option is only available for E-Defines.

### Add to Xtra Global Table (Alt + x)

Check this box to Case CATalyst send the global to its destination (based on the type of global) and to the Xtra Global Table. The Xtra Global Table is a feature that allows scopist to make defines while editing a transcript and send specific globals to an additional global table that can be applied when needed. For example, there might be a few phrases or specific terminology that the reporter occasionally misstrokes and the scopist is globaling these same steno outlines in multiple jobs. While defining, the scopist defines the steno as usual and then selects the Add to Xtra Global Table option in the Global dialog box. The global is sent to the destination (based on the type of global) and sent to the Xtra Global Table at the same time. The scopist can apply the Xtra Global Table while editing any transcript by pressing **Alt + g, x** (Apply Xtra Global Table).

### Generate All Possible Misstrokes (Alt + m)

Check this box to have Case CATalyst generate definitions in the designated dictionary based on all the possible misstrokes of the original steno outline. Only the original steno outline goes into the current Global Table. All misstrokes are available for future translations.

Case CATalyst generates a definition provided the generated misstroke does not conflict with an existing entry in the Personal Dictionary. For example, you define /SROEUS as "voice" with Generate All Possible Misstrokes selected. Case CATalyst also creates a dictionary definition for the following steno outlines as "voice": /SROUS, SROES, and /SROS. The steno outline, /SRAOEUS already has a definition in your Personal Dictionary as "vice", so Case CATalyst did not generate /SRAOEUS as a misstroke.

By default, this option is not selected when you open the Global define dialog box. You can [change](#) the default so that the Global define dialog box displays with Generate All Possible Misstrokes selected. A separate default setting for D-Defines, J-Defines, and K-Define can be set.

### Add 2 Cat Scratch (Alt + 2)

Send the definition to the [Cat Scratch](#) dialog pane in addition to the Global Table and selected dictionary. Depending on the Cat Scratch scope, the entries are sent to the job, case or user Cat Scratch pane.

4. When finished defining, press **Enter (OK)**.

## Keyboard Command: Set Focus to Edit

Set Focus to Edit is a keyboard command that places the cursor focus back to the Edit screen when you are in the Reveal Codes or Vertical Notes dialog pane. You must select a keyboard combination to use the feature, adding it to the desired [keyboard map](#). You can quickly add the command to the active keyboard map during Edit.

To add Set Focus to Edit to the active keyboard map during Edit:

1. From Edit, double click the keyboard name in the Status bar at the bottom of the screen.
2. Press **Ctrl + i (Edit/Insert)**. The Assign Key to Function dialog box displays.
3. Click any function in the Functions list and press **Ctrl + f**. The Find dialog box displays.
4. Type **Set Focus to Edit**, select a direction and press **Enter (OK)**. Case CATalyst highlights the feature.
5. In the Key field, select a key for assignment from the drop down list and then click the radio button next to **one** of the following: **Key Only**, **Ctrl + Key**, **Shift + Key**, **Ctrl + Shift + Key**. When a function is currently assigned to the selected key combination, it displays in the Currently Assigned to field. If no function is assigned, the field is blank.

When selecting a single key for assignment, consider assigning Shift plus the key to prevent the possibility of invoking the capped version of a keyboard command when the Caps Lock is on.

6. Press **Enter (Assign)**. The entry displays in the Keyboard Map list.

If you select a key combination currently assigned to another function, the following message displays: "The Key: *nameofkey* is already assigned to the Function: *nameoffunction*. Do you want to replace it?" Choose **Yes** to replace the existing assignment with the new function. Choose **No** to retain the existing assignment.

7. Press **Esc (Close)** to exit the Assign Key to Function dialog box.
8. Press **Ctrl + s (File/Save)** to save the change to the keyboard map.
9. Press **Ctrl + F4**, to close the keyboard map. Case CATalyst returns you to Edit.

## TrueStroke Data

TrueStroke™ technology, available on Stenograph's Luminex, Diamante® and Wave™ steno machines, is a sophisticated algorithm that tracks the direction and velocity of keystrokes. The data contains information about timing, the direction of travel and the velocity for each steno key in each steno outline. This allows you to examine a steno outline to determine the cause for a stroke to register as it did, providing instant feedback on your writing style. For example, you may want to examine split, stacked, dragged or dropped strokes.

When the TrueStroke option is active on the writing machine, TrueStroke data is written to the .sgxr2 subfile on the Luminex and Diamante Data SD card or to the Wave memory along with the steno note file. When you read the steno note file into Case CATalyst 10.07 higher or write realtime via USB cable or WiFi connection to Case CATalyst 10.07, the TrueStroke data is automatically copied to the job subfile, Steno X-ray2. The Steno X-ray2 file is also available when you read in a steno file from the Luminex or Diamante SD card or the Wave Memory. You can view the TrueStroke information in Vertical Notes or using the free TrueView® Utility program. Students and instructors can view and print steno notes from TrueView program which is available at [www.stenograph.com](http://www.stenograph.com).

If there are steno strokes you continually misstroke, and that misstroke cannot be defined as anything else, it is strongly recommended that you define the outline in your dictionary. You can also use the Case CATalyst [TrueStroke Drag/Drop](#) (realtime translation only) and the [Drag/Drop Analysis](#) features to aid in translation. Consult the user guide for your writing machine regarding information on keyboard adjustments.

### View TrueStroke Data

1. In Edit, open the vertical notes for the realtime file. Press **Alt + v, v (View/Vertical Notes)**.
2. Double click the steno outline for which you want to view the TrueStroke data. The Steno X-ray dialog box displays in Compact View.
3. Double click a steno outline to view the details of the steno outline in Expanded View.
4. To close the Steno X-ray dialog pane, click the **X** in the upper right hand corner of the pane.

### Understanding the TrueStroke Data

TrueStroke data is visible in two views, Compact and Expanded. Compact view provides initial information about a keystroke to assist you in locating steno outlines you may want to review. For example, you may notice steno outlines that contain characters which appear lighter or darker than others in the same stroke; characters that are higher or lower than others; or you may notice a stroke that contains a character with a horizontal bar through it, indicating a key was pressed but did not register.

Double clicking the steno outline opens Expanded view, providing additional detail about each individual character of the keystroke in specific colors at varying intervals in the keystroke:

- The light gray color at the beginning of a stroke indicates the key is being pressed down. When the light gray color continues to display for a key, it indicates a shadowed character that does not register. In Compact view, a shadowed character displays with a horizontal bar through it, .

- The green color indicates the key has been held down long enough and with sufficient velocity to register. The brighter the color, the more pressure or velocity occurred when the key was depressed.

In a multi-character steno outline, some keys are visible in the down stroke before other characters. This indicates that the keys were pressed at different times instead of all together.

- The soft white color reflects when the keys are released and move up.
- The blue color closely represents when TrueStroke registers all the keys as a complete stroke.

#### **Example 1**

The steno outline for the word, “don’t” occurs in the steno notes. In the Steno X-ray file, Compact View shows some characters appear lighter and higher than others. The “U”, displays with horizontal bar indicating it was pressed but did not register. Double click the steno stroke to display the Expanded view.

In Expanded View, the “O” and “P” keys are bright green throughout the stroke, indicating they received consistently strong pressure on the downstroke. The “B” key receives less pressure as indicated by the lighter green color. All the intended keys are pressed or released at approximately the same time and are registered as indicated by the blue color.

14:12:02.49	TK	O	E	P	T
14:12:02.49	TK	O	E	P	T
14:12:02.50	TK	O	E	P	T
14:12:02.52	TK	O	E	P	T
14:12:02.54	TK	O	E	P	T
14:12:02.56	TK	O	E	P	T
14:12:02.58	TK	O	E	P	T
14:12:02.60	TK	O	E	P	T

Compact View

Expanded View

**Example 2**

The steno outline for the word, “yes” occurs in the steno notes. In the Steno X-ray file, Compact View shows this intended single stroke outline as two strokes. Double click the steno stroke to display the Expanded view.

In Expanded View, the “K” “W” and “R” keys display in green and register together, as indicated by the blue but are then dragged, as shown by the light gray color and no longer register while the “E” key is depressed. All the intended keys did not get pressed or released at the same time resulting in the single stroke splitting into two strokes.

Compact View

Expanded View

**Example 3**

The steno outline for the “Q” followed by the word “I” occur in the steno notes. In the Steno X-ray file, Compact View shows this intended two stroke outline written as one stroke. Double click the steno stroke to display the Expanded view.

The “S” “T” “K” “P” “W” “H” and “R” keys display in green and continue to display in green when the “E” and “U” keys are depressed. The keys intended for the first stroke were not released before the keys for the keys for the second stroke were depressed. All the keys register together, as indicated by the blue color.

Compact View

Expanded View

## EZ Text

EZ Text displays the EZ Text table in a dialog pane on the Edit screen. The EZ Text table allows you to create up to 20 strings of text which you can insert into the transcript or the Text field of a dialog box. Each text line can contain up to approximately 900 characters including conflicts, scan stops, format symbols, etc. EZ Text lines are stored in the EZ Text table located in the Systems Files case.

To insert an EZ Text line into the transcript while editing, position your cursor at the location in the transcript where you want the text and do one of the following:

- Highlight the EZ Text entry and click Insert on the EZ Text toolbar.
- Double click an EZ Text entry from the EZ Text dialog pane.
- Press F4 plus the EZ Text entry number; for example, F4 2. To insert EZ Text entry 10, press F4 0. To insert EZ Text entry 12, press F4 Shift + 2.

You can also insert EZ Text lines into the Text field of a dialog box. For example, you may want to create EZ Text entries that contain format symbols which do not have a shortcut key combination, allowing you to quickly insert the format symbols into dictionary definitions or a dialog box. To insert an EZ Text entry into a Text field of a dialog box, position the cursor in the Text field, press F4 and then press the EZ Text entry number.

You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to

move) of the pane, your cursor will change to a horizontal double arrow (  ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen

## Create and Modify EZ Text Lines

1. Press **Alt + v, e, e** (View/Panes/EZ Text).
2. Use the fields and options as necessary:

### Number

Identifies the number associated with the EZ Text line listed in the Text field. The first ten lines are numbered #1 through #10 and the next five lines are numbers Shift + 1- 0.

## Text

The current text for the EZ Text entry, if any, displays in this field.

### Insert

Insert the highlighted EZ Text line into the transcript. Case CATalyst places the entry into the job at the cursor location. You can also double click the an entry to insert it into the transcript or press F4 plus the EZ Text line number; for example, F4 2.

### Modify (Ctrl + m)

Highlight an EZ Text line and click the **Modify EZ Text Entry** icon. The EZ Text Assignment dialog box displays with the current text from the highlighted EZ Text line. Make necessary entries and press **Enter (OK)**.

## Text

Type new text or make changes as necessary. Each text line can contain up to approximately 900 characters including conflicts, scan stops, format symbols and [extended characters](#). The maximum number of EZ Text lines is 15.

### Insert Auto Include

Display the EZ Text Auto Include dialog box. Select an Include file to associate with the selected EZ Text key. Do the following:

- Select **Browse** to display the Choose Include File dialog box.
- Navigate to the location of the file you want to insert. This may be a credit or XDS file.
- Select a file and press **Enter (Open)**. The file name displays in the Entry Text field. The "at" symbol, @, at the beginning of the entry designates the file as an Include file and must precede the file name.

### Insert Field

Display the [Insert Field](#) dialog box from which you can select a field to insert into the definition. For example, you may have entries for dropped examinations and want to use the EZ Speaker fields. You create the entry: <Centered Paragraph>DIRECT EXAMINATION<By-line>BY[!EZ SPEAKER 1]:<Question>

## FS

Display the list of available format symbols. Double click the format symbol you want to use or highlight the format symbol and press **Enter**. You can insert a format symbol at any point in the text entry. To have the format symbol list always display, check the Always Show Format Symbols box. You can also use shortcut keys to insert a format symbol.

### Insert Auto Include File

Highlight an EZ Text line and click the **Modify EZ Text Entry** icon. The EZ Text Auto Include dialog box displays with the current text from the highlighted EZ Text key. Choose an Include file to associate with the selected EZ Text key:

- Select **Browse** to display the Choose Include File dialog box. To use the associated layout with the selected include file, check the box **Bring Layout**.
- Navigate to the location of the file you want to insert.

- c. Select a file and press **Enter (Open)**. The file name displays in the Entry Text field. The "at" symbol, @, at the beginning of the entry designates the file as an Include file and must precede the file name.

#### Delete

Highlight the EZ Text line and press **Delete** or click the **Delete** icon. Choose **Yes** at the confirmation prompt.

#### Print

Print the EZ Text table. In the [Print](#) dialog box make any necessary changes and press **Enter (OK)**.

3. Press **Ctrl + s (File/Save)** to save the changes.
4. Press **Alt + f, x (File/Exit)** to close and exit the EZ Text table.

## Speaker List

The Speaker List contains speakers created using the [Create EZ Speakers](#) feature, typed speaker names entered before translating in the [Translate Speaker List](#) and Common Speakers added in [Field Options](#). The Speaker List pane in Edit allows you to insert speaker names or other fields directly into the job. For example, you may need to insert the speaker name for a dropped steno outline or misidentified speaker. Speaker fields from the Fill In Field List or [Field List Groups](#) used to identify speakers, can be added to the Speaker List. In addition to using EZ Speaker fields and Speaker fields from the Fill In Field List, you can add predefined fields such as the Seal Date field or a user define field such as Location. Speaker names and Speaker # fields display in the Speaker section of the Speaker List. All other fields display in the Fields section. The Speaker List pane can display a total of 310 unique speakers. EZ Speakers 01 - 100 are standard (specific steno) speakers, 101 - 299 are super (placeholder in lieu of steno) speakers and 300 - 309 are [common speakers](#).

The Speaker section of the Speaker List displays the speaker name along with the speaker number and the associated steno, if applicable. Speakers from the Speaker section insert into the transcript as Colloquy, unless the cursor location is immediately before or after a Question, then Case CATalyst inserts it as a By Line. To specify the By Line format, use the [By Line Options](#). The speaker name displays in the job with the color assigned to it in the Speaker List. You can add and modify speaker entries in the Speaker List.

The Field section of the Speaker List displays the field value in the Name column and the empty field name in the Number column. Fields from the Field section insert into the transcript as text without formatting. Fields can be added to the list using the [Settings](#) option in the Speaker List dialog pane. Additional Field options are accessed through the Settings option.

When a speaker name in the Speaker List contains text that is part of a Personal Global or E-Define, the Personal Global or E-Define applies to the inserted speaker. The [Advanced Global Option, Use Personal Global](#), must be active to automatically apply text that is part of a Personal Global. The Advance Global Option, *Apply E-Defines to typed-in text*, must be active to apply automatically apply text that is part of an E-Define. For example, you are required to bold the speaker name in Colloquy and By Lines. You include the bold attribute as part of your speaker definitions. Since the bold formatting attribute does not carry over to the Speaker List you create a Personal Global to apply the bold attribute.

Using the speaker names from the Speaker List, you can create a graphical [Seating Chart](#), viewable in the MiniViewer at the top of the Speaker List dialog pane or on the computer screen. Speakers display in their assigned colors. When viewing the Seating Chart on the screen, the speaker indicator includes the speaker name, speaker number and, if applicable, the associated steno.

[Brief it](#), when active, automatically creates a brief for a speaker when you create a new speaker using the Create EZ Speaker feature, insert a new speaker from the Speaker List dialog pane or modify a speaker name from the Speaker List. Briefs are not generated for Common speakers in the Speaker List.

The Speaker List works in conjunction with Spell Check during Edit. For example, you have a repeated speaker in colloquy. Spell Check displays speaker names from the Speaker List in the Suggestions field and allows you to change to another speaker name in that job.

Insert a speaker name or field into the job from the Speaker List by double clicking the entry or highlighting the entry and clicking the Insert button. To insert a speaker name into the transcript without opening the Speaker List, use the [Insert Speaker](#) command.

You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to

move) of the pane, your cursor will change to a horizontal double arrow ( ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen.

To access the Speaker List pane in Edit, press **Alt + v, e, k (View/Panes/Speaker List)**.

[Keyboard Map](#) Functions: Insert Field

Seating Chart: Hide MiniViewer

Seating Chart: Show All Speakers

Seating Chart: Hide All Speakers

Seating Chart: Toggle AutoHide Feature

## Speaker List Pane Features

### Name

In the Speaker section, the defined speaker name or the name of the speaker field. In the Field section, the value of the field or the empty field name. Click the title bar to display the names in ascending or descending alphabetical order.

### Steno

Type the steno, if any, you want to associate with the speaker. You can retain the association by checking the box in the Locked field. If you have your speaker identifications defined in a dictionary, most likely your Personal Dictionary, and you always want them to display in the speaker list, type the associated steno and select the Locked column. Instead of using the Create EZ Speakers feature, you will simply fill in the field in the transcript or Speaker List.

### Locked

Check this box to retain the association of the steno entered in the Steno field with the speaker number. If you have your speaker identifications defined in a dictionary, most likely your Personal Dictionary, and you always want them to display in the speaker list, type the associated steno in the Steno field and select the Locked column. Instead of using the Create EZ Speakers feature, you will simply fill in the field in the transcript or Speaker List.

#### Insert

Insert the highlighted speaker name or field into the transcript. You can also double click an entry to insert it into the transcript. Speaker fields either insert as Colloquy or Byline depending on cursor location. If your cursor is located following a colloquy or question paragraph style, the speaker will be inserted as Colloquy. If your cursor is positioned after an answer paragraph style, the speaker will be inserted as a by line. To customize how your by line is inserted using this feature see [By Line Options](#).

#### New Speaker

Create a new speaker name. The Select EZ Speaker dialog box displays with the next sequential speaker number. Use the displayed number in the Enter Value field or type a new number and press **Enter (OK)**. Valid number are **1 - 99**. A new speaker name field displays with the assigned speaker number. Type the name in the field and press **Enter**.

#### Fill in Speaker

Modify an existing speaker or user defined field name. Highlight an entry and select **Fill in Speaker**. When you modify a speaker name, type the change and press **Enter**. When you modify a user defined field, the [Fill in Field](#) dialog box displays. Make necessary entries and select **OK**.

#### Change Color

Change the speaker name color. Highlight the field and select **Change Color**. Select a color from the color palette. The More Colors options displays the [Color](#) dialog box for additional and custom colors.

You can also change the field color assignment. Highlight a field and select **Change Color** to select a color from the color palette. The change affects the user color for all fields.

#### Delete

Delete an existing speaker name entry. Highlight the entry and press **Delete** or click the Delete icon. To remove a field from the list, click the Settings icon to uncheck the field from the list in the Choose Speaker List Fields dialog box.

#### Filter

Select this option to display all the available speakers with associated speaker numbers. Deselect this option to only display speaker numbers with assigned speaker names.

#### Allcap Text

Select this option to enter the speaker name in all capital letters. Deselect this option to enter the Speaker Name in upper and lower case letters.

### Show/Hide Seating Chart MiniViewer

Select this option to display the [Seating Chart](#) MiniViewer above the speaker list in the Speaker List dialog pane. The MiniViewer shows the placements of the Seating Chart speakers. Deselect this option to hide the MiniViewer. You can still display the Seating Chart speakers.

### Show/Hide Seating Chart Speakers

Select this option to display [Seating Chart](#) speakers on the screen. Deselect this option to automatically hide the Seating Chart speakers. This is the default. When you move your cursor over the MiniViewer, the Seating Chart speakers display on the screen for a few seconds and then automatically hide. You can [change](#) the number of seconds the Seating Chart displays before it automatically hides or have the Seating Chart continuously display.

### Options

Display the Speaker List / Seating Chart Options dialog box where you can choose additional fields to add to the Speaker List. Click the option, *Add fields to Speaker List* and check the box next to the fields you want to add to the Speaker List. Click **OK** when finished. You can modify the name of new user defined fields. [Field Options](#) are also accessible from the Choose Speaker List Field dialog box.

### Help

Display the Case CATalyst Help.

## Seating Chart

The Seating Chart feature allows you to create a graphical Seating Chart of speakers from the Speaker List, placing speaker information on the computer screen in a position relative to where the speakers are sitting during the proceedings. The Seating Chart is viewable on the computer screen and in the MiniViewer located above the [Speaker List](#) in the Speaker List dialog pane.

The Seating Chart MiniViewer, by default, displays when the Speaker List opens. The Show/Hide Seating Chart MiniViewer  icon toggles the display of the MiniViewer. To add speakers to the Seating Chart, display the MiniViewer and drag a speaker from the Speaker List onto the MiniViewer or right click the speaker and select Add to Seating Chart. Speaker items display in the MiniViewer and the computer screen in the assigned speaker color. Speaker items on the computer screen show with a default height and width that can be modified in the Speaker List options or temporarily changed by clicking and dragging the edges. Each speaker item on the computer screen, by default, shows the speaker name on the top line, the speaker number and, if applicable, the associated steno on the second line. To reposition a speaker item, click and drag the speaker item on the computer screen to a different location. Moving a speaker item on the computer screen changes the position of the speaker item in the MiniViewer.

Seating Chart speaker items display when you click the Show/Hide Seating Chart Speakers  icon or when you position your cursor over the MiniViewer. When the Seating Chart displays, the Show/Hide Seating Chart Speakers icon is highlighted. By default, the Seating Chart is set to AutoHide after displaying for 3 seconds. You can change the display time or disable the AutoHide feature to continuously show the speakers items. You can toggle between enabling and disabling the AutoHide feature by changing the Seating Chart options or by using the Seating Chart: Toggle AutoHide Feature key combination. When you display the Seating Chart speaker items with the AutoHide feature is disabled, the speaker items remain on the computer screen until you enable AutoHide. Case CATalyst remembers the last display state of the Seating Chart.

You can remove individual or all speaker items from the Seating Chart by right clicking and selecting the desired item. Once a speaker item is removed, it is necessary to add the speaker item again if you want to redisplay it in the Seating Chart. If you remove all the speakers items from the Seating Chart and want to redisplay them, it is necessary to add each speaker item individually.

You can create a default Seating Chart to automatically populate the Seating Chart with speakers when you start a new job. Using the [Default Seating Chart/Scope](#) option, you select the scope, User or Case and then select the speakers to populate the Seating Chart. When you write the steno for a selected speaker in the current job, the Speaker List populates. For example, the case you are working on has ten attorneys. You determine the default Seating Chart arrangement and set the scope to Case. The Seating Chart arrangement is remembered for all jobs in that case. Speakers added from the default Seating Chart after translation begins are automatically added to the seating chart. For example, your default seating chart includes [!EZ Speaker 01], [!EZ Speaker 02], [!EZ Speaker 03], [!EZ Speaker 04]. You identify [!EZ Speaker 01] and [!EZ Speaker 03] before starting the realtime. A half hour into the job a break is taken when the second attorney for the plaintiff arrives. You use [Create EZ Speakers](#) to identify [!EZ Speaker 02] and the speaker is automatically added to the Seating Chart. Settings apply to new jobs or cases and do not affect the current job or previous jobs or cases.

[Seating Chart options](#) allow you to customize the actions and display of the Seating Chart and speaker items, such as the Seating Chart display time, the text layout for the speaker items or creating a default Seating Chart.

[Keyboard Map](#) Functions: Seating Chart: Show MiniViewer

Seating Chart: Hide MiniViewer

Seating Chart: Show All Speakers

Seating Chart: Hide All Speakers

Seating Chart: Toggle AutoHide Feature

## Create a Seating Chart

1. Press **Alt + v, e, k (View/Panes/Speaker List)** to display the Speaker List dialog pane.
2. Do one of the following to add speakers to the Seating Chart:
  - Right click a speaker name in the Speaker List and select **Add to Seating Chart**. The speaker name displays in the middle of the computer screen. Click the Seating Chart speaker item and drag it to the desired position on the screen.

- Click the Show/Hide Seating Chart MiniViewer  icon to display the MiniViewer if it is not displayed. Click a speaker name and drag it to the desired position in the MiniViewer. The speaker item displays on the computer screen in the same position as the MiniViewer.
3. Do any of the following:

#### Reposition a seating chart speaker

Click and drag the Seating Chart speaker item to the correct position.

#### Change the size of the seating chart speaker

Click the edge or corner of a Seating Chart speaker item and drag to the desired size. The change only applies to the selected Seating Chart speaker. There is a default minimum and maximum size. You can [change](#) the default.

#### Remove a speaker from the seating chart

Position the cursor on the Seating Chart speaker item, right click and select **Remove from Seating Chart**. To remove all the speakers from the Seating Chart, select **Remove All from Seating Chart**.

#### Toggle the display of the seating chart items

Click Show/Hide Seating Chart Speakers  icon to toggle the display of the Seating Chart on the computer screen.

#### Toggle the display of the MiniViewer

Click the Show/Hide MiniViewer  icon.

#### Toggle the Auto Hide Feature

Invoke the Toggle AutoHide feature command. You must have [assigned](#) the Toggle AutoHide Feature command to a keyboard map function.

## Speaker List/Seating Chart Options

Speaker List and Seating Chart options determine certain customized settings that control Seating Chart actions and display. These settings affect both regular CATalyst translation and CATalyst BCS captioning. Access Speaker List / Seating Chart Options from the Speaker List dialog pane in Edit. Press **Alt + v, e, k (View/Panes/Speaker List)** to display the Speaker List dialog pane. Click the Settings  icon.

## Speaker List/Seating Chart Options

Use the following fields to customize Speaker List and Seating Chart settings:

### Add fields to Speaker List

Display the Select Fields for Speaker List dialog box. Choose fields to display in the Speaker List that do not usually show. The Speaker List is most commonly populated using the Create EZ Speaker feature and the selection of common speakers.

### Show Common Speakers

Select **Yes** to display Common Speakers, such as THE WITNESS or the THE COURT, in the Speaker List. Select **No** to hide the Common Speakers. The default is No.

### Show MiniViewer

Select **Show** to automatically display the Seating Chart MiniViewer in the Speaker List dialog pane. Select **Hide** to manually open the Seating Chart MiniViewer Speaker.

### Default Seating Chart/Scope

Automatically display selected speakers in the Seating Chart when you start a new job. You can set the scope of the Seating Chart to display for a user or case. Settings apply to speakers selected for the current job and new jobs but do not affect previous jobs or cases. Highlight the option, click the drop-down arrow, select the scope and click the **Edit** button to select the specific speakers you want in the Seating Chart in future jobs. You can create a separate default seating chart for User and Case.

When the Default seating chart is set to Case, the seating chart information is saved in the *nameofcase\_case* settings file. When the Default seating chart is set to User, the seating chart information is saved in the *UserSettings* file located in your System Files case.

### Sticky Windows

Select **Yes** to easily align speaker items with each other or along the monitor borders using your mouse. Speaker items remain independent allowing you to reposition them individually. The default setting is **No**.

### Speaker Item Transition

Select how the speaker items change from visible to hidden and hidden to visible. Choose one:

#### Fade

Speaker items show on the screen and fade from the screen in their designated locations.

#### Zoom

Speaker items move on and off the screen in a zooming motion between the MiniViewer and their designated location.

### Speaker Item Transparency

Select **Yes** to have the speaker items display at a specified level of transparency when they do not have cursor focus. When you click a speaker item, the speaker item displays as a solid image until you remove the cursor focus. Set the transparency level in the *Transparency Setting* field. Select **No** to have the speaker items always display as a solid image.

#### Transparency Setting

When the *Speaker Item Transparency* option is active, use the slider bar to set the transparency level. A low setting increases the transparency and a high setting decreases the transparency.

### Speaker Item Layout

Determine the layout for the speaker items on the screen. Layouts determine the text arrangement of the speaker name, speaker number, if available, and steno for the speaker items. Choose one:

- Layout 1 – Name on the top, steno on the bottom, number on bottom left.
- Layout 2 – Steno on the top, name on the bottom, number on bottom left.
- Layout 3 – Name on the top, steno on the bottom, large number on left.
- Layout 4 – Steno on the top, name on the bottom, large number on left.
- Layout 5 – Name on the top, steno on the bottom, no speaker number.
- Layout 6 – Steno on the top, name on the bottom, no speaker number.

### Auto Hide Speakers Items

Select Yes to automatically hide the speaker items when they do not have cursor focus. Select No to continuously display the speaker items on the screen. Using the Seating Chart: Toggle AutoHide Feature command, you can toggle between enabling and disabling the AutoHide feature. Create a [keyboard assignment](#) or an [AccelerWriter](#) for the command.

### Auto Hide Close Delay

Use the slider bar to determine the number of deciseconds the speaker items display before automatically hiding when they no longer have cursor focus. This option is only available when the *Auto Hide Speakers Items* option is set to Yes.

### Auto Hide Show Delay

Use the slider bar to determine the number of deciseconds the speaker items wait before displaying

when you hover the cursor over the MiniViewer or click, , Show/Hide Seating Chart Speakers. This option is only available when the *Auto Hide Speakers Items* option is set to Yes.

### Speaker Item Size

The current width and height of the speaker items. Make entries in the *Width* and *Height* fields to customize the default size of new speaker items. If there are current speaker items that you want to reflect the default settings, remove all speakers from the Seating Chart and then add them to the Seating Chart.

To temporarily customize the size of current speaker items, click and drag the sides while displayed on the screen. Manually resizing one speaker item does not affect the other speaker items on the screen.

### Clear All Speakers from Speaker List

A Clear All Speakers command is available in the Speaker List from the right click menu. When creating EZ Speakers in a job that is within a case, you have an option to create the EZ Speakers in the Case dictionary or Job dictionary. Creating the EZ Speakers with fields in the Case dictionary means the speaker field information is contained in the Case History file and all speakers will be available and appear in the speaker list for all future jobs in that case. When you select Job dictionary, the speaker field information is stored in the Job dictionary and is only used for the current job and when selecting that job dictionary to help translate other jobs.

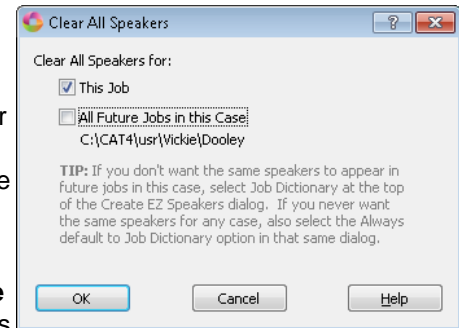

There may be times when all the speakers are no longer relevant for the current job or for all future jobs in the case. The Clear All Speakers command is available for just those times!

**Important:** The Clear All Speakers command will remove the speakers from the Speaker List, but if you do not use for your EZ Speakers fields and you do not want the speakers to apply to future jobs in the Case, you will also want to remove the entries from the Case dictionary. In other words, if you do not use fields in your EZ Speakers, the values for your EZ Speakers are entirely definitions created in your Case dictionary (if using a Case), not in the Case History file.

#### To use the Clear All Speakers command:

1. Open the job that is in a case where you want to clear all the speakers.

2. With the Speakers List pane displayed (**Alt + v, e, k**), highlight a speaker in the Speaker List, right click and select **Clear All Speakers...**
3. The Clear All Speakers dialog box displays. Do any of the following
  - a. Select **This Job** to remove all speakers from the speaker list for the current job and clear the field values for those speakers. This option has no effect on speakers for future jobs if you are in a case. By default, the This Job option is selected.
  - b. If you are in a case, select **All Future Jobs in this Case** along with the **This Job** option to remove all the speakers from the speaker list and clear the field values for those speakers in the current job and all subsequent jobs in this case.
  - c. Select **All Future Jobs in this Case** alone to remove all the existing speakers in this case's history file and prevent them from appearing in the speaker list for all subsequent jobs in this case. This option does not remove them in the current job.
4. At the "Are you sure..." message, select Yes to remove all speakers for the job or all future jobs in this case depending on your choice in Step 3.

When you select the All Future Jobs in this Case option, information displays below the option about creating EZ Speakers in a case. Understanding how creating EZ Speakers in a case works can save you time.

For example, let's say you are an official reporter and you have an upcoming three week trial. You create a case for the trial and when you take the first job in that case, you create your EZ Speakers. Since it is most likely that the same attorneys will be present in most or all of the trial, you create the EZ Speakers in the Case dictionary. Every time you start a job in that case, those same speakers display which saves you time from adding EZ Speakers every day.

On the other hand, some reporters like to organize jobs based on when the job was taken. For example, let's say you are a reporter that creates a case for the month and year you report depositions or proceedings. You start out creating the first case named January 2017. The only thing all the jobs in that case have in common is that all the jobs in that case were taken in January of 2017. When you start a job in the case, it is highly unlikely that the same speakers will be in every job in the case, so when creating EZ speakers, you should select Job Dictionary and select the Always default to Job dictionary option. The Always default to Job dictionary option is remembered for every job in that case. Every time you create EZ Speakers for a job in the January 2017 case, the entries are automatically sent to that job's dictionary and are not carried over to the next job in the same case. If you needed previously created speaker definitions, you could always select the correct job dictionary to help translate the current file and use the field values from that job to fill in the speakers. If you fit this second organizational method, but you accidentally selected to put your speakers in a case dictionary, you may find this new option helpful to remove those speakers from the speaker list for future jobs in the January case.

## Speaker List Right Click menu

When the Speaker List is displayed, you can right click in the [Speaker List](#) pane and select any of the following items:

### Insert

Insert the highlighted speaker name or field into the transcript. You can also double click an entry to insert it into the transcript. Speaker fields either insert as Colloquy or Byline depending on cursor location. If your cursor is located following a colloquy or question paragraph style, the speaker will be inserted as Colloquy. If your cursor is positioned after an answer paragraph style, the speaker will be inserted as a by line. To customize how your by line is inserted using this feature see [By Line Options](#).

### New Speaker

Use the New Speaker feature to create a new EZ Speaker field and add the speaker to the Speaker List. When you select New Speaker, the Select EZ Speaker dialog box displays in which you need to select an EZ Speaker [field](#) number. Valid numbers are 1 - 99. A blank speaker spot is added to the Speaker List, type the speaker name and click the down arrow to select a color, if desired, for the speaker.

### Add to Seating Chart

The [Seating Chart](#) allows you to create a graphical Seating Chart of speakers from the Speaker List, placing speaker information on the computer screen in a position relative to where the speakers are sitting during the proceedings. Use the Add to Seating Chart feature to create a graphic for a speaker which you can drag to any position on your screen. Click a speaker in the Speaker List and select Add to Seating Chart. The [Speaker List/Seating Chart Options](#) control the Seating Chart graphic settings.

### Fill in Field

Modify an existing speaker or user defined field name. Highlight an entry, right click and select **Fill in Field**. When you modify a speaker name, type the change and press **Enter**. When you modify a user defined field, the [Fill in Field](#) dialog box displays. Make necessary entries and select **OK**.

### Clear All Speakers

When creating EZ Speakers in a job that is within a case, you have an option to create the EZ Speakers in the Case dictionary or Job dictionary. Creating the EZ Speakers with fields in the Case dictionary means the speaker field information is contained in the Case History file and all speakers will be available and appear in the speaker list for all future jobs in that case. When you select Job dictionary, the speaker field information is stored in the Job dictionary and is only used for the current job and when selecting that job dictionary to help translate other jobs.

There may be times when all the speakers are no longer relevant for the current job or for all future jobs in the case. The [Clear All Speakers](#) command is available for just those times!

**Important:** The Clear All Speakers command will remove the speakers from the Speaker List, but if you do not use for your EZ Speakers fields and you do not want the speakers to apply to future jobs in the Case, you will also want to remove the entries from the Case dictionary. In other words, if you do not use fields in your EZ Speakers, the values for your EZ Speakers are entirely definitions created in your Case dictionary (if using a Case), not in the Case History file.

### Delete

Delete an existing speaker name entry. Click the entry in the Speaker List and then select **Delete**. The speaker name is removed and if using EZ Speaker fields, the EZ Speaker field displays throughout the job.

### Case CATalyst Help

Display the Case CATalyst Help.

### Hidden Text

The Hidden Text feature displays the [Hidden Text](#) dialog pane which shows all the Hidden Text in the transcript along with the page location. You can search, modify, delete and print items.

The Hidden Text dialog pane displays the line of Hidden Text, the page and the line number on which it occurs and the section number. You can sort the list by clicking a column heading. Alternate ascending and descending order by clicking on the same column heading again. An arrow in the column indicates the sort order.

Double clicking an entry in the Hidden Text dialog pane moves the cursor to the location in the file where the selected Hidden Text occurs.

You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to

move) of the pane, your cursor will change to a horizontal double arrow (  ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen

### Access the Hidden Text dialog pane in Edit:

- Press **Alt + v, e, h (View/Panes/Hidden Text)**.
- Double click a hidden text entry in the transcript.

[Keyboard Map](#) Function: View Hidden Text

## Hidden Text Dialog Pane Features

### Modify (Ctrl + m)

Highlight an entry and click the Modify icon. Case CATalyst moves the cursor to the line in the job where the selected Hidden Text occurs and displays Hidden Text dialog box.

Add, delete or modify the Hidden text. Insert format symbols or fields as necessary. When finished, click **OK**.

### Delete

Highlight an entry and press Delete or click the **Delete** icon to remove the Hidden Text entry from the transcript. Choose **Yes** at the confirmation prompt.

### Search

Search the Hidden Text. In the Search dialog box make necessary entries and press **Enter (OK)**.

### Search

Type the text you want to locate in the Hidden Text dialog box. Use the remaining options, as necessary.

#### Entry Type

Check this box and select the criteria from the drop down list:

- Numbers — The first entry that contains numbers.
- Contain Format Symbol — The first entry that contains a format symbol.
- Contains field(s) — The first entry that contains a field.
- Phrase — The first entry that contains two or more words separated by a space.

**Case Sensitive**

Check this box to limit the search based on the upper and lower case letters of text typed in the Search field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field. This field is unavailable when you select to search by Entry Type.

**Whole Word**

Search only for the words that match the text typed in the Search field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. This field is unavailable when you select to search by Entry Type.

**FS**

Include a format symbol in the Search. Type the format symbol or display the format symbol list by clicking **FS** and double click a format symbol to choose it. It is unavailable when you select to filter by Entry Type.

**Insert Field**

Include a field in the Search. Click **Insert Field** and double click a field from the list to choose it. This field is unavailable when you select to filter by Entry Type.

**Location**

Limit the search to include one of the following criteria. These fields are unavailable when you select to search by Entry Type.

- Exact Match — Search for entries that exactly match the text entered in the Search field.
- Begins With — Search for entries that begin with the text entered in the Search field.
- Ends With — Search for entries that end with the text entered in the Search field.
- Contains — Search for entries that contain, anywhere in the entry, the text entered in the Search field.

**Direction**

Select one of the following:

**Forward**

Search forward from the cursor position to the end.

**Backward**

Search backward from the cursor position to the beginning.

**Filter**

Display the Hidden Text based on specific criteria.

**Filter**

Select a criteria from the drop down list and type the appropriate entry in the field to the right:

- Text — All entries for the specified text. Type the text. Include any other optional filtering features.
- Page — All entries on a specific page. Type the page number in the field.
- Line — All entries for a specific line number. Type the line number in the field.
- Sec— All entries for a specific section. Type the section number in the field.

### Entry Type

Check this box and select the criteria from the drop down list:

- Text — All entries that contain specific text criteria. Select a criteria from the drop down box to the right:
  - ♦ Numbers — The first entry that contains numbers.
  - ♦ Contain Format Symbol — The first entry that contains a format symbol.
  - ♦ Contains field(s) — The first entry that contains a field.
  - ♦ Phrase — The first entry that contains two or more words separated by a space.
- Page — All entries on a specific page. Type the page number in the field.
- Line — All entries for a specific line number. Type the line number in the field.
- Sec— All entries for a specific section. Type the section number in the field.

### Case Sensitive

Check this box to limit the filter based on the upper and lower case letters of text typed in the field. If you do not select Case Sensitive, the filter displays all words containing the indicated characters, regardless of case. This field is only available when filtering by typed text in the field.

### Whole Word

Filter only for the words that match the text typed in the field. If you do not select Whole Word, the filter displays the word both as it stands alone and as part of another word. This field is only available when filtering by the typed text in the field. It is unavailable when you select to filter by Entry Type.

### FS

To Filter with format symbol, type the format symbol or display the format symbol list by clicking FS and double click a format symbol to choose it. This field is only available when filtering by the typed text in the field. It is unavailable when you select to filter by Entry Type.

### Insert Field

Filter with a field. Click Insert Field and double click a field from the list to choose it. This field is only available when filtering by the typed text in the field. It is unavailable when you select to filter by Entry Type.

### Location

Filter by one of the following criteria. These fields are unavailable when you select to filter by Entry Type.

- Exact Match — Filter entries that exactly match the text typed in the field.
- Begins With — Filter for entries that begin with the text typed in the field.

- Ends With — Filter entries that end with the text typed in the field.
- Contains — Filter entries that contain, anywhere in the entry, the text typed in the field.

### Remove Filter

Display all the Hidden Text.

### Print

Print the Hidden Text. In the [Print](#) dialog box make any necessary changes and press **Enter (OK)**.

### Case CATalyst Help

Display Case CATalyst Help.

## Hotspots

Hotspots is a dialog pane that contains occurrences of the [Oops](#) format symbols (up to 10 Oops categories available), an empty (undefined) field or an untranslate in the transcript. For example, you might have an Oops format symbol category that you write when you need to check the spelling before someone leaves the proceedings. With the Hotspots pane, you can quickly find all the occurrences of where you need to check spellings before all participants leave the proceedings.

The Hotspots dialog pane displays the entire transcript line along with the page, line number and section number on which an Oops format symbol, empty field or untranslate occurs. The different entry types display in separate color coded groups. Lines containing the Oops format symbol display in the color selected in the Hotspots pane Options. Each Oops category can have a different color assignment and name. By default, the Oops categories display at the top of the list, followed by empty fields in blue and then lines containing untranslates in green. You can set the Hotspots [options](#) to hide item types you do not want displayed and you can also Filter in the Hotspots pane to see exactly what you want (see Filter/Sort before). The Hotspots options affect both regular CATalyst translation and CATalyst BCS captioning.

Double click a Hotspots entry to move the cursor to that location in the transcript. If the Hotspots entry is an undefined field Case CATalyst also opens the Fill-in-Field dialog box based on the field type. If the Hotspots entry is an untranslate, Case CATalyst positions your cursor immediately before the untranslate in the transcript. If there is more than one untranslate on a transcript line, a Hotspots entry displays for each untranslate. When the Hotspots audio option is active for the selected Hotspots entry, double clicking on the Hotspots entry plays the audio, if any, associated with the entry.

You can search, sort, modify, delete and print the Hotspots entries. Use the Hotspots icons on the title bar of the Hotspots dialog pane.

You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to move) of the pane, your cursor will change to a horizontal double arrow (  ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen.

To access the Hotspots dialog pane in Edit, press **Alt + v, e, o (View/Panes/Hotspots)**.

## Hotspots Dialog Pane Features

Click a column heading to sort the entries in ascending and descending order. An arrow in the column indicates the sort order.

Double click an entry to move the cursor to the location in the file where the selected Hotspots occurs. Review the line and make any necessary changes.

### Modify (Ctrl + m)

Highlight an entry and click the **Modify** icon. Case CATalyst moves the cursor to the line in the job where the selected Hotspots entry occurs.

### Delete

Highlight an entry and press **Delete** or click the **Delete** icon to remove the Oops format symbol from the transcript. By default, a confirmation prompt displays. Choose **Yes** to delete the entry. You can change the display of the confirmation prompt by changing the Hotspots Pane option, [Prompt before deleting Oops format symbol?](#). The Delete feature is only available for Oops entries.

### Search

Search the Hotspots entries . In the [Search dialog box](#) make necessary entries and press **Enter** (OK).

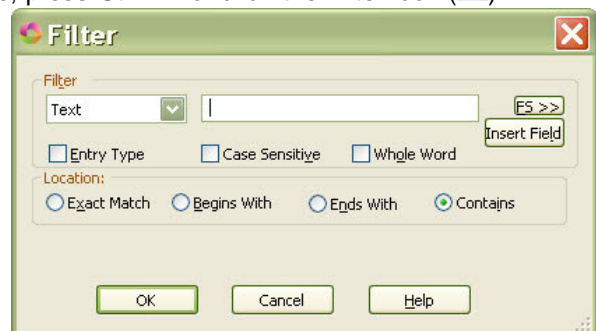

### Filter / Sort

When displaying the Hotspots pane in Edit, you can easily sort the entries by category. Simply click the **Type** column heading and the entries will sort in either ascending or descending order based on the alphabetic name of the type of item displayed in Hotspots.

#### To Filter the Hotspots pane:

- With your cursor focus in the Hotspots pane, press **Ctrl + f** or click the Filter icon (.
- The Filter dialog box displays. Do **any** of the following:
  - The Filter dialog box defaults to a Text filter with the cursor in the Text field. Type the text you want to filter on that may be in an entry in the Hotspots pane. **Go to Step 4.**
  - To Filter on a specific type of item in the Hotspots pane such as an Oops format symbol assigned to "spelling", click the down arrow next to Text and select Type. In the Text field type the item name to which you want to filter. **Go to Step 4.**
  - To Filter on the type of item in the Hotspots pane and select from a list of items (such as untranslates or empty fields or a particular Oops category), click the down arrow next to Text and select Type and then press **Alt + e** to select the Entry Type option. The Text field will display an entry. Click the down arrow at the end of the Text field to see additional items. Select the type of Hotspots item. **This is the most popular filter option.** All other options are disabled, **go to Step 6.**

- This is a universal Filter dialog box so there may be additional filter options that do not necessarily apply in the Hotspots pane. For example, you can filter base on a page number, line number or section number. These additional Filter options don't usually apply when filtering in Hotspots.
3. If in Step 3 you selected Text and typed the text in which you wanted to filter, you can narrow the filter:
    - Press **Alt + v** to filter on the specific text based on the case of the letters typed.
    - Press **Alt + o** to filter on the specific text as a whole word.
  4. If, based on your Filter options, the Location field is available, do **one** of the following:
    - Press **Alt + x** to filter on an exact match of the text typed.
    - Press **Alt + b** to filter on entries that begin with the typed text.
    - Press **Alt + n** to filter on entries that end with the typed text.
    - Press **Alt + i** to filter on entries that end with the typed text.
  5. To filter, press **Enter** or click **OK**.
  6. To remove the filtered display in the Hotspots pane, click the Remove Filter () icon.

#### Remove Filter

Display all the Hotspots entries.

#### Print

Print the Hotspots. You can print Hotspots entries to a printer or to PDF. In the [Print](#) dialog box make any necessary changes and press **Enter (OK)**.

#### Settings

Modify the Hotspots dialog pane [options](#).

#### Case CATalyst Help

Display Case CATalyst Help.

## Hotspots Pane Options

Access the Hotspots Pane options from the Hotspots Pane. Click the Settings  icon. Click **OK** when finished making changes.

### Show Oops

Select **Yes** to display the transcript line in the Hotspots dialog pane on which an Oops format symbol is located. Select **No** to hide the display of lines containing the Oops format symbol.

### Play Audio when double-clicking <Oops> entries

Select **Yes** to play the associated audio, if available, when you double click an <Oops> entry in the Hotspots dialog pane.

### Show Untranslates

Select **Yes** to display the transcript line in the Hotspots dialog pane on which an untranslate is located. Select **No** to hide the display of lines containing untranslates. If there is more than one untranslate on a transcript line, a Hotspots entry displays for each untranslate.

### Play Audio when double-clicking Untranslate entries

Select **Yes** to play the associated audio, if available, when you double click an untranslate entry in the Hotspots dialog pane.

### Maximum number of Untranslate entries to show

Determine the maximum number of untranslate entries to display in the Hotspots dialog pane at one time. The default setting is 5. Once you resolve an untranslate, Case CATalyst populates the Hotspots dialog pane with the next untranslate, if another one exists in the file.

### Show undefined fields

Select **Yes** to display the transcript line in the Hotspots dialog pane on which an undefined (empty) field is located. Select **No** to hide the display of lines containing undefined fields.

### Play Audio when double-clicking undefined fields

Select **Yes** to play the associated audio, if available, when you double click an undefined field entry in the Hotspots dialog pane.

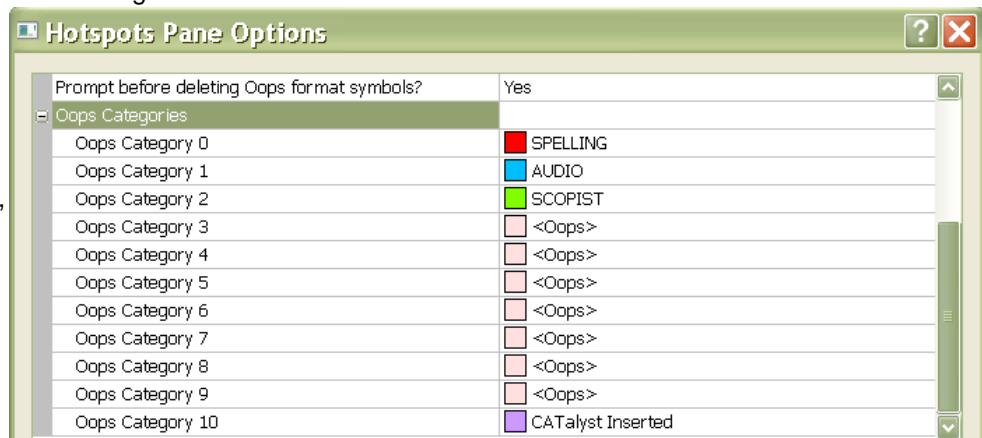

### Prompt before deleting Oops format symbol

Select **Yes** to display a confirmation message when you delete an Oops format symbol. Deleting an Oops format symbol from the Hotspots dialog pane removes the Oops format symbol from the transcript. Select **No** to bypass the confirmation prompt when you delete an Oops format symbol.

### To assign a category to Oops and a color:

- At Manage Jobs or anywhere in CATalyst, press **Alt + t** and select **All Options** or click the All Options icon (  ) available on the toolbar. Select Edit Panes and then Hotspots. If you are in Edit, you can press **Alt + v, e, o** (View, Panes, Hotspots) to display the Hotspots pane and then click the Options icon on the Hotspots pane title bar.
- Do any of the following:

- To assign a category name, double click the Oops in the right-hand column and type the name for the Oops.

- To assign a color, click the Down arrow (  ) and select a color.

3. When finished, do any of the following:

- To save and close the Oops options, press **Enter**.
- To restore the default Oops categories, press **Alt + r**.
- To forget your changes and close the dialog box, click **Cancel**.

#### Things to know:

- If you do not assign a category to any of Oops format symbols, when you insert the Oops format symbol in a job by pressing F4 and selecting the Oops format symbol, you will be prompted for a category number. Once inserted into the job, Reveal Codes will show the <Oops #> and the Hotspots pane will simply show <Oops>.
- Category 10 is reserved and assigned to CATalyst Inserted category. For example if you have the Advanced Translate option, Insert Oops FS after aborted Power Define set to Yes and you abort a Power Define, Scan Define, EZ Speakers or Text Define during realtime, the Oops category 10 format symbol is inserted into the transcript. Category 10 Oops format symbol is also inserted when translating a steno file or re-translating a realtime file that contains AccelerWriters (macros invoked from the steno machine) and/or Power Defines at the point where the AccelerWriter or Power Define was invoked.

## Search Hotspots Entries

Search the Hotspots dialog pane for specific text, format symbols, fields or entry types. You can search forward or backward for a whole word, part of a word, or multiple words. Once a searched entry displays, you can repeat Search for the same text and search parameters by using Repeat Search Forward or Repeat Search Backward.

To search Hotspots entries:

1. In the Hotspots dialog pane, click the Search  icon. The Search dialog box displays.
2. Select the method by which you want to search the Hotspots entries.

#### Specific Text

Search by specific text. In the *Search* field, type the text you want to find.

#### Entry Type

Check this box to search by entry type. Case CATalyst searches only for entries with the selected entry type.

Entry Types

#### Conflict

The first entry that contains a conflict end format symbol.

#### Scan Stop

The first entry that contains a scan stop begin or end format symbols.

#### Numbers

The first entry that contains numbers.

#### All Capped

The first entry that contains all capped text.

**Contains capped**

The first entry that contains at least one capital letter.

**Phrase**

The first entry that contains two or more words separated by a space.

**Contains punctuation**

The first entry that contains punctuation.

**Contains format symbol**

The first entry that contains a format symbol.

**Contains Fields(s)**

The first entry that contains a field.

**Auto Include**

The first entry that begin with @.

**AccelerWriter**

The first entry that begin with &&.

**Number Conversion**

The first entry that contain the {Number Conversion} translate command.

**Number Trigger**

The first entry that contain the {Number Trigger} translate command.

**Numeral Words**

The first entry that contain a word number including hundred, thousand, million, etc.

**Speaker Entries**

The first entry that contain a <Colloquy> format symbol and a colon.

3. Use the remaining fields as necessary:

**Case Sensitive**

Check this box to limit the search based on the upper and lower case letters of text typed in the Search field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field. This field is only available when you select to search for text.

**Whole Word**

Search only for the words that match the text typed in the Search field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. This field is only available when you select to search for text.

**FS**

Include a format symbol in the Search. Type the format symbol or display the format symbol list by clicking **FS** and double click a format symbol to choose it. This field is only available when you select to search for text.

### Insert Field

Include a field in the Search. Click **Insert Field** and double click a field from the list to choose it. This field is only available when you select to search for text.

### Location

Limit the search to include one of the following criteria. These fields are only available when you select to search for text.

#### Exact Match

Search for entries that exactly match the text entered in the Search field.

#### Begins With

Search for entries that begin with the text entered in the Search field.

#### Ends With

Search for entries that end with the text entered in the Search field.

#### Contains

Search for entries that contain, anywhere in the entry, the text entered in the Search field.

### Direction

Select one of the following:

#### Forward

Search forward from the cursor position to the end.

#### Backward

Search backward from the cursor position to the beginning.

4. Press **Enter (OK)** to start the search. If no match is found for the search item, a message displays.
5. To repeat the same search, press **F3 (Edit/Repeat Search Forward)** or **Shift + F3 (Edit/Repeat Search Backward)**.

## Filter Hotspots

Display Hotspots entries in the Hotspots dialog pane based on text, Hotspots type, page number, line number or section number.

1. In the Hotspots dialog pane, click the Filter  icon. The Filter dialog box displays.
2. Select a filter criteria from the drop down list.

### Text

All entries for the specified text. Type the text you want to filter on and include any other optional filtering features such as Whole Word or Case Sensitive.

### Type

All entries for the specified type of Hotspots entry.

- Oops - if you have Oops categories and have applied a name to the Oops category, type the category name. For example, let's say you have <Oops-1> named Audio. In the Filter dialog box, select Type, in the blank field type: *Audio*.
- Untranslates - if you are showing untranslates in the Hotspots pane, in the Filter dialog box, select Type and in the blank field to the right, type: *untranslate*.
- Field - if you are showing Empty fields in the Hotspots pane, in the Filter dialog box, select Type and in the blank field to the right, type: *empty field*.

### Page

All entries on a specific page. Type the page number in the field.

### Line

All entries for a specific line number. Type the line number in the field.

### Sec

All entries for a specific section. Type the section number in the field.

3. Use the following options as necessary:

### Entry Type

Check this box to filter by entry type. Select an entry type from the drop down list. Only entries with the entry type selected display. This option is available when the Filter criteria selected is *Text* or *Type*.

Entry Types

#### Conflict

All the entries that contains a conflict end format symbol.

#### Scan Stop

All the entries that contains a scan stop begin or end format symbols.

#### Numbers

All the entries that contains numbers.

#### All Capped

All the entries that contains all capped text.

#### Contains capped

All the entries that contains at least one capital letter.

#### Phrase

All the entries that contains two or more words separated by a space.

#### Contains punctuation

All the entries that contains punctuation.

**Contains format symbol**

All the entries that contains a format symbol.

**Contains Field(s)**

All the entries that contains a field.

**Auto Include**

All the entries that begin with @.

**AccelerWriter**

All the entries that begin with &&.

**Number Conversion**

All the entries that contain the {Number Conversion} translate command.

**Number Trigger**

All the entries that contain the {Number Trigger} translate command.

**Numerical Words**

All the entries that contain a word number including hundred, thousand, million, etc.

**Speaker Entries**

All the entries that contain a <Colloquy> format symbol and a colon.

**Case Sensitive**

Check this box to limit the filter based on the upper and lower case letters of text typed in the field. If you do not select Case Sensitive, the filter displays all words containing the indicated characters, regardless of case. This field is only available when filtering text.

**Whole Word**

Filter only for the words that match the text typed in the field. If you do not select Whole Word, the filter displays the word both as it stands alone and as part of another word. This field is only available when filtering by the typed text in the field.

**FS**

Include a format symbol in the Filter. Type the format symbol or display the format symbol list, double click **FS** and double click a format symbol to choose it. This field is only available when filtering by text.

**Insert Field**

Include a field in the Filter. Click **Insert Field** and double click a field from the list to choose it. This field is only available when filtering by text.

**Location**

Filter by one of the following criteria. These fields are only available when filtering by text.

**Exact Match**

Filter entries that exactly match the text typed in the field.

### **Begins With**

Filter for entries that begin with the text typed in the field.

### **Ends With**

Filter entries that end with the text typed in the field.

### **Contains**

Filter entries that contain, anywhere in the entry, the text typed in the field.

4. Do one of the following:

- To filter on your current criteria, press **Enter** or click **OK**.

- To filter on a new set of criteria, click the Filter  icon.

- To remove the current filter and display all the Hotspot entries, click the Remove Filter  icons.

## **Clipboard**

Clipboard is an Edit feature that allows you to copy and cut text, storing up to ten items while editing. There is no limit to the amount of text you can copy or cut for each item. Selecting Copy twice on the same highlighted text automatically opens the Clipboard. Selecting Copy again, toggles the display of the Clipboard. Items sent to the Clipboard remain available for all edit files during the current Case CATalyst session. Once you close Case CATalyst, the Clipboard items are deleted unless you lock one or more items. When you lock Clipboard items, those items will remain on the clipboard even when you close Case CATalyst. For example, you are working on a case that is expected to last a week. There are a few lengthy text items that need to be added to each job. You copy those items to the Clipboard and lock them. Every time you open a job, even after closing and reopening CATalyst, those items are available for pasting. When you no longer need them, you simply unlock the items and when you close CATalyst, they will be removed from the Clipboard.

The Clipboard displays in an dialog pane. As you copy and cut items to the clipboard, the newest item is stored at the top of the list. Items are added to the list, regardless of the clipboard being displayed or hidden. If you copy and cut more than 10 items, Case CATalyst removes the oldest item and adds the new text to the top of the list. You can lock a Clipboard item, preventing it from being removed from the list as new entries are added. The appearance of an entry changes to identify the item as locked. When you lock Clipboard items, those items remain on the clipboard even when you close Case CATalyst. For example, you are working on a case that is expected to last a week. There are a few lengthy text items that need to be added to each job. You copy those items to the Clipboard and lock them. Every time you open a job, even after closing and reopening CATalyst, those items are available for pasting. When you no longer need them, you simply unlock the items and when you close CATalyst, they will be removed from the Clipboard. Items remained locked until they are individually unlocked or the Unlock All button is used.

You can paste any of the 10 items into the job using the Clipboard or by pressing an assigned keyboard command. Invoking the [Paste](#) command inserts the last item copied into the job. The text of Clipboard entries can be pasted into the Text field of a dialog box. In the Text field of a dialog box, press F11 and then type the number for the clipboard item. Numbers 0 - 9 are valid. For example, you want to copy exhibit descriptions into the Make Exhibit Index Entries dialog box. Copy each description to the clipboard. Open the Make Exhibit Index Entries dialog box and in the description text field press F11 and then press the desired Clipboard number.

## Using the Clipboard

1. Press **Alt + v, e, b (View/Panes/Clipboard)** to open the Clipboard dialog pane.
2. Highlight the text you want to copy or cut and press **Ctrl + c (Edit/Copy)** or **Ctrl + x (Edit/Cut)**. Case CATalyst adds the item to the list in the number one position. Repeat copying and cutting text as necessary. Selecting Copy twice on the same highlighted text automatically opens the Clipboard. Selecting Copy again, toggles the display of the Clipboard.

To lock a Clipboard item, right click the item in the Clipboard dialog pane and select **Lock**. You can also invoke the assigned Toggle Clipboard Lock keyboard command for that item while editing. You must first create a [keyboard map assignment](#).

To unlock a Clipboard item: Right click the item in the Clipboard dialog pane and select **Unlock**. To unlock all locked items, click the **Unlock All** button. You can also invoke the assigned Toggle Clipboard Lock keyboard command for that item while editing. You must first create a keyboard map assignment.

You cannot delete individual items from the Clipboard. Use **Clear All** to remove all the items from the Clipboard.

3. To paste a Clipboard item, position your cursor in the job at the point you want to insert the text.
4. In the Clipboard dialog pane, position your cursor in the box that contains the text you want to insert and press **Enter**. Case CATalyst inserts the text immediately after the last cursor location in the job.

### Things to know:

- Items sent to the Clipboard remain available for all edit files during the current Case CATalyst session.
- Locked Clipboard items remain in the Clipboard when Case CATalyst is closed.
- Locked Clipboard items will have brackets [ ] around the Clipboard item number.
- Keyboard Map functions are available for locking/unlocking Clipboard items and for pasting Clipboard items.
- Selecting Copy twice on the same highlighted text automatically opens the Clipboard. Selecting Copy again, toggles the display of the Clipboard.

[Keyboard Map](#) Functions:    View Clipboard  
    Paste Item #  
    Toggle Clipboard Lock #

## Brief It

The [Brief It](#) translation feature that suggests conflict free brief forms for words and phrases that you write during a realtime job. When you write three or more steno strokes, Case CATalyst generates a brief form or reminds you of an existing brief form and displays it in the Brief It dialog pane. The Brief It option on the Case CATalyst Translate Options [Realtime tab](#) must be checked for Brief It to be active during realtime writing. By default, the option is active. [Live Suggestions](#) are also displayed in the Brief It pane.

[Brief It Options](#) determine certain customized settings that control how Case CATalyst suggests briefs in the Brief It dialog pane during realtime. You can create Personal Briefs, include and exclude keys in suggested briefs, suggest only one stroke briefs and identify common words that occur at the beginning or end of phrases to prevent a brief from being suggested. You may want to customize Brief It before beginning translation.

You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to

move) of the pane, your cursor will change to a horizontal double arrow ( ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen.

Access the Brief It dialog pane in Edit. Press **Alt + v, e, t (View/Panes/Brief It)**. The Brief It dialog pane can be set to float or be docked anywhere on the screen.

## Brief It Dialog Pane

The briefs in the dialog pane have a color-coded background for easy identification. The more often the same brief is offered and not used, the darker the background color.

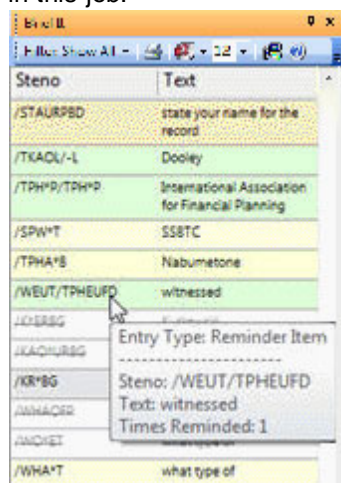

Steno	Text
/STAURPBO	state your name for the record
/TKAOL/-L	Dooley
/TPH*P/TPH*P	International Association for Financial Planning
/SPW*T	SSBTC
/TPHA*8	Nabumetone
/WEUT/TPHEUFD	witnessed
/KXERBG	Kurkowski
/KACHURBG	Kurkowski
/KX*BG	Kurkowski
/WHAQED	what type of
/WQHET	what type of
/WHA*T	what type of

Brief It dialog pane colors include:

- Green — indicates a Reminder brief. This is a brief that exists in a dictionary being used for translation.
- Yellow — indicates a Suggested brief. This is a brief Case CATalyst generates.
- Orange — indicates a Personal brief. This is a brief you created and entered in the Briefs.txt file.
- Gray — indicates a Used brief. This is any type of brief displayed in the Brief It dialog pane you used in this job.
- White with strike out — indicates a Rejected brief. A rejected brief occurs when you use the Reject Suggestion or New Suggestion command.

## Brief Details

Rest the cursor on an entry in the dialog box to display information about the brief, including the type of brief, the steno and text contained in the brief, and how often the brief has been suggested in this job.

## Managing Briefs

Right click a single entry in the Brief It dialog pane to take an action on the brief. Available actions depend on the type of brief selected. To take an action on multiple entries at once, use Windows conventions to highlight multiple briefs. Only actions applicable to all the selected entries are available. For example, if you highlight a Reminder brief and a Suggested brief, the only feature available is, Send to Cat Scratch. If you highlight several Suggested briefs, the available actions include, Send to Cat Scratch, J-define Suggestions, Reject Suggestions and New Suggestions.

### Entry Type

Identifies the type of brief: Reminder, Personal, Suggested or Used.

### Send to Case Cat Scratch

Depending on your [Cat Scratch](#) pane scope, Send to Job Cat Scratch, Send to Case Cat Scratch or Send to Cat Scratch displays.

### Lookup Steno

Displays the entry in the dictionary where the existing brief entry is located. This action only displays for Reminder entries. The dictionary, that contains the entry, opens with the entry highlighted.

### J-Define Suggestion

[Create a J-Define](#) from the brief. Displays the Add Dictionary Definition – Job Dictionary dialog box with the brief form in the Steno field and the definition in the Text field. This action is available for Suggested and Personal briefs.

If you have the Brief It Option, *Define to Case Dictionary*, selected, right click displays K-define Suggestions.

### Reject Suggestion

Reject the Suggested brief. Case CATalyst strikes through the brief form, changes the background to white and makes the brief unavailable. When you use the reject suggestion command, the steno and text brief combination will not be suggested again during the current realtime session. This action is available for Suggested and Personal briefs.

### New Suggestion

Automatically rejects the brief and suggests a new brief; or suggests a new brief for a brief already rejected. This action is available for Suggested and Personal briefs.

### J-Define Rejection

[Create a J-Define](#) from a rejected brief. Displays the Add Dictionary Definition – Job Dictionary dialog box with the brief form in the Steno field and the definition in the Text field. This action only displays for rejected briefs.

## Dialog Pane Features

### Filter Type

Filter allows you to display the briefs by category or with specific criteria. Click the down arrow to select the type of entries to display. A check mark next to the item indicates it is selected to be included in the filter. Filter hides the display of specified items in the Brief It dialog pane. It does not remove them. All entries display when you return to Show All. By default, the Filter is set to Show All entries except Live Suggestions. [Live Suggestions](#) is a filter option that allows you to see Live Suggestions in the Brief It pane while you are writing realtime. In order to see Live Suggestions, this option must be selected.

If you write a brief generated by Brief It that is not displayed in the Brief It dialog pane because the Filter is hiding the entry, Case CATalyst job defines.

If you are showing Live Suggestions and the Rejected filter type is not selected, when you replace/define a Live Suggestion all the other Live Suggestions offered for that steno are no longer displayed in the Brief It pane. If the Rejected filter type is selected, when you replace/define a Live Suggestion all the other Live Suggestions offered for that steno are crossed out and display in the Brief It pane until the next Live Suggestion.

### Print

Display the Print dialog box allowing you to print the list of briefs. If you select to print to PDF, by default Case CATalyst uses the current job name followed by "\_Brief It.pdf". You can modify the name.

### Select Font Type

Select a font type from the drop down list to affect all the steno and text in the Brief It dialog pane. Depending on the font style selected, briefs in the Brief It pane may wrap. Two stroke briefs wrap the second steno stroke after the slash (/). If a format symbol exists, the text wraps after the format symbol.

### Select Font Size

Select a font size from the drop down list to affect all the steno and text in the Brief It dialog pane. Depending on the font style selected, briefs in the Brief It pane may wrap. Two stroke briefs wrap the second steno stroke after the slash (/). If a format symbol exists, the text wraps after the format symbol.

### Options

Display the Realtime Aids Options dialog box which provides access to [Brief It](#) and [Live Suggestions](#) options. Brief It options allow you to customized settings that control how Case CATalyst suggests brief and Live Suggestions option allow you to customize the number of Live Suggestions that display, defined suggestions go to the job or case dictionary, etc.

### Export to CSV

Allows you to export the contents (whatever type of briefs are displaying in the Brief It pane) to a CSV (comma separated value) file type which can be opened in Microsoft Excel or a compatible file type.

### Case CATalyst Help

Display the Case CATalyst help.

### Toolbar Options

Click the down arrow on the right side of the toolbar to add or remove icons from the Brief It toolbar.

## Cat Scratch

The Cat Scratch dialog pane is designed to be a virtual scratch pad. You can add notes, names, job orders that you normally would jot down on paper or the job sheet to the Cat Scratch pane. The notes remain with the job and cannot become misplaced. In addition to personal notes, the Cat Scratch pane provides quick access to briefs, dictionary entries, power define definitions or newly created AccelerWriter definitions.

There are two sections to the Cat Scratch dialog pane. A Text section and a Text/Steno section. The Text section holds all text items without steno, such as copied or text typed directly into the Cat Scratch pane such as a name, transcript order instructions, terminology or anything you want to remember. The Text/Steno section holds all items containing text and steno that are sent to the Cat Scratch pane such as used briefs, sent briefs, most used Case dictionary entries, newly created AccelerWriters, Power Defines or manually selected dictionary entries. The Brief It option, [Show Phonetic Steno](#), determines whether the steno displays in steno characters or the “phonetic” sound of the combined letters. For example, let’s say you have the Show Phonetic Steno option selected and you write the phrase “large imbalances”, Brief It displays the suggestion as “LARJ” instead of “HRARPBLG.” And in the Steno field of the Text/Steno section, you would see "LARJ". And when you send that brief to the Cat Scratch pane, the steno display as "LARJ" in the Text/Steno section.

Each section separately numbers items and is separately sortable by column. Click on a column heading to change the sort order. The [Search](#) features allows you to quickly locate specific items within a section. Pinning an item locks it to the top of the respective section for quick accessibility. Locked items do not scroll off the screen when more item are added to the Cat Scratch pane.

The availability of information in the Cat Scratch dialog pane for the job depends on the selected Cat Scratch scope: job, case or user. When the scope is set to job, items in the Cat Scratch pane are available for that job and the information is stored in the Job History. When the scope is set to Case, items in the Cat Scratch pane are available for any job related to the case and the information is stored in the Case History. When the scope is set to User, items in the Cat Scratch pane are available for all jobs in the current user and the information is stored in the User History, System Files\_Case. Set the scope in [Cat Scratch options](#). The default scope setting is Case. When the job is not in a case, the existing CAT Scratch information is available in the job. The Cat Scratch options affect both regular CATalyst translation and CATalyst BCS captioning.

Action commands in the Cat Scratch pane are available by right-clicking an item. You can insert text from the Cat Scratch pane into the job, case or your Personal Wordlist. Each word in the selected item is analyzed and sent to a wordlist only if it is not recognized. For example, you have "Susan Zorne." Susan is a recognized word, so it is not added to the wordlist. Zorne is not recognized so it is added. Other right-click commands allow you to insert the text portion of a steno/text entry into the transcript, add the entry to the job, case or Personal dictionary and suggest a brief for the selected entry, which is added to the Brief It pane. Available right-click actions depend on the item selected.

You can copy an individual item, multiple items or all the entries in the Cat Scratch pane from your job and paste them into the Cat Scratch pane of another job regardless of scope. For example, you are working on the RWAnderson case with the scope for the Cat Scratch pane set to Case. You work on this case for a week. You have various information such as names, addresses, dictionary definitions and briefs. Each day you open a new job file, the items in the Cat Scratch pane from the previous days are available. The next week you work on a new case, JDorsinski. You copy and paste selected new briefs from the RWAnderson Cat Scratch dialog pane to the Cat Scratch pane for the new case.

You can quickly send text from the transcript to the Cat Scratch pane by highlighting the text, right-clicking the mouse and selecting Send to Cat Scratch. The keyboard command, Send Steno & Text to Cat Scratch Pane, sends highlighted text with the underlying steno in the transcript to the Steno/Text section of the Cat Scratch pane. You must [create a keyboard command](#) to use this feature.

The Cat Scratch toolbar is customizable. Click the down arrow located on the right side of the toolbar. Select **Add or Remove Button** and choose the toolbar to modify. Click a command to show or hide it from the toolbar. A check mark indicates the icon shows on the toolbar.

You can increase or decrease the horizontal size of the pane. If you see information in the pane followed by ... (ellipses) it is an indication that there is more information or data to be shown. To increase or decrease the horizontal size of a pane, position your cursor on the free edge (a side that is available to

move) of the pane, your cursor will change to a horizontal double arrow ( ). Left click and drag the edge to the horizontal position you want. Once the ellipses are no longer displaying, all the data in the pane can be seen.

To display the Cat Scratch pane in Edit, press **Alt + v, e, c (View/Panes/Cat Scratch)**.

[Keyboard Map](#) Function: Send To Cat Scratch Pane

Send Steno & Text to Cat Scratch Pane

Send Selected Brief to Cat Scratch

Send Last Brief to Cat Scratch

## Cat Scratch Dialog Pane Features

### Entry/Text

All text items without steno, such as transcript text sent to the Cat Scratch pane or typed text like a witness names, transcript order information or personal notes.

### Entry/Text/Steno

All items containing text and steno that are sent to the Cat Scratch pane such as most used dictionary entries, briefs you want to remember or new AccelerWriters. The Brief It option, [Show Phonetic Steno](#), determines whether the steno displays in steno characters or the “phonetic” sound of the combined letters. For example, let’s say you have the Show Phonetic Steno option selected and you write the phrase “large imbalances”, Brief It displays the suggestion as “LARJ” instead of “HRARPBLG.” And when you send that brief to the Cat Scratch pane, the Steno field of the Text/Steno section would display as “LARJ”.

If you edit the steno field in Cat Scratch, the steno will temporarily change to all steno characters instead of phonetic. Once your edit is complete, the display changes back to phonetic if that Brief It option is selected.

### Insert

Insert an item from the text section into the transcript. Position the cursor in the transcript where you want to insert the text. Highlight the Cat Scratch item and click the Insert icon or right-click and select **Insert**.

### New

Create a new text item. A blank line displays where you can type the text.

### Modify

Modify an existing item in the Text or Text/Steno section. Highlight the item and click the Modify icon. Type the new text or steno.

### Delete

Delete an existing item in the Text or Text/Steno section. Highlight the item and press **Delete** or click the Delete icon. At the Delete confirmation message, press **Enter** to delete.

### Copy

Copy an individual item, multiple items or all the entries in the Cat Scratch pane from one job and paste them into the Cat Scratch pane of another job. Use Windows conventions to highlight the desired items and click the Copy icon.

### Paste

Paste copied items from another Cat Scratch pane into the current Cat Scratch pane.

### Search

Search the Cat Scratch pane. Depending on your cursor focus, the Search looks in the Text or the Steno/Text section.

### **Pin/Lock**

Highlight entries and click the Pin icon to lock the items at the top of their respective sections. Locked items do not scroll when other entries are added to the Cat Scratch pane. Locking items may be useful when you have key briefs or dictionary entries that you want displayed first. Use the Unpin icon to unlock an item.

### **Unpin/Unlock**

Highlight entries and click the Unpin icon to unlock the items from the top of their respected section. Unpinned items display in the list with their original sorting number.

### **Add Most Used Dictionary Entries**

Automatically copy the most used Case Dictionary entries to the Steno/Text section of the Cat Scratch dialog pane. The most used entries count is based on the Usage Count information in the Case Dictionary. For example, you have an on-going case in which two weeks passed since the last proceeding. As a quick reference to the way you wrote the most commonly used names and terminology in the case, you click the Add Most used Dictionary Entries icon. The most used entries in the Case dictionary automatically display in the Cat Scratch dialog pane. The number of entries that display is determine by the setting in Cat Scratch Options.

### **Font Type**

Select a font type for all the characters in the Cat Scratch pane. This affects both sections.

### **Font Size**

Determine the size of the font for all the characters in the Cat Scratch pane. This affects both sections.

### **Print**

Print the items in the Cat Scratch dialog pane.

### **Options**

Display the [Cat Scratch Options](#) dialog box to customize the options for the Cat Scratch dialog pane.

## **Cat Scratch Options**

### **Cat Scratch Scope**

Determine the availability of information in the Cat Scratch dialog pane. This option is available from the Cat Scratch Options or Advanced Edit Options dialog box. Changing the option in one location changes it in the other location.

Select one of the following:

#### **Case**

Items in the Cat Scratch pane are available for any job related to the case and the information is stored in the Case History. The default scope setting is Case. When the job is not in a case, the CAT Scratch information is available in the job.

**Job**

Items in the Cat Scratch pane are available for that job and the information is stored in the Job History.

**User**

Items in the Cat Scratch pane are available for any job in the current user and the information is stored in the User History, System Files\_Case.

**Number of Case Dictionary entries to add**

Specify the number of Case Dictionary entries to automatically add to the Cat Scratch dialog pane. Click the Add most used entries from case dictionary icon to automatically add the specified number of most used entries. Valid settings are 1 - 25. The default is 10.

**Display text section first**

Select **Yes** to display the text section first in the Cat Scratch pane. Select **No** to display the Steno/Text section first. Changing the setting applies to any new jobs opened in Edit. It does not apply the currently open file.

**Search Cat Scratch Pane****Search****Text Section**

Search the Text section for specific text or entry type. To search for text, type the text and include any format symbols, fields or [extended characters](#) as necessary.

To search for an entry type, check the Entry Type box and select an item from the list.

**Steno/Text Section**

Search the Steno/Text section for text or steno. To search for text, select **Text** from the list and type the text, including any format symbols, fields or extended characters as necessary.

To search for steno, select **Steno** from the list and type the steno. Separate multiple strokes with a forward slash. When starting with a final stroke, place a – (hyphen) before the first letter.

**FS**

Add format symbols to a text search. Select **FS** and double click the symbol from the list or position the cursor in the Search field, press **F4** and then press the appropriate format symbol shortcut letter or symbol.

**Insert Field**

Add fields to a text search. Display the [Insert Field](#) dialog box and select a field.

**Entry Type**

Limit a text search by entry type. Check this box and select an entry type from the Search list.

Entry Types

**Conflict**

An entry that contains a conflict end format symbol.

**Scan stop**

An entry that contains a scan stop begin or end format symbol.

**Numbers**

An entry that contains numbers.

**All Capped**

An entry that contains all capped text.

**Contains capped**

An entry that contains at least one capital letter.

**Phrase**

An entry that contains two or more words separated by a space.

**Contains punctuation**

An entry that contains punctuation.

**Contains format symbol**

An entry that contains a format symbol.

**Contains Field(s)**

An entry that contains a field.

**Auto Includes**

An entry that begin with @.

**AccelerWriter**

An entry that begin with &&.

**Number Conversion**

An entry that contain the {Number Conversion} translate command.

**Number Trigger**

An entry that contain the {Number Trigger} translate command.

**Numeral Words**

An entry that contain a word number including hundred, thousand, million, etc.

**Speaker Entries**

An entry that contain a <Colloquy> format symbol and a colon.

**Case Sensitive**

Search only for text that matches the text typed in the Search field exactly as it occurs in upper and lower case. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field.

### Whole Word

Search only for whole words that match the text typed in the Search field.

If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. For example, searching for "of" would result in Search finding "of", "officer", "coffee", "soft", etc.

### Partial Stroke

Search for the specified steno as an entire steno outline or as part of a steno outline. For example, searching for –FPLT with the Partial Stroke option active displays entries: -FPLT,

-FPLTD, -FRPBLGTS, -FRPBLTS, etc. Searching for –FPLT without Partial Stroke, displays entries with –FPLT as a separate outline, such as: -FPLT, -FPLT/-FPLT, etc. Case CATalyst searches all steno strokes for the letters indicated in the Steno column based on your selection in the Location field.

### Location

Select search parameters.

#### Exact Match

Search for entries that exactly match the steno or text entered in the Search field.

#### Begins With

Search for entries that begin with the steno or text entered in the Search field.

#### Ends With

Search for entries that end with the steno or text entered in the Search field.

#### Contains

Search for entries that contain, anywhere in the entry, the steno or text entered in the Search field.

### Direction

Select the direction of the search in the list.

#### Forward

Search forward, from the cursor position to the end of the section.

#### Backward

Search backward, from the cursor position to the end of the section.

## Search Results

When you invoke a [Search](#) in Edit with the *List Search Results* option selected, Case CATalyst searches the transcript and automatically displays the results of the Search in the Search Results dialog pane. The text content, page, line and section reference display for each occurrence of the searched item. When performing a [Wildcard](#) or [Regular Expression](#) search with the List Search Results option selected, the Wildcard and Regular Expression matches will be underlined. If you search for Q, A or Colloquy format symbols, the first letter following the format symbol will be underlined.

If you use the [Mistran Minder](#) feature, the Mistran Minder matches display in the Search Results pane and are underlined.

Double click an entry to move the cursor to that location in the current transcript. You can also use the [Search Next and Previous Search Result](#) to move your cursor from the current position in the transcript to the next occurrence.

To manually open the Search Result pane, press **Alt + v, e, s (View/Pane/Search Results)**.

### Search Results Dialog Pane Features

#### Font Type

Select a font type for all the characters in the Search Results pane.

#### Font Size

Determine the size of the font for all the characters in the Search Results pane.

#### Print

Print the items in the Search Results pane.

### Track Changes

The [Track Changes](#) feature, when active, tracks non-global changes made to a transcript. The changes display in the body of the transcript when in Normal view and with the [Display Changes](#) feature selected. The Track Changes pane provides a summary of all the changes made while the Track Changes feature was active. The changed items can include deletions, inserts, including a file, replacing and adding spaces. To activate Track Changes while editing, select **Special Edit/Track Changes**.

Details for each change display in the Track Changes pane and are organized into three columns: Change, Page and Editor. Each change, except for deletions, display in the [assigned color](#) for the active editor. All deletions display in the assigned deletion color regardless of the editor. When replacing steno or text, the replaced item is considered deleted. Replacement text is considered an inserted change. Inserted and included text show editor color with the initial words followed by an ellipsis (...) and then the last words. Global definitions, undo last global, layout changes and filling in fields are not tracked, however, if you use the Undo Global Once command, the action is recorded a Replace. The display color for changes made with Undo feature depends upon the resulting action. For example, if you delete a word but then Undo it, the change displays in the editor color because Undo inserts the word back into the transcript. If you type a word and then Undo it, the change displays in the deletion color because the Undo removes the word from the transcript.

The current user name identifies the current editor of the tracked changes unless a name is specified in Application/Computer option, [Editor ID](#). The *Editor ID* option allows you to specify an editor name. The editor name applies to all users on the system who select to use the Track Changes feature. If you are exchanging files with another Case CATalyst user, you can track the changes for the multiple editors. The first person that edits the file is Editor 1. The next person that edits the file is Editor 2. You can assign up to five editor colors. For example, Track Changes is active when the reporter makes small changes to the transcript before sending the transcript to the scopist. The change is recorded in the pane using the editor name and assigned color for Editor 1. The reporter sends the file to the scopist. The scopist becomes the second editor. Changes are recorded using their editor name in the assigned color for Editor 2. When the transcript is returned to the reporter, scopist changes are displayed in the Editor 2 color.

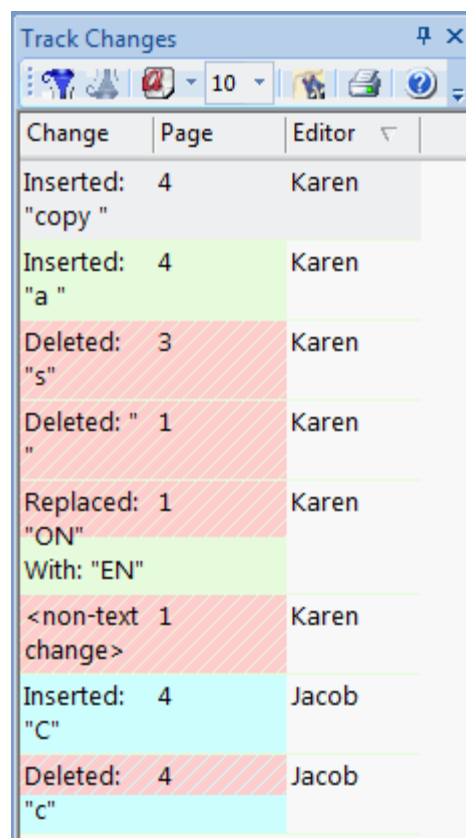

You can access the Track Changes pane in Edit by pressing **Alt + v, e, a (View/Track Changes)**. If your cursor is positioned on a change in the transcript, you can right click and select Change Info to open the Track Changes pane and see more information about the transcript change. The right click menu item, Change Info, is only available if your cursor is positioned on a change in the transcript and the Track Changes option is selected. The Track Changes pane can be set to float or be docked anywhere on the screen.

## Track Changes Dialog Pane

The changes in the pane are organized into three columns: Change, Page and Editor. Click a column heading to sort the entries in ascending and descending order. An arrow in the column indicates the sort order. Double click an entry to move the cursor to the location in the file where the selected edit occurs. When you Arrow Up and Arrow Down in the Track Changes pane, the cursor scrolls in the transcript, vertical notes pane and reveal codes pane.

The Track Changes default colors include:

- Pink — deleted item or item removed for a replacement.
- Light Green — inserted item or replacement item for Editor 1.
- Light Blue — inserted item or replacement item for Editor 2.
- Light Purple — inserted item or replacement item for Editor 3.
- Gray Row — current or last change location.
- Gray Column — sort column.

Change	Page	Editor
Inserted: "copy "	4	Karen
Inserted: "a "	4	Karen
Deleted: "s"	3	Karen
Deleted: " "	1	Karen
Replaced: "ON"	1	Karen
With: "EN"		
<non-text change>	1	Karen
Inserted: "C"	4	Jacob
Deleted: "c"	4	Jacob

## Dialog Pane Features

### Filter

Display entries based on page number, the editor or changes. Click the Filter icon to display the [Filter dialog box](#).

### Remove Filter

Display all the entries.

### Select Font Type

Select a font type from the drop down list to affect all the steno and text in the pane. Depending on the font style selected, entries in the pane may wrap.

### Select Font Size

Select a font size from the drop down list to affect all the steno and text in the pane. Depending on the font style selected, entries in the pane may wrap.

### Search

Search the entries . In the [Search dialog box](#) make necessary entries and press **Enter (OK)**.

### Print

Display the Print dialog box allowing you to print the list of changes. If you select to print to PDF, by default Case CATalyst uses the current job name followed by the text, "TrackChanges." For example, SMP122811\_TrackChanges. You can modify the name.

### Case CATalyst Help

Display the Case CATalyst help

### Toolbar Options

Click the down arrow on the right side of the toolbar to add or remove icons from the dialog pane toolbar.

## Filter Changes

Display entries based on specific change, page number, editor, or entry type.

1. In the Track Changes dialog pane, click the Filter  icon. The Filter dialog box displays.
2. Select a filter criteria from the drop down list.

### Page #

All entries on a specific page. Type the page number in the field.

**Editor**

All entries for the specified editor. Type the name of the editor in the field.

**Change**

All entries for the specified change. Type the text.

**Case Sensitive**

Check this box to limit the filter based on the upper and lower case letters of text typed in the field. If you do not select Case Sensitive, the filter displays all words containing the indicated characters, regardless of case. This field is only available when filtering text.

**Whole Word**

Filter only for the words that match the text typed in the field. If you do not select Whole Word, the filter displays the word both as it stands alone and as part of another word. This field is only available when filtering by the typed text in the field.

**Location**

Filter by one of the following criteria. These fields are only available when filtering by text.

**Exact Match**

Filter entries that exactly match the text typed in the field.

**Begins With**

Filter for entries that begin with the text typed in the field.

**Ends With**

Filter entries that end with the text typed in the field.

**Contains**

Filter entries that contain, anywhere in the entry, the text typed in the field.

**Search Changes**

Search the Track Changes dialog pane for specific text. You can search forward or backward for a whole word, part of a word or multiple words. Once a searched entry displays, you can repeat Search for the same text and search parameters by using Repeat Search Forward or Repeat Search Backward.

To search entries:

1. In the Track Changes dialog pane, click the Search  icon. The Search dialog box displays.
2. Select the method by which you want to search the entries.
3. In the *Search* field, type the text you want to find.
4. Use the remaining fields as necessary:

**Case Sensitive**

Check this box to limit the search based on the upper and lower case letters of text typed in the *Search* field. If you do not select Case Sensitive, the search finds all words containing the indicated characters, regardless of the case typed into the field. This field is only available when you select to search for text.

**Whole Word**

Search only for the words that match the text typed in the *Search* field. If you do not select Whole Word, the search finds the word both as it stands alone and as part of another word. This field is only available when you select to search for text.

**Location**

Limit the search to include one of the following criteria. These fields are only available when you select to search for text.

**Exact Match**

Search for entries that exactly match the text entered in the *Search* field.

**Begins With**

Search for entries that begin with the text entered in the *Search* field.

**Ends With**

Search for entries that end with the text entered in the *Search* field.

**Contains**

Search for entries that contain, anywhere in the entry, the text entered in the *Search* field.

**Direction**

Select one of the following:

**Forward**

Search forward from the cursor position to the end.

**Backward**

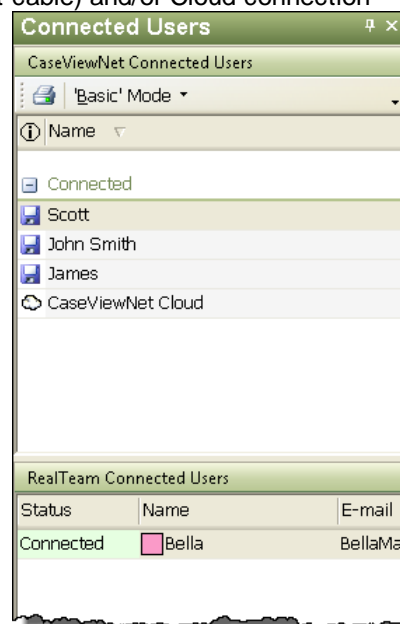

Search backward from the cursor position to the beginning.

5. Press **Enter (OK)** to start the search. If no match is found for the search item, a message displays.
6. To repeat the same search, press **F3 (Edit/Repeat Search Forward)** or **Shift + F3 (Edit/Repeat Search Backward)**.

## Connected Users

The Connected Users dialog pane displays the connection status of [CaseViewNet/iCVNet users](#), if applicable, connected via a network connection (wireless or Ethernet cable) and/or Cloud connection" and also displays [RealTeam connected users](#), if applicable. The top part of the pane is reserved for CaseViewNet users and the bottom part of the pane is reserved for RealTeam users. You can click and drag the title bars within the pane to adjust the size of each section.

## Normal, Page & Full Screen View

You can choose how you want to view the text while you work in Edit between Normal, Page or Full Screen view. Changing the view does not change any text or formatting in the job. To magnify or decrease the view of your document without changing any format settings use [Zoom](#).

### Normal

View the text in a word processing format. Text formatting displays, but other formatting features such as page borders, header and footers, and graphics do not. Press **Alt + v, n (View/Normal)**. To see what the printed page will look like, change to Page view. Many users like to edit in Normal view but will change to Page view to see how a page, i.e. title page, is going to print and then switch back to Normal view to continue editing.

By default, Normal view displays the text in single spacing. To display the text in [double space](#), select **View/Show/Double Space** in the Normal view. In Page view, text displays based on how it will print.

### Page

View the text as the file would appear when printed. Formatting features such as text formatting, page borders, headers and footers, and graphics display in Page view. Press **Alt + v, p (View/Page)**. If you prefer editing in Normal view, you can easily switch to Page view to see how a page is going to print, i.e. title page, and then switch back to Normal view to continue editing.

Using the mouse pointer, you can move the ruler markers to make margins adjustments for the associated item.

### Page View – Ruler Marker Symbols

	Margins
	First Line Indent
	Paragraph Symbol
	Box Lines
	Timestamps
	Paragraph Numbers
	Line Numbers
	Continuation Paragraph

## Full Screen

Allows you to hide all the toolbars and the Function bar, except for the Full Screen toolbar, to provide more text space on the screen. You may want to use this feature if you provide CART service. As an alternative to using full screen for CART, you can use the [CARTView](#) output.

You can customize the toolbars that display while in Full Screen view without changing the toolbars while editing in Normal or Page view. To change the display, click the down arrow on the right side of the Full Screen toolbar. Click **Add or Remove Buttons** and then click **Customize**. In the Customize dialog box check the box next to the toolbar you want to display on the screen.

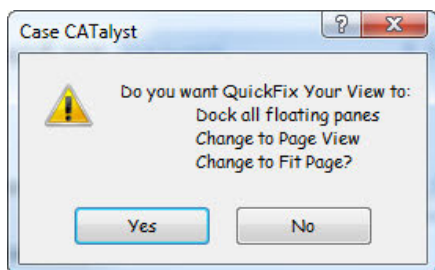

Uncheck the box to hide the toolbar. Case CATalyst remembers the new settings for Full Screen view in the current user until changed.

## QuickFix Your View

QuickFix Your View will change your current Edit view to Page view, set the Zoom to Fit Page and dock all floating panes. QuickFix Your View is located under the View menu. Once you select QuickFix Your View, a dialog box displays listing what QuickFix Your View is going to change and if you want to make the change. If you select to make the change, you are prompted to keep the changes. If you select No, the view returns to the original settings.

You can also reset your view to Case CATalyst's default edit view by using the [Reset the View](#) feature.

Depending on your current view settings, the following is an example of the QuickFix Your View dialog box:

Keyboard Map Function: QuickFix Your View

## Reset the View

The Reset the View option is available on the View menu and is an alternative to the QuickFix Your View option. Reset the View changes the current view settings to CATalyst's default view settings. You might want to use the Reset the View option if you have moved your panes around or changed your view and now you just want to go back to the default settings. Or for example, if you have one or more dialog panes on top of each other and you used the QuickFix Your View option but that didn't change the panes being on top of each other. The Reset the View settings are Page view, Fit Page with Vertical Notes and Reveal Codes panes docked and the Speaker List set to auto hide. Selecting Reset the View does not affect your toolbars or color settings. When selecting Reset the View, you will be prompted to make the view change. If you select to make the change, you will be prompted to keep the view changes. If you select No, the view returns to the original settings.

You can also use [QuickFix Your View](#) to change your transcript view to Page, Zoom setting default to Fit Page and all floating dialog panes will be docked.

Keyboard Map Function: Reset the View

## Show

The Show feature presents a selection of toolbar and window options that allows you to customize your screen view. Press **Alt + v, s (View/Show)** to display the Show menu. Click an option to select or deselect it. A check mark next a menu item indicates the feature is active. When you click Customize Toolbar, the Customize dialog box displays.

## Show or Hide Case CATalyst Screen Features

### Audio Indicators

Show the [Audio Indicators](#) in Normal View.

### Bench Text

Show or hide text written in [Bench Mode](#) during a realtime session.

### Double Space in Normal View

Show text [double spaced](#) when in Normal View.

### Reporter's Area

Show or hide the [Reporter's Area](#) on the Edit screen during realtime writing.

### Show Subfiles

Show or hide subfiles on the Manage Job screen.

### Status Bar

Show or hide the [Status Bar](#) at the bottom of the Case CATalyst screen. The Edit Status Bar displays above the [stationary Status Bar](#) (CATalyst frame). It shows the corresponding steno outline when marking outlines. It also shows steno outlines, if any, when the [Hold Strokes](#) option is selected when writing realtime. On the right side of the toolbar, original conflicts resolved by EZ Choice or Auto Conflict display.

Stationary Status Bar

### Timers

Show or hide the [Timers](#) On/Off dialog box.

### Timestamps

Show or hide the [Show Timestamps](#) dialog box on the Edit screen.

### Timestamps in Vertical Notes

Show or hide the [Timestamps](#) in the Vertical Notes.

### Translate Statistics

Show or hide the [Translation Status](#) dialog box.

### Visible columns

Selecting Visible columns displays the Column Settings dialog box. You can [modify the column format](#) in Manage Jobs when you display the screen in Detailed List View. You can also choose which columns display, determine the order of the column display from left to right, and adjusts the width of the columns.

### Work Unit Area

Show or hide the Work Unit Area while writing realtime. The Work Unit Area is a shaded area on the realtime screen that, when showing, displays text that has been sent to a [work unit](#).

## Show Audio Indicators

Show Audio Indicators is an Edit feature that displays the Audio Indicators automatically in Normal View when timestamps do not display or when timestamps display in clock mode. You can hide the Audio Indicators when in Normal View.

## Show Double Space in Normal View

Show Double Space in Normal View is an Edit feature that allows you to display text in double space when in Normal View. This feature is a display only option and available only in Normal View. Page View displays the transcript text in the spacing selected for printing.

To toggle the display between double and single space, select **View/Show/Double Space in Normal View**. A check mark in front of the option indicates the display is double spaced.

## Show Status Bar

Enter topic text here.

## Show Timers

Show Timers displays the Timers dialog box in Edit. The Timers dialog box contains information about the [Timers](#) for the current job. When Timers are Off, the title bar of the dialog box displays TIMERS OFF. When you start a Timer, the name associated with the Timer displays in the title bar.

Display the Timers dialog box from the View menu. Select **Show/Timers**. You can place the dialog box anywhere on the screen.

## Timers Dialog Box

### Timers

The names of all identified Timers along with each individual Timer's total time. Identify Timer names and clock colors in Edit using the [Timer Information](#) option.

### Group Timers

When you select to create group Timers, the group name displays along with the total time for all members in the group. Create Timer groups in Edit using the Timer Information option.

### Arrow Buttons

Click the  button to expand the dialog box. Click the  to condense the dialog box. When you condense the dialog box, the following information displays: either the clock time for the current Timer or, if no Timers are active, TIMERS OFF.

## Show Reporter's Area

The Reporter's Area is designed to be a visual indicator when a reporter and scopist is working together. When selected, the Reporter's Area is a shaded area on the realtime screen that displays text that is available to the court reporter to make changes using realtime commands (from the steno machine) and/or keyboard edits. Since the reporter could make changes in this area, the scopist may want to always be editing up to the Reporter's Area but not in the Reporter's Area. It all depends on the reporter and scopist working together and whether the reporter is going to make changes during realtime.

The Reporter's Area is approximately the last 128 steno outlines written during realtime. The Reporter's Area is not visible to realtime viewers but is visible and accessible by the reporter or scopist on the Case CATalyst system. Realtime commands written by the reporter (from the steno machine), such as [number conversions](#), [conflict resolution](#) and [AccelerWriters](#) apply in the Reporter's Area. Once the translated text extends beyond the Reporter's Area, realtime commands (such as number conversions, conflict resolution) written by the reporter do not apply. AccelerWriters do apply to the Reporter's Area. For example, if the reporter writes a command for conflict resolution, but the conflict is already "outside" the Reporter's Area, then no resolution takes place and the conflict remains in the transcript until edited by the scopist or reporter. The Reporter's Area does not affect Power Defines, Power Defines apply to the entire file.

The Reporter's Area temporarily shrinks when accessed, for example, by the scopist. The Reporter's Area does not restrict the scopist from editing. It is a visual indication for the reporter to know where specific realtime (from the steno machine) commands take action.

## Display Reporter's Area

From Translate & Edit press **Alt + v, s, a** (**View/Show/Reporter's Area**).

## Show Work Unit Area

The Work Unit Area is a shaded area on the realtime screen that, when showing, displays text that has been sent to a work unit. A [work unit](#) is a portion of the realtime file that is sent to a specific location at incremented times. For example, you can set it so a work unit is created every 20 minutes. Work Units allow a scopist or more than one scopist to access the work units and begin editing for faster production turnaround time. You can customize the Work Unit Area shading by selecting **View/Display/Colors**.

There is also a [Create Work Unit](#) command that allows you to create a work unit on demand

## Show Bench Text

Bench Mode text is text that is written between the [Toggle Bench Mode](#) On/Off translate command to suspend the display of text on the realtime received systems. The reporter would use the Toggle Bench Mode On command immediately before a bench conference, for example, the reporter then writes the contents of the bench conference and writes the Toggle Bench Mode Off command when testimony resumes. The Bench Mode text is in the realtime file but appears as /// in the CaseViewNet realtime receive systems. The Toggle Bench Mode On/Off commands can be used in any situation when the reporters wants to prevent others from viewing the realtime translation, such as confidential bench conferences, in-chambers discussions, or when writing a note to a scopist or yourself.

When Bench Mode is On, a "B" displays on the Translate & Edit Status bar. To toggle between viewing and hiding the Case CATalyst realtime text written after the Bench Mode On command, select **View/Show/Bench Text**. A check mark in front of the option indicates it is selected. To view the Bench Text in a particular color, select **View/Display/Colors**.

To invoke the Toggle Bench Mode command from your writer, a steno outline defined as {Toggle Bench Mode} needs be in a dictionary being used during realtime. The Toggle Bench Mode dictionary entry is included in the default [Realtime Commands Dictionary](#). Modify the entry, as necessary, to accommodate your writing style.

## Show Timestamps

Show Timestamps is an Edit feature that allows you to change the display of timestamps in Edit. Timestamps automatically generate when writing realtime. You also can display timestamps when you read steno notes from the writing machine and create an Edit file, if the writing machine has the ability to generate timestamps.

You can change the color of the timestamps in Edit using the [Color](#) feature.

## Display Timestamps in Edit

1. From the View menu, select **Show/Timestamps**. The Show Timestamp dialog box displays.
2. Make entries as necessary:

### Show Timestamps in Normal View

Check this box to display timestamps in Normal View. You can always view Timestamps in Page View unless you disable them in the layout.

### Affect Both Normal and Page View

Select to display timestamps in actual time or elapsed time. Your choice affects both Normal and Page View.

- Clock (actual time)
- Elapsed (starting at 0:00)

3. Press **Enter (OK)**.

## Show Timestamps in Vertical Notes

Show Timestamps in Vertical Notes is an Edit feature that allows you to view timestamps along with your vertical notes. If vertical notes are open on the Edit screen when you select to view timestamps in vertical notes, it is necessary to resize the vertical notes pane by widening the view to include the timestamps. You can also close and reopen vertical notes to have Case CATalyst automatically resize the pane.

## View Timestamps in Vertical Notes

Do one of the following:

### When vertical notes are open

1. Press **Alt + v, s, v (View/Show/Timestamps in Vertical Notes)**.

2. Using the mouse, position the cursor on the line between the transcript and the vertical notes pane. When the cursor is in the correct position, it displays as a horizontal line with arrows on each end as shown below:

3. Hold the left mouse button and move the cursor to the left until the timestamps display.

#### When vertical notes are closed

1. Press **Alt + v, s, v** (**View/Show/Timestamps in Vertical Notes**).
2. Press **Alt + v, v** (**View/Vertical Notes**).

## Show Translate Statistics

Show Translation Status is a Translate & Edit and Edit feature that displays translation statistics about the open job.

When you select to Show Translation Status, the dialog box displays in a condensed format, displaying the current time, total strokes and untranslates, total number of dictionaries, and total pages for the job. Click the down arrow  to expand the dialog box and display all the translation status details. When the dialog box is expanded, click the up arrow  to condense the dialog box.

To toggle the display On and Off in Translate & Edit and Edit, press **Alt + v, s, n** (**View/Show/Translation Status**). The following information displays when you expand the translation status dialog box to show all the translation details for the job.

Power Defines and keyboard actions, such as defining and resolving conflicts, do not affect translation statistics in any manner.

#### Name of the job

The name of the job displays on the Title Bar of the dialog box.

#### Current Time

The current time based on the computer's clock.

#### Strokes

##### Total

The total number of strokes written in the job.

When you write a steno stroke that is an untranslate and then use a deletion stroke, such as asterisk delete, to delete the untranslated stroke, neither the steno stroke or the deletion stroke count in the total number of strokes.

##### Untrans

The number of untranslates in the job.

When you write a steno stroke that is an untranslate and then use a deletion stroke, such as asterisk delete, to delete the untranslated stroke, neither the steno stroke or the deletion stroke count as an untranslate statistic.

When you write a deletion stroke at the beginning of the file or when the Reporter's Area is zero, the deletion stroke displays as an untranslate if there is nothing to delete. The deletion stroke is not added to the untranslate count because there is a definition in the dictionary for it. It is included in the total number of strokes.

**Untran %**

The percentage of untranslates.

**Elapsed Time****Adjusted**

The total elapsed time of the job.

**Total**

The total elapsed time of the job.

**Conflicts****Total**

The total number of conflicts written. Conflicts selected by Auto Conflict count in the total. Strokes written that result in a conflict are also included.

EZ Choice resolved conflicts do not count towards the total number of conflicts.

**Resolved**

The number of conflicts resolved by selecting conflicts from the writing machine using the Resolve Conflict Choice commands.

**Job Dictionaries**

The list of job dictionaries selected at the time of translation.

**Pages**

The total number of pages in the job.

**Options**

Displays the Used in Last Translation dialog box which indicates the [translate options](#) used during the translation of this job. This information may be helpful in the event that troubleshooting is necessary. Press **Enter (Close)** when finished viewing the information.

**Show Words Per Minute**

The Words Per Minute toolbar allows you to view the approximate number of words written per minute while writing realtime. The average number of words per minute is calculated over a minimum of two seconds up to a maximum of about 30 seconds. The software uses the longest consistent writing speed, within 25 percent. If you write substantially more words per minute for over 2 seconds, the Words Per Minute feature reflects the faster rate even if you cannot maintain the speed. For example, if you are writing at approximately 180 words per minute, the toolbar displays, 180. If you write approximately 225 words per minute for a short time, the toolbar displays, 225. When you stop writing, the display returns to 000 after a few seconds.

**Display the Words per Minute toolbar**

1. Press **Alt + v, s (View/Show)** to display the Show menu.

2. Click the **Words Per Minute** toolbar. A check mark next the feature indicates it is active.

## Word Definition

Word Definition is an Edit feature that allows you to look up the definition of a selected word. You can view a word definition at any time when working in Edit or during Spell Check. Hyperlinks are available for words contained in a definition which exist as a defined word in the selected dictionary. These links display in underlined bold text. Links are also available for words listed as synonyms in a definition which exist as a defined word in the selected dictionary. These links display in underlined text. Links, by default, are set to display in blue. You can modify Word Definition Dictionary dialog box colors in [Word Definition Dictionary Options](#).

The Merriam-Webster dictionary is the default dictionary for Word Definition and comes with the Case CATalyst software. Definitions are provided for approximately 215,000 words.

## View a Word's Definition

1. Do one of the following:
  - In Edit, place your cursor immediately before or on the word for which you want to look up a dictionary definition and press **Alt +v, w (View/Word Definition)**.
  - From the Spell Check dialog box, select **Definitions**.
2. The Merriam-Webster Dictionary dialog box displays with the definition for the highlighted word. If you receive the "no definition found" message, you can type a new word in the field and click **Find Word**.

Use **any** of the following options:

### Find Word

Look up another word. Type a new word in the field and press **Enter** or click the Find Word icon.

### Dictionary Search

Connect to the [user specified](#) website for additional definition possibilities. You must have an active Internet connection.

### First Word

Display the first word in the dictionary.

### Previous Word

Display the word in the dictionary that occurs before the word currently displayed.

### Next Word

Display the word in the dictionary that occurs after the word currently displayed.

### Last Word

Display the last word in the dictionary.

### Settings

Modify the Word Definition Dictionary Settings. This includes dictionary choice and dialog box colors.

### Wordlist

Expand the Word Definition Dictionary dialog box to show the list of dictionary words. You can scroll through the Wordlist using the Up Arrow, Down Arrow, Page Up, and Page Down keys.

### Begins With Filter

Show only those words in the dictionary that contain the word currently displayed.

3. When finished looking up word definitions, press **Esc**.

## Zoom

Zoom settings allow you to change the viewing size of the text on the screen by manually increasing or decreasing the viewing percent. You can select a higher zoom percentage to get a close up view of the text or select a lower Zoom setting to reduce the viewing size of the job allowing you to see more of the page. Depending on your Zoom choice, all the text may not fit on the screen and you may need to use the horizontal bar at the bottom of the screen to read all the text. Also available on the Zoom menu is Fit Text and Fit Page options. **Fit Text** maximizes the display of text to the current size of the screen. **Fit Page** maximizes the display of text including page elements, such as line numbers, timestamps, headers/footers, etc., to the current size of the screen.

## Change Text Size For Viewing Only

### Use the View Menu

1. Press **Alt + v, z (View/Zoom)** to display the Zoom menu. A check mark displays next to the current selection.
2. Select a new percent. To display the viewing size at a percentage other than the values provided, select **Custom**. In the Custom Zoom dialog box, enter a number between 1 and 800 in the Enter Value field.

### Click the Zoom icon

1. Click the Zoom  icon. Case CATalyst displays the next percentage increase in the list.
2. Continue to click the Zoom icon. Case CATalyst selects the next percentage increase in the list until it reaches the largest size. For example, the viewing percentage is set at 100%. You click the Zoom icon and the viewing percent increases to 150%. When you reach the largest size, Case CATalyst toggles to Fit Text, Fit Page and up the list again.

Zoom Keyboard commands: Cycle through zoom settings  
 Cycle through zoom settings (Reverse)  
 Zoom 100%

Zoom 150%  
Zoom 200%  
Zoom 400%  
Zoom 50%  
Zoom 75%  
Zoom Fit Page  
Zoom Fit Text

## Display Changes

The Display Changes feature, when active, shows non-global changes made when the [Track Changes](#) feature is active during editing. You can quickly Scan to changes in the transcript by selecting *Changes* in your [Scan For Options](#) or using the [Scan For](#) or Scan Backward For Changes features. You must be in Normal View to show the changes.

Inserted text is shown in the [assigned](#) editor color. When replacing steno or text, the replaced item is considered deleted. The replacement text is considered an inserted change. Global definitions, undo last global, layout changes and filling in fields are not tracked and are not indicated. If, however, you use the Undo Global Once command, the action is recorded a Replace. The display color for changes made with Undo feature depends upon the resulting action. For example, if you delete a word but then Undo it, the change displays in the editor color because Undo inserts the word back into the transcript. If you type a word and then Undo it, the change displays in the deletion color because the Undo removes the word from the transcript. Deleted text is indicated by the assigned deletion color regardless of the editor. Depending on type of deletion, the color block displays as a space or in the first letter of the following word.

The user that makes the first changes to the transcript is Editor 1 and changes display in the assigned color for Editor 1. If you exchange files with another Case CATalyst user, multiple editor colors display. Changes made by the first person to edit the file display in the color assigned to Editor 1, while changes for the next person to edit the file display in the color assigned to Editor 2. Color assignments are available for up to five editors. For example, Track Changes is active when the reporter makes small changes to the transcript before sending the transcript to the scopist. The change is recorded in the default color, Light Green, assigned to Editor 1. The reporter sends the file to the scopist. The scopist becomes the second editor. When the transcript is returned to the reporter, scopist changes are displayed in the default, Light Blue, color assigned to Editor 2.

It is important to remember that the current user name identifies the editor of the tracked changes unless a name is specified in Application/Computer option, [Editor ID](#). The *Editor ID* option allows you to specify an editor name, however, the editor name applies to all users on the system who select to use the Track Changes feature.

To view a summary of all the changes, use the [Track Changes pane](#). The Track Changes pane allows you to view and sort the changes by change, page or editor.

To display changes in the transcript, select **View/Display Changes**.

## Global Commands

Case CATalyst contains several global commands that allow you to create and manage [global definitions](#), or globals, while editing. Globals are steno-based words or phrases that you define once and are automatically applied to all occurrences from that point through to the end of the job, to the entire file if selected or only to selected items. You can define untranslates, mistranslates, partial translates which include translated words and untranslates, or conflicts. You can also press **Shift + F10** (right click) when your cursor is in the New Text field and the [right click menu](#) displays additional actions such as number conversion, surrounding quotes, surrounding commas, etc.

If you write realtime via a Luminex or Diamante (v 2.x or higher) WiFi or USB connection, D-defines created in Case CATalyst are sent to the Luminex or Diamante. The define applies at the current location in the Luminex or Diamante file and is stored in the Luminex or Diamante dictionary memory and applies to all jobs on the Luminex or Diamante until the dictionary memory is cleared. (Please see your steno machine's user guide for instructions on clearing the writer's dictionary memory.) J-defines made on the Luminex or Diamante apply at the current location in the Luminex or Diamante file, are sent to the file's job dictionary, stored in the dictionary memory and are sent to the Case CATalyst's realtime file job dictionary and [Global Table](#).

## Global Definitions

Global definitions, or globals, let you define steno-based words or phrases or plain text (E-defines) once and then automatically apply the definition to all occurrences from that point through to the end of the job, to the entire job or selected occurrences. You can define untranslates, mistranslates, partial translates (translated words and untranslates), or conflicts. Global definition types include: D-Define, K-Define, J-Define, E-Define and Other Dictionary. Defines are created using the edit command of the same name. You can define globals during Manage Notes, Edit, or during realtime translation. You can also press **Shift + F10** (right click) when your cursor is in the New Text field and the [right click menu](#) displays additional actions such as number conversion, surrounding quotes, surrounding commas, etc.

When you create a global, Case CATalyst automatically applies it forward through to the end of document. When writing realtime, globals apply to any incoming text. To apply globals backward in the file, select the Entire File option in the Global Define dialog box when defining. When you select Entire File, globals apply forward and backward. When writing realtime, you can use the Power Define feature to apply globals forward and backward in the file and to all incoming text. To apply globals backward in the file, use the [Apply All Globals Backward](#) command.

When you create a global using the [Selective](#) option, Case CATalyst stops on the first occurrence affected by the global change. You can choose to apply the change to this occurrence, all occurrences, to the current Section only, skip the occurrence and go to the next occurrence or take no action and return to Edit. If you apply the change to all occurrences, the global is no longer selective. The Entire File option is ignored when using the Selective option but selecting Entire Section does apply the global to **all** occurrences in the current section. Selective globals (not Entire Section) do not apply to previous text. The selective global starts at the current cursor location, moves forward in the file until CATalyst is finished applying the selective global. Click OK in finished dialog box and the cursor returns to the location where the global was started.

When you create a global using the [Suggest](#) option displays a list of up to ten possible text definition for the steno displayed in the Global Definition dialog box. You can set Case CATalyst to automatically display the Suggestion list by checking the *Open with Suggestions* option.

If you are a scopist and want to create a special global table of common defines that the reporter might misstroke or that you use when editing, you can use the Add to [Xtra Global Table](#) option.

When writing realtime, globals apply to any incoming text. You can use the [Power Define](#) feature to apply globals forward and backward in the file and to all incoming text. Selective globals do not apply to new realtime text. If a selective global changes to no longer be selective, the global then applies to new realtime text.

You can create new definitions for future translations from the current steno outline. Select Generate All Possible Misstrokes in the global definition dialog box to generate misstroke definitions and place them in the destination dictionary. The current steno outline and text definition go to the Global Table and apply through the rest of the current captioning file in the History window. The generated misstroke definitions do not apply to the open file. Before generating misstroke definitions, Case CATalyst checks the Personal Dictionary to avoid creating conflicting entries.

Selecting the Endings option in the global definition dialog box also allows you to create new definitions for future translations from the current steno outline. Case CATalyst analyzes the word in the Text field to see if a " G", " S" or " D" steno outline could be added to the word. If so, then Case CATalyst generates suggested definitions with the endings.

Case CATalyst places a global define into the global table and, with the exception of E-Defines, into the appropriate dictionary. An E-Define only goes into the global table. Case CATalyst handles global dictionary definitions as follows:

- A D-Define goes directly into your Personal Dictionary unless you select to use the [Update Area](#) in the Dictionary options. A new D-Define applies during translation and is added to your Personal Dictionary the next time you open it.
- A K-Define goes into the associated case dictionary, the dictionary with the same name as the case. The current job must be in a case in order to create a K-Define.
- A J-Define goes into the associated job dictionary, the dictionary with the same name as the job. You can select a different job dictionary by pressing selecting Other Dictionary in the Global Type field.
- An Other Dictionary define goes into a selected alternative dictionary.

If you write realtime via a Luminex or Diamante (v 2.x or higher) WiFi or USB connection, D-defines created in Case CATalyst are sent to the Luminex or Diamante. The define applies at the current location in the Luminex or Diamante file and is stored in the Luminex or Diamante dictionary memory and applies to all jobs on the Luminex or Diamante until the dictionary memory is cleared. (Please see your steno machine's user guide for instructions on clearing the writer's dictionary memory.) J-defines made on the Luminex or Diamante apply at the current location in the Luminex or Diamante file, are sent to the file's job dictionary, stored in the dictionary memory and are sent to the Case CATalyst's realtime file job dictionary and [Global Table](#).

### D-Define

D-Define (Ctrl + d) is a default command used to define untranslated steno outlines or steno outlines and text. Use D-Defines for common words or phrases that you want in your Personal Dictionary (referred to in some software packages as main dictionary) to use each time you translate. You can only D-Define words or phrases that have steno associated with them. You cannot D-Define typed words or phrases you insert unless you use the [Text to Dict Define](#) command.

The D-define command globally changes the steno-based words from the point in the job you create the global through to the end of the job or throughout the entire file or only selected items depending on the option selected. It also puts the definition into the Global Table and, depending on your Dictionary Options, into your Personal Dictionary or the Update Area, if selected for use.

If you write realtime via a Luminex or Diamante (v 2.x or higher) WiFi or USB connection, D-defines created in Case CATalyst are sent to the Luminex or Diamante. The define applies at the current

location in the Luminex or Diamante file and is stored in the Luminex or Diamante dictionary memory and applies to all jobs on the Luminex or Diamante until the dictionary memory is cleared. (Please see your steno machine's user guide for instructions on clearing the writer's dictionary memory.) J-defines made on the Luminex or Diamante apply at the current location in the Luminex or Diamante file, are sent to the file's job dictionary, stored in the dictionary memory and are sent to the Case CATalyst's realtime file job dictionary and [Global Table](#).

[Click here to create a D-define.](#)

## E-Define

E-Define (Ctrl + e) is a command used to define untranslated steno outlines and/or text that does not have associated steno, such as scan stops or typed words or phrase you have inserted. For example, you reported a proceeding where they referred to Mr. Smith throughout the job. While editing, you realize that Mr. Smith is actually spelled Mr. Smyth. You can E-define all occurrences of Mr. Smith to Mr. Smyth and CATalyst only looks at the matching text and changes those that match. You can also replace one format symbol with another. For example, you use <Index Heading On A>. format symbols for an Exhibits number and <Index On A> for the description. In the current job, you don't have to report the descriptions on the index page so you could E-Define <Index Heading On A> to be <Index On A> if you have a job that doesn't require a description for exhibits.

The E-define command globally changes the words from the point in the job you create the global through to the end of the job, throughout the entire file or to selected items depending on the option selected. It also puts the definition into the Global Table. The definition is NOT put into a dictionary. You can create [E-defines on the fly](#) using the {Text E-Define} realtime command.

To create a case sensitive E-Define, select the Case Sensitive option so that the E-Define is applied to words that match the case of the word in the Old Text field. If you do not select this option, Case CATalyst changes all occurrences of the word in the Old Text field regardless of case. For example, to change Mark to Marc throughout the job without changing the word "mark", you could select the Case Sensitive option and type "Marc".

Case CATalyst interprets words which are automatically initial caps, such as the first word following a Q or A symbol, as lower case words. Case CATalyst only recognizes the word as initial capped when:

- You type it initially capped.
- It is initial capped as a dictionary entry.
- It is initial capped as the result of a Cap Previous command or Cap Next command.

If the Apply E-Defines to Typed Text option is active, E-defines apply to:

- Include files
- Appended files
- Auto Include files
- Realtime data

Apply E-defines to Typed Text never applies to:

- Restored text (Ctrl + z)
- Number converted text (Ctrl + n)

[Click here to create an E-define.](#)

## J-Define

A J-Define (Ctrl + j) is a command used to define untranslated steno outlines or steno outlines and text. Use J-Defines for words or phrases that you want in your job dictionary. You can only J-Define words or phrases that have steno associated with them. You cannot J-Define any typed words or phrases you have inserted unless you use the [Text to Dict Define](#) command.

The J-define command globally changes the steno-based words from the point in the job where you create the global through to the end of the job, throughout the entire the file or to selected items, depending on the option selected. It also puts the definition into the Global Table and into the Job dictionary.

If you write realtime via a Luminex or Diamante (v 2.x or higher) WiFi or USB connection, J-defines created in Case CATalyst are sent to the Luminex or Diamante. The define applies at the current location in the Luminex or Diamante file and is stored in the Luminex or Diamante dictionary memory and apply to all jobs on the Luminex or Diamante until the dictionary memory is cleared. (Please see your steno machine's user guide for instructions on clearing the writer's dictionary memory.) J-defines made on the Luminex or Diamante apply at the current location in the Luminex Diamante file, sent to the file's job dictionary, stored in the dictionary memory and are sent to the Case CATalyst's realtime file job dictionary and [Global Table](#).

By default, Case CATalyst uses the job dictionary of the same name as the file for J-Defines. You can choose a different job dictionary by selecting Other Dictionary (Ctrl + Shift + o) in the Global Type field of the global definition dialog box. The selection is remembered for the current session. You can also change the default job dictionary for this job using the [Change Job Dictionary](#) feature.

[Click here to create a J-define.](#)

## K-Define

A K-Define (Ctrl + k) is a command used to define untranslated steno outlines or steno outlines and text. Use K-Defines for words or phrases that you want in your Case Dictionary. You can create K-Defines only if the current job is in a case and if the words or phrases have steno associated with them. You cannot K-Define any typed words or phrases you insert unless you use the [Text to Dict Define](#) command.

The K-define command globally changes the steno-based words from the point in the job you create the global through to the end of the job, throughout the entire file or to selected items, depending on the option selected. It also puts the definition into the Global Table and into the Case dictionary.

If you write realtime via a Luminex or Diamante (v 2.x or higher) WiFi or USB connection, K-defines created in Case CATalyst are sent to the Luminex or Diamante. The define applies at the current location in the Luminex or Diamante file and is stored in the Luminex Diamante dictionary memory and apply to all jobs on the Diamante until the dictionary memory is cleared. (Please see your steno machine's user guide for instructions on clearing the writer's dictionary memory.) J-defines made on the Luminex or Diamante apply at the current location in the Luminex or Diamante file, sent to the file's job dictionary, stored in the dictionary memory and are sent to the Case CATalyst's realtime file job dictionary and [Global Table](#).

Case CATalyst automatically uses K-Defines during translation on any job file translated within the Case. Using a Case dictionary can be useful when you have several jobs in the same Case. You can apply steno and text defines to an entire Case to eliminate the need to copy the day one job dictionary to the day two job dictionary so that all those entries can apply to the day three job.

---

[Click here to create a K-define.](#)

## Other Dictionary Define

An Other Dictionary Define (Ctrl + o in the global dialog box) is a command used to define untranslated steno outlines or steno outlines and text. Use Other Dictionary Defines for words or phrases that you want in a dictionary. You can only use the Other Dictionary Define for words or phrases that have steno associated with them. You cannot Other Dictionary Define any typed words or phrases you have inserted unless you use the [Text to Dict Define](#) command.

An Other Dictionary define allows you to place a dictionary define into any dictionary used to translate the current job, another existing job dictionary or a new job dictionary. For example, you have a medical word that you would like to define but not necessarily put in your Personal Dictionary or the current job dictionary. Using Other Dictionary, you can place your define in your Medical job dictionary. Case CATalyst remembers your Other dictionary selection for the current session.

If you write realtime via a Luminex or Diamante (v 2.x or higher) WiFi or USB connection, O-defines created in Case CATalyst are sent to the Luminex or Diamante. The define applies at the current location in the Luminex or Diamante file and is stored in the Luminex or Diamante dictionary memory and apply to all jobs on the Luminex or Diamante until the dictionary memory is cleared. (Please see your steno machine's user guide for instructions on clearing the writer's dictionary memory.) Other Dictionary defines made on the Luminex or Diamante apply at the current location in the Luminex or Diamante file, sent to the file's job dictionary, stored in the dictionary memory and are sent to the Case CATalyst's realtime file job dictionary and [Global Table](#).

The Other Dictionary command globally changes the steno-based words from the point in the job where you create the global through to the end of the job, throughout the entire the file or only to selected items , depending on the option selected. It puts the definition into the Global Table and into the other selected dictionary.

[Click here to create an Other Dictionary define.](#)

## Create a Global Definition

Complete the following steps to create a D-Define, K-Define, J-Define, E-Define or Other Dictionary definition. Depending on the type of define, not all options are available. For example, the Case Sensitive option is only available when creating an E-define but the Suggest option is not available when creating an E-define.

When writing realtime via USB or WiFi connection using Case CATalyst V13 or higher and the Luminex and Diamante V2.0 or higher, J-Defines made on the Luminex or Diamante, including used briefs, are automatically sent to the global table of the Case CATalyst realtime file. Any dictionary definitions made in the Case CATalyst realtime file, including D-Defines, J-Defines, K-Defines and Other Defines, are automatically sent to the Luminex or Diamante. The exchanged definitions apply from the point of creation forward to all new realtime steno written.

## Steps to Create a Global Definition

1. Place the cursor immediately before the word, on the word, or mark the steno or text you want to define.
2. Press one of the following:
  - **Ctrl + d (D-Define)**. The Global – D-Define dialog box displays.

- **Ctrl + k (K-Define)**. The Global – K-Define dialog box displays.
  - **Ctrl + j (J-Define)**. The Global – J-Define dialog box displays.
  - **Ctrl + e (E-Define)**. The Global – E-Define dialog box displays.
  - **Ctrl + Shift + o (Other Dictionary)**. The Global – Other Dictionary dialog box displays.
3. Make necessary entries:

#### **Old Text**

The selected steno/text to global.

#### **Steno**

The steno for the steno/text selected to global. This field is unavailable for E-Defines.

#### **Mark/Unmark Left**

Press **Alt + [** (left bracket) to expand the marked selection to the left in the Old Text field.

Press **Alt + ]** (right bracket) to deselect the marked selection to the left in the Old Text field.

#### **Mark/Unmark Right**

Press **Alt + Right Arrow** or **Ctrl + g** to expand the marked selection to the right in the Old Text field. Press **Alt + Left Arrow** to deselect the marking in the Old Text field.

#### **New Text**

The cursor defaults to the *New Text* field when defining. Type the new text, including any format symbols you want to global. The following options are available:

Press **F9** to add [extended characters](#).

- To copy the old text to the *New Text* field, press **F6**.
- To toggle through the last ten typed replacement text, press **Ctrl + r** with the cursor in the *New Text* field; or **Ctrl + Shift + r** to toggle backwards through the selection.
- Press **Shift + F10** (or right click in the *New Text* field) to display the [Right Click menu](#) options. Most Right Click menu items can be invoked used without displaying the menu.

When the Open with Suggestions option is checked, a list of up to 10 suggestions display when the Global dialog box opens. To select a suggestion, press the associated suggestion number or arrow up or down to highlight a suggestion and press **Enter**. To clear the suggestion list, press any other key, such as Esc.

When the option, [Spell Check While Defining](#) is not active, press **Shift + F7** to Spell Check the word in the *New Text* Field. To look up a definition, press **Ctrl + F7**.

#### **FS (Alt +f)**

Display the list of available [format symbols](#). To always display the format symbol list, check the box, Always Show Format Symbols. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. You can also use shortcut keys to insert a format symbol. Place the cursor in the *New Text* field, press **F4** and then press the appropriate letter or symbol.

#### **Insert Field (Alt + i)**

Display the [Insert Field](#) dialog box from which you can select a field to insert into the text portion of the definition.

### Cap (Alt + a)

Copy the text in the *Old Text* field to the *New Text* field and cycle through three Cap/Uncap options for the text in the *New Text* field. Cap applies the capping options to the text. You can also use the Ctrl + F5 method to cycle through the capping options. The capping options include:

- Capitalize the first letter in a word or phrase, except for words in the "Words to suppress capping when found in the middle of the phrase" list. This option is available in the Advanced Edit dialog box.
- Capitalize all the letters in a word or phrase.
- Uncap the letters in a word or phrase.

### Conflict (Alt + o)

This option is available when a conflict is part of the Old Text. When you select Conflict, Case CATalyst copies the text from the Old Text field to the New Text field, automatically choosing the first conflict. If you select Conflict a second time, Case CATalyst chooses the second conflict. If additional conflict choices exist, select Conflict until the desired choice displays in the New Text field. When more than one conflict exists in the Old Text field, your selection applies to all the conflicts.

### Suggest (Alt + u)

Display a list of up to ten possible text definitions for the steno in the *Steno* field. Click on a selection or press the associated number to insert the entry into the *New Text* field. If you do not want to select a suggestion, type the correct text; or press ESC or ALT. The suggestion list closes and places the cursor focus in the *New Text* field. To automatically display the Suggestion list when the Global dialog box opens, select the *Open with Suggestions* option. The list of suggestions is not available when E-Define or Replace is selected in the *Global Type* field.

Suggested definitions display based on current globals, dictionaries used to translate the job, dictionary entry usage count, recently used data, drag/drop and stacking possibilities and spell checked phonetic suggestions based on the current Phonetic Table. When editing on a computer other than the one on which the job was originally taken, you must have all dictionaries and the phonetic table used during translation.

### Open with Suggestions

Automatically display a list of up to ten possible text definitions for the steno in the *Steno* field when the Global Define dialog box opens. The change applies the next time the Global Define dialog box displays. This option is not available when Replace is selected in the *Global Type* field.

If you do not select this option, you can manually display the list by selecting *Suggest* in the Global Define dialog box. If you are using macros or AccelerWriters to open a Global Define dialog box, do not select this option. Use a key combination, such as **Alt + u** to manually select *Suggest* to display the suggestion list.

### Endings (Alt + n)

When you type a word in the *New Text* field, Case CATalyst analyzes the word to determine if a " G", " S" or " D" steno outline could be added to the word. If so, then Case CATalyst

activates the Endings button. Edit's [Plural Endings](#) Option setting also applies to the Endings feature. The Plural Endings option allows you to set the final S, final Z or both as keys you write to indicate a plural.

The Global Endings dialog box displays when the Endings button is selected. You can choose any of the suggested definitions to add to your dictionary. For example, you have REPT in the Steno field and type "represent" in the Text field. The following suggested entries display when you select Endings:

REPTD = represented

REPTS = represents

The word "representing" is not suggested because the final "g" comes before the final "t" in the original steno outline.

### Spaces

When two or more words display in the Old Text field, the Spaces option is available. Spaces copies the text to the New Text field and toggles the placement of a [<Sticky Space>](#) format symbol between words, removes the spaces between words and returns to the original state. Spaces is also available when you type two or more words in the New Text field.

### Stitch (Alt + -)

Copy the text in the *Old Text* field to the New Text field and place hyphens between each word. Stitch is also available when you type words in the *New Text* field. If there is one word, the letters are hyphenated, if there are two words, the words are hyphenated. If you press Alt + hyphen again, CATalyst toggles to the hyphens being removed.

If there are three or more words, a drop-down list displays with different stitch choices. For example, if the highlighted words are unique CATalyst features, the drop-down list displays. You can select the number of the choice you want or click the choice:

unique-CATalyst-features

unique-CATalyst features

unique CATalyst-features

Using the above three examples, you can press Alt + , (comma), a list displays. You can select the number of the choice you want or click the choice:

, unique CATalyst features,

, unique CATalyst, features

unique, CATalyst features

Using the above three examples, you can press Alt + " (quote symbol) a list displays. You can select the number of the choice you want or click the choice:

"unique CATalyst features"

"unique CATalyst" features

unique "CATalyst features"

### Global Type

The type of define originally selected displays. To select a different type of global define, choose from the drop down box, or press **one** of the following key combinations. When you D-Define, K-Define, or J-Define the entry, the correct steno must display in the *Steno* field.

- **Alt + d** (D-Define)
- **Alt + k** (K-Define) - if the file is in a case.
- **Alt + j** (J-Define)

- **Alt + e** (E-Define) - does not place the global definition into a dictionary.
- **Alt + r** (Replace) - for this occurrence only.
- **Ctrl + Shift + o** (Other Dictionary) - send job dictionary defines to an alternative dictionary.

### Pick Other Dictionary

Send job dictionary defines to an alternative dictionary when making an O-Define. Select a current dictionary from the drop down list or use **Browse** to choose another dictionary. Depending on your [Global options](#) settings, Case CATalyst remembers your selection for the current session or for every job. This field displays when you select Other Dictionary in the Global Type field.

### Entire File (Alt + l)

Check this box to apply the global change forward and backward throughout the job.

### Case Sensitive (Alt + v)

When making an E-Define, check this box for Case CATalyst to change any occurrence of the word in the *Old Text* field only when it matches the same upper and lower case letters as the text in the *New Text* field. Uncheck this box, to change all occurrences of the word in the *Old Text* field regardless of the case.

This option is only available for E-Defines.

### Selective (Alt + s)

Check this box to have Case CATalyst mark the global as [Selective](#) and identify it in the Global Table. Case CATalyst stops on the first occurrence affected by the global change. You can choose to apply the change to this occurrence, all occurrences, to the current Section only, skip the occurrence and go to the next occurrence or take no action and return to Edit. If you apply the change to all occurrences, the global is no longer selective. The Entire File option is ignored when using the Selective option but selecting Entire Section does apply the global to **all** occurrences in the current section. Selective globals (not Entire Section) do not apply to previous text. The selective global starts at the current cursor location, moves forward in the file until CATalyst is finished applying the selective global. Click OK in finished dialog box and the cursor returns to the location where the global was started.

To prevent selective globals from being added or pasted when using the [Add Other Globals](#) command or when marking and copying globals from one table to another, check the Global Table [option](#), *Exclude Selective Global*.

### Quick add to Personal Global Table (Alt + q)

Check this box to add the definition to the [Personal Global Table](#).

This option is only available for E-Defines.

### Add to Xtra Global Table (Alt + x)

Check this box to have Case CATalyst send the global to its destination (based on the type of global) and to the [Xtra Global Table](#). The Xtra Global Table is a feature that allows scopist or reporters to make defines while editing a transcript and send specific globals to an additional global table that can be applied when needed. For example, there might be a few phrases or specific terminology that the reporter occasionally misstrokes and the scopist is globaling these same steno outlines in multiple jobs. While defining, the scopist defines the steno as usual and then selects the Add to Xtra Global Table option in the Global dialog box. The global is sent to the destination (based on the type of global) and sent to the Xtra Global Table at the same time. The scopist can apply the Xtra Global Table while editing any transcript by pressing **Alt + g, x** ([Apply Xtra Global Table](#)).

### Generate All Possible Misstrokes (Alt + m)

Check this box to have Case CATalyst generate definitions in the designated dictionary based on all the possible misstrokes of the original steno outline. Only the original steno outline goes into the current Global Table. All misstrokes are available for future translations.

Case CATalyst generates a definition provided the generated misstroke does not conflict with an existing entry in the Personal Dictionary. For example, you define /SROEUS as "voice" with Generate All Possible Misstrokes selected. Case CATalyst also creates a dictionary definition for the following steno outlines as "voice": /SROUS, SROES, and /SROS. The steno outline, /SRAOEUS already has a definition in your Personal Dictionary as "vice", so Case CATalyst did not generate /SRAOEUS as a misstroke.

By default, this option is not selected when you open the Global define dialog box. You can [change](#) the default so that the Global define dialog box displays with Generate All Possible Misstrokes selected. A separate default setting for D-Defines, J-Defines, and K-Define can be set.

This feature does not apply to E-Defines.

### Add 2 Cat Scratch (Alt + 2)

Selecting this option results in the steno and text of the global being added to the Steno/Text section of the Cat Scratch pane. The Add 2 Cat Scratch option is not remembered regardless of Remember selected options for D, J, K and O defines status in the Advanced Global Options dialog box.

This feature does not apply to E-Defines.

4. When finished defining, do **one** of the following:
  - Press **Enter (OK)** to apply the definition.
  - Press **F8** to apply the definition and scan to the next untranslate.

## Global Definition Dialog Box Shortcut Keys

- |         |   |
|---------|---|
| F4 + #  | Insert EZ Text into the <i>New Text</i> field.        |
| F6      | Copy the old text to the <i>New Text</i> field.       |
| F9      | Add extended characters to the <i>New Text</i> field. |
| F11 + # | Copy clipboard text to the <i>New Text</i> field.     |

- 
- Alt + 2 Copy text in the *New Text* field to the Text portion of the Cat Scratch pane.
  - Alt + - Stitch the text in the *New Text* field. If more than two words are in the Text field, CATalyst displays a drop-down list of hyphenated options.
  - Alt + , CATalyst displays a drop-down list of comma placements depending on the number of words in the Text field.
  - Alt + " CATalyst displays a drop-down list of quote placements depending on the number of words in the Text field.
  - Alt + → Expand the marked text to the right.
  - Alt + ← Deselect the marked text from the right.
  - Alt + [ Expand the marked text to the left.
  - Alt + ] Deselect the marked text from the left.
  - Alt + a Copy the old text to the *New Text* field and cycle capitalization options.
  - Alt + f Display the list of available format symbols.
  - Alt + i Insert a field into the *New Text* field.
  - Alt + l Apply the global change forward and backward throughout the job.
  - Alt + m Generate all possible misstrokes.
  - Alt + n Activate the Endings button.
  - Alt + o When the old text contains a conflict, copy the text from the *Old Text* field to the *New Text* field, automatically choosing the first conflict.
  - Alt + q Add the definition to the Personal Global Table.
  - Alt + s Mark the global as Selective.
  - Alt + u Display a list of up to ten possible text definitions for the steno in the *Steno* field.
  - Alt + v Change occurrences of the word in the *Old Text* field only when it matches the same upper and lower case letters as text in the *New Text* field
  - Ctrl + g Expand the marked selection.
  - Ctrl + r With the cursor in the *New Text* field, toggle through the last ten typed replacement words.
  - Ctrl + F7 Spelling Lookup.
  - Ctrl + Shift + r With the cursor in the *New Text* field, toggle backward through the last ten typed replacement words.
  - Shift + F7 Spell check the word in the *New Text* field when the option, [Spell Check While Defining](#), is not active.
  - Shift + F10 Display the Right Click menu options for the New Text field.

## Add to Xtra Global Table option

The Xtra Global Table option (available in the Define dialog box) was originally created to assist scopists that worked with dictionaries that were not continually updated with new definitions. For example, let's say the scopist gets a transcript from a reporter and while scoping, comes across "enter containment" with the steno SPWER/TAEUPLT. The scopist defines the steno correctly as "entertainment" and when finished with the job, sends the job and defines back to the reporter. For whatever reason, the scopist continues to get jobs from the reporter with words or phrases that have been correctly defined by the scopist but the reporter's dictionary never was updated. As a result, the scopist is continually defining the same words/phrases over and over again in multiple jobs. When you check the add to Xtra Global Table option in a define dialog box, CATalyst will add the definition to the current job and selected dictionary if applicable, but also will add the definition to the Xtra Global Table. The scopist can apply the Xtra Global Table to all future jobs the scopist receives from the reporter and the result is a better translation because defines are applied even though the reporter never updated her/his dictionary.

Although the Xtra Global Table was originally designed for scopists, reporters may find it useful also. For example, let's say the reporter has made some e-defines while editing and has also added them to the Xtra Global Table. The reporter can select the Xtra Global Table to help translate future jobs so the e-defines apply to the text during translation on future jobs.

When making a global and selecting the Add to Xtra Global Table option, the definition is sent to the correct destination (based on the type of global being made) and is sent to the Xtra Global Table with the same global type. The Xtra Global Table is automatically created in the user's System Files case the first time the Add to Xtra Global Table option is selected in the global dialog box. In an effort to keep the Xtra Global Table efficient, duplicate entries are removed.

### Creating a global and sending it to the Xtra Global Table

1. Create a global as usual.
2. To send the entry to the Xtra Global Table, press **Alt + x** (Add to Xtra Global Table).
3. Press **Enter** to complete the global. The global is sent to the destination (based on the type of global) and sent to the Xtra Global Table.

If this is the first time you selected the Xtra Global Table option, the Xtra Global Table is created in your System Files case.

**Please note:** The **Alt + g, x** accelerator key was previously assigned to the Text List Brief It command. The accelerator key for Text List Brief It is now **f** (**Alt + g, f**).

## Global Right Click menu

When defining or replacing in the Global dialog box, with your cursor positioned in the New Text field, you can press **Shift + F10** or right click and select a multitude of additional actions to be applied to the text in the New Text field. Stenograph has received a variety of requests to be able to global selected text and perform an action on the text without retyping it, such actions as number conversions, suggesting capitalization options where the word "and" is changed to an ampersand (&) and more. Some of the actions are already available with keyboard commands but many users are not aware of the commands. Due to the limited amount of space in the Global dialog box and limited number of

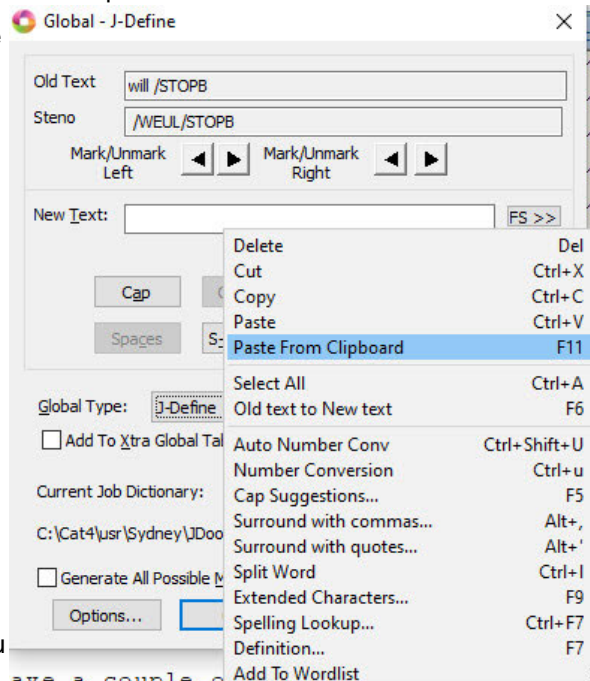

accelerator keys available, the right click menu fulfills most requests.

To display the right click menu, use your right mouse button or press **Shift + F10**. If you know the shortcut key for the command, you can simply press the shortcut key and eliminate displaying the right click menu.

Available right click actions based on the text in the New Text field. Right click short cuts can be used (except where noted) in the Global dialog box without displaying the Right Click menu:

- Delete - press **Del** or from the right click menu press **d** -- this action deletes all text in the New Text field.
- Cut - press **Ctrl + x** or from the right click menu press **t** -- this action deletes the selected text in the New Text field and retains it for pasting until other text is cut or copied.
- Copy - press **Ctrl + c** or from the right click menu press **c** -- this action copies the selected text in the New Text field and retains it for pasting until other text is cut or copied.
- Paste - press **Ctrl + v** or from the right click menu press **p** -- this action places the most recent copied or cut text in the New Text field.
- Paste From Clipboard - Press **F11** or from the right click menu click the Paste From Clipboard option. -- this action lets you quickly paste text you've placed on your [Case CATalyst Clipboard](#) into the New Text field of a define dialog. After pressing **F11** or selecting the Paste From Clipboard right click menu option, type the Clipboard Number associated to what you'd like pasted into the New Text field. The valid numbers are 0 - 9.
- Select All - press **Ctrl + a** or from the right click menu press **a** -- this action marks all the text that is in the New Text field.
- Old text to New text -press **F6** or from the right click menu press **n** -- this action brings the text in the Old Text field down to the New Text field. This action is not new to Case CATalyst but many users are not aware that **F6** can be pressed to bring the Old Text to the New Text field. Why might you use this action -- if the text in the Old Text field is spelled correctly and just needs something added to the end of the text, you can save time and energy by pressing **F6** and copying it to the New Text field rather than retyping the text.
- Auto Number Conv(ersion) - press **Ctrl + Shift + u** or from the right click menu press **v** -- this feature brings down the old text to the New Text field and uses the keywords in your NumberConversion.ini file to convert the number and/or words based on the text in the New Text field. For example, if you have "25 hundred dollars" in the New Text field and you select Auto Number Conv, the result will be "\$2500." If the New Text field contained 15 red river Drive, selecting Auto Number Conv would result in 15 Red River Drive. This option allows you to use the automatic number conversion feature and global it throughout the transcript.
- Number Conversion - press **Ctrl + u** or from the right click menu press **m** -- this feature displays Edit's Number Conversion (**Ctrl + u** while editing) dialog box with a list of conversion formats. For example, let's say "twelve thousand four hundred sixty-eight" is repeated throughout the transcript. Instead of highlighting the entire number and pressing **Ctrl + u** to convert each occurrence, you can

simply highlight the number, define/global, press **Ctrl + u** and display the same conversion list and global it throughout the transcript.

- Cap Suggestions - press **F5** or from the right click menu press **g--** this feature displays a list of capitalization suggestions along with capitalization suggestions that change the word "and" to an ampersand (&). Although the right click menu is available, **F5** can be used directly from the Global dialog box. **Alt + a** and **Ctrl + F5** are still available in the global dialog box to cycle through the usual capitalization options.

- Surround with commas - **Alt + ,** (comma) or from the right click menu, press **s** -- this feature displays a list of suggested comma placements based on the words in the New Text field. Once you select a suggestion, it is globalized in the transcript. This is not a new feature in the Global dialog box as **Alt + ,** (comma) in the Global dialog box will bring down the same suggestions.
- Surround with quotes - **Alt + '** (apostrophe) or from the right click menu, press **r** -- this feature displays a list of suggested quote placements based on the words in the New Text field. Once you select a suggestion and complete the global, it is globalized in the transcript.
- Split word - press **Ctrl + I** (L) or from the right click menu, press **I** (L) -- this feature displays a list of words that can be made from a compound word and allows you to globalize the split words. For example, if the word in the New Text field is "background", the list displays "back ground". This feature uses the same split word logic as Edit's Split Compound Word feature.
- Extended Characters - **F9** or from the right click menu, press **x** -- this action displays the Insert Character dialog box which allows the insertion of extended ASCII characters or symbols. F9 is active from the Global dialog box and also from the right click menu. F9 is not new to Case CATalyst but many users may not be aware of the feature so we added it to the right click menu.
- Spelling Lookup - **Ctrl + F7** or from the right click menu, press **e** -- invokes the Spelling Lookup feature on a word in the New Text field depending on the cursor location. Ctrl + F7 is not a new feature to Case CATalyst but was added to the right click menu to make users aware of its availability.
- Definition - **F7** or from the right click menu, press **f** -- highlight a word in the New Text field and check the definition. The Merriam-Webster Dictionary dialog box displays the definition, if available.
- Add To Wordlist - from the right click menu only, press **w** -- this action allows you add words to your personal, job or case (if in a case) directly from the New Text field. Rather than waiting for spellcheck to tell you something is misspelled, you can add the word right at the time you are defining it.

## Add Other Globals

Add Other Globals allows you to copy global definitions from another job to your current job and place the globals into the global table of the current job. You can select individual globals or all the globals. The added globals automatically apply when other globals apply. If you only apply the globals forward and then later decide you want to apply them backward, use the [Apply All Globals Backwards](#) command.

When you add globals using the Add Other Globals command, any globals previously identified as [selective](#) are no longer considered selective and Case CATalyst no longer stops on each occurrence. To prevent selective globals from being added or pasted when using the Add Other Globals command or when marking and copying globals from one table to another, check the Global Table [option](#), *Exclude Selective Global*.

## Select and Add Globals from Another Job

1. In Edit, press **Alt + g, a** (**Global/Add Other Globals**). The Add Other Globals dialog box displays. When editing a job inside a case, the Open dialog box defaults to displaying global tables contained within the same case.
2. Make necessary entries:

### Look in

Defaults to the current user. To select a global file from a different case or user, click the Up One Level  icon, to select a different user.

### Available Files Window

Select a global file. If the file is in a Case, first open the case. The selected file displays in the File name field below. You can also type the name of the file in the File name field.

### File name

The global file selected to open. Type a file name or select a file from the list.

### Files of type

Identifies the file type that displays in the Available Files Window. The default is Global Files (.sgglb).

### Browse

Locate a different folder outside of Case CATalyst.

3. Press **Enter (Open)**. The selected Global Table displays.
4. Select globals to add to the global table and apply to the open job. Do **one** of the following:

#### Select one entry

Highlight the entry for selection.

#### Select specific entries

Press and hold **Ctrl** while you click the individual entries to highlight.

#### Select a consecutive group of entries

Click to highlight the first entry of the group. Locate the last entry you want to select. Press and hold **Shift**, while you click the last entry. Case CATalyst highlights all the entries between the first and last selected entry.

#### Select all the entries

Press **Ctrl + a (Select All)** to highlight all the entries.

5. Add and apply the scope of selected globals. Do **one** of the following:

#### Forward Only

Add the globals to the global table and apply the selected globals forward in the file, from the point of your cursor.

#### Entire File

Add the globals to the global table and apply the selected globals forward and backward throughout the job.

#### Cancel

Do not apply any globals and close the Add Globals dialog box.

## Apply All Globals Backwards

When you make a D-Define, E-Define, J-Define, K-Define or Other global, by default, the global applies forward from the point you create it through to the end of the job but does not apply to previous transcript. Apply All Globals Backwards allows you to apply all globals backward in the job. The global remains active for new text, such as realtime. A global marked as "[selective](#)" does not automatically apply backward.

To apply only certain globals backward open the [Global Table](#). Choose the desired globals and use the Global Table, Apply Backward feature. The globals remains active for new text, such as realtime.

If you select the option, *Entire File*, when creating a global definition, then the global automatically applies both forward and backward in the file.

To apply all globals backward, press **Alt + g, g (Global/Apply All Globals Backward)**.

## Apply Personal Globals

Case CATalyst, by default, automatically corrects mistyped words while editing based on entries in the [Personal Globals](#) table. The Apply Personal Globals feature allows you to correct mistyped words in a previously translated file.

The *Use Personal Globals* option in [Advanced Global Options](#) must be active to use the Personal globals features. By default, this option is active.

## Apply Personal Globals to a Translated File

1. Open the transcript in Edit.
2. Press **Alt + g, p (Global/Apply Personal Globals)**. Personal Globals apply to the entire file regardless of cursor location.

## Apply Xtra Global Table

The Apply Xtra Global Table (**Alt + g, x**) feature is available on the Global Menu. While defining, you can send the current definition to the transcript global's table, designated dictionary if applicable and to the [Xtra Global Table](#). The Xtra Global Table is automatically created in the System Files case the first time the option is selected in the Global dialog box. Selecting the Apply Xtra Global Table automatically applies all the globals in the Xtra Global Table to the current file.

**Please Note:** Apply Xtra Global Table feature is **Alt + g, x**. Alt + g, x was previously assigned to Global, Text List Brief It feature. The accelerator key for Text List Brief It feature is now **f**. To access the Text List Brief It function, press Alt + g, f.

## Global Suggest

When you create a [Global definition](#) using the Suggest option, a list of up to ten possible text definitions for the steno displayed in the *Steno* field of the Global definition dialog box displays. Clicking a suggested selection or pressing the associated number of a suggestion inserts the entry into the *New Text* field. To ignore the suggestion, press Esc to close the Suggestion List and place the cursor in the *New Text field* or click in the *New Text* field and type the correct text. To automatically display the Suggestion List, check the [Open with Suggestions](#) option in the Global definition dialog box or in the Advanced Global dialog box. The Open with Suggestions option is only available for Global definitions and is not available when replacing text.

Suggested definitions display based on current globals, dictionaries used to translate the job, dictionary entry usage count, recently used data, drag/drop and stacking possibilities and spell checked phonetic suggestions based on the current [Phonetic Table](#).

When editing a job on a computer other than the one on which the job was originally taken, you will want to have all dictionaries and the Phonetic Table used during the translation in order to take advantage of the accurate Suggest feature.

**Note:** If you are recording or playing back a macro, the Global dialog box will never display Suggestions regardless of the state of the Open With Suggestions option in the Global box or in the Advanced Global options.

## Global Table

A Global Table contains definitions created using D-Define, K-Define, J-Define, E-Define and Other Dictionary Define commands in the job. Each job has its own Global Table. When you make the first [global definition](#) for the job, Case CATalyst creates a Global Table, if one does not already exist. [Global Table Options](#) determine how certain global features are handled and allows you to customize Global Table display settings.

You can [manage the globals](#) in the Global Table for the job. Apply, undo, modify, delete and print globals. Other features allow you add globals from other Global Tables and to copy and paste globals from one Global Table to another.

Global Tables are available for use in translation. Global Tables are available for use in translation. Translating with a Global Table allows you to use previously created [E-Defines](#) in the selected Global Table along with any defines in the selected dictionaries. To use Global Tables in translation, in the Translate dialog box, select the [Show Global Tables](#) option to display global files for selection.

Access the Global Table:

- in Edit. Press **Ctrl + y (Global/Global Table)**.
- in Manage Jobs. Press **Alt + f, o, i, t (File, Open, List/Table, Global Table)**. In the Open Existing Document dialog box, select a Global Table and press **Enter (Open)**.

Modifying a Global Table entry from Manage Jobs does not change the globalled text already applied to the job. To apply changes to text, it is necessary to modify the globals from within Edit. Additionally, Undo Global is only available from within Edit.

[Keyboard Map](#) Functions: Global Table

## Understanding the Global Table

The following information displays in a Global Table. The most recent global displays at the top. Use the [Search](#) and [Filter](#) features to locate a specific entry or entries with specific criteria.

You can sort globals in the table by clicking a column heading. Continue to click the column heading until the triangle points up for ascending order or down for descending order. By default, the cursor moves to the top row in the sort order. To have the cursor remain at the current line location change the [Retain position after sort](#) Global Table option.

### Number

The number of the global. When you create globals, Case CATalyst sequentially assigns a number to each global. The Global Table opens with the entries listed in descending global number order, the most recent global first in the list.

### Type

The type of global define: D-Define, K-Define, J-Define, E-Define or a Personal Global. If you made an Other global, it will be listed as a J-define type of global.

**Steno**

The steno portion of the global.

**Case Sensitive**

Y or N displays in this column when the entry is an [E-Define](#) or a Personal Global. Y indicates you made the global case sensitive so that it replaces only text with the upper and lower case letters as they display in the definition.

**Old Text**

The text, steno and format symbols, if applicable, the global replaces.

**New Text**

The replacement text for the global.

**Selective**

The global was marked as [Selective](#) when the steno or text was defined. If you use the [Add Other Globals](#) command to apply the global, Case CATalyst no longer considers the global Selective. A Selective global used during realtime does not apply to new realtime text.

The Global Table option, [Exclude Selective Global](#) determines if a selective global should be included when copying and pasting.

**Global Table Options**

Global Options determine how certain global features are handled and allow you to customize Global Table display settings. You can access Global Table Options from the Global Table. Press **Alt + t, o** (**Tools/Options**).

You can also [manage the globals](#) in the Global Table such as delete, modify, undo, etc.

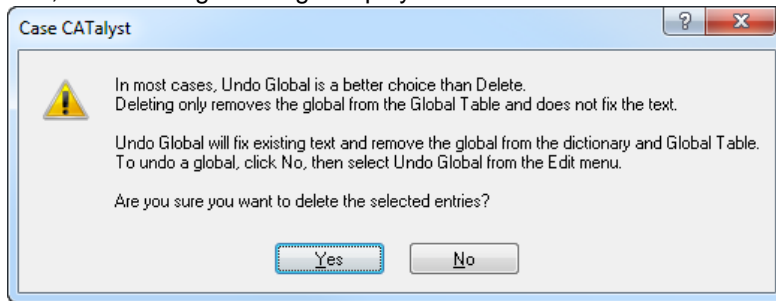

**Global Table Options**

To make a change, click an option. Depending on the field, select a choice from the drop down box, type an entry or use the Browse button. When finished with all your changes, select **OK**. The *Restore Default Settings* option returns all the Global Table Options to their original Case CATalyst default selection.

**Warn before deleting entries**

Check this box to display a confirmation message when you delete global table entries. Deleting a global removes it from the global table and does not fix or change existing text. In most cases, users want to reverse a global to change the transcript text back to what it was (steno/text) before making the global and remove the definition from the designated dictionary. To do that, use the [Undo Global](#) command which is available when opening the Global Table while in a Transcript or you can locate the global in the transcript and select Undo Global from the Global menu.

If you opened the Global Table while in a transcript and select to delete a global and this option is set to Yes, the following message displays:

The Delete global confirmation message differs depending on whether you are deleting globals in a Global Table that was opened at Manage Jobs or a global table that opened within a transcript. When opening a Global Table from Manage Jobs and selecting to delete a global, a Yes No confirmation message displays.

Uncheck this option to disable the confirmation message when you delete entries

### Exclude Selective Global

Check this box to exclude [selective](#) globals from being added or pasted when using the [Add Other Globals](#) command or when copying and pasting globals from one table to another.

Uncheck this box to have selective globals available when using the Add Other Globals... feature.

### Global Table Heading font

The current font selection for the column headings displays in the field. Click the **Browse** button to display the Font dialog box. Select the font and click **OK**. Font style attributes do not apply.

Global Table fonts apply to the Add Globals dialog box when you use the Add Other Globals feature.

### Global Table Steno font

The current font selection for the steno portion of the entries displays in the field. Click the **Browse** button to display the Font dialog box. Select the font and click **OK**. Font style attributes do not apply.

When selecting font types for steno display, it is best to select a Fixed Space Font. Case CATalyst, by default, has three fixed spaced fonts: Andale Mono, Arial Monospaced and Letter Gothic MT plus the Windows Courier New. If you select a proportional font, steno characters may not line up based on their placement on the steno keyboard.

Global Table fonts apply to the Add Globals dialog box when you use the Add Other Globals feature.

### Global Table Text font

The current font selection for the text that displays in the Old Text and New Text fields. Click the **Browse** button to display the Font dialog box. Select the font and click **OK**. Font style attributes do not apply.

Global Table fonts apply to the Add Globals dialog box when you use the Add Other Globals feature.

### Global Table Other font

The current font selection for Global Table text under the Number, Type, Case Sensitive and Selective headings displays in the field. Click the **Browse** button to display the Font dialog box. Select the font and click **OK**. Font style attributes do not apply.

### Retain position after sort

Select **No** to have the cursor move to the top row in the Global Table after clicking a column heading to change the sort order. This is the default.

Select **Yes** to maintain the cursor position at the current line location after click a column heading to change the sort order.

### Add Other Globals go to dictionaries

Select **Yes** to have the *Add Other Globals* feature add all D-Defines, K-Defines and J-Defines to the Global Table and their respective dictionaries. This is the default setting.

Select **No** to have the *Add Other Globals* feature add all D-Defines, K-Defines and J-Defines only to the Global Table.

## Manage Global Table Entries

You can apply, undo, add, modify and delete globals in your Global Table. The Global Table is accessible from Edit and from Manage Jobs. Modifying a Global Table entry from Manage Jobs, however, does not change globals already applied to the open job. To affect globals, it is necessary to modify the globals from within Edit (open the transcript and then open the Global Table). Additionally, it is only possible to Undo a global from within Edit. If you are scopist, you may be using the [Xtra Global Table](#) feature which you can also manage from the System Files case.

Use the [Search](#) feature to quickly locate an entry. The [Filter](#) feature allows you to display Global Table entries in a specified category or with specific criteria.

Access the Global Table:

- in Edit. Press **Ctrl + y (Global/Global Table)**. When modifying a global in Edit, the modified text applies to matching global of the existing global throughout the entire file.
- in Manage Jobs. Press **Alt + f, o, i, t (File, Open, List/Table, Global Table)**. In the Open Existing Document dialog box, select a Global Table and press **Enter (Open)**. When modifying a global at Manage Jobs, the modified text is changed in the Global Table and has no effect on the text in the job. If you open the job and then open the Global Table, the text of the global will be modified but it does not apply to the job.

## Add Other Globals to the Global Table

The [Add Other Globals](#) feature allows you to copy global definitions from another job to your current job and place the globals into the global table of the current job.

## Apply Globals Backwards in the Global Table

When making a global definition, by default, the global only applies forward in the file unless you select the Entire File option. The global does not apply to previous transcript. The Global Table feature, Apply Backwards, allows you to choose globals and apply them backward in the job. The global remains active for new text, such as realtime.

Use [Apply All Global Backward](#) to quickly apply all globals in the transcript backward in the job. A global marked as "[selective](#)" does not automatically apply backward when using this feature.

### Apply Globals Backward

1. Do one of the following:
  - Highlight the entry for selection.
  - Press and hold **Ctrl** while you click the multiple entries to highlight.
  - Click to highlight the first entry of the group. Locate the last entry you want to select. Press and hold **Shift**, while you click the last entry. Case CATalyst highlight all the entries in-between.
  - Press **Ctrl + a** to highlight all the entries.
2. Press Alt + e, a (Apply Backward) to apply the globals backward in the job.

## Copy and Paste Globals

To copy and paste globals from one Global Table to another:

1. Open Global Table from which you want to copy. Do one of the following:

#### Select one entry

Highlight a single entry.

#### Select specific entries

Press and hold **Ctrl** while you click multiple entries to highlight for selection.

#### Select a consecutive group of entries

Click to highlight the first entry of the group. Press and hold **Shift**, while you click the last entry. Case CATalyst highlights all the entries in-between for selection.

#### Select all the entries

Press **Ctrl + a** to highlight all the entries for selection.

2. Right click and select **Copy** and close the Global Table.
3. Open the Global Table in which you want to Paste the entries.
4. Right click and select **Paste**.

## Delete Globals

You can remove globals from the Global Table using the Delete command which removes the globals from the Global Table but does not fix or change existing text. Deleting a global prevents it from applying to new, incoming text. ***If you opened the Global Table while in a transcript, in most cases, users want to reverse the action of a global so it changes the transcript text back to what it was (steno/text) before making the global in all instances in the transcript where the global was applied and remove the entry from the designated dictionary.***

When deleting a global from a Global Table opened from Manage Jobs, an *Are you sure you want to delete?* message displays.

When deleting a global from a Global Table while in a transcript, a warning message displays explaining that deleting a global will not change or fix the existing text.

To reverse the global action, use the [Undo Global](#) command. Undo Global does not affect text modified after the global applied.

To remove globals from the global table:

1. Highlight the entries to delete. Do **one** of the following:

#### Select one entry

Highlight a single entry.

#### Select specific entries

Press and hold **Ctrl** while you click multiple entries to highlight for selection.

#### Select a consecutive group of entries

Click to highlight the first entry of the group. Press and hold **Shift**, while you click the last entry. Case CATalyst highlights all the entries in-between for selection.

#### Select all the entries

Press **Ctrl + a** to highlight all the entries for selection.

2. Press **Delete** to remove the global from the global table. A confirmation message displays if you have the [Warn before deleting entries](#) option selected. Select **Yes** to continue the deletion.

## Modify Global Text

To modify the text in the New Text field of an entry:

1. Highlight the entry and press **Ctrl + m (Edit/Modify)**
2. Case CATalyst positions the cursor in the *New Text* field at the end of the current text. Make necessary changes. To insert a format symbol, press **F4, F4** to display the Format Symbol list. Double click an entry to select it.
3. Press **Enter** to complete the modification.
4. At the modify confirmation prompt, press **Enter** confirm the change.

In edit, the modified global applies throughout the entire file to the matching steno/text of the existing global.

In realtime, the modified global applies only to the existing globals. Once the file is saved, the modified global text is saved in the destination dictionary if appropriate.

At Manage Jobs, the modified global text is changed in the Global Table and has no effect on the text in the file.

## Print Globals

To print global entries for the open job in Edit:

1. From the Global Table, press **Ctrl + p (File/Print)**. The Print dialog box displays.
2. Select the printer and press **Enter (OK)**.

## Send Globals to Cat Scratch

Send global entries to the User, Case or Job Cat Scratch Dialog Pane, depending on the selected user scope of the Cat Scratch pane.

1. In the Global Table, highlight the entries to send. Do **one** of the following:

### Select one entry

Highlight a single entry.

### Select specific entries

Press and hold **Ctrl** while you click multiple entries to highlight for selection.

### Select a consecutive group of entries

Click to highlight the first entry of the group. Press and hold **Shift**, while you click the last entry. Case CATalyst highlights all the entries in-between for selection.

### Select all the entries

Press **Ctrl + a** to highlight all the entries for selection.

2. Select **Edit/Send to Case Cat Scratch**.

## Undo Globals

While editing a job, you can undo globals using one of three different commands without opening the Global Table:

- [Undo Last Global](#) reverses the last global action.
- [Undo Global](#) reverses the global from the job. Undo is also available in the Global Table. You can undo a global at anytime.
- [Undo Global Once](#) reverses the global action for a single word.

## Modify Global

You can modify the text of a D, J, K or E global in the Global Table. If you are in edit, you open the Global Table and you modify the text of a global, the modified text of the global is applied to all occurrences of the global in the transcript. In realtime, the modified global applies only to the existing globals in the transcript. Once the file is saved, the modified global text is saved in the destination dictionary if appropriate. If you want to change a global during realtime and have it apply, you will need to redefine it or re-global it to have it apply. [Personal Globals](#) cannot be modified from the Global Table.

If open a Global Table at Manage Jobs, you can modify the text of a global but it does not affect the transcript text.

To modify the text in the New Text field of a Global Table entry:

1. Do one of the following:
  - In Translate & Edit, press **Ctrl + y** (Global, Global Table).
  - At Manage Jobs, double click the Global Table subfile or highlight the Global Table subfile, right click and select Open.
2. Highlight the entry and press **Ctrl + m** (Edit/Modify)
3. Case CATalyst positions the cursor in the *New Text* field at the end of the current text. Make necessary changes. To insert a format symbol, press **F4, F4** to display the Format Symbol list. To insert a format symbol from the list, press the first letter of the format symbol (if multiple format symbols start with the same letter you can continue to press the first letter until the format symbol want is highlighted) and press **Enter**, double click the desired format symbol or use the up/down arrow keys to move to the format symbol you want to insert and press **Enter**. Double click the format symbol to select it. You can also use F4 and the format symbol shortcut to insert format symbols.
4. Press **Enter** to complete the modification.
5. At the *Are you sure you want to modify this global* confirmation prompt, press **Enter** to confirm the change.
6. To close and save the change(s), press **Ctrl + F4** or click the X in the upper right hand corner of the Global Table dialog box.

**In edit**, the modified global applies throughout the entire transcript to the matching steno/text of the existing global.

**In realtime**, the modified global applies only to the existing globals in the transcript. Once the file is saved, the modified global text is saved in the destination dictionary if appropriate. If you want to change a global during realtime and have it apply, you will need to redefine it or re-global it to have it apply.

**At Manage Jobs**, the modified global text is changed in the Global Table and has no effect on the text in the transcript. If you use the global table with the modified global for future translations or applying globals, the modified global is active.

## Search Global Table

Search allows you to locate a entry in the Global Table you want to view or modify. You can search forward or backward for steno or text, including whole word, part of a word, or multiple words. Once a searched entry displays, you can repeat Search for the same text and search parameters by using *Repeat Search*.

Use the [Filter](#) feature to display Global Table entries in a specified category or with specific criteria.

Access the Global Table:

- in Edit. Press **Ctrl + y** (Global/Global Table).
- in Manage Jobs. Press **Alt + f, o, i, t** (File, Open, List/Table, Global Table). In the Open Existing Document dialog box, select a Global Table and press **Enter** (Open).

Modifying a Global Table entry from Manage Jobs does not change the globalled text already applied to the job. To apply changes to text, it is necessary to modify the globals from within Edit.

Additionally, Undo Global, and other undo global features, are only available from within Edit.

## Search Global Table

1. From the Global Table, press **Ctrl + f (Edit/Search)**. The Search dialog box displays.
2. Make entries as necessary:

### Search For

Select the method by which you want to search the Global Table.

#### Steno

Search by steno. Type the search steno in the field. Separate multiple strokes with a forward slash. When starting with a final stroke, place a – (hyphen) before the first letter.

#### Partial Stroke

Check this box to search for the specified steno regardless of whether or not it is part of a steno outline. For example, searching for –FPLT finds: -FPLT, FPLTD, FRPBLGTS, FRPBLTS, etc. Without the *Partial Stroke* option, searching –FPLT displays entries with –FPLT as a separate outline, such as: -FPLT, -FPLT/-FPLT, etc. This option only displays when you search for Steno.

#### Text

Search by text. Type the search text in the field. The search considers both *Old Text* and *New Text*.

#### FS

Add format symbols to a text search. Select **FS** and double click the format symbol from the list to select it; or use shortcut keys. To use a shortcut key, place the cursor in the *Search For* field, press **F4** and then the appropriate letter or symbol.

#### Case Sensitive

Limit the search based on the upper and lower case letters of text typed in the *Search For* field. Without this option, the search considers all words containing the indicated characters, regardless of the case typed into the field. This option only displays when you search for Text.

3. Press **Enter (OK)** to start the search. The Search dialog box closes and the Global Table window displays the entry. If Case CATalyst does not find a match for the selected steno or text search, a message displays.
4. To repeat the same search, press **F3 (Edit/Repeat Search)**.

## Filter Global Table

Filter displays only the entries in the Global Table that contain the specified criteria. Entries filtered out are not removed from the file. All the entries redisplay when you select Unfilter or the next time you open the Global Table.

Use the [Search](#) feature to quickly locate an entry you want to view or modify.

Access the Global Table:

- in Edit. Press **Ctrl + y (Global/Global Table)**.
- in Manage Jobs. Press **Alt + f, o, i, t (File, Open, List/Table, Global Table)**. In the Open Existing Document dialog box, select a Global Table and press **Enter (Open)**.

Modifying a Global Table entry from Manage Jobs does not change the globalled text already applied to the job. To apply changes to text, it is necessary to modify the globals from within Edit. Additionally, Undo Global, and other undo global features, are available from within Edit.

## Filter Global Table

1. From the Global Table, press **Alt + v, f (View/Filter)**. The Filter dialog box displays.
2. Make entries as necessary:

### Filter

Click the down arrow to display the filter criteria. Select one of the following:

#### Number

Filter the display by the assigned entry number. Type the entry number in the field.

#### Steno

Filter the display by steno. Type the steno in the field. Separate multiple strokes with a forward slash. When starting with a final stroke, place a – (hyphen) before the first letter.

#### Partial Stroke

Check this box to filter on entries that contain a portion of the steno outlined typed. For example, you filter on –FPLT. The filter includes: -FPLT, FPLTD, FRPBLGTS, FRPBLTS, etc. Filtering on –FPLT without the *Partial Stroke* option, displays entries with –FPLT as a separate outline, such as: -FPLT, -FPLT/-FPLT, etc.

#### Case Sensitive

Filter the display based on the E-Define Case Sensitive attribute. A global created with the Case Sensitive attribute replaces only text with upper and lower case letters as they display in the definition. Select **Y** to filter on entries with the Case Sensitive attribute. Select **N** to filter on entries without it.

#### Type

Filter the display by global define type. Select a define type from the drop down list.

#### Old Text

Filter the display based on text in the *Old Text* field. Type the text in the field.

Add format symbols and fields to the filter as necessary. Select **FS** and double click the format symbol from the list to select it; or use shortcut keys. To use a shortcut key, place the cursor in the field, press **F4** and then the appropriate letter or symbol. To add a field, click [Insert Field](#) and select a field. Press **F9** to add [extended characters](#).

#### New Text

Filter the display based on text in the *New Text* field. Type the text in the field.

Add format symbols and fields to the filter as necessary. Select **FS** and double click the format symbol from the list to select it; or use shortcut keys. To use a shortcut key, place the cursor in the field, press **F4** and then the appropriate letter or symbol. To add a field, click [Insert Field](#) and select a field. Press **F9** to add [extended characters](#).

#### Selective

Filter the display based on the Selective attribute. A global created with the Selective attribute moves to each occurrence affected by the global change, allowing you to choose to apply the change, skip the occurrence or apply the change to all occurrences. Select **Y** to filter on entries with the Selective attribute. Select **N** to filter on entries without it.

### **Entry Type**

Filter the display by entry type, such as conflict or Auto Include. Select an entry type from the drop down list. This field is available when *Old Text* or *New Text* is selected in the *Filter* field.

#### **Entry Types**

##### **Conflict**

The first entry that contains a conflict end format symbol.

##### **Scan stop**

The first entry that contains a scan stop begin or end format symbols.

##### **Numbers**

The first entry that contains numbers.

##### **All Capped**

The first entry that contains all capped text.

##### **Contains capped**

The first entry that contains at least one capital letter.

##### **Phrase**

The first entry that contains two or more words separated by a space.

##### **Contains punctuation**

The first entry that contains punctuation.

##### **Contains format symbol**

The first entry that contains a format symbol.

##### **Contains Field(s)**

The first entry that contains a field.

##### **Auto Includes**

The first entry that begin with @.

##### **AccelerWriter**

The first entry that begin with &&.

##### **Number Conversion**

The first entry that contain the {Number Conversion} translate command.

##### **Number Trigger**

The first entry that contain the {Number Trigger} translate command.

**Numeral Words**

The first entry that contain a word number including hundred, thousand, million, etc.

**Speaker Entries**

The first entry that contain a <Colloquy> format symbol and a colon.

**Case Sensitive**

Filter on entries based on the upper and lower case letters of text typed in the field. Without this option, the filter considers all words containing the indicated characters, regardless of the case typed into the field. This field is available when *Old Text* or *New Text* is selected in the *Filter* field.

**Whole Word**

Filter only on entries that match the filter text typed in the field. If you do not select *Whole Word*, the filter locates the text as it stands alone and as part of another word. This field is available when *Old Text* or *New Text* is selected in the *Filter* field.

**Location**

Select filter parameters.

**Exact Match**

Filter on entries that exactly match the text entered in the *Filter* field.

**Begins With**
